

## EFM32ZG Reference Manual

### Zero Gecko Series

- 32-bit ARM Cortex-M0+ processor running at up to 24 MHz
- Up to 32 kB Flash and 4 kB RAM memory
- Energy efficient and autonomous peripherals
- Ultra low power Energy Modes with sub- $\mu$ A operation
- Fast wake-up time of only 2  $\mu$ s

The EFM32ZG microcontroller series revolutionizes the 8- to 32-bit market with a combination of unmatched performance and ultra low power consumption in both active- and sleep modes. EFM32ZG devices consume as little as 114  $\mu$ A/MHz in run mode.

EFM32ZG's low energy consumption outperforms any other available 8-, 16-, and 32-bit solution. The EFM32ZG includes autonomous and energy efficient peripherals, high overall chip- and analog integration, and the performance of the industry standard 32-bit ARM Cortex-M0+ processor.

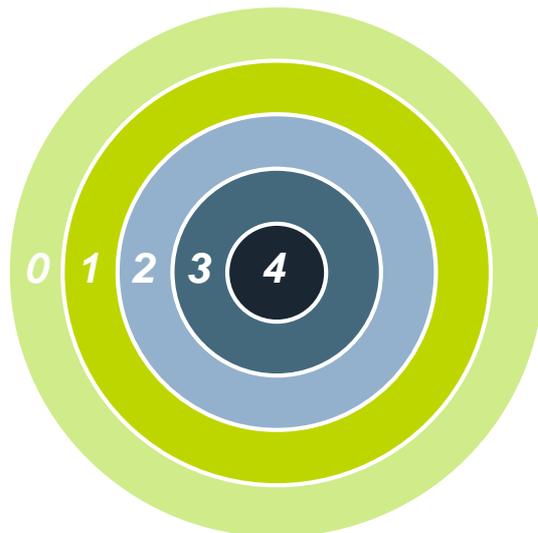

# 1 Energy Friendly Microcontrollers

## 1.1 Typical Applications

The EFM32ZG Zero Gecko is the ideal choice for demanding 8-, 16-, and 32-bit energy sensitive applications. These devices are developed to minimize the energy consumption by lowering both the power and the active time, over all phases of MCU operation. This unique combination of ultra low energy consumption and the performance of the 32-bit ARM Cortex-M0+ processor, help designers get more out of the available energy in a variety of applications.

**Ultra low energy EFM32ZG microcontrollers are perfect for:**

- Gas metering
- Energy metering
- Water metering
- Smart metering
- Alarm and security systems
- Health and fitness applications
- Industrial and home automation

## 1.2 EFM32ZG Development

Because EFM32ZG use the Cortex-M0+ CPU, embedded designers benefit from the largest development ecosystem in the industry, the ARM ecosystem. The development suite spans the whole design process and includes powerful debug tools, and some of the world's top brand compilers. Libraries with documentation and user examples shorten time from idea to market.

The range of EFM32ZG devices ensure easy migration and feature upgrade possibilities.

## 2 About This Document

This document contains reference material for the EFM32ZG series of microcontrollers. All modules and peripherals in the EFM32ZG series devices are described in general terms. Not all modules are present in all devices, and the feature set for each device might vary. Such differences, including pin-out, are covered in the device-specific datasheets.

### 2.1 Conventions

#### Register Names

Register names are given as a module name prefix followed by the short register name:

TIMERn\_CTRL - Control Register

The "n" denotes the numeric instance for modules that might have more than one instance.

Some registers are grouped which leads to a group name following the module prefix:

GPIO\_Px\_DOUT - Port Data Out Register,

where x denotes the port instance (A,B,...).

#### Bit Fields

Registers contain one or more bit fields which can be 1 to 32 bits wide. Multi-bit fields are denoted with (x:y), where x is the start bit and y is the end bit.

#### Address

The address for each register can be found by adding the base address of the module (found in the Memory Map), and the offset address for the register (found in module Register Map).

#### Access Type

The register access types used in the register descriptions are explained in Table 2.1 (p. 3) .

**Table 2.1. Register Access Types**

Access Type	Description
R	Read only. Writes are ignored.
RW	Readable and writable.
RW1	Readable and writable. Only writes to 1 have effect.
RW1H	Readable, writable and updated by hardware. Only writes to 1 have effect.
W1	Read value undefined. Only writes to 1 have effect.
W	Write only. Read value undefined.
RWH	Readable, writable and updated by hardware.

#### Number format

**0x** prefix is used for hexadecimal numbers.

**0b** prefix is used for binary numbers.

Numbers without prefix are in decimal representation.

### Reserved

Registers and bit fields marked with *reserved* are reserved for future use. These should be written to 0 unless otherwise stated in the Register Description. Reserved bits might be read as 1 in future devices.

### Reset Value

The reset value denotes the value after reset.

Registers denoted with X have an unknown reset value and need to be initialized before use. Note that, before these registers are initialized, read-modify-write operations might result in undefined register values.

### Pin Connections

Pin connections are given as a module prefix followed by a short pin name:

USn\_TX (USARTn TX pin)

The pin locations referenced in this document are given in the device-specific datasheet.

## 2.2 Related Documentation

Further documentation on the EFM32ZG family and the ARM Cortex-M0+ can be found at the Silicon Laboratories and ARM web pages:

## 3 System Overview

### 3.1 Introduction

The EFM32 MCUs are the world's most energy friendly microcontrollers. With a unique combination of the powerful 32-bit ARM Cortex-M0+, innovative low energy techniques, short wake-up time from energy saving modes, and a wide selection of peripherals, the EFM32ZG microcontroller is well suited for any battery operated application, as well as other systems requiring high performance and low-energy consumption, see Figure 3.1 (p. 6) .

### 3.2 Features

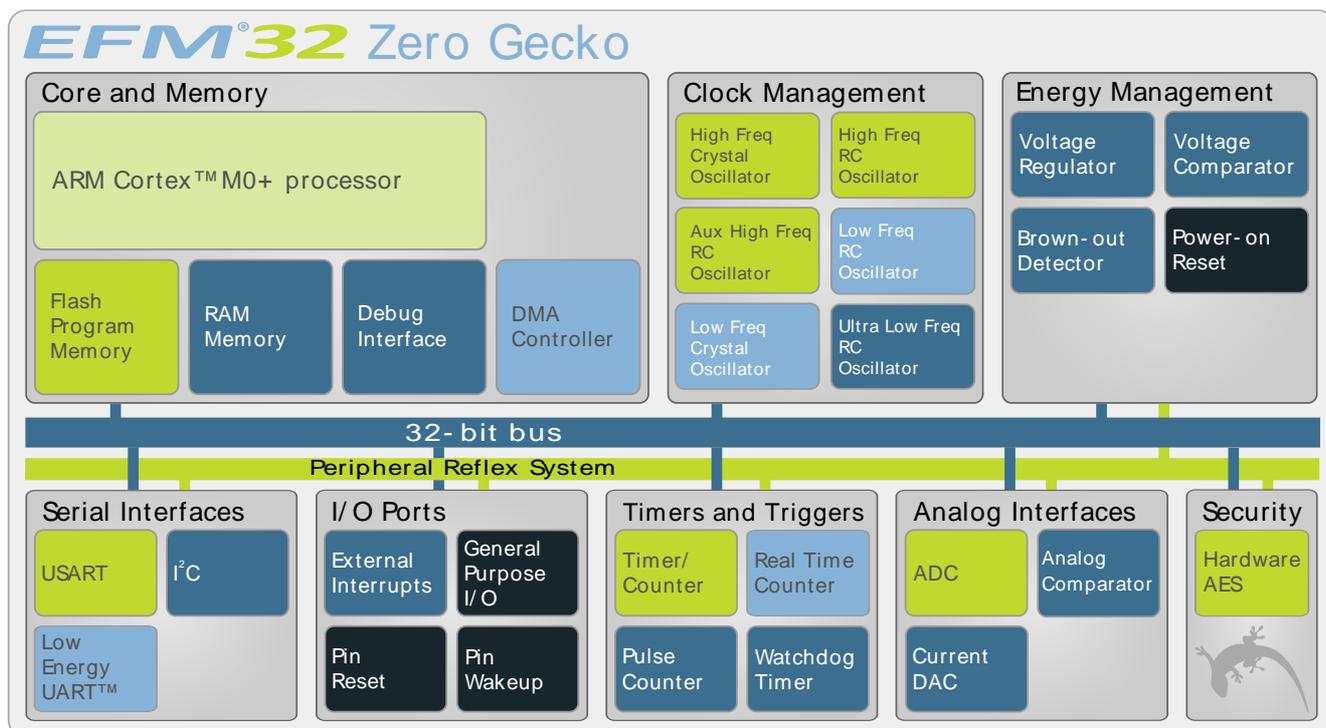

- **ARM Cortex-M0+ CPU platform**
  - High Performance 32-bit processor @ up to 24 MHz
  - Wake-up Interrupt Controller
- **Flexible Energy Management System**
  - 20 nA @ 3 V Shutoff Mode
  - 0.5  $\mu$ A @ 3 V Stop Mode, including Power-on Reset, Brown-out Detector, RAM and CPU retention
  - 0.9  $\mu$ A @ 3 V Deep Sleep Mode, including RTC with 32768 Hz oscillator, Power-on Reset, Brown-out Detector, RAM and CPU retention
  - 48  $\mu$ A/MHz @ 3 V Sleep Mode
  - 114  $\mu$ A/MHz @ 3 V Run Mode, with code executed from flash
- **32/16/8/4 KB Flash**
- **4/2 KB RAM**
- **Up to 37 General Purpose I/O pins**
  - Configurable push-pull, open-drain, pull-up/down, input filter, drive strength
  - Configurable peripheral I/O locations
  - 16 asynchronous external interrupts
  - Output state retention and wake-up from Shutoff Mode
- **4 Channel DMA Controller**
  - Alternate/primary descriptors with scatter-gather/ping-pong operation
- **4 Channel Peripheral Reflex System**
  - Autonomous inter-peripheral signaling enables smart operation in low energy modes
- **Hardware AES with 128-bit Keys in 54 cycles**
- **Communication interfaces**
  - 1x Universal Synchronous/Asynchronous Receiver/Transmitter
    - Triple buffered full/half-duplex operation
    - 4-16 data bits
  - 1x Low Energy UART
    - Autonomous operation with DMA in Deep Sleep Mode
  - 1x I<sup>2</sup>C Interface with SMBus support
    - Address recognition in Stop Mode
- **Timers/Counters**
  - 2x 16-bit Timer/Counter
    - 3 Compare/Capture/PWM channels
  - 24-bit Real-Time Counter
  - 1x 16-bit Pulse Counter
    - Asynchronous pulse counting/quadrature decoding
  - Watchdog Timer with dedicated RC oscillator @ 50 nA
- **Ultra low power precision analog peripherals**
  - 12-bit 1 Msamples/s Analog to Digital Converter

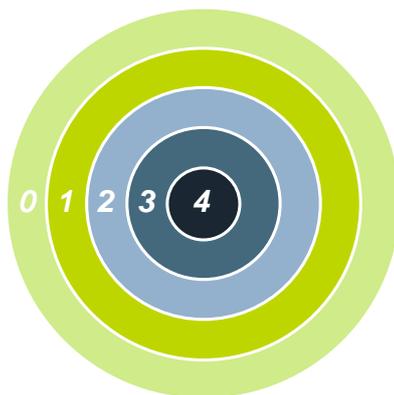

- 8 input channels and on-chip temperature sensor
- Single ended or differential operation
- Conversion tailgating for predictable latency
- Current Digital to Analog Converter
  - Source or sink a configurable constant current
- 1x Analog Comparator
  - Programmable speed/current
  - Capacitive sensing with up to 8 inputs
- Supply Voltage Comparator
- **Ultra efficient Power-on Reset and Brown-Out Detector**
- **2-pin Serial Wire Debug interface**
- **Temperature range -40 - 85°C**
- **Single power supply 1.98 - 3.8 V**
- **Packages**
  - QFN24
  - QFN32
  - TQFP48

### 3.3 Block Diagram

Figure 3.1 (p. 6) shows the block diagram of EFM32ZG. The color indicates peripheral availability in the different energy modes, described in Section 3.4 (p. 7) .

**Figure 3.1. Block Diagram of EFM32ZG**

**Figure 3.2. Energy Mode Indicator****Note**

In the energy mode indicator, the numbers indicates Energy Mode, i.e EM0-EM4.

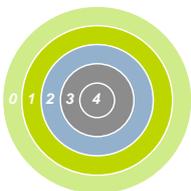

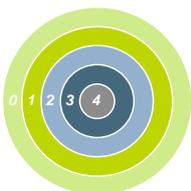

## 3.4 Energy Modes

There are five different Energy Modes (EM0-EM4) in the EFM32ZG, see Table 3.1 (p. 8). The EFM32ZG is designed to achieve a high degree of autonomous operation in low energy modes. The intelligent combination of peripherals, RAM with data retention, DMA, low-power oscillators, and short wake-up time, makes it attractive to remain in low energy modes for long periods and thus saving energy consumption.

**Tip**

Throughout this document, the first figure in every module description contains an Energy Mode Indicator showing which energy mode(s) the module can operate (see Table 3.1 (p. 8) ).

**Table 3.1. Energy Mode Description**

Energy Mode	Name	Description
	EM0 – Energy Mode 0 (Run mode)	In EM0, the CPU is running and consuming as little as 114 $\mu$ A/MHz, when running code from flash. All peripherals can be active.
	EM1 – Energy Mode 1 (Sleep Mode)	In EM1, the CPU is sleeping and the power consumption is only 48 $\mu$ A/MHz. All peripherals, including DMA, PRS and memory system, are still available.
	EM2 – Energy Mode 2 (Deep Sleep Mode)	In EM2 the high frequency oscillator is turned off, but with the 32.768 kHz oscillator running, selected low energy peripherals (RTC, PCNT, LEUART, I <sup>2</sup> C, WDOG and ACMP) are still available. This gives a high degree of autonomous operation with a current consumption as low as 0.9 $\mu$ A with RTC enabled. Power-on Reset, Brown-out Detection and full RAM and CPU retention is also included.
	EM3 - Energy Mode 3 (Stop Mode)	In EM3, the low-frequency oscillator is disabled, but there is still full CPU and RAM retention, as well as Power-on Reset, Pin reset, EM4 wake-up and Brown-out Detection, with a consumption of only 0.5 $\mu$ A. The low-power ACMP, asynchronous external interrupt, PCNT, and I <sup>2</sup> C can wake-up the device. Even in this mode, the wake-up time is a few microseconds.
	EM4 – Energy Mode 4 (Shutoff Mode)	In EM4, the current is down to 20 nA and all chip functionality is turned off except the pin reset, GPIO pin wake-up, GPIO pin retention and the Power-On Reset. All pins are put into their reset state.

### 3.5 Product Overview

Table 3.2 (p. 8) shows a device overview of the EFM32ZG Microcontroller Series, including peripheral functionality. For more information, the reader is referred to the device specific datasheets.

### 3.6 Device Revision

The device revision number is read from the ROM Table. The major revision number and the chip family number is read from PID0 and PID1 registers. The minor revision number is extracted from the PID2 and PID3 registers, as illustrated in Figure 3.3 (p. 9). The Fam[5:2] and Fam[1:0] must be combined to complete the chip family number, while the Minor Rev[7:4] and Minor Rev[3:0] must be combined to form the complete revision number.

**Figure 3.3. Revision Number Extraction**

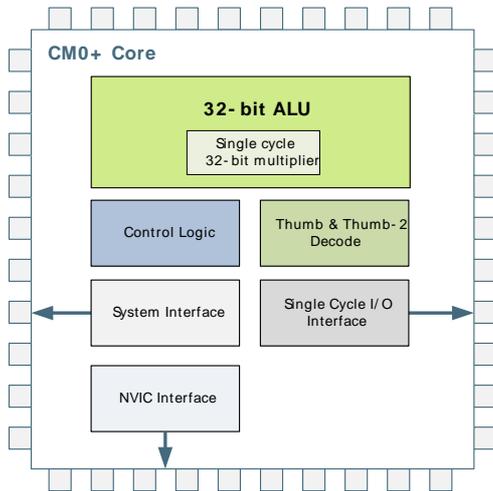

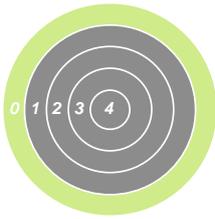

For the latest revision of the Zero Gecko family, the chip family number is 0x04 and the major revision number is 0x01. The minor revision number is to be interpreted according to Table 3.3 (p. 10) .

**Table 3.3. Minor Revision Number Interpretation**

Minor Rev[7:0]	Revision
0x00	A

## 4 System Processor

### Quick Facts

#### What?

The industry leading Cortex-M0+ processor from ARM is the CPU in the EFM32ZG microcontrollers.

#### Why?

The ARM Cortex-M0+ is designed for exceptional short response time, high code density, and high 32-bit throughput while maintaining a strict cost and power consumption budget.

#### How?

Combined with the ultra low energy peripherals available, the Cortex-M0+ makes the EFM32ZG devices perfect for 8- to 32-bit applications. The processor is featuring a 2 stage pipeline, dedicated single cycle I/O interface, efficient single cycle instructions, Thumb/Thumb-2 instruction set support, and fast interrupt handling.

### 4.1 Introduction

The ARM Cortex-M0+ 32-bit RISC processor provides outstanding computational performance and exceptional system response to interrupts while meeting low cost requirements and low power consumption.

The ARM Cortex-M0+ implemented is revision r0p1.

### 4.2 Features

- 2-stage pipeline
- Thumb/Thumb-2 instruction subset
  - Enhanced levels of performance, energy efficiency, and code density
  - Enables direct portability to other ARM Cortex-M processors
- Hardware single-cycle multiplication
  - Enables 32-bit multiplication in a single cycle
- Dedicated Single-cycle I/O interface
  - Provides immediate access to all GPIO-registers
  - Enables the processor to simultaneously fetch the next instructions over the System bus
- Configurable IRQ-latency
  - Allows developers to select a trade-off between interrupt response time and predictability
- Up to 1.08 DMIPS/MHz
- 24-bit System Tick Timer for Real-Time Operating System (RTOS)
- Excellent 32-bit migration choice for 8/16 bit architecture based designs
  - Simplified stack-based programmer's model is compatible with traditional ARM architecture and retains the programming simplicity of legacy 8- and 16-bit architectures
- Integrated power modes

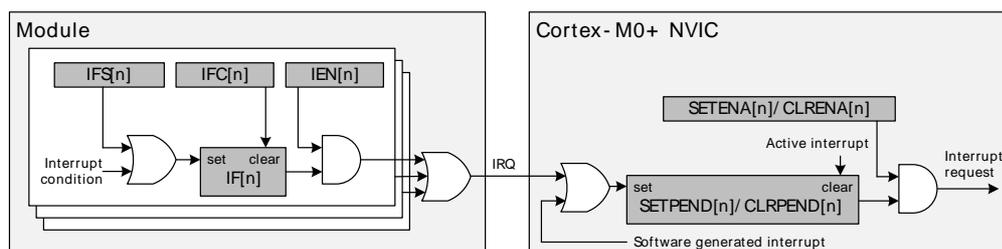

- Sleep Now mode for immediate transfer to low power state
- Sleep on Exit mode for entry into low power state after the servicing of an interrupt
- Ability to extend power savings to other system components
- Optimized for low latency, nested interrupts

### 4.3 Functional Description

For a full functional description of the ARM Cortex-M0+ (r0p1) implementation in the EFM32ZG family, the reader is referred to the *ARM Cortex-M0+ Devices Generic User Guide*.

#### 4.3.1 Interrupt Operation

Figure 4.1. Interrupt Operation

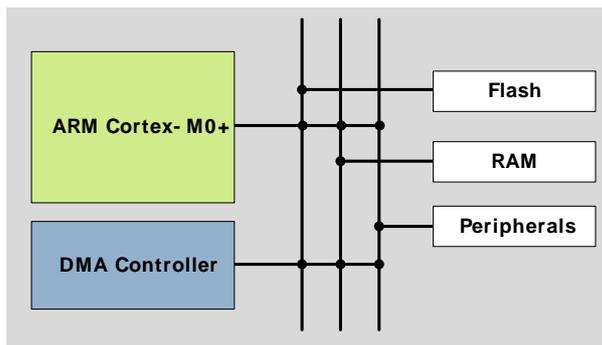

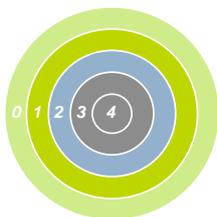

The EFM32ZG devices have up to 17 interrupt request lines (IRQ) which are connected to the Cortex-M0+. Each of these lines (shown in Table 4.1 (p. 12)) are connected to one or more interrupt flags in one or more modules. The interrupt flags are set by hardware on an interrupt condition. It is also possible to set/clear the interrupt flags through the IFS/IFC registers. Each interrupt flag is then qualified with its own interrupt enable bit (IEN register), before being OR'ed with the other interrupt flags to generate the IRQ. A high IRQ line will set the corresponding pending bit (can also be set/cleared with the SETPEND/CLRPEND bits in ISPR0/ICPR0) in the Cortex-M0+ NVIC. The pending bit is then qualified with an enable bit (set/cleared with SETENA/CLRENA bits in ISER0/ICER0) before generating an interrupt request to the core. Figure 4.1 (p. 12) illustrates the interrupt system. For more information on how the interrupts are handled inside the Cortex-M0+, the reader is referred to the *ARM Cortex-M0+ Devices Generic User Guide*.

Table 4.1. Interrupt Request Lines (IRQ)

IRQ #	Source
0	DMA
1	GPIO_EVEN
2	TIMER0
3	ACMP0
4	ADC0
5	I2C0
6	GPIO_ODD
7	TIMER1
8	USART1_RX
9	USART1_TX
10	LEUART0
11	PCNT0

IRQ #	Source
12	RTC
13	CMU
14	VCMP
15	MSC
16	AES

# 5 Memory and Bus System

### Quick Facts

#### What?

A low latency memory system, including low energy flash and RAM with data retention, makes extended use of low-power energy-modes possible.

#### Why?

RAM retention reduces the need for storing data in flash and enables frequent use of the ultra low energy modes EM2 and EM3 with as little as 0.5  $\mu$ A current consumption.

#### How?

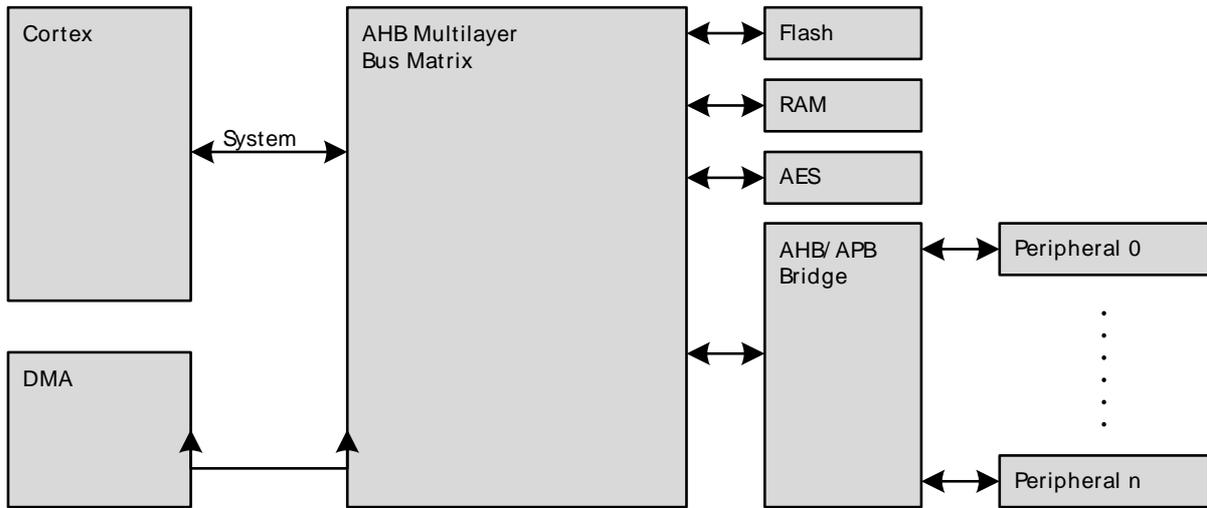

Low energy and non-volatile flash memory stores program and application data in all energy modes and can easily be reprogrammed in system. Low leakage RAM, with data retention in EM0 to EM3, removes the data restore time penalty, and the DMA ensures fast autonomous transfers with predictable response time.

## 5.1 Introduction

The EFM32ZG contains an AMBA AHB Bus system allowing bus masters to access the memory mapped address space. A multilayer AHB bus matrix, using a Round-robin arbitration scheme, connects the master bus interfaces to the AHB slaves (Figure 5.1 (p. 15)). The bus matrix allows several AHB slaves to be accessed simultaneously. An AMBA APB interface is used for the peripherals, which are accessed through an AHB-to-APB bridge connected to the AHB bus matrix. The AHB bus masters are:

- **Cortex-M0+ System:** Used for instruction fetches, data and debug access (0x00000000 - 0xDFFFFFFF).
- **DMA:** Can access SRAM, Flash and peripherals (0x00000000 - 0xDFFFFFFF), except GPIO (0x40006000 - 0x40007000).

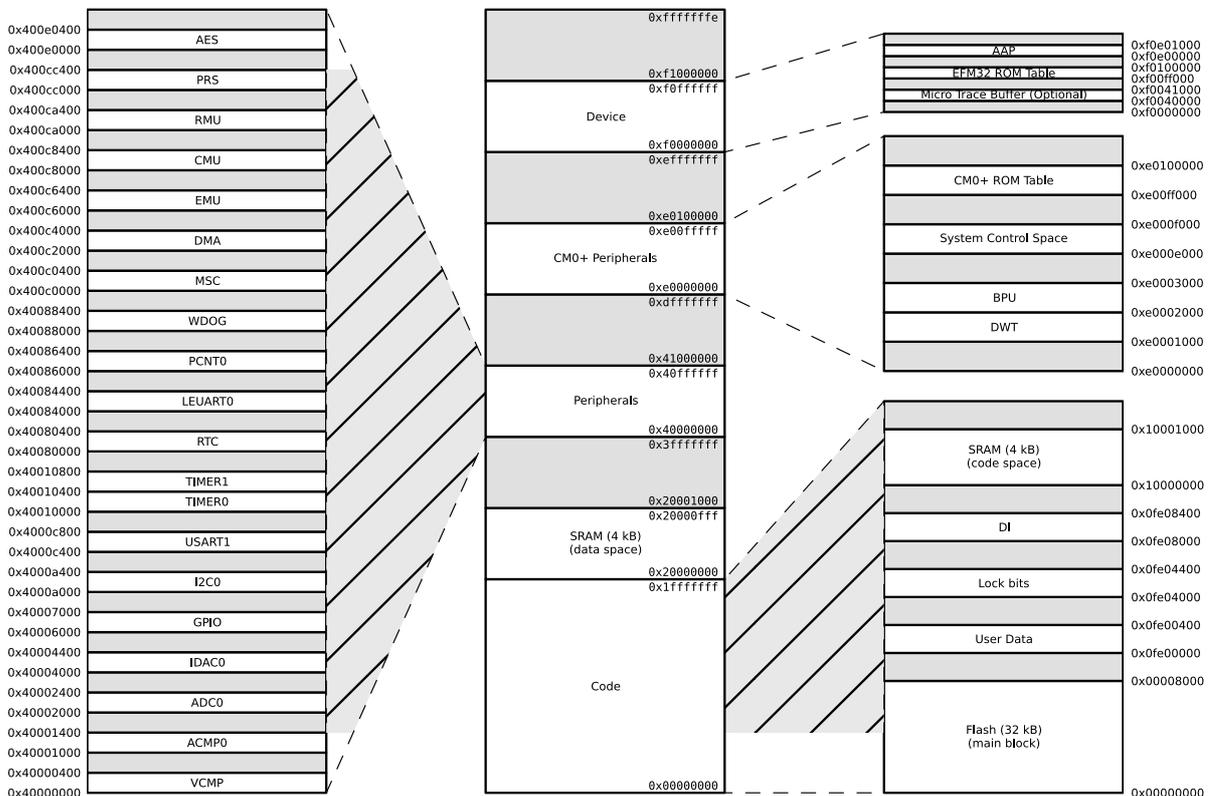

Figure 5.1. EFM32ZG Bus System

## 5.2 Functional Description

The memory segments are mapped together with the internal segments of the Cortex-M0+ into the system memory map shown by Figure 5.2 (p. 15)

Figure 5.2. System Address Space

The embedded SRAM is located at address 0x20000000 in the memory map of the EFM32ZG. It is also mapped in code space at address 0x10000000 to keep compatibility towards Cortex-M3 and Cortex-M4 EFM32-devices, that uses this code-space mapped SRAM for faster instruction fetching.

## 5.2.1 Peripherals

The peripherals are mapped into the peripheral memory segment, each with a fixed size address range according to Table 5.1 (p. 16) , Table 5.2 (p. 16) and Table 5.3 (p. 16) .

**Table 5.1. Memory System Core Peripherals**

Core peripherals	
Address Range	Module Name
0x400E0000 - 0x400E03FF	AES
0x400CA000 - 0x400CA3FF	RMU
0x400C8000 - 0x400C83FF	CMU
0x400C6000 - 0x400C63FF	EMU
0x400C2000 - 0x400C3FFF	DMA
0x400C0000 - 0x400C03FF	MSC

**Table 5.2. Memory System Low Energy Peripherals**

Low Energy peripherals	
Address Range	Module Name
0x40088000 - 0x400883FF	WDOG
0x40086000 - 0x400863FF	PCNT0
0x40084000 - 0x400843FF	LEUART0
0x40080000 - 0x400803FF	RTC

**Table 5.3. Memory System Peripherals**

Peripherals	
Address Range	Module Name
0x400CC000 - 0x400CC3FF	PRS
0x40010400 - 0x400107FF	TIMER1
0x40010000 - 0x400103FF	TIMER0
0x4000C400 - 0x4000C7FF	USART1
0x4000A000 - 0x4000A3FF	I2C0
0x40006000 - 0x40006FFF	GPIO
0x40004000 - 0x400043FF	IDAC0
0x40002000 - 0x400023FF	ADC0
0x40001000 - 0x400013FF	ACMP0
0x40000000 - 0x400003FF	VCMP

## 5.2.2 Bus Matrix

The Bus Matrix connects the memory segments to the bus masters:

- Code: CPU instruction or data fetches from the code space
- System: CPU read and write to the SRAM and peripherals
- DMA: Access to SRAM, Flash and peripherals

### 5.2.2.1 Arbitration

The Bus Matrix uses a round-robin arbitration algorithm which enables high throughput and low latency while starvation of simultaneous accesses to the same bus slave are eliminated. Round-robin does not assign a fixed priority to each bus master. The arbiter does not insert any bus wait-states.

### 5.2.2.2 Access Performance

The Bus Matrix is a multi-layer energy optimized AMBA AHB compliant bus with an internal bandwidth equal to 4 times a single AHB-bus.

The Bus Matrix accepts new transfers initiated by each master in every clock cycle without inserting any wait-states. The slaves, however, may insert wait-states depending on their internal throughput and the clock frequency.

The Cortex-M0+, the DMA Controller, and the peripherals run on clocks that can be prescaled separately. When accessing a peripheral which runs on a frequency equal to or faster than the HFCORECLK, the number of wait cycles per access, in addition to master arbitration, is given by:

#### **Memory Wait Cycles with Clock Equal or Faster than HFCORECLK**

$$N_{\text{cycles}} = 2 + N_{\text{slave cycles}}, \quad (5.1)$$

where  $N_{\text{slave cycles}}$  is the wait cycles introduced by the slave.

When accessing a peripheral running on a clock slower than the HFCORECLK, wait-cycles are introduced to allow the transfer to complete on the peripheral clock. The number of wait cycles per access, in addition to master arbitration, is given by:

#### **Memory Wait Cycles with Clock Slower than CPU**

$$N_{\text{cycles}} = (2 + N_{\text{slave cycles}}) \times f_{\text{HFCORECLK}}/f_{\text{HFPERCLK}}, \quad (5.2)$$

where  $N_{\text{slave cycles}}$  is the number of wait cycles introduced by the slave.

For general register access,  $N_{\text{slave cycles}} = 1$ .

More details on clocks and prescaling can be found in Chapter 11 (p. 92) .

## 5.3 Access to Low Energy Peripherals (Asynchronous Registers)

### 5.3.1 Introduction

The Low Energy Peripherals are capable of running when the high frequency oscillator and core system is powered off, i.e. in energy mode EM2 and in some cases also EM3. This enables the peripherals to perform tasks while the system energy consumption is minimal.

The Low Energy Peripherals are:

- Low Energy UART - LEUART
- Pulse Counter - PCNT
- Real Time Counter - RTC
- Watchdog - WDOG

All Low Energy Peripherals are memory mapped, with automatic data synchronization. Because the Low Energy Peripherals are running on clocks asynchronous to the core clock, there are some constraints on how register accesses can be done, as described in the following sections.

### 5.3.1.1 Writing

Every Low Energy Peripheral has one or more registers with data that needs to be synchronized into the Low Energy clock domain to maintain data consistency and predictable operation. There are two different synchronization mechanisms on the Zero Gecko; immediate synchronization, and delayed synchronization. Immediate synchronization is available for the RTC and results in an immediate update of the target registers. Delayed synchronization is used for the other Low Energy Peripherals, and for these peripherals, a write operation requires 3 positive edges on the clock of the Low Energy Peripheral being accessed. Registers requiring synchronization are marked "Asynchronous" in their description header.

#### 5.3.1.1.1 Delayed synchronization

After writing data to a register which value is to be synchronized into the Low Energy Peripheral using delayed synchronization, a corresponding busy flag in the <module\_name>\_SYNCBUSY register (e.g. LEUART\_SYNCBUSY) is set. This flag is set as long as synchronization is in progress and is cleared upon completion.

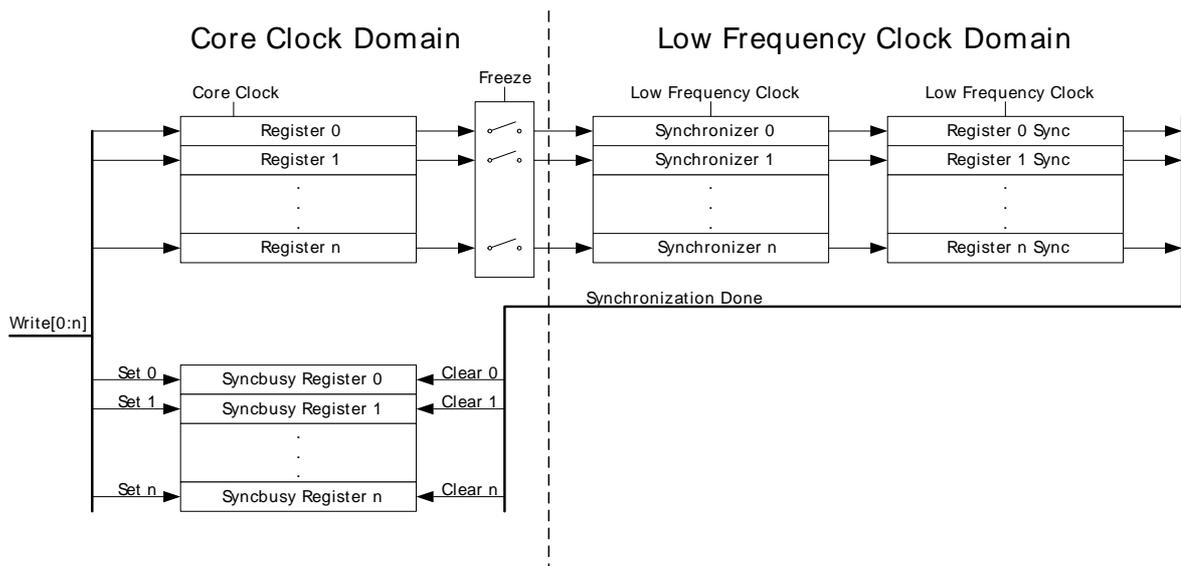

**Note**

Subsequent writes to the same register before the corresponding busy flag is cleared is not supported. Write before the busy flag is cleared may result in undefined behavior.

In general, the SYNCBUSY register only needs to be observed if there is a risk of multiple write access to a register (which must be prevented). It is not required to wait until the relevant flag in the SYNCBUSY register is cleared after writing a register. E.g EM2 can be entered immediately after writing a register.

See Figure 5.3 (p. 18) for a more detailed overview of the write operation.

**Figure 5.3. Write operation to Low Energy Peripherals**

#### 5.3.1.1.2 Immediate synchronization

Contrary to the peripherals with delayed synchronization, data written to peripherals with immediate synchronization, takes effect in the peripheral immediately. They are updated immediately on the

peripheral write access. If a write is set up close to a peripheral clock edge, the write is delayed to after the clock edge. This will introduce wait-states on peripheral access. In the worst case, there can be three wait-state cycles of the HFCORECLK\_LE and an additional wait-state equivalent of up to 315 ns.

For peripherals with immediate synchronization, the SYNCBUSY registers are still present and serve two purposes: (1) commands written to a peripheral with immediate synchronization are not executed before the first peripheral clock after the write. During this period, the SYNCBUSY flag in the command register is set, indicating that the command has not yet been executed; (2) to maintain backwards compatibility with the EFM32G series, SYNCBUSY registers are also present for other registers. These are however, always 0, indicating that register writes are always safe.

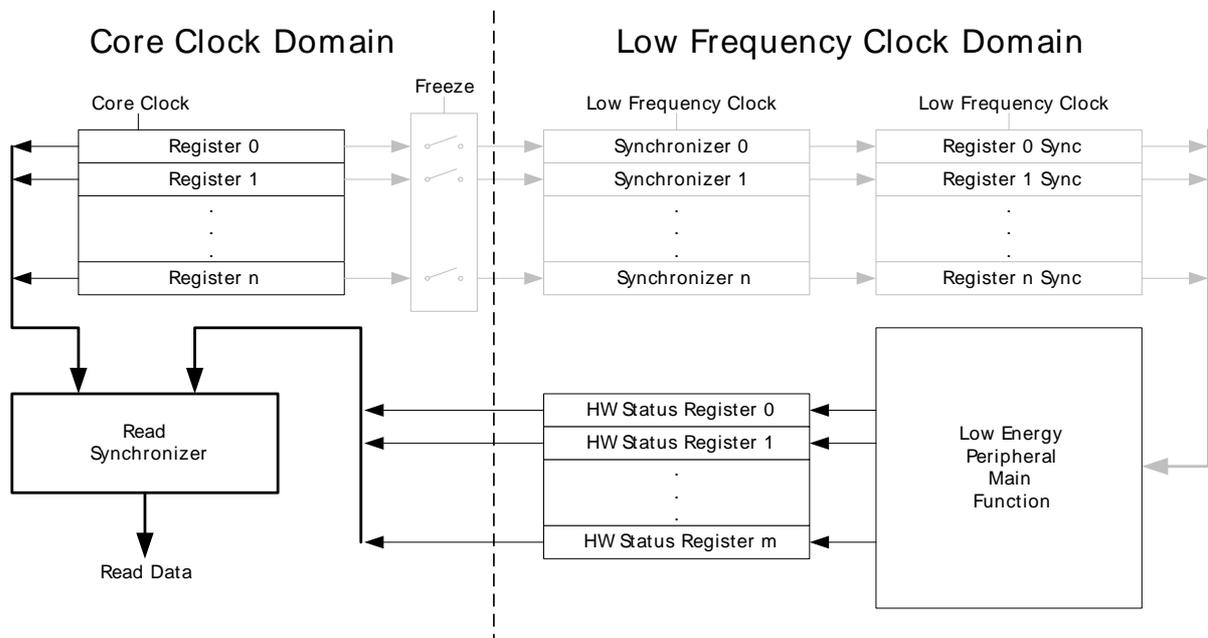

**Note**  
If the application must be compatible with the EFM32G series, all Low Energy Peripherals should be accessed as if they only had delayed synchronization, i.e. using SYNCBUSY.

### 5.3.1.2 Reading

When reading from Low Energy Peripherals, the data is synchronized regardless of the originating clock domain. Registers updated/maintained by the Low Energy Peripheral are read directly from the Low Energy clock domain. Registers residing in the core clock domain, are read from the core clock domain. See Figure 5.4 (p. 19) for a more detailed overview of the read operation.

**Note**  
Writing a register and then immediately reading back the value of the register may give the impression that the write operation is complete. This is not necessarily the case. Please refer to the SYNCBUSY register for correct status of the write operation to the Low Energy Peripheral.

**Figure 5.4. Read operation from Low Energy Peripherals**

### 5.3.2 FREEZE register

For Low Energy Peripherals with delayed synchronization there is a <module\_name>\_FREEZE register (e.g. RTC\_FREEZE), containing a bit named REGFREEZE. If precise control of the synchronization process is required, this bit may be utilized. When REGFREEZE is set, the synchronization process is halted, allowing the software to write multiple Low Energy registers before starting the synchronization

process, thus providing precise control of the module update process. The synchronization process is started by clearing the REGFREEZE bit.

#### Note

The FREEZE register is also present on peripherals with immediate synchronization, but has no effect.

## 5.4 Flash

The Flash retains data in any state and typically stores the application code, special user data and security information. The Flash memory is typically programmed through the debug interface, but can also be erased and written to from software.

- Up to 32 kB of memory
- Page size of 1024 bytes (minimum erase unit)
- Minimum 20 000 erase cycles
- More than 10 years data retention at 85°C
- Lock-bits for memory protection
- Data retention in any state

## 5.5 SRAM

The primary task of the SRAM memory is to store application data. Additionally, it is possible to execute instructions from SRAM, and the DMA may be used to transfer data between the SRAM, Flash and peripherals.

- Up to 4 kB memory
- Data retention of the entire memory in EM0 to EM3

## 5.6 Device Information (DI) Page

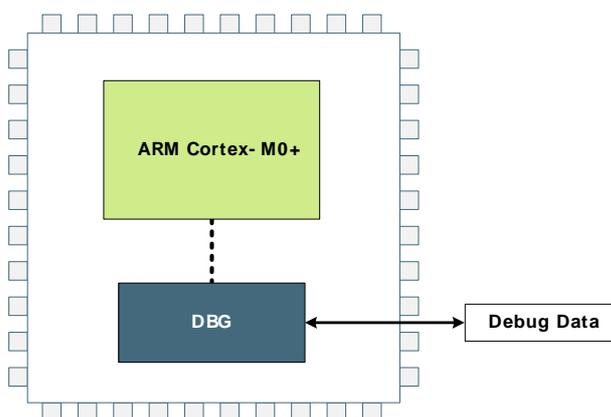

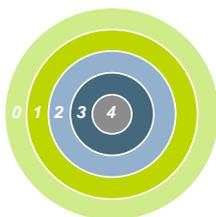

The DI page contains calibration values, a unique identification number and other useful data. See the table below for a complete overview.

**Table 5.4. Device Information Page Contents**

DI Address	Register	Description
0x0FE08020	CMU_LFRCTRL	Register reset value.
0x0FE08028	CMU_HFRCTRL	Register reset value.
0x0FE08030	CMU_AUXHFRCTRL	Register reset value.
0x0FE08040	ADC0_CAL	Register reset value.
0x0FE08048	ADC0_BIASPROG	Register reset value.
0x0FE08050	ACMP0_CTRL	Register reset value.
0x0FE08078	IDAC0_CAL	Register reset value.
0x0FE081B0	DI_CRC	[15:0]: DI data CRC-16.
0x0FE081B2	CAL_TEMP_0	[7:0] Calibration temperature (°C).
0x0FE081B4	ADC0_CAL_1V25	[14:8]: Gain for 1V25 reference, [6:0]: Offset for 1V25 reference.
0x0FE081B6	ADC0_CAL_2V5	[14:8]: Gain for 2V5 reference, [6:0]: Offset for 2V5 reference.

DI Address	Register	Description
0x0FE081B8	ADC0_CAL_VDD	[14:8]: Gain for VDD reference, [6:0]: Offset for VDD reference.
0x0FE081BA	ADC0_CAL_5VDIFF	[14:8]: Gain for 5VDIFF reference, [6:0]: Offset for 5VDIFF reference.
0x0FE081BC	ADC0_CAL_2XVDD	[14:8]: Reserved (gain for this reference cannot be calibrated), [6:0]: Offset for 2XVDD reference.
0x0FE081BE	ADC0_TEMP_0_READ_1V25	[15:4] Temperature reading at 1V25 reference, [3:0]: Reserved.
0x0FE081C8	IDAC0_CAL_RANGE0	[7:0]: Current range 0 tuning.
0x0FE081C9	IDAC0_CAL_RANGE1	[7:0]: Current range 1 tuning.
0x0FE081CA	IDAC0_CAL_RANGE2	[7:0]: Current range 2 tuning.
0x0FE081CB	IDAC0_CAL_RANGE3	[7:0]: Current range 3 tuning.
0x0FE081D4	AUXHFRCO_CALIB_BAND_1	[7:0]: Tuning for the 1.2 MHz AUXHFRCO band.
0x0FE081D5	AUXHFRCO_CALIB_BAND_7	[7:0]: Tuning for the 6.6 MHz AUXHFRCO band.
0x0FE081D6	AUXHFRCO_CALIB_BAND_11	[7:0]: Tuning for the 11 MHz AUXHFRCO band.
0x0FE081D7	AUXHFRCO_CALIB_BAND_14	[7:0]: Tuning for the 14 MHz AUXHFRCO band.
0x0FE081D8	AUXHFRCO_CALIB_BAND_21	[7:0]: Tuning for the 21 MHz AUXHFRCO band.
0x0FE081DC	HFRCO_CALIB_BAND_1	[7:0]: Tuning for the 1.2 MHz HFRCO band.
0x0FE081DD	HFRCO_CALIB_BAND_7	[7:0]: Tuning for the 6.6 MHz HFRCO band.
0x0FE081DE	HFRCO_CALIB_BAND_11	[7:0]: Tuning for the 11 MHz HFRCO band.
0x0FE081DF	HFRCO_CALIB_BAND_14	[7:0]: Tuning for the 14 MHz HFRCO band.
0x0FE081E0	HFRCO_CALIB_BAND_21	[7:0]: Tuning for the 21 MHz HFRCO band.
0x0FE081F0	UNIQUE_0	[31:0] Unique number.
0x0FE081F4	UNIQUE_1	[63:32] Unique number.
0x0FE081F8	MEM_INFO_FLASH	[15:0]: Flash size, kbyte count as unsigned integer (e.g. 128).
0x0FE081FA	MEM_INFO_RAM	[15:0]: Ram size, kbyte count as unsigned integer (e.g. 16).
0x0FE081FC	PART_NUMBER	[15:0]: EFM32 part number as unsigned integer (e.g. 230).
0x0FE081FE	PART_FAMILY	[7:0]: EFM32 part family number (Gecko = 71, Giant Gecko = 72, Tiny Gecko = 73, Leopard Gecko=74, Wonder Gecko=75, Zero Gecko=76).
0x0FE081FF	PROD_REV	[7:0]: EFM32 Production ID.

## 6 DBG - Debug Interface

### Quick Facts

#### What?

The DBG (Debug Interface) is used to program and debug EFM32ZG devices.

#### Why?

The Debug Interface makes it easy to re-program and update the system in the field, and allows debugging with minimal I/O pin usage.

#### How?

The Cortex-M0+ supports advanced debugging features. EFM32ZG devices only use two port pins for debugging or programming. The internal and external state of the system can be examined with debug extensions supporting instruction or data access break- and watch points.

### 6.1 Introduction

The EFM32ZG devices include hardware debug support through a 2-pin serial-wire debug (SWD) interface.

For more technical information about the debug interface the reader is referred to:

- ARM Cortex-M0+ Technical Reference Manual
- ARM CoreSight Components Technical Reference Manual
- ARM Debug Interface v5 Architecture Specification

### 6.2 Features

- Flash Patch and Breakpoint (FPB) unit
  - Implement breakpoints and code patches
- Data Watch point and Trace (DWT) unit
  - Implement watch points, trigger resources and system profiling

### 6.3 Functional Description

There are two debug pins available on the device. Their operation is described in the following section.

#### 6.3.1 Debug Pins

The following pins are the debug connections for the device:

- Serial Wire Clock input (SWCLK): This pin is enabled after reset and has a built-in pull down.
- Serial Wire Data Input/Output (SWDIO): This pin is enabled after reset and has a built-in pull-up.

The debug pins can be enabled and disabled through GPIO\_ROUTE, see Section 25.3.4.1 (p. 361). Please remember that upon disabling, debug contact with the device is lost. Also note that, because the debug pins have pull-down and pull-up enabled by default, leaving them enabled might increase the current consumption with up to 200  $\mu\text{A}$  if left connected to supply or ground.

### 6.3.2 Debug and EM2/EM3

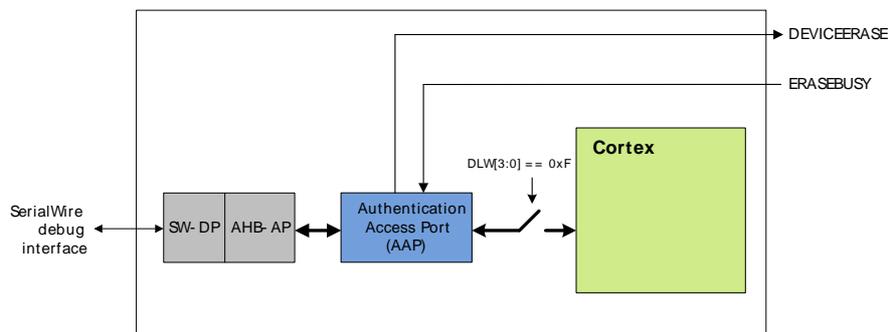

Leaving the debugger connected when issuing a WFI or WFE to enter EM2 or EM3 will make the system enter a special EM2. This mode differs from regular EM2 and EM3 in that the high frequency clocks are still enabled, and certain core functionality is still powered in order to maintain debug-functionality. Because of this, the current consumption in this mode is closer to EM1 and it is therefore important to disconnect the debugger before doing current consumption measurements.

## 6.4 Debug Lock and Device Erase

The debug access to the Cortex-M0+ is locked by clearing the Debug Lock Word (DLW) and resetting the device, see Section 7.3.2 (p. 29).

When debug access is locked, the debug interface remains accessible but the connection to the Cortex-M0+ core and the whole bus-system is blocked as shown in Figure 6.2 (p. 24). This mechanism is controlled by the Authentication Access Port (AAP) as illustrated by Figure 6.1 (p. 23). The AAP is only accessible from a debugger and not from the core.

**Figure 6.1. AAP - Authentication Access Port**

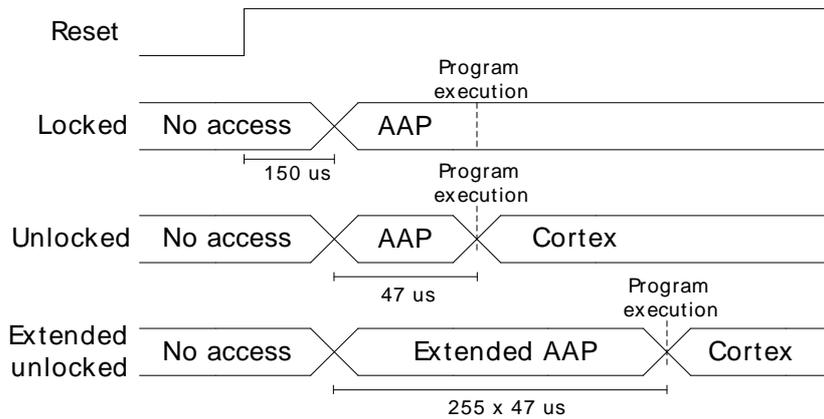

As seen from Figure 6.1 (p. 23), the AAP is situated after the AHB-AP, meaning it should be accessed like any other peripheral from the debug. The address of the AAP is 0xF0E00000 as can also be seen from Figure 5.2 (p. 15).

#### Note

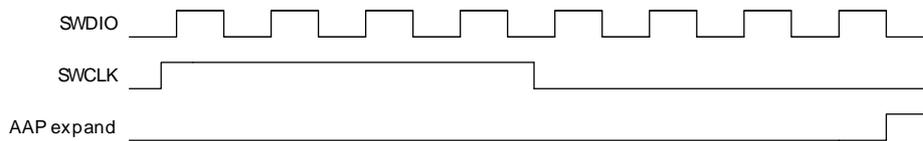

This is different from some other EFM32 devices, where the AAP is integrated as a separate AP (Access Port), please see the reference manual of the respective devices.

The debugger can access the AAP-registers, and only these registers just after reset, for the time of the AAP-window outlined in Figure 6.2 (p. 24). If the device is locked, access to the core and bus-system is blocked even after code execution starts, and the debugger can only access the AAP-registers. If the device is not locked, the AAP is no longer accessible after code execution starts, and the debugger can access the core and bus-system normally. The AAP window can be extended by issuing the bit pattern on SWDIO/SWCLK as shown in Figure 6.3 (p. 24). This pattern should be applied just before reset is deasserted, and will give the debugger more time to access the AAP.

**Figure 6.2. Device Unlock**

**Figure 6.3. AAP Expansion**

If the device is locked, it can be unlocked by writing a valid key to the AAP\_CMDKEY register and then setting the DEVICEERASE bit of the AAP\_CMD register via the debug interface. The commands are not executed before AAP\_CMDKEY is invalidated, so this register should be cleared to to start the erase operation. This operation erases the main block of flash, all lock bits are reset and debug access through the AHB-AP is enabled. The operation takes 40 ms to complete. Note that the SRAM contents will also be deleted during a device erase, while the UD-page is not erased.

Even if the device is not locked, the can device can be erased through the AAP, using the above procedure during the AAP window. This can be useful if the device has been programmed with code that, e.g., disables the debug interface pins on start-up, or does something else that prevents communication with a debugger.

If the device is locked, the debugger may read the status from the AAP\_STATUS register. When the ERASEBUSY bit is set low after DEVICEERASE of the AAP\_CMD register is set, the debugger may set the SYSRESETREQ bit in the AAP\_CMD register. After reset, the debugger may resume a normal debug session through the AHB-AP. If the device is not locked, the device erase starts when the AAP window closes, so it is not possible to poll the status.

## 6.5 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	AAP_CMD	W1	Command Register
0x004	AAP_CMDKEY	W1	Command Key Register
0x008	AAP_STATUS	R	Status Register
0x0FC	AAP_IDR	R	AAP Identification Register

## 6.6 Register Description

### 6.6.1 AAP\_CMD - Command Register

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0	0
<b>Access</b>																															W1	W1
<b>Name</b>																															SYSRESETREQ	DEVICEERASE

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
1	SYSRESETREQ	0	W1	<b>System Reset Request</b> A system reset request is generated when set to 1. This register is write enabled from the AAP_CMDKEY register.
0	DEVICEERASE	0	W1	<b>Erase the Flash Main Block, SRAM and Lock Bits</b> When set, all data and program code in the main block is erased, the SRAM is cleared and then the Lock Bit (LB) page is erased. This also includes the Debug Lock Word (DLW), causing debug access to be enabled after the next reset. The information block User Data page (UD) is left unchanged, but the User data page Lock Word (ULW) is erased. This register is write enabled from the AAP_CMDKEY register.

### 6.6.2 AAP\_CMDKEY - Command Key Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x00000000	
<b>Access</b>																															W1	
<b>Name</b>																															WRITEKEY	

Bit	Name	Reset	Access	Description
31:0	WRITEKEY	0x00000000	W1	<b>CMD Key Register</b>

Bit	Name	Reset	Access	Description
The key value must be written to this register to write enable the AAP_CMD register. After AAP_CMD is written, this register should be cleared to execute the command.				
	Value	Mode	Description	
	0xCFACC118	WRITEEN	Enable write to AAP_CMD	

### 6.6.3 AAP\_STATUS - Status Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0
<b>Access</b>																																R
<b>Name</b>																																ERASEBUSY

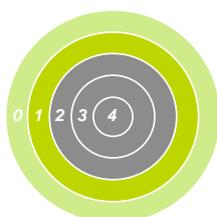

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
0	ERASEBUSY	0	R	<b>Device Erase Command Status</b> This bit is set when a device erase is executing.

### 6.6.4 AAP\_IDR - AAP Identification Register

Offset	Bit Position																															
0x0FC	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x16E60001
<b>Access</b>																																R
<b>Name</b>																																ID

Bit	Name	Reset	Access	Description
31:0	ID	0x16E60001	R	<b>AAP Identification Register</b> Access port identification register in compliance with the ARM ADI v5 specification (JEDEC Manufacturer ID) .

## Quick Facts

**What?**  
 The user can perform Flash memory read, read configuration and write operations through the Memory System Controller (MSC) .

**Why?**  
 The MSC allows the application code, user data and flash lock bits to be stored in non-volatile Flash memory. Certain memory system functions, such as program memory wait-states and bus faults are also configured from the MSC peripheral register interface, giving the developer the ability to dynamically customize the memory system performance, security level, energy consumption and error handling capabilities to the requirements at hand.

**How?**  
 The MSC integrates a low-energy Flash IP with a charge pump, enabling minimum energy consumption while eliminating the need for external programming voltage to erase the memory. An easy to use write and erase interface is supported by an internal, fixed-frequency oscillator and autonomous flash timing and control reduces software complexity while not using other timer resources.

Application code may dynamically scale between high energy optimization and high code execution performance through advanced read modes.

A highly efficient low energy instruction cache reduces the number of flash reads significantly, thus saving energy. Performance is also improved when wait-states are used, since many of the wait-states are eliminated. Built-in performance counters can be used to measure the efficiency of the instruction cache.

## 7.1 Introduction

The Memory System Controller (MSC) is the program memory unit of the EFM32ZG microcontroller. The flash memory is readable and writable from both the Cortex-M0+ and DMA. The flash memory is divided into two blocks; the main block and the information block. Program code is normally written to the main block. Additionally, the information block is available for special user data and flash lock bits. There is also a read-only page in the information block containing system and device calibration data. Read and write operations are supported in the energy modes EM0 and EM1.

## 7.2 Features

- AHB read interface
  - Scalable access performance to optimize the Cortex-M0+ code interface
    - Zero wait-state access up to 16 MHz and one wait-state for 16 MHz and above
    - Advanced energy optimization functionality
      - Instruction Cache
  - DMA read support in EM0 and EM1
- Command and status interface
  - Flash write and erase
    - Accessible from Cortex-M0+ in EM0
    - DMA write support in EM0 and EM1
  - Core clock independent Flash timing
    - Internal oscillator and internal timers for precise and autonomous Flash timing
      - General purpose timers are not occupied during Flash erase and write operations
  - Configurable interrupt erase abort
    - Improved interrupt predictability
  - Memory and bus fault control
- Security features
  - Lockable debug access
  - Page lock bits
  - SW Mass erase Lock bits
  - User data lock bits
- End-of-write and end-of-erase interrupts

## 7.3 Functional Description

The size of the main block is device dependent. The largest size available is 32 kB (32 pages). The information block has 1024 bytes available for user data. The information block also contains chip configuration data located in a reserved area. The main block is mapped to address 0x00000000 and the information block is mapped to address 0x0FE00000. Table 7.1 (p. 29) outlines how the Flash is mapped in the memory space. All Flash memory is organized into 1024 byte pages.

**Table 7.1. MSC Flash Memory Mapping**

Block	Page	Base address	Write/Erase by	Software readable	Purpose/Name	Size
Main <sup>1</sup>	0	0x00000000	Software, debug	Yes	User code and data	4 kB - 32 kB
	.		Software, debug	Yes		
	31	0x00007C00	Software, debug	Yes		
Reserved	-	0x00008000	-	-	Reserved for flash expansion	~24 MB
Information	0	0x0FE00000	Software, debug	Yes	User Data (UD)	1 kB
	-	0x0FE00400	-	-	Reserved	
	1	0x0FE04000	Write: Software, debug Erase: Debug only	Yes	Lock Bits (LB)	1 kB
	-	0x0FE04400	-	-	Reserved	
	2	0x0FE08000	-	Yes	Device Information (DI)	1 kB
	-	0x0FE08400	-	-	Reserved	
Reserved	-	0x0FE10000	-	-	Reserved for flash expansion	Rest of code space

<sup>1</sup>Block/page erased by a device erase

### 7.3.1 User Data (UD) Page Description

This is the user data page in the information block. The page can be erased and written by software. The page is erased by the ERASEPAGE command of the MSC\_WRITECMD register. Note that the page is not erased by a device erase operation. The device erase operation is described in Section 6.4 (p. 23) .

### 7.3.2 Lock Bits (LB) Page Description

This page contains the following information:

- Debug Lock Word (DLW)
- User data page Lock Word (ULW)
- Mass erase Lock Word (MLW)
- Main block Page Lock Words (PLWs)

The words in this page are organized as shown in Table 7.2 (p. 29) :

**Table 7.2. Lock Bits Page Structure**

127	DLW
126	ULW
125	MLW
...	...
0	PLW[0]

Word 127 is the debug lock word (DLW). The four LSBs of this word are the debug lock bits. If these bits are 0xF, then debug access is enabled. If the bits are not 0xF, then debug access to the core is locked. See Section 6.4 (p. 23) for details on how to unlock the debug access.

Word 126 is the user page lock word (ULW). Bit 0 of this word is the User Data Page lock bit. Bit 1 in this word locks the Lock Bits Page.

Word 125 is the mass erase lock word (MLW). Bit 0 locks the entire flash. The mass erase lock bits will not have any effect on device erases initiated from the Authentication Access Port (AAP) registers. The AAP is described in more detail in Section 6.4 (p. 23) .

There are 32 page lock bits per page lock word (PLW). Bit 0 refers to the first page and bit 31 refers to the last page within a PLW. Thus, PLW[0] contains lock bits for page 0-31 in the main block. A page is locked when the bit is 0. A locked page cannot be erased or written.

The lock bits can be reset by a device erase operation initiated from the Authentication Access Port (AAP) registers. The AAP is described in more detail in Section 6.4 (p. 23) . Note that the AAP is only accessible from the debug interface, and cannot be accessed from the Cortex-M0+ core.

### 7.3.3 Device Information (DI) Page

This read-only page holds the calibration data for the oscillator and other analog peripherals from the production test as well as a unique device ID. The page is further described in Section 5.6 (p. 20) .

### 7.3.4 Post-reset Behavior

Calibration values are automatically written to registers by the MSC before application code startup. The values are also available to read from the DI page for later reference by software. Other information such as the device ID and production date is also stored in the DI page and is readable from software.

#### 7.3.4.1 One Wait-state Access

After reset, the HFCORECLK is normally 14 MHz from the HFRCO and the MODE field of the MSC\_READCTRL register is set to WS1 (one wait-state). The reset value must be WS1 as an uncalibrated HFRCO may produce a frequency higher than 16 MHz. Software must not select a zero wait-state mode unless the clock is guaranteed to be 16 MHz or below, otherwise the resulting behavior is undefined. If a HFCORECLK frequency above 16 MHz is to be set by software, the MODE field of the MSC\_READCTRL register must be set to WS1 before the core clock is switched to the higher frequency clock source.

When changing to a lower frequency, the MODE field of the MSC\_READCTRL register can be set to WS0, but only after the frequency transition is completed. If the HFRCO is used, wait until the oscillator is stable on the new frequency. Otherwise, the behavior is unpredictable.

#### 7.3.4.2 Zero Wait-state Access

At 16 MHz and below, read operations from flash may be performed without any wait-states. Zero wait-state access greatly improves code execution performance at frequencies from 16 MHz and below.

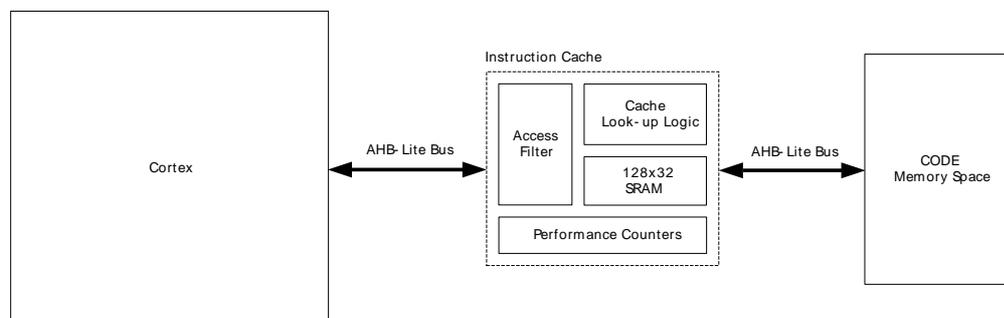

#### 7.3.4.3 Instruction Cache

The MSC includes an instruction cache. The instruction cache for the internal flash memory is enabled by default, but can be disabled by setting IFCDIS in MSC\_READCTRL. When enabled, the instruction cache typically reduces the number of flash reads significantly, thus saving energy. In most cases a cache hit-rate of more than 70 % is achievable. When a 32-bit instruction fetch hits in the cache the data is returned to the processor in one clock cycle. Thus, performance is also improved when wait-states are used (i.e. running at frequencies above 16 MHz).

The instruction cache is connected directly to the Cortex-M0+ and functions as a memory access filter between the processor and the memory system, as illustrated in Figure 7.1 (p. 31) . The cache consists of an access filter, lookup logic, a 128x32 SRAM (512 bytes) and two performance counters. The access filter checks that the address for the access is of an instruction in the code space (instructions

in RAM outside the code space are not cached). If the address matches, the cache lookup logic and SRAM is enabled. Otherwise, the cache is bypassed and the access is forwarded to the memory system. The cache is then updated when the memory access completes. The performance counters, when enabled, keep track of the number of cache hits and misses. The cache consists of 16 8-word cachelines organized as 4 sets with 4 ways. The cachelines are filled up continuously one word at a time as the individual words are requested by the processor. Thus, not all words of a cacheline might be valid at a given time.

**Figure 7.1. Instruction Cache**

By default, the instruction cache is automatically invalidated when the contents of the flash is changed (i.e. written or erased). In many cases, however, the application only makes changes to data in the flash, not code. In this case, the automatic invalidate feature can be disabled by setting AIDIS in MSC\_READCTRL. The cache can (independent of the AIDIS setting) be manually invalidated by writing 1 to INVCACHE in MSC\_CMD.

In general it is highly recommended to keep the cache enabled all the time. However, for some sections of code with very low cache hit-rate more energy-efficient execution can be achieved by disabling the cache temporarily. To measure the hit-rate of a code-section, the built-in performance counters can be used. Before the section, start the performance counters by writing 1 to STARTPC in MSC\_CMD. This starts the performance counters, counting from 0. At the end of the section, stop the performance counters by writing 1 to STOPPC in MSC\_CMD. The number of cache hits and cache misses for that section can then be read from MSC\_CACHEHITS and MSC\_CACHEMISSES respectively. The total number of 32-bit instruction fetches will be MSC\_CACHEHITS + MSC\_CACHEMISSES. Thus, the cache hit-ratio can be calculated as  $MSC\_CACHEHITS / (MSC\_CACHEHITS + MSC\_CACHEMISSES)$ . When MSC\_CACHEHITS overflows the CHOF interrupt flag is set. When MSC\_CACHEMISSES overflows the CMOF interrupt flag is set. These flags must be cleared explicitly by software. The range of the performance counters can thus be extended by increasing a counter in the MSC interrupt routine. The performance counters only count when a cache lookup is performed. If the lookup fails, MSC\_CACHEMISSES is increased. If the lookup is successful, MSC\_CACHEHITS is increased. For example, a cache lookup is not performed if the cache is disabled or the code is executed from RAM outside the code space.

The cache content is not retained in EM2, EM3 and EM4. The cache is therefore invalidated regardless of the setting of AIDIS in MSC\_READCTRL when entering these energy modes. Applications that switch frequently between EM0 and EM2/3 and execute the very same non-looping code almost every time will most likely benefit from putting this code in RAM. The interrupt vectors can also be put in RAM to reduce current consumption even further.

### 7.3.5 Erase and Write Operations

The AUXHFRCO is used for timing during flash write and erase operations. To achieve correct timing, the MSC\_TIMEBASE register has to be configured according to the settings in CMU\_AUXHFRCOCTRL. BASE in MSC\_TIMEBASE defines how many AUXCLK cycles - 1 there is in 1 us or 5 us, depending on the configuration of PERIOD. To ensure that timing of flash write and erase operations is within the specification of the flash, the value written to BASE should give at least a 10% margin with respect to

the period, i.e. for the 1 us PERIOD, the number of cycles should at least span 1.1 us, and for the 5 us period they should span at least 5.5 us. For the 1 MHz band, PERIOD in MSC\_TIMEBASE should be set to 5US, while it should be set to 1US for all other AUXHFRCO bands.

Both page erase and write operations require that the address is written into the MSC\_ADDRB register. For erase operations, the address may be any within the page to be erased. Load the address by writing 1 to the LADDRIM bit in the MSC\_WRITECMD register. The LADDRIM bit only has to be written once when loading the first address. After each word is written the internal address register ADDR will be incremented automatically by 4. The INVADDR bit of the MSC\_STATUS register is set if the loaded address is outside the flash and the LOCKED bit of the MSC\_STATUS register is set if the page addressed is locked. Any attempts to command erase or write to the page are ignored if INVADDR or the LOCKED bits of the MSC\_STATUS register are set. To abort an ongoing erase, set the ERASEABORT bit in the MSC\_WRITECMD register.

When a word is written to the MSC\_WDATA register, the WDATAREADY bit of the MSC\_STATUS register is cleared. When this status bit is set, software or DMA may write the next word.

A single word write is commanded by setting the WRITEONCE bit of the MSC\_WRITECMD register. The operation is complete when the BUSY bit of the MSC\_STATUS register is cleared and control of the flash is handed back to the AHB interface, allowing application code to resume execution.

For a DMA write the software must write the first word to the MSC\_WDATA register and then set the WRITETRIG bit of the MSC\_WRITECMD register. DMA triggers when the WDATAREADY bit of the MSC\_STATUS register is set.

It is possible to write words twice between each erase by keeping at 1 the bits that are not to be changed. Let us take as an example writing two 16 bit values, 0xAAAA and 0x5555. To safely write them in the same flash word this method can be used:

- Write 0xFFFFAAAA (word in flash becomes 0xFFFFAAAA)
- Write 0x5555FFFF (word in flash becomes 0x5555AAAA)

Note that there is a maximum of two writes to the same word between each erase due to a physical limitation of the flash.

**Note**

During a write or erase, flash read accesses will be stalled, effectively halting code execution from flash. Code execution continues upon write/erase completion. Code residing in RAM may be executed during a write/erase operation.

**Note**

The MSC\_WDATA and MSC\_ADDRB registers are not retained when entering EM2 or lower energy modes.

### 7.3.5.1 Mass erase

A mass erase can be initiated from software using ERASEMAIN0 in MSC\_WRITECMD. This command will start a mass erase of the entire flash. Prior to initiating a mass erase, MSC\_MASSLOCK must be unlocked by writing 0x631A to it. After a mass erase has been started, this register can be locked again to prevent runaway code from accidentally triggering a mass erase.

The regular flash page lock bits will not prevent a mass erase. To prevent software from initiating mass erases, use the mass erase lock bits in the mass erase lock word (MLW).

## 7.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	MSC_CTRL	RW	Memory System Control Register
0x004	MSC_READCTRL	RW	Read Control Register
0x008	MSC_WRITECTRL	RW	Write Control Register
0x00C	MSC_WRITECMD	W1	Write Command Register
0x010	MSC_ADDRB	RW	Page Erase/Write Address Buffer
0x018	MSC_WDATA	RW	Write Data Register
0x01C	MSC_STATUS	R	Status Register
0x02C	MSC_IF	R	Interrupt Flag Register
0x030	MSC_IFS	W1	Interrupt Flag Set Register
0x034	MSC_IFC	W1	Interrupt Flag Clear Register
0x038	MSC_IEN	RW	Interrupt Enable Register
0x03C	MSC_LOCK	RW	Configuration Lock Register
0x040	MSC_CMD	W1	Command Register
0x044	MSC_CACHEHITS	R	Cache Hits Performance Counter
0x048	MSC_CACHEMISSES	R	Cache Misses Performance Counter
0x050	MSC_TIMEBASE	RW	Flash Write and Erase Timebase
0x054	MSC_MASSLOCK	RW	Mass Erase Lock Register
0x058	MSC_IRQLATENCY	RW	Irq Latency Register

## 7.5 Register Description

### 7.5.1 MSC\_CTRL - Memory System Control Register

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																1
<b>Access</b>																																RW
<b>Name</b>																																BUSFAULT

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
0	BUSFAULT	1	RW	<b>Bus Fault Response Enable</b> When this bit is set, the memory system generates bus error response.
	Value	Mode	Description	
	0	GENERATE	A bus fault is generated on access to unmapped code and system space.	
	1	IGNORE	Accesses to unmapped address space is ignored.	

### 7.5.2 MSC\_READCTRL - Read Control Register

Offset	Bit Position																																																						
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																							
<b>Reset</b>																									0			0	0																										0x1
<b>Access</b>																									RW			RW	RW																										RW
<b>Name</b>																									RAMCEN																														MODE

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
7	RAMCEN	0	RW	<b>RAM Cache Enable</b> Enable instruction caching for RAM in code-space.
6:5	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
4	AIDIS	0	RW	<b>Automatic Invalidate Disable</b> When this bit is set the cache is not automatically invalidated when a write or page erase is performed.
3	IFCDIS	0	RW	<b>Internal Flash Cache Disable</b> Disable instruction cache for internal flash memory.
2:0	MODE	0x1	RW	<b>Read Mode</b> If software wants to set a core clock frequency above 16 MHz, this register must be set to WS1 before the core clock is switched to the higher frequency. When changing to a lower frequency, this register can be set to WS0 after the frequency transition has been completed. After reset, the core clock is 14 MHz from the HFRCO but the MODE field of MSC_READCTRL register is set to WS1. This is because the HFRCO may produce a frequency above 16 MHz before it is calibrated. If the HFRCO is used as clock source, wait until the oscillator is stable on the new frequency to avoid unpredictable behavior.
	Value	Mode	Description	
	0	WS0	Zero wait-states inserted in fetch or read transfers.	
	1	WS1	One wait-state inserted for each fetch or read transfer. This mode is required for a core frequency above 16 MHz.	

### 7.5.3 MSC\_WRITECTRL - Write Control Register

Offset	Bit Position																																																								
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																									
<b>Reset</b>																																																						0	0		
<b>Access</b>																																																								RW	RW
<b>Name</b>																																																								IRQERASEABORT	WREN

Bit	Name	Reset	Access	Description
31:2	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
1	IRQERASEABORT	0	RW	<b>Abort Page Erase on Interrupt</b> When this bit is set to 1, any Cortex interrupt aborts any current page erase operation.
0	WREN	0	RW	<b>Enable Write/Erase Controller</b>

### 7.5.5 MSC\_ADDRB - Page Erase/Write Address Buffer

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																	0x00000000															
Access																	RW															
Name																	ADDRB															

Bit	Name	Reset	Access	Description
31:0	ADDRB	0x00000000	RW	<b>Page Erase or Write Address Buffer</b>
<p>This register holds the page address for the erase or write operation. This register is loaded into the internal MSC_ADDR register when the LADDRIM field in MSC_WRITECMD is set. The MSC_ADDR register is not readable. This register is not retained when entering EM2 or lower energy modes.</p>				

### 7.5.6 MSC\_WDATA - Write Data Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																	0x00000000															
Access																	RW															
Name																	WDATA															

Bit	Name	Reset	Access	Description
31:0	WDATA	0x00000000	RW	<b>Write Data</b>
<p>The data to be written to the address in MSC_ADDR. This register must be written when the WDATAREADY bit of MSC_STATUS is set. This register is not retained when entering EM2 or lower energy modes.</p>				

### 7.5.7 MSC\_STATUS - Status Register

Offset	Bit Position																																																						
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																							
Reset																									0	0	0	1	0	0	0																								
Access																									R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Name																									PCRUNNING	ERASEABORTED	WORDTIMEOUT	WDATAREADY	INVADDR	LOCKED	BUSY																								

Bit	Name	Reset	Access	Description
31:7	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
6	PCRUNNING	0	R	<b>Performance Counters Running</b> This bit is set while the performance counters are running. When one performance counter reaches the maximum value, this bit is cleared.
5	ERASEABORTED	0	R	<b>The Current Flash Erase Operation Aborted</b> When set, the current erase operation was aborted by interrupt.
4	WORDTIMEOUT	0	R	<b>Flash Write Word Timeout</b> When this bit is set, MSC_WDATA was not written within the timeout. The flash write operation timed out and access to the flash is returned to the AHB interface. This bit is cleared when the ERASEPAGE, WRITETRIG or WRITEONCE commands in MSC_WRITECMD are triggered.
3	WDATAREADY	1	R	<b>WDATA Write Ready</b> When this bit is set, the content of MSC_WDATA is read by MSC Flash Write Controller and the register may be updated with the next 32-bit word to be written to flash. This bit is cleared when writing to MSC_WDATA.
2	INVADDR	0	R	<b>Invalid Write Address or Erase Page</b> Set when software attempts to load an invalid (unmapped) address into ADDR.
1	LOCKED	0	R	<b>Access Locked</b> When set, the last erase or write is aborted due to erase/write access constraints.
0	BUSY	0	R	<b>Erase/Write Busy</b> When set, an erase or write operation is in progress and new commands are ignored.

## 7.5.8 MSC\_IF - Interrupt Flag Register

Offset	Bit Position																															
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0	0	0	0												
<b>Access</b>																	R	R	R	R												
<b>Name</b>																	CMOF	CHOF	WRITE	ERASE												

Bit	Name	Reset	Access	Description
31:4	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
3	CMOF	0	R	<b>Cache Misses Overflow Interrupt Flag</b> Set when MSC_CACHEMISSES overflows.
2	CHOF	0	R	<b>Cache Hits Overflow Interrupt Flag</b> Set when MSC_CACHEHITS overflows.
1	WRITE	0	R	<b>Write Done Interrupt Read Flag</b> Set when a write is done.
0	ERASE	0	R	<b>Erase Done Interrupt Read Flag</b> Set when erase is done.

### 7.5.13 MSC\_CMD - Command Register

Offset	Bit Position																															
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																												0	0	0		
<b>Access</b>																												W1	W1	W1		
<b>Name</b>																												STOPPC	STARTPC	INVCACHE		

Bit	Name	Reset	Access	Description
31:3	Reserved	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
2	STOPPC	0	W1	<b>Stop Performance Counters</b> Use this command bit to stop the performance counters.
1	STARTPC	0	W1	<b>Start Performance Counters</b> Use this command bit to start the performance counters. The performance counters always start counting from 0.
0	INVCACHE	0	W1	<b>Invalidate Instruction Cache</b> Use this register to invalidate the instruction cache.

### 7.5.14 MSC\_CACHEHITS - Cache Hits Performance Counter

Offset	Bit Position																															
0x044	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																		0x00000														
<b>Access</b>																		R														
<b>Name</b>																		CACHEHITS														

Bit	Name	Reset	Access	Description
31:20	Reserved	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
19:0	CACHEHITS	0x00000	R	<b>Cache hits since last performance counter start command.</b> Use to measure cache performance for a particular code section.

### 7.5.15 MSC\_CACHEMISSES - Cache Misses Performance Counter

Offset	Bit Position																															
0x048	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																				0x00000												
<b>Access</b>																				R												
<b>Name</b>																				CACHEMISSES												

Bit	Name	Reset	Access	Description
31:20	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
19:0	CACHEMISSES	0x00000	R	<b>Cache misses since last performance counter start command.</b> Use to measure cache performance for a particular code section.

### 7.5.16 MSC\_TIMEBASE - Flash Write and Erase Timebase

Offset	Bit Position																															
0x050	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																0																0x10
<b>Access</b>																RW																RW
<b>Name</b>																PERIOD																BASE

Bit	Name	Reset	Access	Description									
31:17	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)											
16	PERIOD	0	RW	<b>Sets the timebase period</b>  Decides whether TIMEBASE specifies the number of AUX cycles in 1 us or 5 us. 5 us should only be used with 1 MHz AUXHFRCO band.									
		<table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>1US</td> <td>TIMEBASE period is 1 us.</td> </tr> <tr> <td>1</td> <td>5US</td> <td>TIMEBASE period is 5 us.</td> </tr> </tbody> </table>		Value	Mode	Description	0	1US	TIMEBASE period is 1 us.	1	5US	TIMEBASE period is 5 us.	
Value	Mode	Description											
0	1US	TIMEBASE period is 1 us.											
1	5US	TIMEBASE period is 5 us.											
15:6	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)											
5:0	BASE	0x10	RW	<b>Timebase used by MSC to time flash writes and erases</b>  Should be set to the number of full AUX clock cycles in the period given by MSC_TIMEBASE_PERIOD. I.e. 1.1 us or 5.5. us with PERIOD cleared or set, respectively. The resetvalue of the timebase matches a 14 MHz AUXHFRCO, which is the default frequency of the AUXHFRCO.									

### 7.5.17 MSC\_MASSLOCK - Mass Erase Lock Register

Offset	Bit Position																															
0x054	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																	0x0001															
Access																	RW															
Name																	LOCKKEY															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		

15:0 LOCKKEY 0x0001 RW **Mass Erase Lock**

Write any other value than the unlock code to lock access the the ERASEMAIN0 and ERASEMAIN1 commands. Write the unlock code 631A to enable access. When reading the register, bit 0 is set when the lock is enabled. Locked by default.

Mode	Value	Description
Read Operation		
UNLOCKED	0	Mass erase unlocked.
LOCKED	1	Mass erase locked.
Write Operation		
LOCK	0	Lock mass erase.
UNLOCK	0x631A	Unlock mass erase.

### 7.5.18 MSC\_IRQLATENCY - Irq Latency Register

Offset	Bit Position																															
0x058	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																	0x00															
Access																	RW															
Name																	IRQLATENCY															

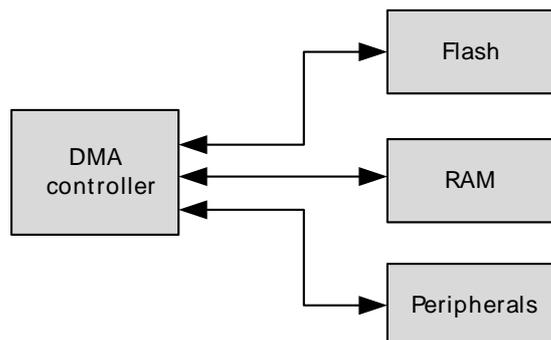

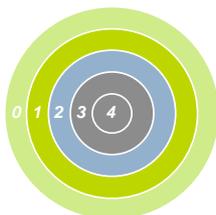

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		

7:0 IRQLATENCY 0x00 RW **Irq Latency Register**

Specify the minimum number of HCORECLK-cycles to wait before handling an interrupt after it has been asserted. This can be used to achieve deterministic (zero-jitter) behavior when handling interrupts, at the cost of speed. To achieve zero-jitter with zero wait-states in flash, set this to 9.

IRQLATENCY	Description
0	Interrupts will be handled as quickly as possible.
1 - 255	The CM0+ will use at least IRQLATENCY+6 HFCORECLK-cycles to handle interrupts.

## 8 DMA - DMA Controller

### Quick Facts

#### What?

The DMA controller can move data without CPU intervention, effectively reducing the energy consumption for a data transfer.

#### Why?

The DMA can perform data transfers more energy efficiently than the CPU and allows autonomous operation in low energy modes. The LEUART can for instance provide full UART communication in EM2, consuming only a few  $\mu\text{A}$  by using the DMA to move data between the LEUART and RAM.

#### How?

The DMA controller has multiple highly configurable, prioritized DMA channels. Advanced transfer modes such as ping-pong and scatter-gather make it possible to tailor the controller to the specific needs of an application.

### 8.1 Introduction

The Direct Memory Access (DMA) controller performs memory operations independently of the CPU. This has the benefit of reducing the energy consumption and the workload of the CPU, and enables the system to stay in low energy modes for example when moving data from the USART to RAM. The DMA controller uses the PL230  $\mu\text{DMA}$  controller licensed from ARM<sup>1</sup>. Each of the PL230s channels on the EFM32 can be connected to any of the EFM32 peripherals.

### 8.2 Features

- The DMA controller is accessible as a memory mapped peripheral
- Possible data transfers include
  - RAM/Flash to peripheral
  - RAM to Flash
  - Peripheral to RAM
  - RAM/Flash to RAM
- The DMA controller has 4 independent channels
- Each channel has one (primary) or two (primary and alternate) descriptors
- The configuration for each channel includes
  - Transfer mode
  - Priority
  - Word-count
  - Word-size (8, 16, 32 bit)
- The transfer modes include
  - Basic (using the primary or alternate DMA descriptor)

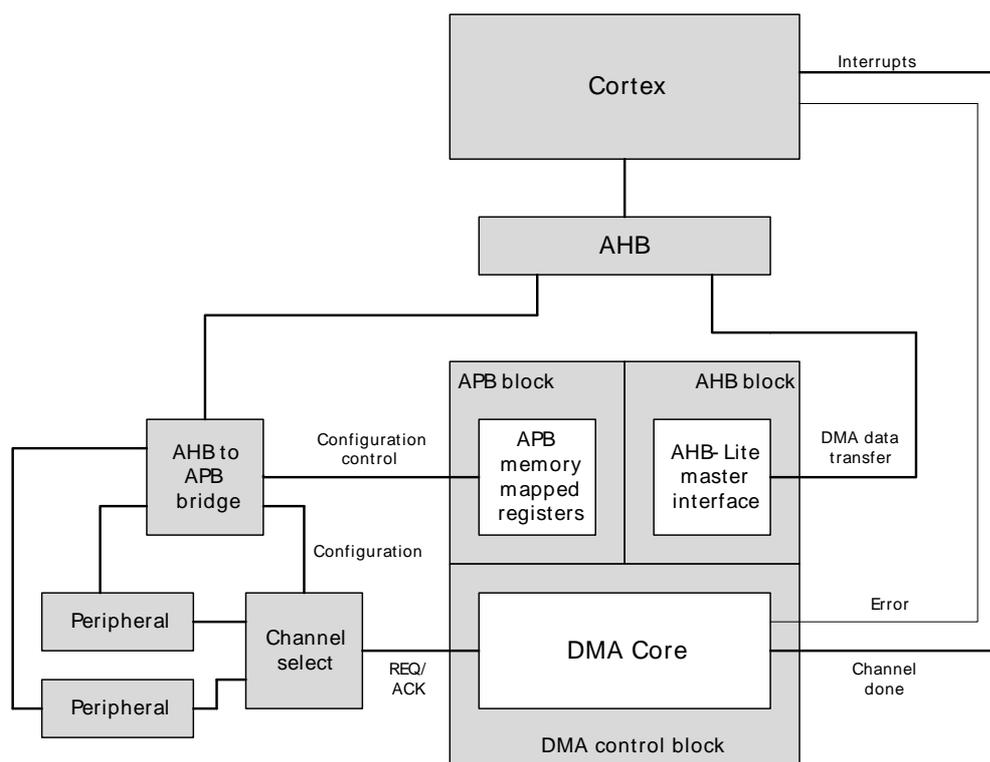

<sup>1</sup>ARM PL230 homepage [<http://infocenter.arm.com/help/index.jsp?topic=/com.arm.doc.ddi0417a/index.html>]

- Ping-pong (switching between the primary or alternate DMA descriptors, for continuous data flow to/from peripherals)
- Scatter-gather (using the primary descriptor to configure the alternate descriptor)
- Each channel has a programmable transfer length
- Channels 0 and 1 support looped transfers
- Channel 0 supports 2D copy
- A DMA channel can be triggered by any of several sources:
  - Communication modules (USART, LEUART)
  - Timers (TIMER)
  - Analog modules (ACMP, ADC)
  - Software
- Programmable mapping between channel number and peripherals - any DMA channel can be triggered by any of the available sources
- Interrupts upon transfer completion
- Data transfer to/from LEUART in EM2 is supported by the DMA, providing extremely low energy consumption while performing UART communications

## 8.3 Block Diagram

An overview of the DMA and the modules it interacts with is shown in Figure 8.1 (p. 44) .

**Figure 8.1. DMA Block Diagram**

The DMA Controller consists of four main parts:

- An APB block allowing software to configure the DMA controller
- An AHB block allowing the DMA to read and write the DMA descriptors and the source and destination data for the DMA transfers
- A DMA control block controlling the operation of the DMA, including request/acknowledge signals for the connected peripherals
- A channel select block routing the right peripheral request to each DMA channel

## 8.4 Functional Description

The DMA Controller is highly flexible. It is capable of transferring data between peripherals and memory without involvement from the processor core. This can be used to increase system performance by off-loading the processor from copying large amounts of data or avoiding frequent interrupts to service peripherals needing more data or having available data. It can also be used to reduce the system energy consumption by making the DMA work autonomously with the LEUART for data transfer in EM2 without having to wake up the processor core from sleep.

The DMA Controller contains 4 independent channels. Each of these channels can be connected to any of the available peripheral trigger sources by writing to the configuration registers, see Section 8.4.1 (p. 45). In addition, each channel can be triggered by software (for large memory transfers or for debugging purposes).

What the DMA Controller should do (when one of its channels is triggered) is configured through channel descriptors residing in system memory. Before enabling a channel, the software must therefore take care to write this configuration to memory. When a channel is triggered, the DMA Controller will first read the channel descriptor from system memory, and then it will proceed to perform the memory transfers as specified by the descriptor. The descriptor contains the memory address to read from, the memory address to write to, the number of bytes to be transferred, etc. The channel descriptor is described in detail in Section 8.4.3 (p. 55).

In addition to the basic transfer mode, the DMA Controller also supports two advanced transfer modes; ping-pong and scatter-gather. Ping-pong transfers are ideally suited for streaming data for high-speed peripheral communication as the DMA will be ready to retrieve the next incoming data bytes immediately while the processor core is still processing the previous ones (and similarly for outgoing communication). Scatter-gather involves executing a series of tasks from memory and allows sophisticated schemes to be implemented by software.

Using different priority levels for the channels and setting the number of bytes after which the DMA Controller re-arbitrates, it is possible to ensure that timing-critical transfers are serviced on time.

### 8.4.1 Channel Select Configuration

The channel select block allows selecting which peripheral's request lines (`dma_req`, `dma_sreq`) to connect to each DMA channel.

This configuration is done by software through the control registers `DMA_CH0_CTRL`-`DMA_CH3_CTRL`, with `SOURCESEL` and `SIGSEL` components. `SOURCESEL` selects which peripheral to listen to and `SIGSEL` picks which output signals to use from the selected peripheral.

All peripherals are connected to `dma_req`. When this signal is triggered, the DMA performs a number of transfers as specified by the channel descriptor ( $2^R$ ). The USARTs are additionally connected to the `dma_sreq` line. When only `dma_sreq` is asserted but not `dma_req`, then the DMA will perform exactly one transfer only (given that `dma_sreq` is enabled by software).

#### Note

A DMA channel should not be active when the clock to the selected peripheral is off.

### 8.4.2 DMA control

#### 8.4.2.1 DMA arbitration rate

You can configure when the controller arbitrates during a DMA transfer. This enables you to reduce the latency to service a higher priority channel.

The controller provides four bits that configure how many AHB bus transfers occur before it re-arbitrates. These bits are known as the `R_power` bits because the value you enter, `R`, is raised to the power of two

and this determines the arbitration rate. For example, if R = 4 then the arbitration rate is 2<sup>4</sup>, that is, the controller arbitrates every 16 DMA transfers.

Table 8.1 (p. 46) lists the arbitration rates.

**Table 8.1. AHB bus transfer arbitration interval**

R_power	Arbitrate after x DMA transfers
b0000	x = 1
b0001	x = 2
b0010	x = 4
b0011	x = 8
b0100	x = 16
b0101	x = 32
b0110	x = 64
b0111	x = 128
b1000	x = 256
b1001	x = 512
b1010 - b1111	x = 1024

**Note** You must take care not to assign a low-priority channel with a large R\_power because this prevents the controller from servicing high-priority requests, until it re-arbitrates.

The number of dma transfers N that need to be done is specified by the user. When N > 2<sup>R</sup> and is not an integer multiple of 2<sup>R</sup> then the controller always performs sequences of 2<sup>R</sup> transfers until N < 2<sup>R</sup> remain to be transferred. The controller performs the remaining N transfers at the end of the DMA cycle.

You store the value of the R\_power bits in the channel control data structure. See Section 8.4.3.3 (p. 58) for more information about the location of the R\_power bits in the data structure.

### 8.4.2.2 Priority

When the controller arbitrates, it determines the next channel to service by using the following information:

- the channel number
- the priority level, default or high, that is assigned to the channel.

You can configure each channel to use either the default priority level or a high priority level by setting the DMA\_CHPRIS register.

Channel number zero has the highest priority and as the channel number increases, the priority of a channel decreases. Table 8.2 (p. 46) lists the DMA channel priority levels in descending order of priority.

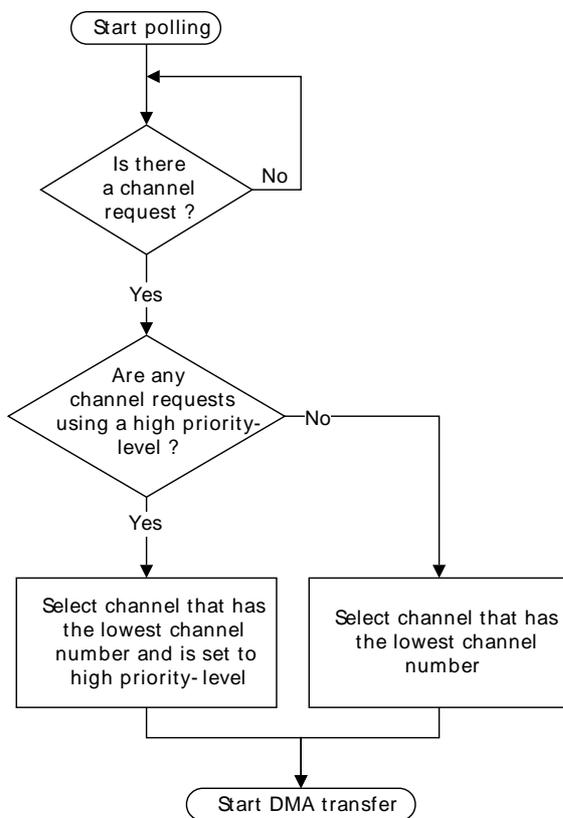

**Table 8.2. DMA channel priority**

Channel number	Priority level setting	Descending order of channel priority
0	High	Highest-priority DMA channel
1	High	-
2	High	-

Channel number	Priority level setting	Descending order of channel priority
3	High	-
0	Default	-
1	Default	-
2	Default	-
3	Default	Lowest-priority DMA channel

After a DMA transfer completes, the controller polls all the DMA channels that are available. Figure 8.2 (p. 47) shows the process it uses to determine which DMA transfer to perform next.

**Figure 8.2. Polling flowchart**

### 8.4.2.3 DMA cycle types

The cycle\_ctrl bits control how the controller performs a DMA cycle. You can set the cycle\_ctrl bits as Table 8.3 (p. 47) lists.

**Table 8.3. DMA cycle types**

cycle_ctrl	Description
b000	Channel control data structure is invalid
b001	Basic DMA transfer
b010	Auto-request
b011	Ping-pong
b100	Memory scatter-gather using the primary data structure

cycle_ctrl	Description
b101	Memory scatter-gather using the alternate data structure
b110	Peripheral scatter-gather using the primary data structure
b111	Peripheral scatter-gather using the alternate data structure

**Note**

The cycle\_ctrl bits are located in the channel\_cfg memory location that Section 8.4.3.3 (p. 58) describes.

For all cycle types, the controller arbitrates after  $2^R$  DMA transfers. If you set a low-priority channel with a large  $2^R$  value then it prevents all other channels from performing a DMA transfer, until the low-priority DMA transfer completes. Therefore, you must take care when setting the R\_power, that you do not significantly increase the latency for high-priority channels.

**8.4.2.3.1 Invalid**

After the controller completes a DMA cycle it sets the cycle type to invalid, to prevent it from repeating the same DMA cycle.

**8.4.2.3.2 Basic**

In this mode, you configure the controller to use either the primary or the alternate data structure. After you enable the channel C and the controller receives a request for this channel, then the flow for this DMA cycle is as follows:

1. The controller performs  $2^R$  transfers. If the number of transfers remaining becomes zero, then the flow continues at step 3 (p. 48) .
2. The controller arbitrates:
  - if a higher-priority channel is requesting service then the controller services that channel
  - if the peripheral or software signals a request to the controller then it continues at step 1 (p. 48) .
3. The controller sets dma\_done[C] HIGH for one HFCORECLK cycle. This indicates to the host processor that the DMA cycle is complete.

**8.4.2.3.3 Auto-request**

When the controller operates in this mode, it is only necessary for it to receive a single request to enable it to complete the entire DMA cycle. This enables a large data transfer to occur, without significantly increasing the latency for servicing higher priority requests, or requiring multiple requests from the processor or peripheral.

You can configure the controller to use either the primary or the alternate data structure. After you enable the channel C and the controller receives a request for this channel, then the flow for this DMA cycle is as follows:

1. The controller performs  $2^R$  transfers for channel C. If the number of transfers remaining is zero the flow continues at step 3 (p. 48) .
2. The controller arbitrates. When channel C has the highest priority then the DMA cycle continues at step 1 (p. 48) .
3. The controller sets dma\_done[C] HIGH for one HFCORECLK cycle. This indicates to the host processor that the DMA cycle is complete.

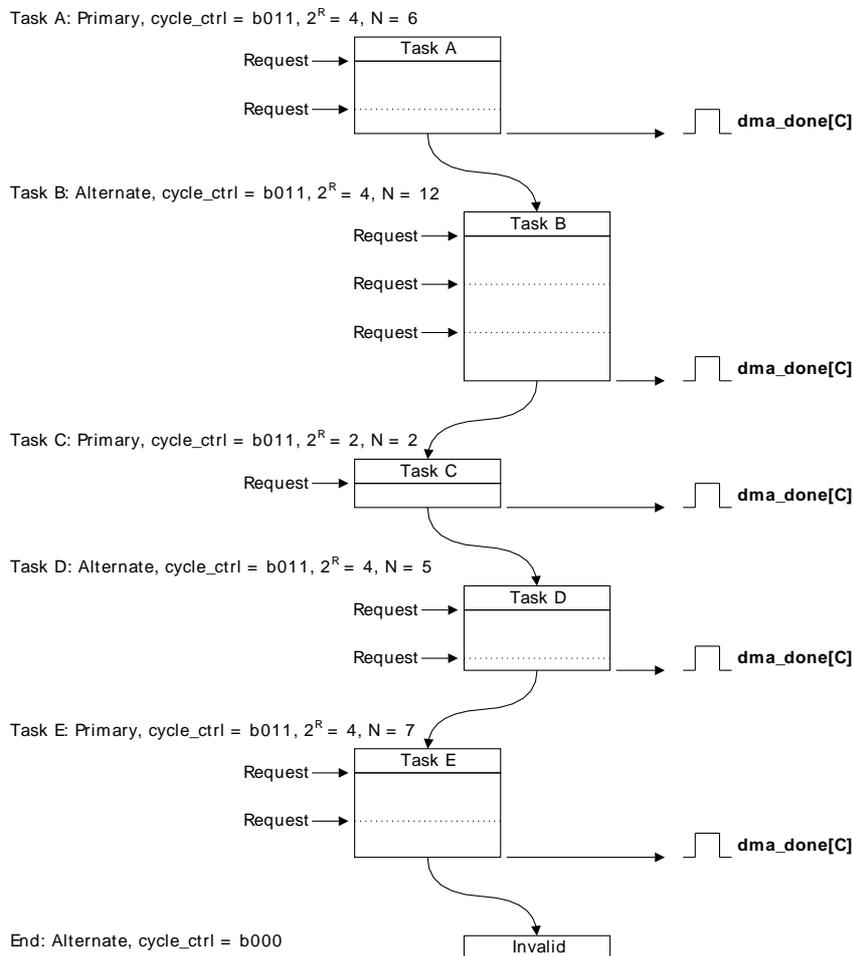

**8.4.2.3.4 Ping-pong**

In ping-pong mode, the controller performs a DMA cycle using one of the data structures (primary or alternate) and it then performs a DMA cycle using the other data structure. The controller continues to

switch from primary to alternate to primary... until it reads a data structure that is invalid, or until the host processor disables the channel.

Figure 8.3 (p. 49) shows an example of a ping-pong DMA transaction.

**Figure 8.3. Ping-pong example**

In Figure 8.3 (p. 49) :

- Task A
1. The host processor configures the primary data structure for task A.
  2. The host processor configures the alternate data structure for task B. This enables the controller to immediately switch to task B after task A completes, provided that a higher priority channel does not require servicing.
  3. The controller receives a request and performs four DMA transfers.
  4. The controller arbitrates. After the controller receives a request for this channel, the flow continues if the channel has the highest priority.
  5. The controller performs the remaining two DMA transfers.
  6. The controller sets dma\_done[C] HIGH for one HFCORECLK cycle and enters the arbitration process.

After task A completes, the host processor can configure the primary data structure for task C. This enables the controller to immediately switch to task C after task B completes, provided that a higher priority channel does not require servicing.

After the controller receives a new request for the channel and it has the highest priority then task B commences:

- Task B
7. The controller performs four DMA transfers.
  8. The controller arbitrates. After the controller receives a request for this channel, the flow continues if the channel has the highest priority.
  9. The controller performs four DMA transfers.
  10. The controller arbitrates. After the controller receives a request for this channel, the flow continues if the channel has the highest priority.
  11. The controller performs the remaining four DMA transfers.
  12. The controller sets `dma_done[C]` HIGH for one `HFCORECLK` cycle and enters the arbitration process.

After task B completes, the host processor can configure the alternate data structure for task D.

After the controller receives a new request for the channel and it has the highest priority then task C commences:

- Task C
13. The controller performs two DMA transfers.
  14. The controller sets `dma_done[C]` HIGH for one `HFCORECLK` cycle and enters the arbitration process.

After task C completes, the host processor can configure the primary data structure for task E.

After the controller receives a new request for the channel and it has the highest priority then task D commences:

- Task D
15. The controller performs four DMA transfers.
  16. The controller arbitrates. After the controller receives a request for this channel, the flow continues if the channel has the highest priority.
  17. The controller performs the remaining DMA transfer.
  18. The controller sets `dma_done[C]` HIGH for one `HFCORECLK` cycle and enters the arbitration process.

After the controller receives a new request for the channel and it has the highest priority then task E commences:

- Task E
19. The controller performs four DMA transfers.
  20. The controller arbitrates. After the controller receives a request for this channel, the flow continues if the channel has the highest priority.
  21. The controller performs the remaining three DMA transfers.
  22. The controller sets `dma_done[C]` HIGH for one `HFCORECLK` cycle and enters the arbitration process.

If the controller receives a new request for the channel and it has the highest priority then it attempts to start the next task. However, because the host processor has not configured the alternate data structure, and on completion of task D the controller set the `cycle_ctrl` bits to `b000`, then the ping-pong DMA transaction completes.

#### Note

You can also terminate the ping-pong DMA cycle in Figure 8.3 (p. 49), if you configure task E to be a basic DMA cycle by setting the `cycle_ctrl` field to `3'b001`.

### 8.4.2.3.5 Memory scatter-gather

In memory scatter-gather mode the controller receives an initial request and then performs four DMA transfers using the primary data structure. After this transfer completes, it starts a DMA cycle using the

alternate data structure. After this cycle completes, the controller performs another four DMA transfers using the primary data structure. The controller continues to switch from primary to alternate to primary... until either:

- the host processor configures the alternate data structure for a basic cycle
- it reads an invalid data structure.

**Note**

After the controller completes the N primary transfers it invalidates the primary data structure by setting the cycle\_ctrl field to b000.

The controller only asserts dma\_done[C] when the scatter-gather transaction completes using an auto-request cycle.

In scatter-gather mode, the controller uses the primary data structure to program the alternate data structure. Table 8.4 (p. 51) lists the fields of the channel\_cfg memory location for the primary data structure, that you must program with constant values and those that can be user defined.

**Table 8.4. channel\_cfg for a primary data structure, in memory scatter-gather mode**

Bit	Field	Value	Description
Constant-value fields:			
[31:30]	dst_inc	b10	Configures the controller to use word increments for the address
[29:28]	dst_size	b10	Configures the controller to use word transfers
[27:26]	src_inc	b10	Configures the controller to use word increments for the address
[25:24]	src_size	b10	Configures the controller to use word transfers
[17:14]	R_power	b0010	Configures the controller to perform four DMA transfers
[3]	next_useburst	0	For a memory scatter-gather DMA cycle, this bit must be set to zero
[2:0]	cycle_ctrl	b100	Configures the controller to perform a memory scatter-gather DMA cycle
User defined values:			
[23:21]	dst_prot_ctrl	-	Configures the state of HPROT <sup>1</sup> when the controller writes the destination data
[20:18]	src_prot_ctrl	-	Configures the state of HPROT when the controller reads the source data
[13:4]	n_minus_1	N <sup>2</sup>	Configures the controller to perform N DMA transfers, where N is a multiple of four

<sup>1</sup>ARM PL230 homepage [<http://infocenter.arm.com/help/index.jsp?topic=/com.arm.doc.ddi0417a/index.html>]

<sup>2</sup>Because the R\_power field is set to four, you must set N to be a multiple of four. The value given by N/4 is the number of times that you must configure the alternate data structure.

See Section 8.4.3.3 (p. 58) for more information.

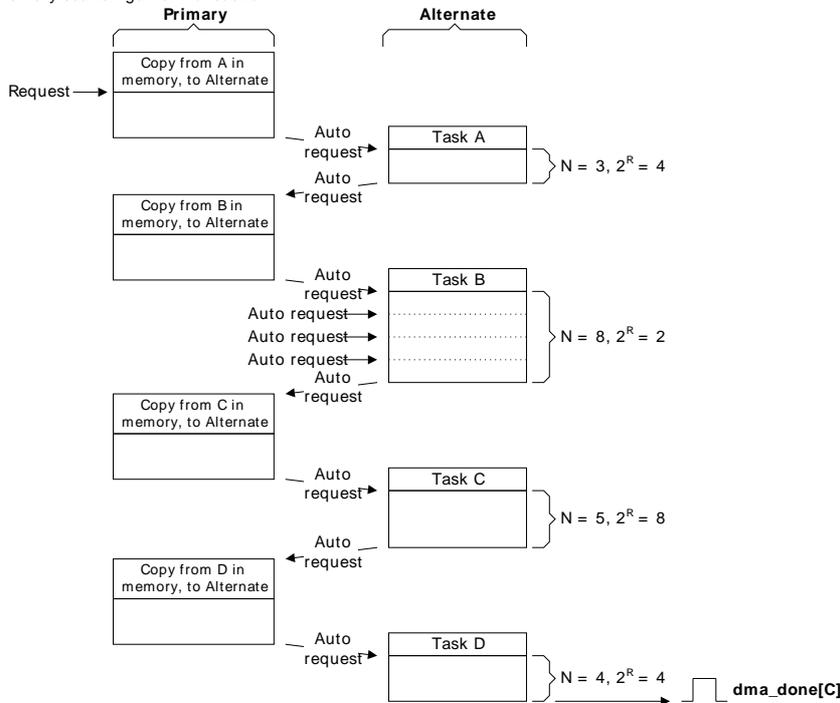

Figure 8.4 (p. 52) shows a memory scatter-gather example.

**Figure 8.4. Memory scatter-gather example**

Initialization: 1. Configure primary to enable the copy A, B, C, and D operations: cycle\_ctrl = b100, 2<sup>R</sup> = 4, N = 16.  
 2. Write the primary source data to memory, using the structure shown in the following table.

	src_data_end_ptr	dst_data_end_ptr	channel_cfg	Unused
Data for Task A	0x0A000000	0x0AE00000	cycle_ctrl = b101, 2 <sup>R</sup> = 4, N = 3	0xFFFFFFFF
Data for Task B	0x0B000000	0x0BE00000	cycle_ctrl = b101, 2 <sup>R</sup> = 2, N = 8	0xFFFFFFFF
Data for Task C	0x0C000000	0x0CE00000	cycle_ctrl = b101, 2 <sup>R</sup> = 8, N = 5	0xFFFFFFFF
Data for Task D	0x0D000000	0x0DE00000	cycle_ctrl = b010, 2 <sup>R</sup> = 4, N = 4	0xFFFFFFFF

Memory scatter-gather transaction:

In Figure 8.4 (p. 52) :

**Initialization**

1. The host processor configures the primary data structure to operate in memory scatter-gather mode by setting cycle\_ctrl to b100. Because a data structure for a single channel consists of four words then you must set 2<sup>R</sup> to 4. In this example, there are four tasks and therefore N is set to 16.
2. The host processor writes the data structure for tasks A, B, C, and D to the memory locations that the primary src\_data\_end\_ptr specifies.
3. The host processor enables the channel.

The memory scatter-gather transaction commences when the controller receives a request on dma\_req[ ] or a manual request from the host processor. The transaction continues as follows:

**Primary, copy A**

1. After receiving a request, the controller performs four DMA transfers. These transfers write the alternate data structure for task A.

**Task A**

2. The controller generates an auto-request for the channel and then arbitrates.
3. The controller performs task A. After it completes the task, it generates an auto-request for the channel and then arbitrates.

**Primary, copy B**

4. The controller performs four DMA transfers. These transfers write the alternate data structure for task B.

**Task B**

5. The controller generates an auto-request for the channel and then arbitrates.
6. The controller performs task B. After it completes the task, it generates an auto-request for the channel and then arbitrates.

**Primary, copy C**

7. The controller performs four DMA transfers. These transfers write the alternate data structure for task C.

- Task C
  - 8. The controller generates an auto-request for the channel and then arbitrates.
  - 9. The controller performs task C. After it completes the task, it generates an auto-request for the channel and then arbitrates.
- Primary, copy D
  - 10. The controller performs four DMA transfers. These transfers write the alternate data structure for task D.
  - 11. The controller sets the cycle\_ctrl bits of the primary data structure to b000, to indicate that this data structure is now invalid.
  - 12. The controller generates an auto-request for the channel and then arbitrates.
- Task D
  - 13. The controller performs task D using an auto-request cycle.
  - 14. The controller sets dma\_done [ C ] HIGH for one HFCORECLK cycle and enters the arbitration process.

### 8.4.2.3.6 Peripheral scatter-gather

In peripheral scatter-gather mode the controller receives an initial request from a peripheral and then it performs four DMA transfers using the primary data structure. It then immediately starts a DMA cycle using the alternate data structure, without re-arbitrating.

**Note**

These are the only circumstances, where the controller does not enter the arbitration process after completing a transfer using the primary data structure.

After this cycle completes, the controller re-arbitrates and if the controller receives a request from the peripheral that has the highest priority then it performs another four DMA transfers using the primary data structure. It then immediately starts a DMA cycle using the alternate data structure, without re-arbitrating. The controller continues to switch from primary to alternate to primary... until either:

- the host processor configures the alternate data structure for a basic cycle
- it reads an invalid data structure.

**Note**

After the controller completes the N primary transfers it invalidates the primary data structure by setting the cycle\_ctrl field to b000.

The controller asserts dma\_done [ C ] when the scatter-gather transaction completes using a basic cycle.

In scatter-gather mode, the controller uses the primary data structure to program the alternate data structure. Table 8.5 (p. 53) lists the fields of the channel\_cfg memory location for the primary data structure, that you must program with constant values and those that can be user defined.

**Table 8.5. channel\_cfg for a primary data structure, in peripheral scatter-gather mode**

Bit	Field	Value	Description
Constant-value fields:			
[31:30]	dst_inc	b10	Configures the controller to use word increments for the address
[29:28]	dst_size	b10	Configures the controller to use word transfers
[27:26]	src_inc	b10	Configures the controller to use word increments for the address
[25:24]	src_size	b10	Configures the controller to use word transfers
[17:14]	R_power	b0010	Configures the controller to perform four DMA transfers
[2:0]	cycle_ctrl	b110	Configures the controller to perform a peripheral scatter-gather DMA cycle
User defined values:			
[23:21]	dst_prot_ctrl	-	Configures the state of HPROT when the controller writes the destination data

Bit	Field	Value	Description
[20:18]	src_prot_ctrl	-	Configures the state of HPROT when the controller reads the source data
[13:4]	n_minus_1	N <sup>1</sup>	Configures the controller to perform N DMA transfers, where N is a multiple of four
[3]	next_useburst	-	When set to 1, the controller sets the chnl_useburst_set [C] bit to 1 after the alternate transfer completes

<sup>1</sup>Because the R\_power field is set to four, you must set N to be a multiple of four. The value given by N/4 is the number of times that you must configure the alternate data structure.

See Section 8.4.3.3 (p. 58) for more information.

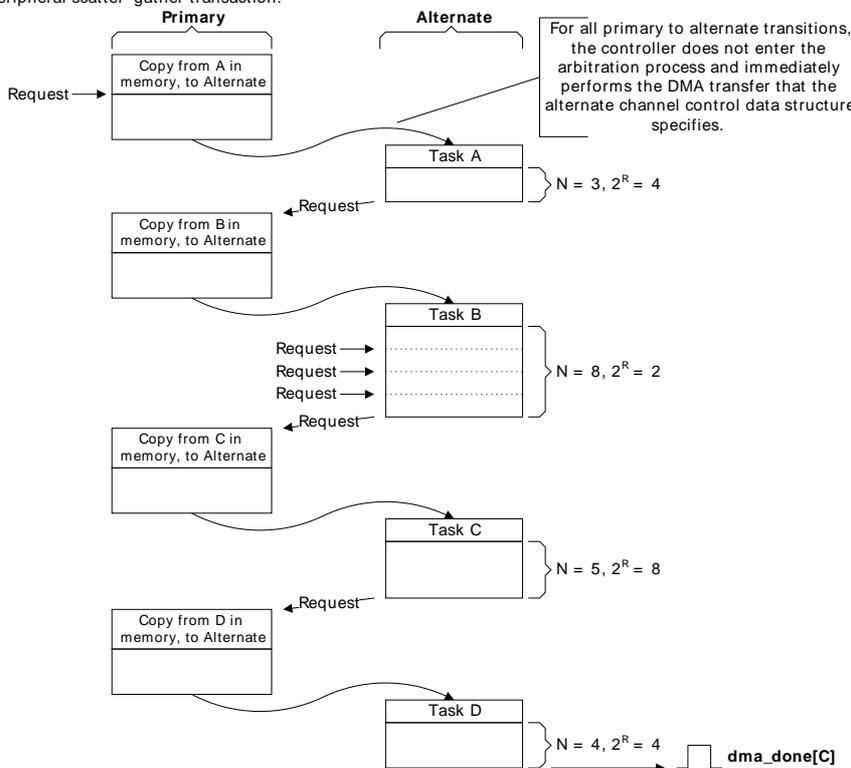

Figure 8.5 (p. 54) shows a peripheral scatter-gather example.

**Figure 8.5. Peripheral scatter-gather example**

Initialization: 1. Configure primary to enable the copy A, B, C, and D operations: cycle\_ctrl = b110, 2<sup>R</sup> = 4, N = 16.  
 2. Write the primary source data in memory, using the structure shown in the following table.

	src_data_end_ptr	dst_data_end_ptr	channel_cfg	Unused
Data for Task A	0x0A000000	0x0AE00000	cycle_ctrl = b111, 2 <sup>R</sup> = 4, N = 3	0xFFFFFFFF
Data for Task B	0x0B000000	0x0BE00000	cycle_ctrl = b111, 2 <sup>R</sup> = 2, N = 8	0xFFFFFFFF
Data for Task C	0x0C000000	0x0CE00000	cycle_ctrl = b111, 2 <sup>R</sup> = 8, N = 5	0xFFFFFFFF
Data for Task D	0x0D000000	0x0DE00000	cycle_ctrl = b001, 2 <sup>R</sup> = 4, N = 4	0xFFFFFFFF

Peripheral scatter-gather transaction:

In Figure 8.5 (p. 54) :

Initialization

1. The host processor configures the primary data structure to operate in peripheral scatter-gather mode by setting cycle\_ctrl to b110. Because a data structure for a single channel consists of four words then you must set 2<sup>R</sup> to 4. In this example, there are four tasks and therefore N is set to 16.
2. The host processor writes the data structure for tasks A, B, C, and D to the memory locations that the primary src\_data\_end\_ptr specifies.
3. The host processor enables the channel.

The peripheral scatter-gather transaction commences when the controller receives a request on dma\_req[ ]. The transaction continues as follows:

- Primary, copy A      1. After receiving a request, the controller performs four DMA transfers. These transfers write the alternate data structure for task A.
- Task A                2. The controller performs task A.  
3. After the controller completes the task it enters the arbitration process.

After the peripheral issues a new request and it has the highest priority then the process continues with:

- Primary, copy B      4. The controller performs four DMA transfers. These transfers write the alternate data structure for task B.
- Task B                5. The controller performs task B. To enable the controller to complete the task, the peripheral must issue a further three requests.  
6. After the controller completes the task it enters the arbitration process.

After the peripheral issues a new request and it has the highest priority then the process continues with:

- Primary, copy C      7. The controller performs four DMA transfers. These transfers write the alternate data structure for task C.
- Task C                8. The controller performs task C.  
9. After the controller completes the task it enters the arbitration process.

After the peripheral issues a new request and it has the highest priority then the process continues with:

- Primary, copy D      10. The controller performs four DMA transfers. These transfers write the alternate data structure for task D.  
11. The controller sets the cycle\_ctrl bits of the primary data structure to b000, to indicate that this data structure is now invalid.
- Task D                12. The controller performs task D using a basic cycle.  
13. The controller sets dma\_done[ C ] HIGH for one HFCORECLK cycle and enters the arbitration process.

#### 8.4.2.4 Error signaling

If the controller detects an ERROR response on the AHB-Lite master interface, it:

- disables the channel that corresponds to the ERROR
- sets dma\_err HIGH.

After the host processor detects that dma\_err is HIGH, it must check which channel was active when the ERROR occurred. It can do this by:

1. Reading the DMA\_CHENS register to create a list of disabled channels.

When a channel asserts dma\_done[ ] then the controller disables the channel. The program running on the host processor must always keep a record of which channels have recently asserted their dma\_done[ ] outputs.

2. It must compare the disabled channels list from step 1 (p. 55), with the record of the channels that have recently set their dma\_done[ ] outputs. The channel with no record of dma\_done[ C ] being set is the channel that the ERROR occurred on.

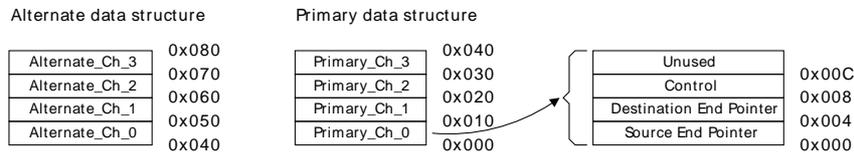

#### 8.4.3 Channel control data structure

You must provide an area of system memory to contain the channel control data structure. This system memory must:

- provide a contiguous area of system memory that the controller and host processor can access
- have a base address that is an integer multiple of the total size of the channel control data structure.

Figure 8.6 (p. 56) shows the memory that the controller requires for the channel control data structure, when all 4 channels and the optional alternate data structure are in use.

**Figure 8.6. Memory map for 4 channels, including the alternate data structure**

This structure in Figure 8.6 (p. 56) uses 128 bytes of system memory. The controller uses the lower 8 address bits to enable it to access all of the elements in the structure and therefore the base address must be at 0xXXXXXX00.

You can configure the base address for the primary data structure by writing the appropriate value in the DMA\_CTRLBASE register.

You do not need to set aside the full 128 bytes if all dma channels are not used or if all alternate descriptors are not used. If, for example, only 4 channels are used and they only need the primary descriptors, then only 64 bytes need to be set aside.

Table 8.6 (p. 56) lists the address bits that the controller uses when it accesses the elements of the channel control data structure.

**Table 8.6. Address bit settings for the channel control data structure**

Address bits	[6]	[5]	[4]	[3:0]
	A	C[1]	C[0]	0x0, 0x4, or 0x8

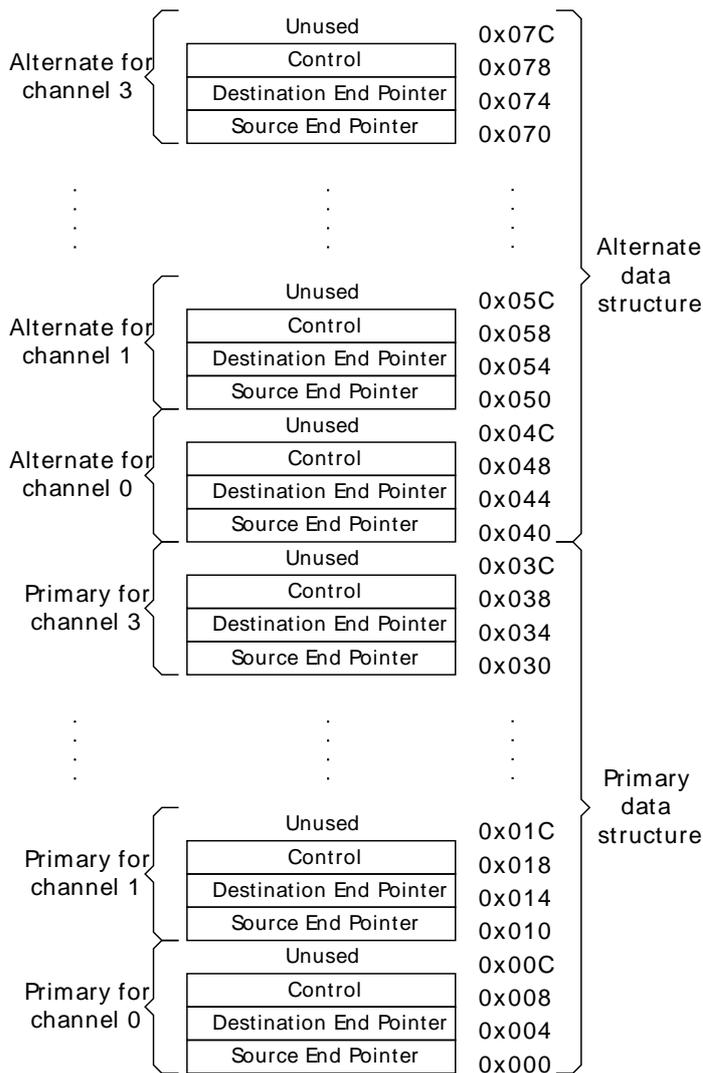

Where:

- A** Selects one of the channel control data structures:  
 A = 0 Selects the primary data structure.  
 A = 1 Selects the alternate data structure.
- C[1:0]** Selects the DMA channel.
- Address[3:0]** Selects one of the control elements:  
 0x0 Selects the source data end pointer.  
 0x4 Selects the destination data end pointer.  
 0x8 Selects the control data configuration.  
 0xC The controller does not access this address location. If required, you can enable the host processor to use this memory location as system memory.

**Note**  
 It is not necessary for you to calculate the base address of the alternate data structure because the DMA\_ALTCTRLBASE register provides this information.

Figure 8.7 (p. 57) shows a detailed memory map of the descriptor structure.

Figure 8.7. Detailed memory map for the 4 channels, including the alternate data structure

The controller uses the system memory to enable it to access two pointers and the control information that it requires for each channel. The following subsections will describe these 32-bit memory locations and how the controller calculates the DMA transfer address.

### 8.4.3.1 Source data end pointer

The `src_data_end_ptr` memory location contains a pointer to the end address of the source data. Figure 8.7 (p. 57) lists the bit assignments for this memory location.

Table 8.7. `src_data_end_ptr` bit assignments

Bit	Name	Description
[31:0]	<code>src_data_end_ptr</code>	Pointer to the end address of the source data

Before the controller can perform a DMA transfer, you must program this memory location with the end address of the source data. The controller reads this memory location when it starts a 2<sup>R</sup> DMA transfer.

**Note**

The controller does not write to this memory location.

Bit	Name	Description
		b1000 Arbitrates after 256 DMA transfers. b1001 Arbitrates after 512 DMA transfers. b1010 - b1111 Arbitrates after 1024 DMA transfers. This means that no arbitration occurs during the DMA transfer because the maximum transfer size is 1024.
[13:4]	n_minus_1	<p>Prior to the DMA cycle commencing, these bits represent the total number of DMA transfers that the DMA cycle contains. You must set these bits according to the size of DMA cycle that you require.</p> <p>The 10-bit value indicates the number of DMA transfers, minus one. The possible values are:</p> <p>b000000000 = 1 DMA transfer</p> <p>b000000001 = 2 DMA transfers</p> <p>b000000010 = 3 DMA transfers</p> <p>b000000011 = 4 DMA transfers</p> <p>b000000100 = 5 DMA transfers</p> <p>.</p> <p>.</p> <p>.</p> <p>b111111111 = 1024 DMA transfers.</p> <p>The controller updates this field immediately prior to it entering the arbitration process. This enables the controller to store the number of outstanding DMA transfers that are necessary to complete the DMA cycle.</p>
[3]	next_useburst	<p>Controls if the chnl_useburst_set [C] bit is set to a 1, when the controller is performing a peripheral scatter-gather and is completing a DMA cycle that uses the alternate data structure.</p> <div style="background-color: #f0f0f0; padding: 5px; margin: 5px 0;"> <p><b>Note</b></p> <p>Immediately prior to completion of the DMA cycle that the alternate data structure specifies, the controller sets the chnl_useburst_set [C] bit to 0 if the number of remaining transfers is less than <math>2^R</math>. The setting of the next_useburst bit controls if the controller performs an additional modification of the chnl_useburst_set [C] bit.</p> </div> <p>In peripheral scatter-gather DMA cycle then after the DMA cycle that uses the alternate data structure completes, either:</p> <p>0 = the controller does not change the value of the chnl_useburst_set [C] bit. If the chnl_useburst_set [C] bit is 0 then for all the remaining DMA cycles in the peripheral scatter-gather transaction, the controller responds to requests on dma_req[ ] and dma_sreq[ ], when it performs a DMA cycle that uses an alternate data structure.</p> <p>1 = the controller sets the chnl_useburst_set [C] bit to a 1. Therefore, for the remaining DMA cycles in the peripheral scatter-gather transaction, the controller only responds to requests on dma_req[ ], when it performs a DMA cycle that uses an alternate data structure.</p>
[2:0]	cycle_ctrl	<p>The operating mode of the DMA cycle. The modes are:</p> <p>b000 Stop. Indicates that the data structure is invalid.</p> <p>b001 Basic. The controller must receive a new request, prior to it entering the arbitration process, to enable the DMA cycle to complete.</p> <p>b010 Auto-request. The controller automatically inserts a request for the appropriate channel during the arbitration process. This means that the initial request is sufficient to enable the DMA cycle to complete.</p> <p>b011 Ping-pong. The controller performs a DMA cycle using one of the data structures. After the DMA cycle completes, it performs a DMA cycle using the other data structure. After the DMA cycle completes and provided that the host processor has updated the original data structure, it performs a DMA cycle using the original data structure. The controller continues to perform DMA cycles until it either reads an invalid data structure or the host processor changes the cycle_ctrl bits to b001 or b010. See Section 8.4.2.3.4 (p. 48) .</p> <p>b100 Memory scatter/gather. See Section 8.4.2.3.5 (p. 50) .</p> <p>When the controller operates in memory scatter-gather mode, you must only use this value in the primary data structure.</p> <p>b101 Memory scatter/gather. See Section 8.4.2.3.5 (p. 50) .</p> <p>When the controller operates in memory scatter-gather mode, you must only use this value in the alternate data structure.</p> <p>b110 Peripheral scatter/gather. See Section 8.4.2.3.6 (p. 53) .</p>

Bit	Name	Description
		When the controller operates in peripheral scatter-gather mode, you must only use this value in the primary data structure.
b111	Peripheral scatter/gather.	See Section 8.4.2.3.6 (p. 53) .
		When the controller operates in peripheral scatter-gather mode, you must only use this value in the alternate data structure.

At the start of a DMA cycle, or 2<sup>R</sup> DMA transfer, the controller fetches the channel\_cfg from system memory. After it performs 2<sup>R</sup>, or N, transfers it stores the updated channel\_cfg in system memory.

The controller does not support a dst\_size value that is different to the src\_size value. If it detects a mismatch in these values, it uses the src\_size value for source and destination and when it next updates the n\_minus\_1 field, it also sets the dst\_size field to the same as the src\_size field.

After the controller completes the N transfers it sets the cycle\_ctrl field to b000, to indicate that the channel\_cfg data is invalid. This prevents it from repeating the same DMA transfer.

### 8.4.3.4 Address calculation

To calculate the source address of a DMA transfer, the controller performs a left shift operation on the n\_minus\_1 value by a shift amount that src\_inc specifies, and then subtracts the resulting value from the source data end pointer. Similarly, to calculate the destination address of a DMA transfer, it performs a left shift operation on the n\_minus\_1 value by a shift amount that dst\_inc specifies, and then subtracts the resulting value from the destination end pointer.

Depending on the value of src\_inc and dst\_inc, the source address and destination address can be calculated using the equations:

- src\_inc = b00 and dst\_inc = b00
  - source address = src\_data\_end\_ptr - n\_minus\_1
  - destination address = dst\_data\_end\_ptr - n\_minus\_1.
- src\_inc = b01 and dst\_inc = b01
  - source address = src\_data\_end\_ptr - (n\_minus\_1 << 1)
  - destination address = dst\_data\_end\_ptr - (n\_minus\_1 << 1).
- src\_inc = b10 and dst\_inc = b10
  - source address = src\_data\_end\_ptr - (n\_minus\_1 << 2)
  - destination address = dst\_data\_end\_ptr - (n\_minus\_1 << 2).
- src\_inc = b11 and dst\_inc = b11
  - source address = src\_data\_end\_ptr
  - destination address = dst\_data\_end\_ptr.

Table 8.10 (p. 61) lists the destination addresses for a DMA cycle of six words.

**Table 8.10. DMA cycle of six words using a word increment**

Initial values of channel_cfg, prior to the DMA cycle				
src_size = b10, dst_inc = b10, n_minus_1 = b101, cycle_ctrl = 1				
	End Pointer	Count	Difference <sup>1</sup>	Address
DMA transfers	0x2AC	5	0x14	0x298
	0x2AC	4	0x10	0x29C
	0x2AC	3	0xC	0x2A0
	0x2AC	2	0x8	0x2A4
	0x2AC	1	0x4	0x2A8
	0x2AC	0	0x0	0x2AC
Final values of channel_cfg, after the DMA cycle				
src_size = b10, dst_inc = b10, n_minus_1 = 0, cycle_ctrl = 0				

<sup>1</sup>This value is the result of count being shifted left by the value of dst\_inc.

Table 8.11 (p. 62) lists the destination addresses for a DMA transfer of 12 bytes using a halfword increment.

**Table 8.11. DMA cycle of 12 bytes using a halfword increment**

Initial values of channel_cfg, prior to the DMA cycle				
src_size = b00, dst_inc = b01, n_minus_1 = b1011, cycle_ctrl = 1, R_power = b11				
	End Pointer	Count	Difference <sup>1</sup>	Address
DMA transfers	0x5E7	11	0x16	0x5D1
	0x5E7	10	0x14	0x5D3
	0x5E7	9	0x12	0x5D5
	0x5E7	8	0x10	0x5D7
	0x5E7	7	0xE	0x5D9
	0x5E7	6	0xC	0x5DB
	0x5E7	5	0xA	0x5DD
	0x5E7	4	0x8	0x5DF
Values of channel_cfg after 2 <sup>R</sup> DMA transfers				
src_size = b00, dst_inc = b01, n_minus_1 = b011, cycle_ctrl = 1, R_power = b11				
	End Pointer	Count	Difference	Address
DMA transfers	0x5E7	3	0x6	0x5E1
	0x5E7	2	0x4	0x5E3
	0x5E7	1	0x2	0x5E5
	0x5E7	0	0x0	0x5E7
Final values of channel_cfg, after the DMA cycle				
src_size = b00, dst_inc = b01, n_minus_1 = 0, cycle_ctrl = 0 <sup>2</sup> , R_power = b11				

<sup>1</sup>This value is the result of count being shifted left by the value of dst\_inc.

<sup>2</sup>After the controller completes the DMA cycle it invalidates the channel\_cfg memory location by clearing the cycle\_ctrl field.

### 8.4.4 Interaction with the EMU

The DMA interacts with the Energy Management Unit (EMU) to allow transfers from , e.g., the LEUART to occur in EM2. The EMU can wake up the DMA sufficiently long to allow data transfers to occur. See section "DMA Support" in the LEUART documentation.

### 8.4.5 Interrupts

The PL230 dma\_done[n:0] signals (one for each channel) as well as the dma\_err signal, are available as interrupts to the Cortex-M0+ core. They are combined into one interrupt vector, DMA\_INT. If the interrupt for the DMA is enabled in the ARM Cortex-M0+ core, an interrupt will be made if one or more of the interrupt flags in DMA\_IF and their corresponding bits in DMA\_IEN are set.

## 8.5 Examples

A basic example of how to program the DMA for transferring 42 bytes from the USART1 to memory location 0x20003420. Assumes that the channel 0 is currently disabled, and that the DMA\_ALTCTRLBASE register has already been configured.

**Example 8.1. DMA Transfer**

1. Configure the channel select for using USART1 with DMA channel 0
  - a. Write SOURCESEL=0b001101 and SIGSEL=XX to DMA\_CHCTRL0
2. Configure the primary channel descriptor for DMA channel 0
  - a. Write XX (read address of USART1) to src\_data\_end\_ptr
  - b. Write 0x20003420 + 40 to dst\_data\_end\_ptr
  - c. Write these values to channel\_cfg for channel 0:
    - i. dst\_inc=b01 (destination halfword address increment)
    - ii. dst\_size=b01 (halfword transfer size)
    - iii. src\_inc=b11 (no address increment for source)
    - iv. src\_size=01 (halfword transfer size)
    - v. dst\_prot\_ctrl=000 (no cache/buffer/privilege)
    - vi. src\_prot\_ctrl=000 (no cache/buffer/privilege)
    - vii. R\_power=b0000 (arbitrate after each DMA transfer)
    - viii. in\_minus\_1=d20 (transfer 21 halfwords)
    - ix. next\_useburst=b0 (not applicable)
    - x. cycle\_ctrl=b001 (basic operating mode)
3. Enable the DMA
  - a. Write EN=1 to DMA\_CONFIG
4. Disable the single requests for channel 0 (i.e., do not react to data available, wait for buffer full)
  - a. Write DMA\_CHUSEBURSTS[0]=1
5. Enable buffer-full requests for channel 0
  - a. Write DMA\_CHREQMASKC[0]=1
6. Use the primary data structure for channel 0
  - a. Write DMA\_CHALTC[0]=1
7. Enable channel 0
  - a. Write DMA\_CHENS[0]=1

## 8.6 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	DMA_STATUS	R	DMA Status Registers
0x004	DMA_CONFIG	W	DMA Configuration Register
0x008	DMA_CTRLBASE	RW	Channel Control Data Base Pointer Register
0x00C	DMA_ALTCTRLBASE	R	Channel Alternate Control Data Base Pointer Register
0x010	DMA_CHWAITSTATUS	R	Channel Wait on Request Status Register
0x014	DMA_CHSWREQ	W1	Channel Software Request Register
0x018	DMA_CHUSEBURSTS	RW1H	Channel Useburst Set Register
0x01C	DMA_CHUSEBURSTC	W1	Channel Useburst Clear Register
0x020	DMA_CHREQMASKS	RW1	Channel Request Mask Set Register
0x024	DMA_CHREQMASKC	W1	Channel Request Mask Clear Register
0x028	DMA_CHENS	RW1	Channel Enable Set Register
0x02C	DMA_CHENC	W1	Channel Enable Clear Register
0x030	DMA_CHALTS	RW1	Channel Alternate Set Register
0x034	DMA_CHALTC	W1	Channel Alternate Clear Register
0x038	DMA_CHPRIS	RW1	Channel Priority Set Register
0x03C	DMA_CHPRIC	W1	Channel Priority Clear Register
0x04C	DMA_ERRORC	RW	Bus Error Clear Register
0xE10	DMA_CHREQSTATUS	R	Channel Request Status
0xE18	DMA_CHSREQSTATUS	R	Channel Single Request Status
0x1000	DMA_IF	R	Interrupt Flag Register
0x1004	DMA_IFS	W1	Interrupt Flag Set Register
0x1008	DMA_IFC	W1	Interrupt Flag Clear Register
0x100C	DMA_IEN	RW	Interrupt Enable register
0x1100	DMA_CH0_CTRL	RW	Channel Control Register
0x1104	DMA_CH1_CTRL	RW	Channel Control Register
0x1108	DMA_CH2_CTRL	RW	Channel Control Register
0x110C	DMA_CH3_CTRL	RW	Channel Control Register

## 8.7 Register Description

### 8.7.1 DMA\_STATUS - DMA Status Registers

Offset	Bit Position																															
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0x000																																
<b>Reset</b>													0x03														0x0				0	
<b>Access</b>													R														R				R	
<b>Name</b>													CHNUM														STATE				EN	

Bit	Name	Reset	Access	Description
31:21	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
20:16	CHNUM	0x03	R	<b>Channel Number</b> Number of available DMA channels minus one.
15:8	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
7:4	STATE	0x0	R	<b>Control Current State</b> State can be one of the following. Higher values (11-15) are undefined.
	Value	Mode	Description	
	0	IDLE	Idle	
	1	RDCHCTRLDATA	Reading channel controller data	
	2	RDSRCENDPTR	Reading source data end pointer	
	3	RDDSTENDPTR	Reading destination data end pointer	
	4	RDSRCDATA	Reading source data	
	5	WRDSTDATA	Writing destination data	
	6	WAITREQCLR	Waiting for DMA request to clear	
	7	WRCHCTRLDATA	Writing channel controller data	
	8	STALLED	Stalled	
	9	DONE	Done	
	10	PERSCATTRANS	Peripheral scatter-gather transition	
3:1	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
0	EN	0	R	<b>DMA Enable Status</b> When this bit is 1, the DMA is enabled.

### 8.7.2 DMA\_CONFIG - DMA Configuration Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0			0				
<b>Access</b>																									W			W				
<b>Name</b>																									CHPROT			EN				

Bit	Name	Reset	Access	Description
31:6	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
5	CHPROT	0	W	<b>Channel Protection Control</b> Control whether accesses done by the DMA controller are privileged or not. When CHPROT = 1 then HPROT is HIGH and the access is privileged. When CHPROT = 0 then HPROT is LOW and the access is non-privileged.
4:1	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
0	EN	0	W	<b>Enable DMA</b> Set this bit to enable the DMA controller.

### 8.7.3 DMA\_CTRLBASE - Channel Control Data Base Pointer Register

Offset	Bit Position																																
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Reset																	0x00000000																
Access																	RW																
Name																	CTRLBASE																

Bit	Name	Reset	Access	Description
31:0	CTRLBASE	0x00000000	RW	<b>Channel Control Data Base Pointer</b> The base pointer for a location in system memory that holds the channel control data structure. This register must be written to point to a location in system memory with the channel control data structure before the DMA can be used. Note that ctrl_base_ptr[8:0] must be 0.

### 8.7.4 DMA\_ALTCTRLBASE - Channel Alternate Control Data Base Pointer Register

Offset	Bit Position																																
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Reset																	0x00000040																
Access																	R																
Name																	ALTCTRLBASE																

Bit	Name	Reset	Access	Description
31:0	ALTCTRLBASE	0x00000040	R	<b>Channel Alternate Control Data Base Pointer</b> The base address of the alternate data structure. This register will read as DMA_CTRLBASE + 0x40.

Bit	Name	Reset	Access	Description
1	CH1USEBURSTC Write to 1 to disable useburst setting for this channel.	0	W1	<b>Channel 1 Useburst Clear</b>
0	CH0USEBURSTC Write to 1 to disable useburst setting for this channel.	0	W1	<b>Channel 0 Useburst Clear</b>

### 8.7.9 DMA\_CHREQMASKS - Channel Request Mask Set Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0	0	0	0
<b>Access</b>																													RW1	RW1	RW1	RW1
<b>Name</b>																													CH3REQMASKS	CH2REQMASKS	CH1REQMASKS	CH0REQMASKS

Bit	Name	Reset	Access	Description
31:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
3	CH3REQMASKS Write to 1 to disable peripheral requests for this channel.	0	RW1	<b>Channel 3 Request Mask Set</b>
2	CH2REQMASKS Write to 1 to disable peripheral requests for this channel.	0	RW1	<b>Channel 2 Request Mask Set</b>
1	CH1REQMASKS Write to 1 to disable peripheral requests for this channel.	0	RW1	<b>Channel 1 Request Mask Set</b>
0	CH0REQMASKS Write to 1 to disable peripheral requests for this channel.	0	RW1	<b>Channel 0 Request Mask Set</b>

### 8.7.10 DMA\_CHREQMASKC - Channel Request Mask Clear Register

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0	0	0	0
<b>Access</b>																													W1	W1	W1	W1
<b>Name</b>																													CH3REQMASKC	CH2REQMASKC	CH1REQMASKC	CH0REQMASKC

Bit	Name	Reset	Access	Description
31:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
3	CH3REQMASKC Write to 1 to enable peripheral requests for this channel.	0	W1	<b>Channel 3 Request Mask Clear</b>
2	CH2REQMASKC	0	W1	<b>Channel 2 Request Mask Clear</b>

Bit	Name	Reset	Access	Description
				Write to 1 to clear high priority for this channel.
0	CH0PRIC	0	W1	<b>Channel 0 High Priority Clear</b>
				Write to 1 to clear high priority for this channel.

### 8.7.17 DMA\_ERRORC - Bus Error Clear Register

Offset	Bit Position																															
0x04C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0
<b>Access</b>																																RW
<b>Name</b>																																ERRORC

Bit	Name	Reset	Access	Description
31:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
0	ERRORC	0	RW	<b>Bus Error Clear</b>
				This bit is set high if an AHB bus error has occurred. Writing a 1 to this bit will clear the bit. If the error is deasserted at the same time as an error occurs on the bus, the error condition takes precedence and ERRORC remains asserted.

### 8.7.18 DMA\_CHREQSTATUS - Channel Request Status

Offset	Bit Position																															
0xE10	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0
<b>Access</b>																																R
<b>Name</b>																																CH3REQSTATUS
																																CH2REQSTATUS
																																CH1REQSTATUS
																																CH0REQSTATUS

Bit	Name	Reset	Access	Description
31:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
3	CH3REQSTATUS	0	R	<b>Channel 3 Request Status</b>
				When this bit is 1, it indicates that the peripheral connected as the input to this DMA channel is requesting the controller to service the DMA channel. The controller services the request by performing the DMA cycle using 2 <sup>R</sup> DMA transfers.
2	CH2REQSTATUS	0	R	<b>Channel 2 Request Status</b>
				When this bit is 1, it indicates that the peripheral connected as the input to this DMA channel is requesting the controller to service the DMA channel. The controller services the request by performing the DMA cycle using 2 <sup>R</sup> DMA transfers.
1	CH1REQSTATUS	0	R	<b>Channel 1 Request Status</b>
				When this bit is 1, it indicates that the peripheral connected as the input to this DMA channel is requesting the controller to service the DMA channel. The controller services the request by performing the DMA cycle using 2 <sup>R</sup> DMA transfers.
0	CH0REQSTATUS	0	R	<b>Channel 0 Request Status</b>
				When this bit is 1, it indicates that the peripheral connected as the input to this DMA channel is requesting the controller to service the DMA channel. The controller services the request by performing the DMA cycle using 2 <sup>R</sup> DMA transfers.

Bit	Name	Reset	Access	Description
				Write to 1 to clear the corresponding DMA channel complete interrupt flag.
0	CH0DONE	0	W1	<b>DMA Channel 0 Complete Interrupt Flag Clear</b> Write to 1 to clear the corresponding DMA channel complete interrupt flag.

### 8.7.23 DMA\_IEN - Interrupt Enable register

Offset	Bit Position																																
0x100C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Reset	0																																
Access	RW																																
Name	ERR																																

Bit	Name	Reset	Access	Description
31	ERR	0	RW	<b>DMA Error Interrupt Flag Enable</b> Set this bit to enable interrupt on AHB bus error.
30:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
3	CH3DONE	0	RW	<b>DMA Channel 3 Complete Interrupt Enable</b> Write to 1 to enable complete interrupt on this DMA channel. Clear to disable the interrupt.
2	CH2DONE	0	RW	<b>DMA Channel 2 Complete Interrupt Enable</b> Write to 1 to enable complete interrupt on this DMA channel. Clear to disable the interrupt.
1	CH1DONE	0	RW	<b>DMA Channel 1 Complete Interrupt Enable</b> Write to 1 to enable complete interrupt on this DMA channel. Clear to disable the interrupt.
0	CH0DONE	0	RW	<b>DMA Channel 0 Complete Interrupt Enable</b> Write to 1 to enable complete interrupt on this DMA channel. Clear to disable the interrupt.

### 8.7.24 DMA\_CHx\_CTRL - Channel Control Register

Offset	Bit Position																															
0x1100	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset														0x00																		0x0
Access														RW																		RW
Name														SOURCESEL																	SIGSEL	

Bit	Name	Reset	Access	Description
31:22	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
21:16	SOURCESEL	0x00	RW	<b>Source Select</b> Select input source to DMA channel.

Value	Mode	Description
0b000000	NONE	No source selected
0b001000	ADC0	Analog to Digital Converter 0

Bit	Name	Reset	Access	Description
	Value	Mode		Description
	0b001101	USART1		Universal Synchronous/Asynchronous Receiver/Transmitter 1
	0b010000	LEUART0		Low Energy UART 0
	0b010100	I2C0		I2C 0
	0b011000	TIMER0		Timer 0
	0b011001	TIMER1		Timer 1
	0b110000	MSC		
	0b110001	AES		Advanced Encryption Standard Accelerator

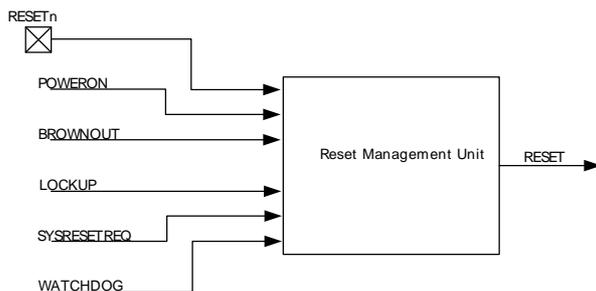

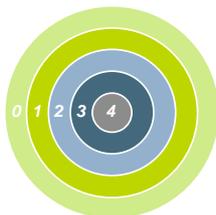

15:4 Reserved To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)

3:0 SIGSEL 0x0 RW Signal Select

Select input signal to DMA channel.

Value	Mode	Description
SOURCESEL = 0b000000 (NONE)		
0bxxxx	OFF	Channel input selection is turned off
SOURCESEL = 0b001000 (ADC0)		
0b0000	ADC0SINGLE	ADC0SINGLE
0b0001	ADC0SCAN	ADC0SCAN
SOURCESEL = 0b001101 (USART1)		
0b0000	USART1RXDATAV	USART1RXDATAV REQ/SREQ
0b0001	USART1TXBL	USART1TXBL REQ/SREQ
0b0010	USART1TXEMPTY	USART1TXEMPTY
0b0011	USART1RXDATAVRIGHT	USART1RXDATAVRIGHT REQ/SREQ
0b0100	USART1TXBLRIGHT	USART1TXBLRIGHT REQ/SREQ
SOURCESEL = 0b010000 (LEUART0)		
0b0000	LEUART0RXDATAV	LEUART0RXDATAV
0b0001	LEUART0TXBL	LEUART0TXBL
0b0010	LEUART0TXEMPTY	LEUART0TXEMPTY
SOURCESEL = 0b010100 (I2C0)		
0b0000	I2C0RXDATAV	I2C0RXDATAV
0b0001	I2C0TXBL	I2C0TXBL
SOURCESEL = 0b011000 (TIMER0)		
0b0000	TIMER0UFOF	TIMER0UFOF
0b0001	TIMER0CC0	TIMER0CC0
0b0010	TIMER0CC1	TIMER0CC1
0b0011	TIMER0CC2	TIMER0CC2
SOURCESEL = 0b011001 (TIMER1)		
0b0000	TIMER1UFOF	TIMER1UFOF
0b0001	TIMER1CC0	TIMER1CC0
0b0010	TIMER1CC1	TIMER1CC1
0b0011	TIMER1CC2	TIMER1CC2
SOURCESEL = 0b110000 (MSC)		
0b0000	MSCWDATA	MSCWDATA
SOURCESEL = 0b110001 (AES)		
0b0000	AESDATAWR	AESDATAWR
0b0001	AESXORDATAWR	AESXORDATAWR
0b0010	AESDATARD	AESDATARD
0b0011	AESKEYWR	AESKEYWR

## 9 RMU - Reset Management Unit

### Quick Facts

#### What?

The RMU ensures correct reset operation. It is responsible for connecting the different reset sources to the reset lines of the EFM32ZG.

#### Why?

A correct reset sequence is needed to ensure safe and synchronous startup of the EFM32ZG. In the case of error situations such as power supply glitches or software crash, the RMU provides proper reset and startup of the EFM32ZG.

#### How?

The Power-on Reset and Brown-out Detector of the EFM32ZG provides power line monitoring with exceptionally low power consumption. The cause of the reset may be read from a register, thus providing software with information about the cause of the reset.

### 9.1 Introduction

The RMU is responsible for handling the reset functionality of the EFM32ZG.

### 9.2 Features

- Reset sources
  - Power-on Reset (POR)
  - Brown-out Detection (BOD) on the following power domains:
    - Regulated domain
    - Unregulated domain
    - Analog Power Domain 0 (AVDD0)
    - Analog Power Domain 1 (AVDD1)
  - RESETn pin reset
  - Watchdog reset
  - EM4 wakeup reset from pin
  - Software triggered reset (SYSRESETREQ)
  - Core LOCKUP condition
- EM4 Detection
- A software readable register indicates the cause of the last reset

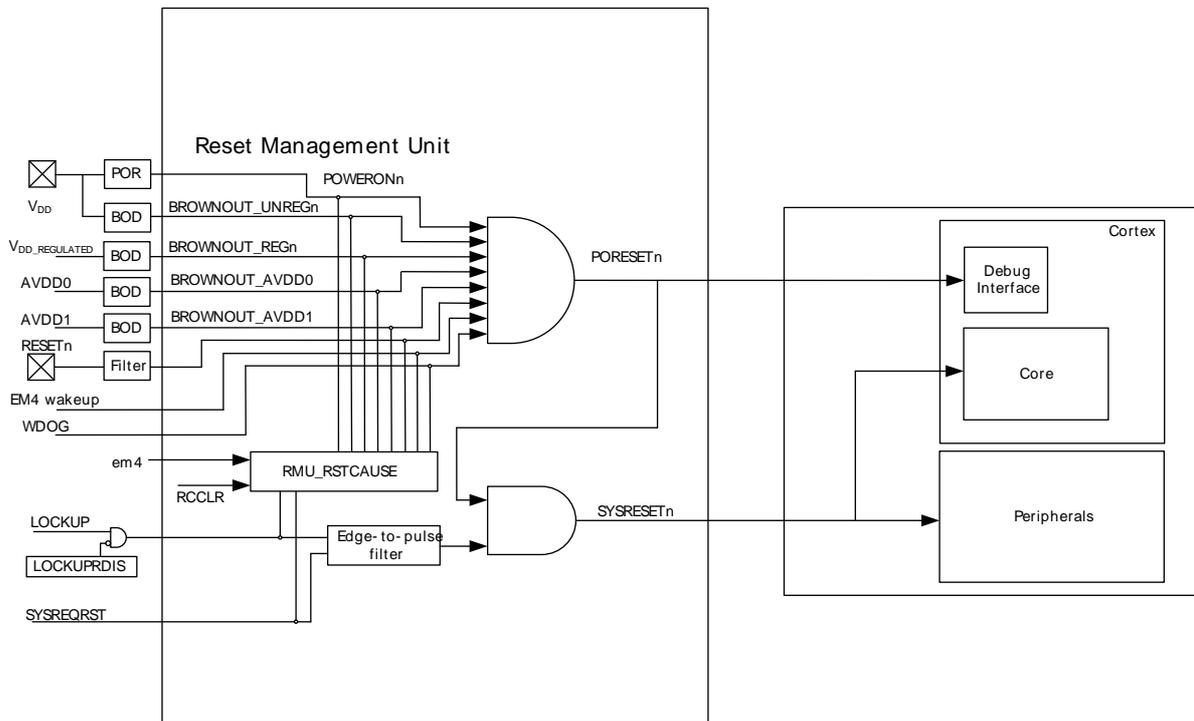

### 9.3 Functional Description

The RMU monitors each of the reset sources of the EFM32ZG. If one or more reset sources go active, the RMU applies reset to the EFM32ZG. When the reset sources go inactive the EFM32ZG starts up. At startup the EFM32ZG loads the stack pointer and program entry point from memory, and starts execution.

As seen in Figure 9.1 (p. 79) the Power-on Reset, Brown-out Detectors, Watchdog timeout and RESETn pin all reset the whole system including the Debug Interface. A Core Lockup condition or a System reset request from software resets the whole system except the Debug Interface.

Whenever a reset source is active, the corresponding bit in the RMU\_RSTCAUSE register is set. At startup the program code may investigate this register in order to determine the cause of the reset. The register must be cleared by software.

**Figure 9.1. RMU Reset Input Sources and Connections.**

### 9.3.1 RMU\_RSTCAUSE Register

The RMU\_RSTCAUSE register indicates the reason for the last reset. The register should be cleared after the value has been read at startup. Otherwise the register may indicate multiple causes for the reset at next startup.

The following procedure must be done to clear RMU\_RSTCAUSE:

1. Write a 1 to RCCLR in RMU\_CMD
2. Write a 1 to bit 0 in EMU\_AUXCTRL
3. Write a 0 to bit 0 in EMU\_AUXCTRL

RMU\_RSTCAUSE should be interpreted according to Table 9.1 (p. 80). X bits are don't care. Notice that it is possible to have multiple reset causes. For example, an external reset and a watchdog reset may happen simultaneously.

**Table 9.1. RMU Reset Cause Register Interpretation**

Register Value	Cause
0bXXX XXXX XXX1	A Power-on Reset has been performed. X bits are don't care.
0bXXX 0XXX XX10	A Brown-out has been detected on the unregulated power.
0bXXX XXX0 0100	A Brown-out has been detected on the regulated power.
0bXXX XXXX 1X00	An external reset has been applied.
0bXXX XXX1 XX00	A watchdog reset has occurred.
0bXXX XX10 0000	A lockup reset has occurred.
0b000 01X0 0000	A system request reset has occurred.
0b000 1XX0 0XX0	The system has woken up from EM4.
0b001 1XX0 0XX0	The system has woken up from EM4 on an EM4 wakeup reset request from pin.
0b010 0000 0000	A Brown-out has been detected on Analog Power Domain 0 (AVDD0).
0b100 0000 0000	A Brown-out has been detected on Analog Power Domain 1 (AVDD1).

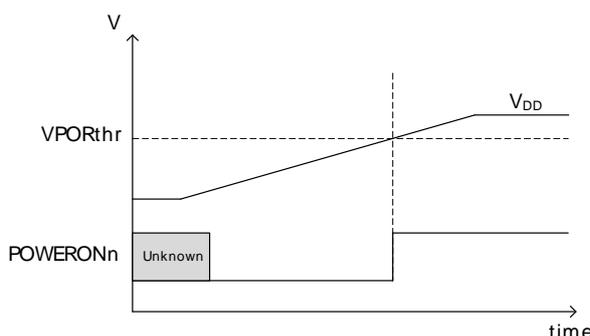

**Note**

When exiting EM4 with external reset, both the BODREGRST and BODUNREGRST in RSTCAUSE might be set (i.e. are invalid)

### 9.3.2 Power-On Reset (POR)

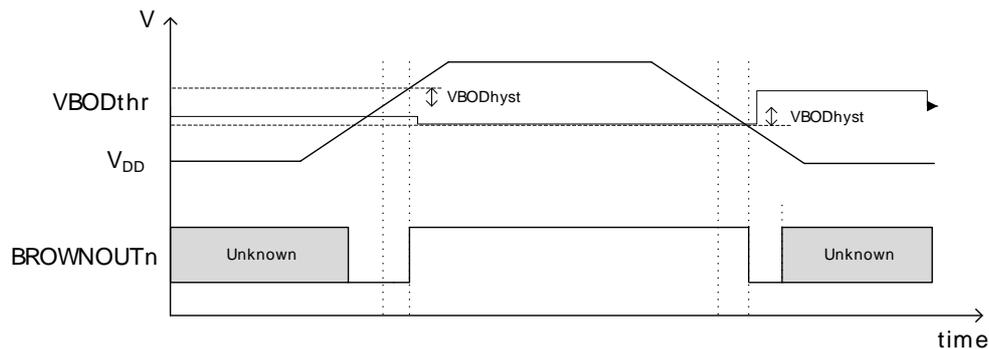

The POR ensures that the EFM32ZG does not start up before the supply voltage  $V_{DD}$  has reached the threshold voltage  $V_{PORthr}$  (see Device Datasheet Electrical Characteristics for details). Before the threshold voltage is reached, the EFM32ZG is kept in reset state. The operation of the POR is illustrated in Figure 9.2 (p. 80), with the active low  $POWERONn$  reset signal. The reason for the “unknown” region is that the corresponding supply voltage is too low for any reliable operation.

**Figure 9.2. RMU Power-on Reset Operation**

### 9.3.3 Brown-Out Detector Reset (BOD)

The EFM32ZG has 4 brownout detectors, one for the unregulated 3.0 V power, one for the regulated internal power, one for Analog Power Domain 0 (AVDD0), and one for Analog Power Domain 1 (AVDD1). The BODs are constantly monitoring the voltages. Whenever the unregulated or regulated power drops below the  $V_{BODthr}$  value (see Electrical Characteristics for details), or if the AVDD0 or AVDD1 drops below the voltage at the decouple pin (DEC), the corresponding active low  $BROWNOUTn$  line is held low. The BODs also include hysteresis, which prevents instability in the corresponding  $BROWNOUTn$  line when the supply is crossing the  $V_{BODthr}$  limit or the AVDD bods drops below decouple pin (DEC). The operation of the BOD is illustrated in Figure 9.3 (p. 81). The “unknown” regions are handled by the POR module.

**Figure 9.3. RMU Brown-out Detector Operation**

### 9.3.4 RESETn pin Reset

Forcing the RESETn pin low generates a reset of the EFM32ZG. The RESETn pin includes an on-chip pull-up resistor, and can therefore be left unconnected if no external reset source is needed. Also connected to the RESETn line is a filter which prevents glitches from resetting the EFM32ZG.

### 9.3.5 Watchdog Reset

The Watchdog circuit is a timer which (when enabled) must be cleared by software regularly. If software does not clear it, a Watchdog reset is activated. This functionality provides recovery from a software stalemate. Refer to the Watchdog section for specifications and description.

### 9.3.6 Lockup Reset

A Cortex-M0+ lockup is the result of the core being locked up because of an unrecoverable exception following the activation of the processor's built-in system state protection hardware.

For more information about the Cortex-M0+ lockup conditions see the ARMv7-M Architecture Reference Manual. The Lockup reset does not reset the Debug Interface. Set the LOCKUPRDIS bit in the RMU\_CTRL register in order to disable this reset source.

### 9.3.7 System Reset Request

Software may initiate a reset (e.g. if it finds itself in a non-recoverable state). By writing to the SYSRESETREQ bit in the Application Interrupt and Reset Control Register (see the Cortex-M0+ reference manual), a reset is issued. The SYSRESETREQ does not reset the Debug Interface.

### 9.3.8 EM4 Reset

Whenever EM4 is entered, the EM4RST bit is set. This bit enables the user to identify that the device has been in EM4. Upon wake-up this bit should be cleared by software.

### 9.3.9 EM4 Wakeup Reset

Whenever the system is woken up from EM4 on a pin wake-up request, the EM4WURST bit is set. This bit enables the user to identify that the device was woken up from EM4 using a pin wake-up request. Upon wake-up this bit should be cleared by software.

## 9.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	RMU_CTRL	RW	Control Register
0x004	RMU_RSTCAUSE	R	Reset Cause Register
0x008	RMU_CMD	W1	Command Register

## 9.5 Register Description

### 9.5.1 RMU\_CTRL - Control Register

Offset	Bit Position

31:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
0	RCCLR	0	W1	<b>Reset Cause Clear</b> Set this bit to clear the LOCKUPRST and SYSREQRST bits in the RMU_RSTCAUSE register. Use the HRCCLR bit in the EMU_AUXCTRL register to clear the remaining bits.

# 10 EMU - Energy Management Unit

## Quick Facts

### What?

The EMU (Energy Management Unit) handles the different low energy modes in the EFM32ZG microcontrollers.

### Why?

The need for performance and peripheral functions varies over time in most applications. By efficiently scaling the available resources in real-time to match the demands of the application, the energy consumption can be kept at a minimum.

### How?

With a broad selection of energy modes, a high number of low-energy peripherals available even in EM2, and short wake-up time (2  $\mu$ s from EM2 and EM3), applications can dynamically minimize energy consumption during program execution.

## 10.1 Introduction

The Energy Management Unit (EMU) manages all the low energy modes (EM) in EFM32ZG microcontrollers. Each energy mode manages if the CPU and the various peripherals are available. The energy modes range from EM0 to EM4, where EM0, also called run mode, enables the CPU and all peripherals. The lowest recoverable energy mode, EM3, disables the CPU and most peripherals while maintaining wake-up and RAM functionality. EM4 disables everything except the POR, pin reset and optionally GPIO state retention and EM4 reset wakeup request.

The various energy modes differ in:

- Energy consumption
- CPU activity
- Reaction time
- Wake-up triggers
- Active peripherals
- Available clock sources

Low energy modes EM1 to EM4 are enabled through the application software. In EM1-EM3, a range of wake-up triggers return the microcontroller back to EM0. EM4 can only return to EM0 by power on reset, external pin reset or EM4 GPIO wakeup request.

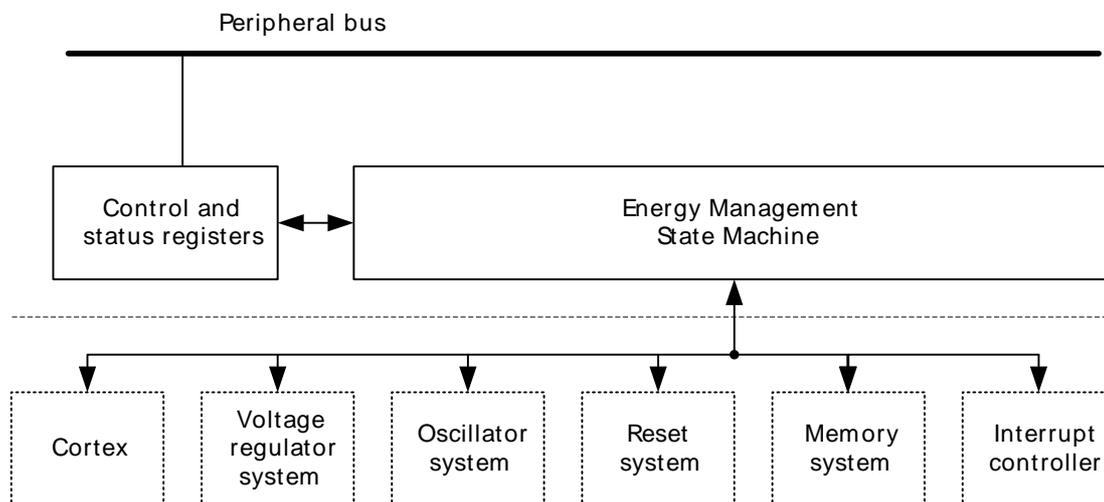

## 10.2 Features

- Energy Mode control from software
- Flexible wakeup from low energy modes
- Low wakeup time

## 10.3 Functional Description

The Energy Management Unit (EMU) is responsible for managing the wide range of energy modes available in EFM32ZG. An overview of the EMU module is shown in Figure 10.1 (p. 85).

**Figure 10.1. EMU Overview**

The EMU is available as a peripheral on the peripheral bus. The energy management state machine is triggered from the Cortex-M0+ and controls the internal voltage regulators, oscillators, memories and interrupt systems in the low energy modes. Events from the interrupt or reset systems can in turn cause the energy management state machine to return to its active state. This is further described in the following sections.

### 10.3.1 Energy Modes

There are five main energy modes available in EFM32ZG, called Energy Mode 0 (EM0) through Energy Mode 4 (EM4). EM0, also called the active mode, is the energy mode in which any peripheral function can be enabled and the Cortex-M0+ core is executing instructions. EM1 through EM4, also called low energy modes, provide a selection of reduced peripheral functionality that also lead to reduced energy consumption, as described below.

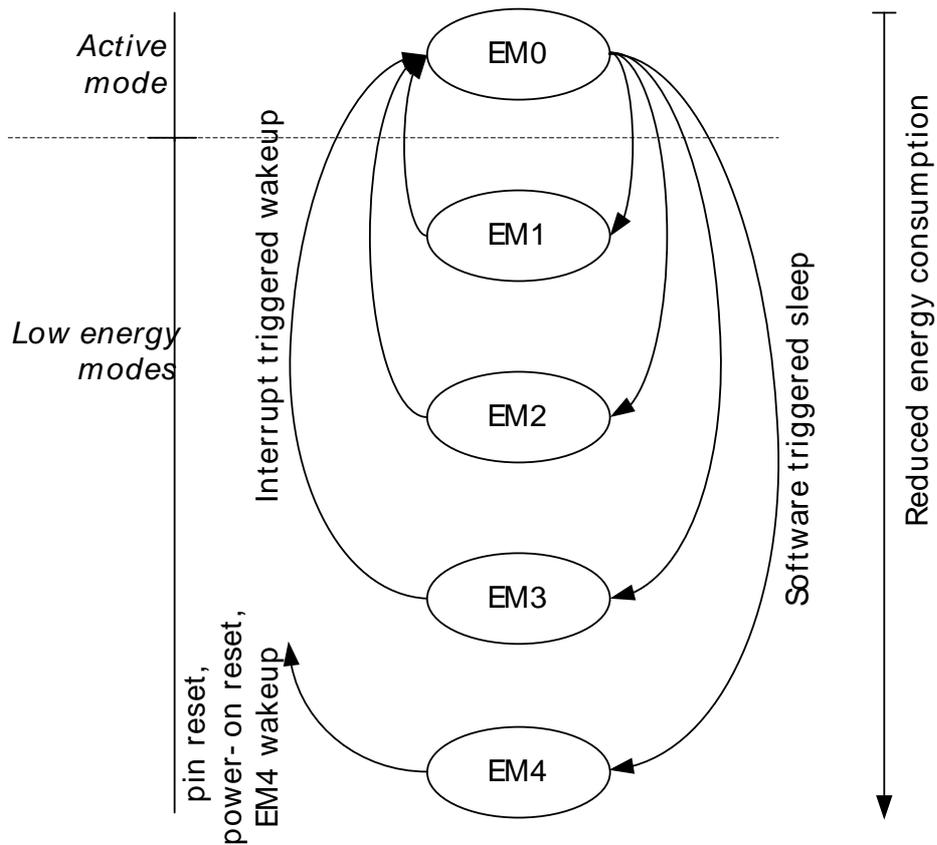

Figure 10.2 (p. 86) shows the transitions between different energy modes. After reset the EMU will always start in EM0. A transition from EM0 to another energy mode is always initiated by software. EM0 is the highest activity mode, in which all functionality is available. EM0 is therefore also the mode with highest energy consumption.

The low energy modes EM1 through EM4 result in less functionality being available, and therefore also reduced energy consumption. The Cortex-M0+ is not executing instructions in any low energy mode. Each low energy mode provides different energy consumptions associated with it, for example because a different set of peripherals are enabled or because these peripherals are configured differently.

A transition from EM0 to a low energy mode can only be triggered by software.

A transition from EM1 – EM3 to EM0 can be triggered by an enabled interrupt or event. In addition, a chip reset will return the device to EM0. A transition from EM4 can only be triggered by a pin reset, power-on reset, or EM4 GPIO wakeup request.

Figure 10.2. EMU Energy Mode Transitions

No direct transitions between EM1, EM2 or EM3 are available, as can also be seen from Figure 10.2 (p. 86) . Instead, a wakeup will transition back to EM0, in which software can enter any other low energy mode. An overview of the supported energy modes and the functionality available in each mode is shown in Table 10.1 (p. 87). Most peripheral functionality indicated as "On" in a particular energy mode can also be turned off from software in order to save further energy.

**Table 10.1. EMU Energy Mode Overview**

	EM0 <sup>1</sup>	EM1 <sup>2</sup>	EM2 <sup>2</sup>	EM3 <sup>2</sup>	EM4 <sup>2</sup>
Wakeup time to EM0	-	-	2 μs	2 μs	160 μs
MCU clock tree	On	-	-	-	-
High frequency peripheral clock trees	On	On	-	-	-
Core voltage regulator	On	On	-	-	-

EM4 Reset Wakeup Request	-	-	-	-	On

<sup>1</sup>Energy Mode 0/Active Mode

<sup>2</sup>Energy Mode 1/2/3/4

<sup>3</sup>When the 1 kHz ULFRCO is selected

The different Energy Modes are summarized in the following sections.

### 10.3.1.1 EM0

- The high frequency oscillator is active
- High frequency clock trees are active
- All peripheral functionality is available

### 10.3.1.2 EM1

- The high frequency oscillator is active
- MCU clock tree is inactive
- High frequency peripheral clock trees are active
- All peripheral functionality is available

### 10.3.1.3 EM2

- The high frequency oscillator is inactive

- The high frequency peripheral and MCU clock trees are inactive
- The low frequency oscillator and clock trees are active
- Low frequency peripheral functionality is available
- Wakeup through peripheral interrupt or asynchronous pin interrupt
- RAM and register values are preserved

### 10.3.1.4 EM3

- Both high and low frequency oscillators and clock trees are inactive
- Wakeup through asynchronous pin interrupts, I<sup>2</sup>C address recognition or ACMP edge interrupt
- Watchdog and some low frequency peripherals available when ULFRCO (1 kHz clock) has been selected
- All other peripheral functionality is disabled
- RAM and register values are preserved

### 10.3.1.5 EM4

- All oscillators and regulators are inactive
- RAM and register values are not preserved
- Optional GPIO state retention
- Wakeup from external pin reset or pins that support EM4 wakeup

## 10.3.2 Entering a Low Energy Mode

A low energy mode is entered by first configuring the desired Energy Mode through the EMU\_CTRL register and the SLEEPDEEP bit in the Cortex-M0+ System Control Register, see Table 10.2 (p. 88). A Wait For Interrupt (WFI) or Wait For Event (WFE) instruction from the Cortex-M0+ triggers the transition into a low energy mode.

The transition into a low energy mode can optionally be delayed until the lowest priority Interrupt Service Routine (ISR) is exited, if the SLEEPONEXIT bit in the Cortex-M0+ System Control Register is set.

Entering the lowest energy mode, EM4, is done by writing a sequence to the EM4CTRL bitfield in the EMU\_CTRL register. Writing a zero to the EM4CTRL bitfield will restart the power sequence. EM2BLOCK prevents the EMU to enter EM2 or lower, and it will instead enter EM1.

EM3 is equal to EM2, except that the LFACTK/LFBCLK are disabled in EM3. The LFACTK/LFBCLK must be disabled by the user before entering low energy mode.

The EMVREG bit in EMU\_CTRL can be used to prevent the voltage regulator from being turned off in low energy modes. The device will then essentially stay in EM1 (with HF oscillators disabled) when entering a low energy mode. Note that if a DMA transfer is initiated in this mode, the HF-oscillators will start and remain enabled until the device is woken up from an EM2 interrupt.

**Table 10.2. EMU Entering a Low Energy Mode**

Low Energy Mode	EM4CTRL	EMVREG	EM2BLOCK	SLEEPDEEP	Cortex-M0+ Instruction
EM1	0	x	x	0	WFI or WFE
EM2	0	0	0	1	WFI or WFE
EM4	Write sequence: 2, 3, 2, 3, 2, 3, 2, 3, 2	x	x	x	x

('x' means don't care)

### 10.3.3 Leaving a Low Energy Mode

In each low energy mode a selection of peripheral units are available, and software can either enable or disable the functionality. Enabled interrupts that can cause wakeup from a low energy mode are shown in Table 10.3 (p. 89). The wakeup triggers always return the EFM32 to EM0. Additionally, any reset source will return to EM0.

**Table 10.3. EMU Wakeup Triggers from Low Energy Modes**

Peripheral	Wakeup Trigger	EM0 <sup>1</sup>	EM1 <sup>2</sup>	EM2 <sup>2</sup>	EM3 <sup>2</sup>	EM4 <sup>2</sup>
RTC	Any enabled interrupt	-	Yes	Yes	Yes <sup>3</sup>	-
USART	Receive / transmit	-	Yes	-	-	-
LEUART	Receive / transmit	-	Yes	Yes	-	-
I <sup>2</sup> C	Any enabled interrupt	-	Yes	-	-	-
I <sup>2</sup> C	Receive address recognition	-	Yes	Yes	Yes	-

<sup>1</sup>Energy Mode 0/Active Mode

<sup>2</sup>Energy mode 1/2/3/4

<sup>3</sup>When the 1 kHz ULFRCO is selected

<sup>4</sup>When using an external clock

## 10.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	EMU_CTRL	RW	Control Register
0x008	EMU_LOCK	RW	Configuration Lock Register
0x024	EMU_AUXCTRL	RW	Auxiliary Control Register

## 10.5 Register Description

### 10.5.1 EMU\_CTRL - Control Register

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0	0			
<b>Access</b>																											RW	RW	RW			
<b>Name</b>																											EM4CTRL	EM2BLOCK	EMVREG			

Bit	Name	Reset	Access	Description
31:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
3:2	EM4CTRL	0x0	RW	<b>Energy Mode 4 Control</b> This register is used to enter Energy Mode 4, in which the device only wakes up from an external pin reset, from a power cycle, or EM4 wakeup reset request. Energy Mode 4 is entered when the EM4 sequence is written to this bitfield.
1	EM2BLOCK	0	RW	<b>Energy Mode 2 Block</b> This bit is used to prevent the MCU to enter Energy Mode 2 or lower.
0	EMVREG	0	RW	<b>Energy Mode Voltage Regulator Control</b> Control the voltage regulator in low energy modes 2 and 3.
	Value	Mode	Description	
	0	REDUCED	Reduced voltage regulator drive strength in EM2 and EM3.	
	1	FULL	Full voltage regulator drive strength in EM2 and EM3.	

### 10.5.2 EMU\_LOCK - Configuration Lock Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																0x0000																
<b>Access</b>																RW																
<b>Name</b>																LOCKKEY																

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		

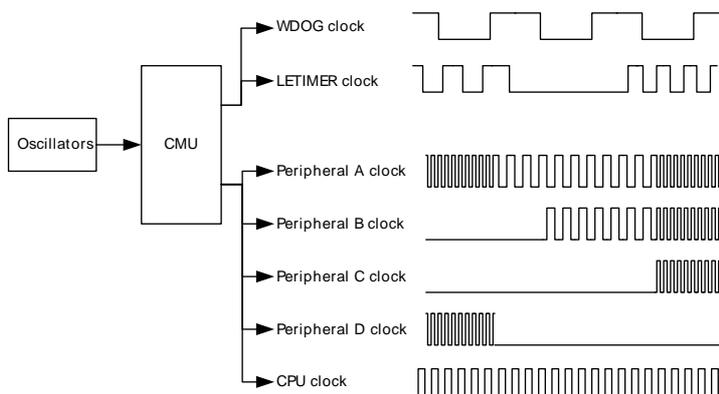

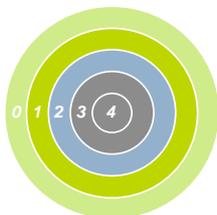

Bit	Name	Reset	Access	Description
15:0	LOCKKEY	0x0000	RW	<b>Configuration Lock Key</b>
Write any other value than the unlock code to lock all EMU registers, except the interrupt registers, from editing. Write the unlock code to unlock. When reading the register, bit 0 is set when the lock is enabled.				
Mode		Value	Description	
Read Operation				
UNLOCKED		0	EMU registers are unlocked.	
LOCKED		1	EMU registers are locked.	
Write Operation				
LOCK		0	Lock EMU registers.	
UNLOCK		0xADE8	Unlock EMU registers.	

### 10.5.3 EMU\_AUXCTRL - Auxiliary Control Register

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0
<b>Access</b>																																RW
<b>Name</b>																																HRCCLR

Bit	Name	Reset	Access	Description
31:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
0	HRCCLR	0	RW	<b>Hard Reset Cause Clear</b>
Write to 1 and then 0 to clear the POR, BOD and WDOG reset cause register bits. See also the Reset Management Unit (RMU).				

# 11 CMU - Clock Management Unit

## Quick Facts

### What?

The CMU controls oscillators and clocks. EFM32ZG supports five different oscillators with minimized power consumption and short start-up time. An additional separate RC oscillator is used for flash programming. The CMU also has HW support for calibration of RC oscillators.

### Why?

Oscillators and clocks contribute significantly to the power consumption of the MCU. With the low power oscillators combined with the flexible clock control scheme, it is possible to minimize the energy consumption in any given application.

### How?

The CMU can configure different clock sources, enable/disable clocks to peripherals on an individual basis and set the prescaler for the different clocks. The short oscillator start-up times makes duty-cycling between active mode and the different low energy modes (EM2-EM4) very efficient. The calibration feature ensures high accuracy RC oscillators. Several interrupts are available to avoid CPU polling of flags.

## 11.1 Introduction

The Clock Management Unit (CMU) is responsible for controlling the oscillators and clocks on-board the EFM32ZG. The CMU provides the capability to turn on and off the clock on an individual basis to all peripheral modules in addition to enable/disable and configure the available oscillators. The high degree of flexibility enables software to minimize energy consumption in any specific application by not wasting power on peripherals and oscillators that are inactive.

## 11.2 Features

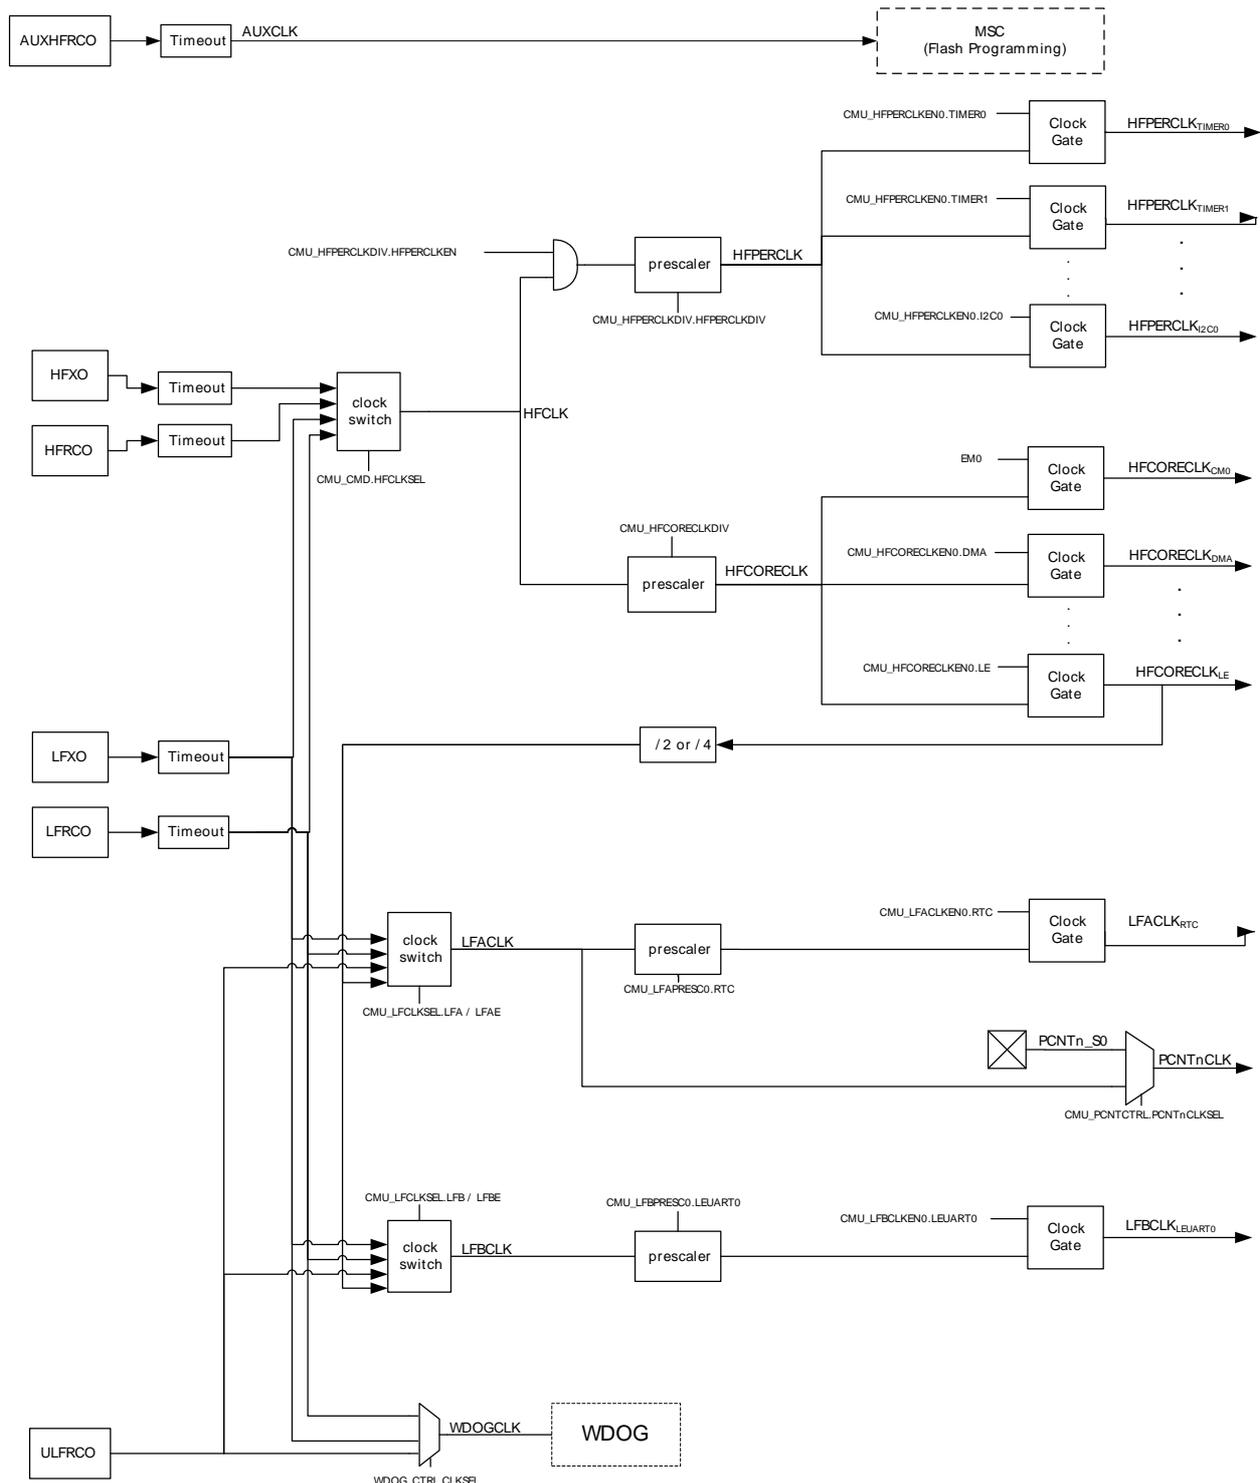

- Multiple clock sources available:
  - 1-21 MHz High Frequency RC Oscillator (HFRCO)
  - 4-24 MHz High Frequency Crystal Oscillator (HF XO)
  - 32768 Hz Low Frequency RC Oscillator (LFRCO)
  - 32768 Hz Low Frequency Crystal Oscillator (LF XO)
  - 1000 Hz Ultra Low Frequency RC Oscillator (ULFRCO)
  -
- Low power oscillators
- Low start-up times
- Separate prescaler for High Frequency Core Clocks (HFCORECLK) and Peripheral Clocks (HFPERCLK)

- Individual clock prescaler selection for each Low Energy Peripheral
- Clock Gating on an individual basis to core modules and all peripherals
- Selectable clocks can be output on two pins for use externally.
- Auxiliary 1-21 MHz RC oscillator (AUXHFRCO) for flash programming.

### 11.3 Functional Description

An overview of the CMU is shown in Figure 11.1 (p. 93). The number of peripheral modules that are connected to the different clocks varies from device to device.

Figure 11.1. CMU Overview

## 11.3.1 System Clocks

### 11.3.1.1 HFCLK - High Frequency Clock

HFCLK is the selected High Frequency Clock. This clock is used by the CMU and drives the two prescalers that generate HFCORECLK and HFPERCLK. The HFCLK can be driven by a high-frequency oscillator (HFRCO or HFXO) or one of the low-frequency oscillators (LFRCO or LFXO). By default the HFRCO is selected. In most applications, one of the high frequency oscillators will be the preferred choice. To change the selected HFCLK write to HFCLKSEL in CMU\_CMD. The HFCLK is running in EM0 and EM1.

### 11.3.1.2 HFCORECLK - High Frequency Core Clock

HFCORECLK is a prescaled version of HFCLK. This clock drives the Core Modules, which consists of the CPU and modules that are tightly coupled to the CPU, e.g. MSC, DMA etc. This also includes the interface to the Low Energy Peripherals. Some of the modules that are driven by this clock can be clock gated completely when not in use. This is done by clearing the clock enable bit for the specific module in CMU\_HFCORECLKEN0. The frequency of HFCORECLK is set using the CMU\_HFCORECLKDIV register. The setting can be changed dynamically and the new setting takes effect immediately.

#### Note

Note that if HFPERCLK runs faster than HFCORECLK, the number of clock cycles for each bus-access to peripheral modules will increase with the ratio between the clocks. Please refer to Section 5.2.2.2 (p. 17) for more details.

### 11.3.1.3 HFPERCLK - High Frequency Peripheral Clock

Like HFCORECLK, HFPERCLK can also be a prescaled version of HFCLK. This clock drives the High-Frequency Peripherals. All the peripherals that are driven by this clock can be clock gated completely when not in use. This is done by clearing the clock enable bit for the specific peripheral in CMU\_HFPERCLKEN0. The frequency of HFPERCLK is set using the CMU\_HFPERCLKDIV register. The setting can be changed dynamically and the new setting takes effect immediately.

#### Note

Note that if HFPERCLK runs faster than HFCORECLK, the number of clock cycles for each bus-access to peripheral modules will increase with the ratio between the clocks. E.g. if a bus-access normally takes three cycles, it will take 9 cycles if HFPERCLK runs three times as fast as the HFCORECLK.

### 11.3.1.4 LFACTK - Low Frequency A Clock

LFACTK is the selected clock for the Low Energy A Peripherals. There are four selectable sources for LFACTK: LFRCO, LFXO, HFCORECLK/2 and ULFRCO. In addition, the LFACTK can be disabled. From reset, the LFACTK source is set to LFRCO. However, note that the LFRCO is disabled from reset. The selection is configured using the LFA field in CMU\_LFCLKSEL. The HFCORECLK/2 setting allows the Low Energy A Peripherals to be used as high-frequency peripherals.

#### Note

If HFCORECLK/2 is selected as LFACTK, the clock will stop in EM2/3.

Each Low Energy Peripheral that is clocked by LFACTK has its own prescaler setting and enable bit. The prescaler settings are configured using CMU\_LFAPRESC0 and the clock enable bits can be found in CMU\_LFACTKEN0. When operating in oversampling mode, the pulse counters are clocked by LFACTK. This is configured for each pulse counter (n) individually by setting PCNTnCLKSEL in CMU\_PCNTCTRL.

### 11.3.1.5 LFBCLK - Low Frequency B Clock

LFBCLK is the selected clock for the Low Energy B Peripherals. There are four selectable sources for LFBCLK: LFRCO, LFXO, HFCORECLK/2 and ULFRCO. In addition, the LFBCLK can be disabled. From reset, the LFBCLK source is set to LFRCO. However, note that the LFRCO is disabled from reset. The selection is configured using the LFB field in CMU\_LFCLKSEL. The HFCORECLK/2 setting allows the Low Energy B Peripherals to be used as high-frequency peripherals.

#### Note

If HFCORECLK/2 is selected as LFBCLK, the clock will stop in EM2/3.

Each Low Energy Peripheral that is clocked by LFBCLK has its own prescaler setting and enable bit. The prescaler settings are configured using CMU\_LFBPRESC0 and the clock enable bits can be found in CMU\_LFBCLKEN0.

### 11.3.1.6 PCNTnCLK - Pulse Counter n Clock

Each available pulse counter is driven by its own clock, PCNTnCLK where n is the pulse counter instance number. Each pulse counter can be configured to use an external pin (PCNTn\_S0) or LFACTK as PCNTnCLK.

### 11.3.1.7 WDOGCLK - Watchdog Timer Clock

The Watchdog Timer (WDOG) can be configured to use one of three different clock sources: LFRCO, LFXO or ULFRCO. ULFRCO (Ultra Low Frequency RC Oscillator) is a separate 1 kHz RC oscillator that also runs in EM3.

### 11.3.1.8 AUXCLK - Auxiliary Clock

AUXCLK is a 1-21 MHz clock driven by a separate RC oscillator, AUXHFRCO. This clock is used for flash programming operation. During flash programming this clock will be active. If the AUXHFRCO has not been enabled explicitly by software, the MSC module will automatically start and stop it. The AUXHFRCO is enabled by writing a 1 to AUXHFRCOEN in CMU\_OSCENCMD.

## 11.3.2 Oscillator Selection

### 11.3.2.1 Start-up Time

The different oscillators have different start-up times. For the RC oscillators, the start-up time is fixed, but both the LFXO and the HFXO have configurable start-up time. At the end of the start-up time a ready flag is set to indicate that the start-up time has exceeded and that the clock is available. The low start-up time values can be used for an external clock source of already high quality, while the higher start-up times should be used when the clock signal is coming directly from a crystal. The start-up time for HFXO and LFXO can be set by configuring the HFXOTIMEOUT and LFXOTIMEOUT bitfields, respectively. Both bitfields are located in CMU\_CTRL. For HFXO it is also possible to enable a glitch detection filter by setting HFXOGLITCHDETEN in CMU\_CTRL. The glitch detector will reset the start-up counter if a glitch is detected, making the start-up process start over again.

There are individual bits for each oscillator indicating the status of the oscillator:

- ENABLED - Indicates that the oscillator is enabled
- READY - Start-up time is exceeded
- SELECTED - Start-up time is exceeded and oscillator is chosen as clock source

These status bits are located in the CMU\_STATUS register.

### 11.3.2.2 Switching Clock Source

The HFRCO oscillator is a low energy oscillator with extremely short wake-up time. Therefore, this oscillator is always chosen by hardware as the clock source for HFCLK when the device starts up (e.g. after reset and after waking up from EM2 and EM3). After reset, the HFRCO frequency is 14 MHz.

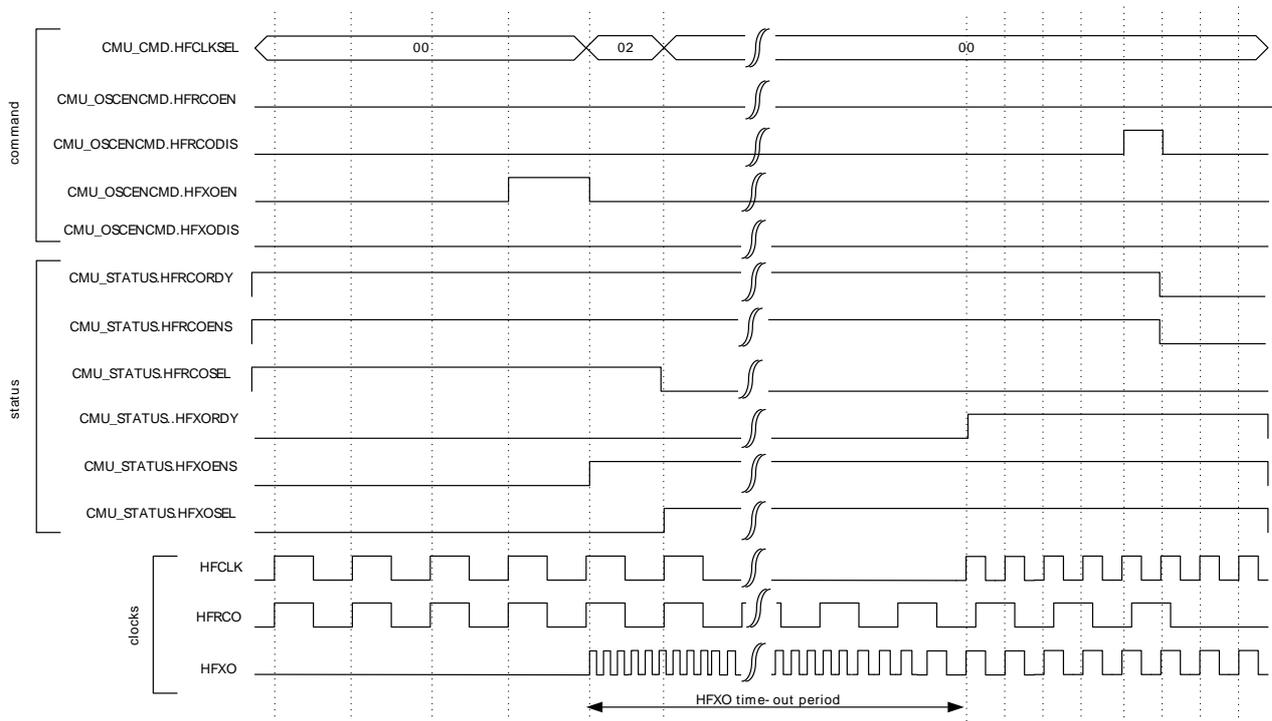

Software can switch between the different clock sources at run-time. E.g., when the HFRCO is the clock source, software can switch to HFXO by writing the field HFCLKSEL in the CMU\_CMD command register. See Figure 11.2 (p. 96) for a description of the sequence of events for this specific operation.

**Note**  
It is important first to enable the HFXO since switching to a disabled oscillator will effectively stop HFCLK and only a reset can recover the system.

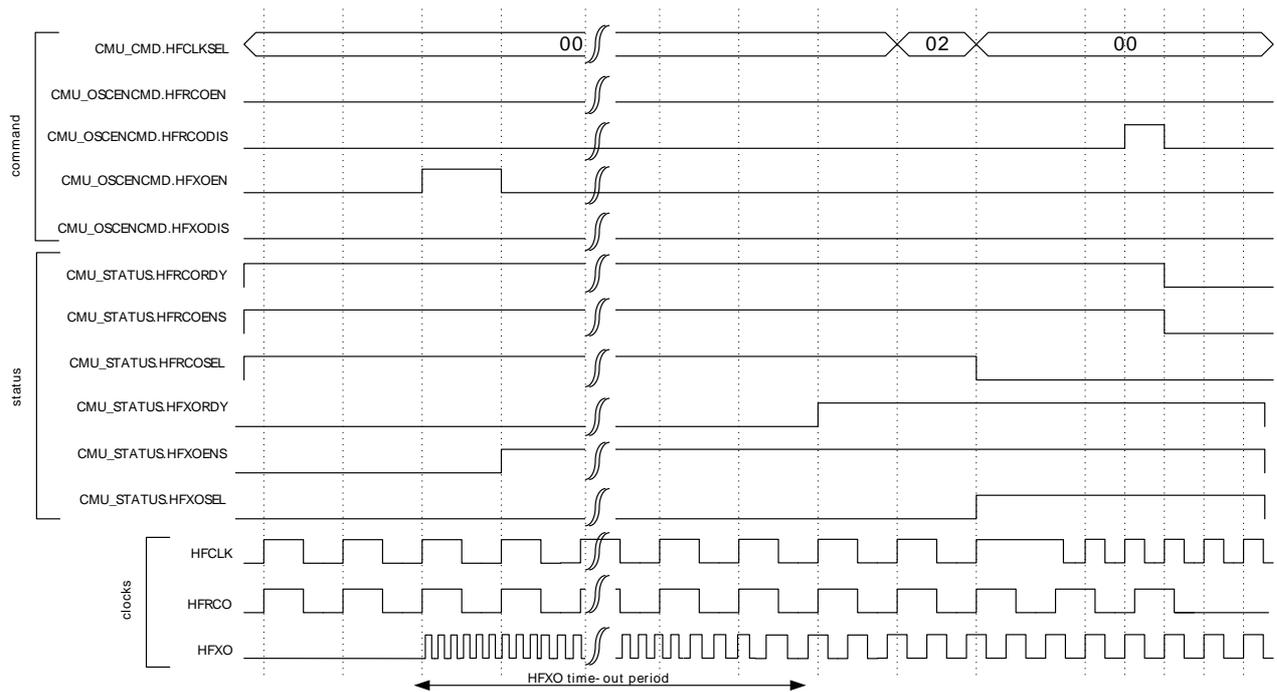

During the start-up period HFCLK will stop since the oscillator driving it is not ready. This effectively stalls the Core Modules and the High-Frequency Peripherals. It is possible to avoid this by first enabling the HFXO and then wait for the oscillator to become ready before switching the clock source. This way, the system continues to run on the HFRCO until the HFXO has timed out and provides a reliable clock. This sequence of events is shown in Figure 11.3 (p. 97) .

A separate flag is set when the oscillator is ready. This flag can also be configured to generate an interrupt.

**Figure 11.2. CMU Switching from HFRCO to HFXO before HFRCO is ready**

**Figure 11.3. CMU Switching from HFRCO to HFXO after HFXO is ready**

Switching clock source for LFACLK and LFBCLK is done by setting the LFA and LFB fields in CMU\_LFCLKSEL. To ensure no stalls in the Low Energy Peripherals, the clock source should be ready before switching to it.

**Note**

To save energy, remember to turn off all oscillators not in use.

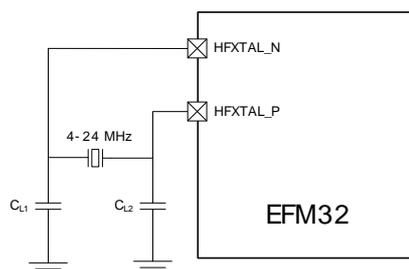

### 11.3.3 Oscillator Configuration

#### 11.3.3.1 HFXO and LFXO

The crystal oscillators are by default configured to ensure safe startup and operation of the most common crystals. In order to optimize startup margin, startup time and power consumption for a given crystal, it is possible to adjust the gain in the oscillator. HFXO gain can be increased by setting HFXOBOOST field in CMU\_CTRL, LFXO gain can be increased by setting LFXOBOOST field in CMU\_CTRL. It is important that the boost settings, along with the crystal load capacitors are matched to the crystals in use. Correct values for these parameters can be found using the energyAware Designer.

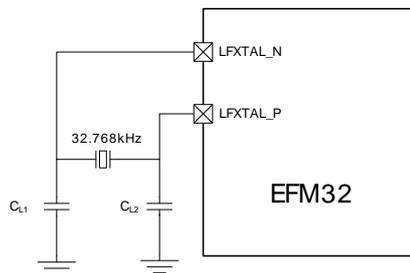

The HFXO crystal is connected to the HFXTAL\_N/HFXTAL\_P pins as shown in Figure 11.4 (p. 97)

**Figure 11.4. HFXO Pin Connection**

Similarly, the LFXO crystal is connected to the LFXTAL\_N/LFXTAL\_P pins as shown in Figure 11.5 (p. 98)

**Figure 11.5. LFXO Pin Connection**

It is possible to connect an external clock source to HFXTAL\_N/LFXTAL\_N pin of the HFXO or LFXO oscillator. By configuring the HFXOMODE/LFXOMODE fields in CMU\_CTRL, the HFXO/LFXO can be bypassed.

### 11.3.3.2 HFRCO, LFRCO and AUXHFRCO

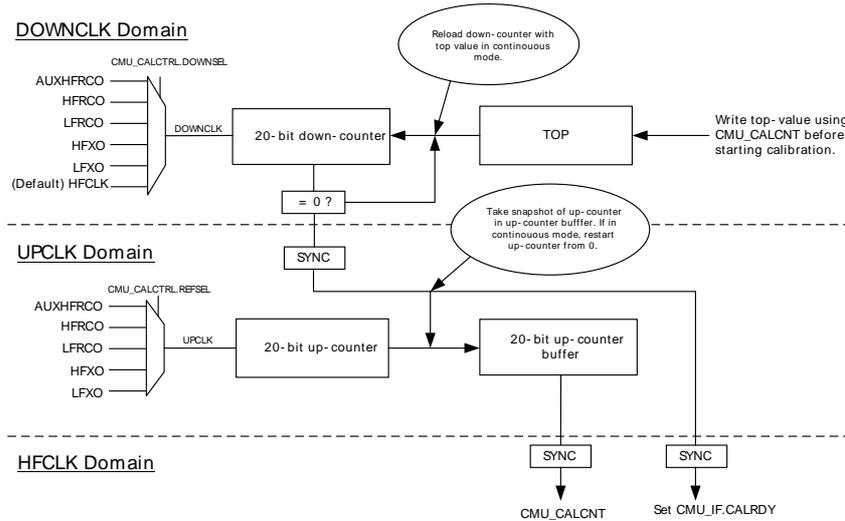

It is possible to calibrate the HFRCO, LFRCO and AUXHFRCO to achieve higher accuracy (see the device datasheets for details on accuracy). The frequency is adjusted by changing the TUNING fields in CMU\_HFRCOCTRL/CMU\_LFRCOCTRL/CMU\_AUXHFRCOCTRL. Changing to a higher value will result in a higher frequency. Please refer to the datasheet for stepsize details.

The HFRCO and AUXHFRCO can be set to one of several different frequency bands from 1 MHz to 28 MHz by setting the BAND field in CMU\_HFRCOCTRL and CMU\_AUXHFRCOCTRL. The HFRCO and AUXHFRCO frequency bands are calibrated during production test, and the production tested calibration values can be read from the Device Information (DI) page. The DI page contains a separate tuning value for each frequency band. During reset, HFRCO and AUXHFRCO tuning values are set to the production calibrated values for the 14 MHz band, which is the default frequency band. When changing to a different HFRCO or AUXHFRCO band, make sure to also update the tuning value.

The LFRCO and is also calibrated in production and its TUNING value is set to the correct value during reset.

The CMU has built-in HW support to efficiently calibrate the RC oscillators at run-time, see Figure 11.6 (p. 99) The concept is to select a reference and compare the RC frequency with the reference frequency. When the calibration circuit is started, one down-counter running on a selectable clock (DOWNSEL in CMU\_CALCTRL) and one up-counter running on a selectable clock (UPSEL in CMU\_CALCTRL) are started simultaneously. The top value for the down-counter must be written to CMU\_CALCNT before calibration is started. The smallest value that can be written to the CMU\_CALCNT is 1. The down-counter counts for CMU\_CALCNT+1 cycles. When the down-counter has reached 0, the up-counter is sampled and the CALRDY interrupt flag is set. If CONT in CMU\_CALCTRL is cleared, the counters are stopped at this point. If continuous mode is selected by setting CONT in CMU\_CALCTRL the down-counter reloads the top value and continues counting and the up-counter restarts from 0. Software can then read out the sampled up-counter value from CMU\_CALCNT. Then it is easy to find the ratio between the reference and the oscillator subject to the calibration. Overflows of the up-counter will not occur. If the up-counter reaches its top value before the down counter reaches 0, the top counter stays at its top value. Calibration can be stopped by writing CALSTOP in CMU\_CMD. With this HW support, it is simple to write efficient calibration algorithms in software.

Figure 11.6. HW-support for RC Oscillator Calibration

The counter operation for single and continuous mode are shown in Figure 11.7 (p. 99) and Figure 11.8 (p. 99) respectively.

Figure 11.7. Single Calibration (CONT=0)

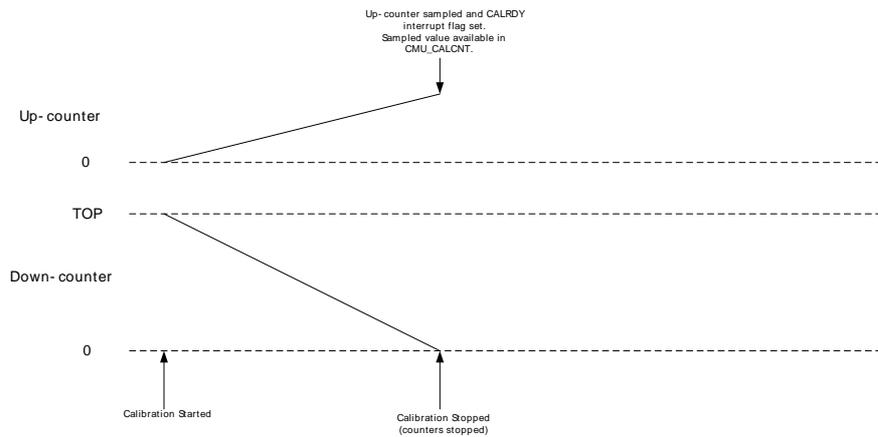

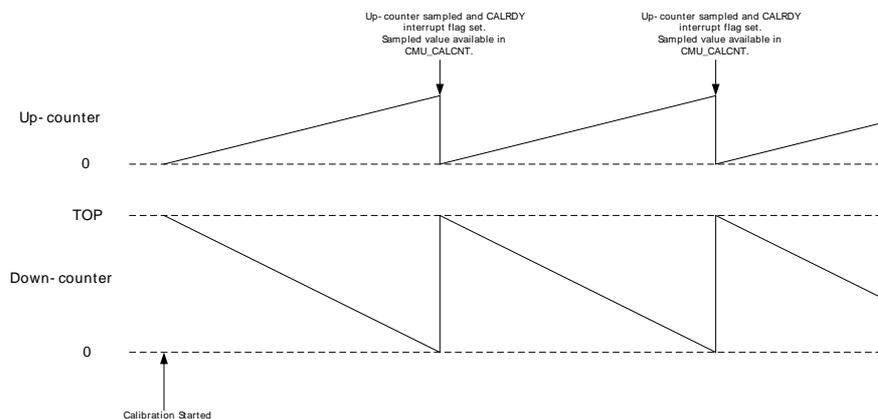

Figure 11.8. Continuous Calibration (CONT=1)

### 11.3.4 Output Clock on a Pin

It is possible to configure the CMU to output clocks on two pins. This clock selection is done using CLKOUTSEL0 and CLKOUTSEL1 fields in CMU\_CTRL. The output pins must be configured in the CMU\_ROUTE register.

- LFRCO, LFXO, HFCLK or the qualified clock from any of the oscillators can be output on one pin (CMU\_OUT1). A qualified clock will not have any glitches or skewed duty-cycle during startup. For LFXO and HFXO you need to configure LFXOTIMEOUT and HFXOTIMEOUT in CMU\_CTRL correctly to guarantee a qualified clock.
- HFRCO, HFXO, HFCLK/2, HFCLK/4, HFCLK/8, HFCLK/16, ULFRCO or AUXHFRCO can be output on another pin (CMU\_OUT0)

Note that HFXO and HFRCO clock outputs to pin can be unstable after startup and should not be output on a pin before HFXORDY/HFRCORDY is set high in CMU\_STATUS.

### 11.3.5 Protection

It is possible to lock the control- and command registers to prevent unintended software writes to critical clock settings. This is controlled by the CMU\_LOCK register.

## 11.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	CMU_CTRL	RW	CMU Control Register
0x004	CMU_HFCORECLKDIV	RW	High Frequency Core Clock Division Register
0x008	CMU_HFPERCLKDIV	RW	High Frequency Peripheral Clock Division Register
0x00C	CMU_HFRCCOCTRL	RW	HFRCO Control Register
0x010	CMU_LFRCCOCTRL	RW	LFRCO Control Register
0x014	CMU_AUXHFRCCOCTRL	RW	AUXHFRCO Control Register
0x018	CMU_CALCTRL	RW	Calibration Control Register
0x01C	CMU_CALCNT	RWH	Calibration Counter Register
0x020	CMU_OSCENCMD	W1	Oscillator Enable/Disable Command Register
0x024	CMU_CMD	W1	Command Register
0x028	CMU_LFCLKSEL	RW	Low Frequency Clock Select Register
0x02C	CMU_STATUS	R	Status Register
0x030	CMU_IF	R	Interrupt Flag Register
0x034	CMU_IFS	W1	Interrupt Flag Set Register
0x038	CMU_IFC	W1	Interrupt Flag Clear Register
0x03C	CMU_IEN	RW	Interrupt Enable Register
0x040	CMU_HFCORECLKEN0	RW	High Frequency Core Clock Enable Register 0
0x044	CMU_HFPERCLKEN0	RW	High Frequency Peripheral Clock Enable Register 0
0x050	CMU_SYNCBUSY	R	Synchronization Busy Register
0x054	CMU_FREEZE	RW	Freeze Register
0x058	CMU_LFACLKEN0	RW	Low Frequency A Clock Enable Register 0 (Async Reg)
0x060	CMU_LFBCLKEN0	RW	Low Frequency B Clock Enable Register 0 (Async Reg)
0x068	CMU_LFAPRESC0	RW	Low Frequency A Prescaler Register 0 (Async Reg)
0x070	CMU_LFBPRESC0	RW	Low Frequency B Prescaler Register 0 (Async Reg)
0x078	CMU_PCNTCTRL	RW	PCNT Control Register
0x080	CMU_ROUTE	RW	I/O Routing Register
0x084	CMU_LOCK	RW	Configuration Lock Register

## 11.5 Register Description

### 11.5.1 CMU\_CTRL - CMU Control Register

Offset	Bit Position																																		
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
<b>Reset</b>							0x0	0x0						0x3	0							1	0x0	0x3	0	0x1							0x3	0x0	
<b>Access</b>							RW	RW						RW	RW							RW	RW	RW		RW	RW							RW	RW
<b>Name</b>							CLKOUTSEL1	CLKOUTSEL0						LFXOTIMEOUT	LFXOBUFCUR							LFXOBOOST	LFXOMODE	HFXOTIMEOUT		HFXOGLITCHDETEN	HFXOBUFCUR							HFXOBOOST	HFXOMODE

Bit	Name	Reset	Access	Description
31:27	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		

26:23 CLKOUTSEL1 0x0 RW **Clock Output Select 1**  
 Controls the clock output multiplexer. To actually output on the pin, set CLKOUT1PEN in CMU\_ROUTE.

Value	Mode	Description
0	LFRCO	LFRCO (directly from oscillator).
1	LF XO	LF XO (directly from oscillator).
2	HFCLK	HFCLK.
3	LF XOQ	LF XO (qualified).
4	HF XOQ	HF XO (qualified).
5	LFRCOQ	LFRCO (qualified).
6	HFRCOQ	HFRCO (qualified).
7	AUXHFRCOQ	AUXHFRCO (qualified).

22:20 CLKOUTSEL0 0x0 RW **Clock Output Select 0**  
 Controls the clock output multiplexer. To actually output on the pin, set CLKOUT0PEN in CMU\_ROUTE.

Value	Mode	Description
0	HFRCO	HFRCO (directly from oscillator).
1	HF XO	HF XO (directly from oscillator).
2	HFCLK2	HFCLK/2.
3	HFCLK4	HFCLK/4.
4	HFCLK8	HFCLK/8.
5	HFCLK16	HFCLK/16.
6	ULFRCO	ULFRCO (directly from oscillator).
7	AUXHFRCO	AUXHFRCO (directly from oscillator).

19:18 LFXOTIMEOUT 0x3 RW **LFXO Timeout**  
 Configures the start-up delay for LFXO.

Value	Mode	Description
0	8CYCLES	Timeout period of 8 cycles.
1	1KCYCLES	Timeout period of 1024 cycles.
2	16KCYCLES	Timeout period of 16384 cycles.
3	32KCYCLES	Timeout period of 32768 cycles.

17 LFXOBUF CUR 0 RW **LFXO Boost Buffer Current**  
 This value has been updated to the correct level during calibration and should not be changed.

16:14 Reserved To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)

13 LFXOBOOST 1 RW **LFXO Start-up Boost Current**  
 Adjusts start-up boost current for LFXO.

Value	Mode	Description
0	70PCENT	70 %.
1	100PCENT	100 %.

12:11 LFXOMODE 0x0 RW **LFXO Mode**  
 Set this to configure the external source for the LFXO. The oscillator setting takes effect when 1 is written to LFXOEN in CMU\_OSCENCMD. The oscillator setting is reset to default when 1 is written to LFXODIS in CMU\_OSCENCMD.

Value	Mode	Description
0	XTAL	32.768 kHz crystal oscillator.
1	BUFEXTCLK	An AC coupled buffer is coupled in series with LFX TAL_N pin, suitable for external sinus wave (32.768 kHz).
2	DIGEXTCLK	Digital external clock on LFX TAL_N pin. Oscillator is effectively bypassed.

10:9 HFXOTIMEOUT 0x3 RW **HFXO Timeout**  
 Configures the start-up delay for HFXO.

Value	Mode	Description
0	8CYCLES	Timeout period of 8 cycles.

Bit	Name	Reset	Access	Description
	Value	Mode		Description
	1	256CYCLES		Timeout period of 256 cycles.
	2	1KCYCLES		Timeout period of 1024 cycles.
	3	16KCYCLES		Timeout period of 16384 cycles.
8	<i>Reserved</i> To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)			
7	HFXOGLITCHDETEN	0	RW	<b>HFXO Glitch Detector Enable</b> This bit enables the glitch detector which is active as long as the start-up ripple-counter is counting. A detected glitch will reset the ripple-counter effectively increasing the start-up time. Once the ripple-counter has timed-out, glitches will not be detected.
6:5	HFXOBUF CUR	0x1	RW	<b>HFXO Boost Buffer Current</b> This value has been set during calibration and should not be changed.
4	<i>Reserved</i> To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)			
3:2	HFXOBOOST	0x3	RW	<b>HFXO Start-up Boost Current</b> Used to adjust start-up boost current for HFXO.
	Value	Mode		Description
	0	50PCENT		50 %.
	1	70PCENT		70 %.
	2	80PCENT		80 %.
	3	100PCENT		100 % (default).
1:0	HFXOMODE	0x0	RW	<b>HFXO Mode</b> Set this to configure the external source for the HFXO. The oscillator setting takes effect when 1 is written to HFXOEN in CMU_OSCENCMD. The oscillator setting is reset to default when 1 is written to HFXODIS in CMU_OSCENCMD.
	Value	Mode		Description
	0	XTAL		4-24 MHz crystal oscillator.
	1	BUFEXTCLK		An AC coupled buffer is coupled in series with HFXTAL_N, suitable for external sine wave (4-24 MHz). The sine wave should have a minimum of 200 mV peak to peak.
	2	DIGEXTCLK		Digital external clock on HFXTAL_N pin. Oscillator is effectively bypassed.

### 11.5.2 CMU\_HFCORECLKDIV - High Frequency Core Clock Division Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																								0					0x0			
<b>Access</b>																								RW					RW			
<b>Name</b>																								HFCORECLKLEDIV				HFCORECLKDIV				

Bit	Name	Reset	Access	Description
31:9	<i>Reserved</i> To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)			
8	HFCORECLKLEDIV	0	RW	<b>Additional Division Factor For HFCORECLKLE</b> Additional division factor for HFCORECLKLE.
	Value	Mode		Description
	0	DIV2		HFCORECLK divided by 2.
	1	DIV4		HFCORECLK divided by 4.

Bit	Name	Reset	Access	Description
7:4	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
3:0	HFCORECLKDIV	0x0	RW	<b>HFCORECLK Divider</b> Specifies the clock divider for HFCORECLK.
	Value	Mode	Description	
	0	HFCLK	HFCORECLK = HFCLK.	
	1	HFCLK2	HFCORECLK = HFCLK/2.	
	2	HFCLK4	HFCORECLK = HFCLK/4.	
	3	HFCLK8	HFCORECLK = HFCLK/8.	
	4	HFCLK16	HFCORECLK = HFCLK/16.	
	5	HFCLK32	HFCORECLK = HFCLK/32.	
	6	HFCLK64	HFCORECLK = HFCLK/64.	
	7	HFCLK128	HFCORECLK = HFCLK/128.	
	8	HFCLK256	HFCORECLK = HFCLK/256.	
	9	HFCLK512	HFCORECLK = HFCLK/512.	

### 11.5.3 CMU\_HFPERCLKDIV - High Frequency Peripheral Clock Division Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																								1					0x0			
<b>Access</b>																								RW					RW			
<b>Name</b>																								HFPERCLKEN					HFPERCLKDIV			

Bit	Name	Reset	Access	Description
31:9	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
8	HFPERCLKEN	1	RW	<b>HFPERCLK Enable</b> Set to enable the HFPERCLK.
7:4	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
3:0	HFPERCLKDIV	0x0	RW	<b>HFPERCLK Divider</b> Specifies the clock divider for the HFPERCLK.
	Value	Mode	Description	
	0	HFCLK	HFPERCLK = HFCLK.	
	1	HFCLK2	HFPERCLK = HFCLK/2.	
	2	HFCLK4	HFPERCLK = HFCLK/4.	
	3	HFCLK8	HFPERCLK = HFCLK/8.	
	4	HFCLK16	HFPERCLK = HFCLK/16.	
	5	HFCLK32	HFPERCLK = HFCLK/32.	
	6	HFCLK64	HFPERCLK = HFCLK/64.	
	7	HFCLK128	HFPERCLK = HFCLK/128.	
	8	HFCLK256	HFPERCLK = HFCLK/256.	
	9	HFCLK512	HFPERCLK = HFCLK/512.	

### 11.5.4 CMU\_HFRCTRL - HFRCO Control Register

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x00						0x3			0x80						
<b>Access</b>																	RW						RW			RW						
<b>Name</b>																	SUDELAY						BAND			TUNING						

Bit	Name	Reset	Access	Description																		
31:17	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)																				
16:12	SUDELAY	0x00	RW	<b>HFRCO Start-up Delay</b> Always write this field to 0.																		
11	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)																				
10:8	BAND	0x3	RW	<b>HFRCO Band Select</b> Write this field to set the frequency band in which the HFRCO is to operate. When changing this setting there will be no glitches on the HFRCO output, hence it is safe to change this setting even while the system is running on the HFRCO. To ensure an accurate frequency, the HFTUNING value should also be written when changing the frequency band. The calibrated tuning value for the different bands can be read from the Device Information page.																		
<table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>1MHZ</td> <td>1 MHz band. 6:0	TUNING	0x40	RW	<b>LFRCO Tuning Value</b> Writing this field adjusts the LFRCO frequency (the higher value, the higher frequency). This field is updated with the production calibrated value during reset, and the reset value might therefore vary between devices.

### 11.5.6 CMU\_AUXHFRCOCTRL - AUXHFRCO Control Register

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																					0x0			0x80								
<b>Access</b>																					RW			RW								
<b>Name</b>																					BAND			TUNING								

Bit	Name	Reset	Access	Description
31:11	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		

Bit	Name	Reset	Access	Description
10:8	BAND	0x0	RW	<b>AUXHFRCO Band Select</b>
<p>Write this field to set the frequency band in which the AUXHFRCO is to operate. When changing this setting there will be no glitches on the AUXHFRCO output, hence it is safe to change this setting even while the system is using the AUXHFRCO. To ensure an accurate frequency, the AUCTUNING value should also be written when changing the frequency band. The calibrated tuning value for the different bands can be read from the Device Information page. Flash erase and write use this clock. If it is changed to another value than the default, MSC_TIMEBASE must also be configured to ensure correct flash erase and write operation.</p>				

Value	Mode	Description
0	14MHZ	14 MHz band. NOTE: Also set the TUNING value (bits 7:0) when changing band.
1	11MHZ	11 MHz band. NOTE: Also set the TUNING value (bits 7:0) when changing band.
2	7MHZ	7 MHz band. NOTE: Also set the TUNING value (bits 7:0) when changing band.
3	1MHZ	1 MHz band. NOTE: Also set the TUNING value (bits 7:0) when changing band.
7	21MHZ	21 MHz band. NOTE: Also set the TUNING value (bits 7:0) when changing band.

Bit	Name	Reset	Access	Description
7:0	TUNING	0x80	RW	<b>AUXHFRCO Tuning Value</b>
<p>Writing this field adjusts the AUXHFRCO frequency (the higher value, the higher frequency). This field is updated with the production calibrated value during reset, and the reset value might therefore vary between devices.</p>				

### 11.5.7 CMU\_CALCTRL - Calibration Control Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																					0			0x0			0x0					
<b>Access</b>																					RW			RW			RW					
<b>Name</b>																					CONT			DOWNSEL			UPSEL					

Bit	Name	Reset	Access	Description
31:7	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		

Bit	Name	Reset	Access	Description
6	CONT	0	RW	<b>Continuous Calibration</b>
<p>Set this bit to enable continuous calibration.</p>				

Bit	Name	Reset	Access	Description
5:3	DOWNSEL	0x0	RW	<b>Calibration Down-counter Select</b>
<p>Selects clock source for the calibration down-counter.</p>				

Value	Mode	Description
0	HFCLK	Select HFCLK for down-counter.
1	HFXO	Select HFXO for down-counter.

Bit	Name	Reset	Access	Description
	Value	Mode		Description
2	LFXO			Select LFXO for down-counter.
3	HFRCO			Select HFRCO for down-counter.
4	LFRCO			Select LFRCO for down-counter.
5	AUXHFRCO			Select AUXHFRCO for down-counter.

2:0	UPSEL	0x0	RW	<b>Calibration Up-counter Select</b>
Selects clock source for the calibration up-counter.				
	Value	Mode		Description
	0	HFXO		Select HFXO as up-counter.
	1	LFXO		Select LFXO as up-counter.
	2	HFRCO		Select HFRCO as up-counter.
	3	LFRCO		Select LFRCO as up-counter.
	4	AUXHFRCO		Select AUXHFRCO as up-counter.

### 11.5.8 CMU\_CALCNT - Calibration Counter Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																				0x00000												
<b>Access</b>																				RWH												
<b>Name</b>																				CALCNT												

Bit	Name	Reset	Access	Description
31:20	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
19:0	CALCNT	0x00000	RWH	<b>Calibration Counter</b>
Write top value before calibration. Read calibration result from this register when Calibration Ready flag has been set.				

### 11.5.9 CMU\_OSCENCMD - Oscillator Enable/Disable Command Register

Offset	Bit Position																																																						
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																							
<b>Reset</b>																								0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
<b>Access</b>																								W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1
<b>Name</b>																								LFXODIS	LFXOEN	LFRCODIS	LFRCOEN	AUXHFRCODIS	AUXHFRCOEN	HFXODIS	HFXOEN	HFRCODIS	HFRCOEN																						

Bit	Name	Reset	Access	Description
31:10	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		

Bit	Name	Reset	Access	Description
9	LFXODIS	0	W1	<b>LFXO Disable</b> Disables the LFXO. LFXOEN has higher priority if written simultaneously.
8	LFXOEN	0	W1	<b>LFXO Enable</b> Enables the LFXO.
7	LFRCODIS	0	W1	<b>LFRCO Disable</b> Disables the LFRCO. LFRCOEN has higher priority if written simultaneously.
6	LFRCOEN	0	W1	<b>LFRCO Enable</b> Enables the LFRCO.
5	AUXHFRCODIS	0	W1	<b>AUXHFRCO Disable</b> Disables the AUXHFRCO. AUXHFRCOEN has higher priority if written simultaneously. WARNING: Do not disable this clock during a flash erase/write operation.
4	AUXHFRCOEN	0	W1	<b>AUXHFRCO Enable</b> Enables the AUXHFRCO.
3	HFXODIS	0	W1	<b>HFXO Disable</b> Disables the HFXO. HFXOEN has higher priority if written simultaneously. WARNING: Do not disable the HFRXO if this oscillator is selected as the source for HFCLK.
2	HFXOEN	0	W1	<b>HFXO Enable</b> Enables the HFXO.
1	HFRCODIS	0	W1	<b>HFRCO Disable</b> Disables the HFRCO. HFRCOEN has higher priority if written simultaneously. WARNING: Do not disable the HFRCO if this oscillator is selected as the source for HFCLK.
0	HFRCOEN	0	W1	<b>HFRCO Enable</b> Enables the HFRCO.

### 11.5.10 CMU\_CMD - Command Register

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																												0	0	0x0		
<b>Access</b>																												W1	W1	W1		
<b>Name</b>																												CALSTOP	CALSTART	HFCLKSEL		

Bit	Name	Reset	Access	Description
31:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
4	CALSTOP	0	W1	<b>Calibration Stop</b> Stops the calibration counters.
3	CALSTART	0	W1	<b>Calibration Start</b> Starts the calibration, effectively loading the CMU_CALCNT into the down-counter and start decrementing.
2:0	HFCLKSEL	0x0	W1	<b>HFCLK Select</b> Selects the clock source for HFCLK. Note that selecting an oscillator that is disabled will cause the system clock to stop. Check the status register and confirm that oscillator is ready before switching.

Value	Mode	Description
1	HFRCO	Select HFRCO as HFCLK.
2	HFXO	Select HFXO as HFCLK.

Bit	Name	Reset	Access	Description
	Value	Mode		Description
3	LFRCO			Select LFRCO as HFCLK.
4	LFXO			Select LFXO as HFCLK.

### 11.5.11 CMU\_LFCLKSEL - Low Frequency Clock Select Register

Offset	Bit Position																																				
0x028	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Name	Reset	Access	Description
15:0	LOCKKEY	0x0000	RW	<b>Configuration Lock Key</b> Write any other value than the unlock code to lock CMU_CTRL, CMU_HFCORECLKDIV, CMU_HFPERCLKDIV, CMU_HFRCOCTRL, CMU_LFRCOCTRL, CMU_AUXHFRCOCTRL, CMU_OSCENCMD, CMU_CMD, CMU_LFCLKSEL, CMU_HFCORECLKEN0, CMU_HFPERCLKEN0, CMU_LFACLKEN0, CMU_LFBCLKEN0, CMU_LFAPRESC0, CMU_LFBPRESC0, and CMU_PCNTCTRL from editing. Write the unlock code to unlock. When reading the register, bit 0 is set when the lock is enabled.

Mode	Value	Description
Read Operation		
UNLOCKED	0	CMU registers are unlocked.
LOCKED	1	CMU registers are locked.
Write Operation		
LOCK	0	Lock CMU registers.
UNLOCK	0x580E	Unlock CMU registers.

# 12 WDOG - Watchdog Timer

## Quick Facts

### What?

The WDOG (Watchdog Timer) resets the system in case of a fault condition, and can be enabled in all energy modes as long as the low frequency clock source is available.

### Why?

If a software failure or external event renders the MCU unresponsive, a Watchdog timeout will reset the system to a known, safe state.

### How?

An enabled Watchdog Timer implements a configurable timeout period. If the CPU fails to re-start the Watchdog Timer before it times out, a full system reset will be triggered. The Watchdog consumes insignificant power, and allows the device to remain safely in low energy modes for up to 256 seconds at a time.

## 12.1 Introduction

The purpose of the watchdog timer is to generate a reset in case of a system failure, to increase application reliability. The failure may e.g. be caused by an external event, such as an ESD pulse, or by a software failure.

## 12.2 Features

- Clock input from selectable oscillators
  - Internal 32.768 Hz RC oscillator
  - Internal 1 kHz RC oscillator
  - External 32.768 Hz XTAL oscillator
- Configurable timeout period from 9 to 256k watchdog clock cycles
- Individual selection to keep running or freeze when entering EM2 or EM3
- Selection to keep running or freeze when entering debug mode
- Selection to block the CPU from entering Energy Mode 4
- Selection to block the CMU from disabling the selected watchdog clock

## 12.3 Functional Description

The watchdog is enabled by setting the EN bit in WDOG\_CTRL. When enabled, the watchdog counts up to the period value configured through the PERSEL field in WDOG\_CTRL. If the watchdog timer is not cleared to 0 (by writing a 1 to the CLEAR bit in WDOG\_CMD) before the period is reached, the chip is reset. If a timely clear command is issued, the timer starts counting up from 0 again. The watchdog can optionally be locked by writing the LOCK bit in WDOG\_CTRL. Once locked, it cannot be disabled or reconfigured by software.

The watchdog counter is reset when EN is reset.

### 12.3.1 Clock Source

Three clock sources are available for use with the watchdog, through the CLKSEL field in WDOG\_CTRL. The corresponding clocks must be enabled in the CMU. The SWOSCBLOCK bit in WDOG\_CTRL can be written to prevent accidental disabling of the selected clocks. Also, setting this bit will automatically start the selected oscillator source when the watchdog is enabled. The PERSEL field in WDOG\_CTRL is used to divide the selected watchdog clock, and the timeout for the watchdog timer can be calculated like this:

#### WDOG Timeout Equation

$$T_{\text{TIMEOUT}} = (2^{3+\text{PERSEL}} + 1)/f, \quad (12.1)$$

where  $f$  is the frequency of the selected clock.

It is recommended to clear the watchdog first, if PERSEL is changed while the watchdog is enabled.

To use this module, the LE interface clock must be enabled in CMU\_HFCORECLKEN0, in addition to the module clock.

#### Note

Before changing the clock source for WDOG, the EN bit in WDOG\_CTRL should be cleared. In addition to this, the WDOG\_SYNCBUSY value should be zero.

### 12.3.2 Debug Functionality

The watchdog timer can either keep running or be frozen when the device is halted by a debugger. This configuration is done through the DEBUGRUN bit in WDOG\_CTRL. When code execution is resumed, the watchdog will continue counting where it left off.

### 12.3.3 Energy Mode Handling

The watchdog timer can be configured to either keep on running or freeze when entering EM2 or EM3. The configuration is done individually for each energy mode in the EM2RUN and EM3RUN bits in WDOG\_CTRL. When the watchdog has been frozen and is re-entering an energy mode where it is running, the watchdog timer will continue counting where it left off. For the watchdog there is no difference between EM0 and EM1. The watchdog does not run in EM4, and if EM4BLOCK in WDOG\_CTRL is set, the CPU is prevented from entering EM4.

#### Note

If the WDOG is clocked by the LFXO or LFRCO, writing the SWOSCBLOCK bit will effectively prevent the CPU from entering EM3. When running from the ULFRCO, writing the SWOSCBLOCK bit will prevent the CPU from entering EM4.

### 12.3.4 Register access

Since this module is a Low Energy Peripheral, and runs off a clock which is asynchronous to the HFCORECLK, special considerations must be taken when accessing registers. Please refer to Section 5.3 (p. 17) for a description on how to perform register accesses to Low Energy Peripherals. note that clearing the EN bit in WDOG\_CTRL will reset the WDOG module, which will halt any ongoing register synchronization.

#### Note

Never write to the WDOG registers when it is disabled, except to enable it by setting WDOG\_CTRL\_EN or when changing the clock source using WDOG\_CTRL\_CLKSEL. Make sure that the enable is registered (i.e. WDOG\_SYNCBUSY\_CTRL goes low), before writing other registers.

## 12.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	WDOG_CTRL	RW	Control Register
0x004	WDOG_CMD	W1	Command Register
0x008	WDOG_SYNCBUSY	R	Synchronization Busy Register

## 12.5 Register Description

### 12.5.1 WDOG\_CTRL - Control Register (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

0	CTRL	0	R	<b>CTRL Register Busy</b> Set when the value written to CTRL is being synchronized.

# 13 PRS - Peripheral Reflex System

## Quick Facts

### What?

The PRS (Peripheral Reflex System) allows configurable, fast and autonomous communication between the peripherals.

### Why?

Events and signals from one peripheral can be used as input signals or triggers by other peripherals and ensure timing-critical operation and reduced software overhead.

### How?

Without CPU intervention the peripherals can send reflex signals (both pulses and level) to each other in single- or chained steps. The peripherals can be set up to perform actions based on the incoming reflex signals. This results in improved system performance and reduced energy consumption.

## 13.1 Introduction

The Peripheral Reflex System (PRS) system is a network which allows the different peripheral modules to communicate directly with each other without involving the CPU. Peripheral modules which send out reflex signals are called producers. The PRS routes these reflex signals to consumer peripherals which apply actions depending on the reflex signals received. The format for the reflex signals is not given, but edge triggers and other functionality can be applied by the PRS.

## 13.2 Features

- 4 configurable interconnect channels
  - Each channel can be connected to any producing peripheral
  - Consumers can choose which channel to listen to
  - Selectable edge detector (rising, falling and both edges)
- Software controlled channel output
  - Configurable level
  - Triggered pulses

## 13.3 Functional Description

An overview of the PRS module is shown in Figure 13.1 (p. 126). The PRS contains 4 interconnect channels, and each of these can select between all the output reflex signals offered by the producers. The consumers can then choose which PRS channel to listen to and perform actions based on the reflex signals routed through that channel. The reflex signals can be both pulse signals and level signals. Synchronous PRS pulses are one HFPERCLK cycle long, and can either be sent out by a producer (e.g., ADC conversion complete) or be generated from the edge detector in the PRS channel. Level signals can have an arbitrary waveform (e.g., Timer PWM output).

### 13.3.1 Asynchronous Mode

Many reflex signals can operate in two modes, synchronous or asynchronous. A synchronous reflex is clocked on HPPERCLK, and can be used as an input to all reflex consumers, but since they require HPPERCLK, they will not work in EM2/EM3.

Asynchronous reflexes are not clocked on HPPERCLK, and can be used even in EM2/EM3. There is a limitation to reflexes operating in asynchronous mode though: they can only be used by a subset of the reflex consumers, the ones marked with async support in Table 13.2 (p. 128). Peripherals that can produce asynchronous reflexes are marked with async support in Table 13.1 (p. 127). To use these reflexes asynchronously, set ASYNC in the CHCTRL register for the PRS channel selecting the reflex signal.

#### Note

If a peripheral channel with ASYNC set is used in a consumer not supporting asynchronous reflexes, the behaviour is undefined.

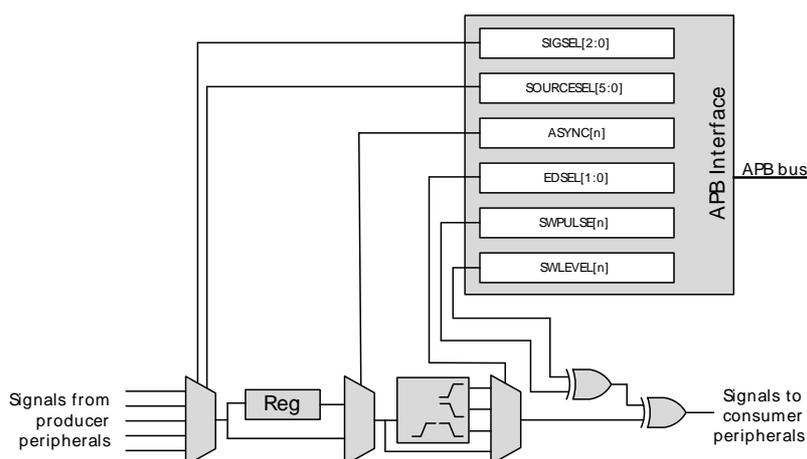

### 13.3.2 Channel Functions

Different functions can be applied to a reflex signal within the PRS. Each channel includes an edge detector to enable generation of pulse signals from level signals. It is also possible to generate output reflex signals by configuring the SWPULSE and SWLEVEL bits. SWLEVEL is a programmable level for each channel and holds the value it is programmed to. The SWPULSE will give out a one-cycle high pulse if it is written to 1, otherwise a 0 is asserted. The SWLEVEL and SWPULSE signals are then XOR'ed with the selected input from the producers to form the output signal sent to the consumers listening to the channel.

#### Note

The edge detector controlled by EDSEL should only be used when working with synchronous reflexes, i.e., ASYNC in CHCTRL is cleared.

**Figure 13.1. PRS Overview**

### 13.3.3 Producers

Each PRS channel can choose between signals from several producers, which is configured in SOURCESEL in PRS\_CHx\_CTRL. Each of these producers outputs one or more signals which can be selected by setting the SIGSEL field in PRS\_CHx\_CTRL. Setting the SOURCESEL bits to 0 (Off) leads to a constant 0 output from the input mux. An overview of the available producers is given in Table 13.1 (p. 127).

**Table 13.1. Reflex Producers**

Module	Reflex Output	Output Format	Async Support
ACMP	Comparator Output	Level	Yes
ADC	Single Conversion Done	Pulse	
	Scan Conversion Done	Pulse	
GPIO	Pin 0 Input	Level	Yes
	Pin 1 Input	Level	Yes
	Pin 2 Input	Level	Yes

VCMP	Comparator Output	Level	Yes

### 13.3.4 Consumers

Consumer peripherals (listed in Table 13.2 (p. 128)) can be set to listen to a PRS channel and perform an action based on the signal received on that channel. Most consumers expect pulse input, while some can handle level inputs as well.

**Table 13.2. Reflex Consumers**

Module	Reflex Input	Input Format	Async Support
ADC	Single Mode Trigger	Pulse	
	Scan Mode Trigger	Pulse	
IDAC	IDAC Enable	Level	Yes
TIMER	CC0 Input	Pulse/Level	
	CC1 Input	Pulse/Level	
	CC2 Input	Pulse/Level	
USART	TX/RX Enable	Pulse	
	IrDA Encoder Input	Pulse	
	RX Input	Pulse/Level	Yes
LEUART	RX Input	Pulse/Level	Yes
PCNT	S0 input	Level	Yes
	S1 input	Level	Yes

**Note**

It is possible to output prs channel 0 - channel 3 onto the GPIO by setting CH0PEN, CH1PEN, CH2PEN, or CH3PEN in the PRS\_ROUTE register.

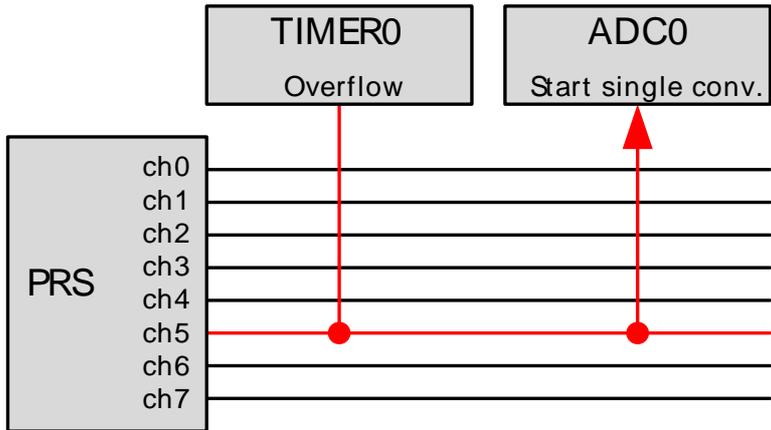

### 13.3.5 Example

The example below (illustrated in Figure 13.2 (p. 129)) shows how to set up ADC0 to start single conversions every time TIMER0 overflows (one HFPERCLK cycle high pulse), using PRS channel 5:

- Set SOURCESEL in PRS\_CH5\_CTRL to 0b011100 to select TIMER0 as input to PRS channel 5.
- Set SIGSEL in PRS\_CH5\_CTRL to 0b001 to select the overflow signal (from TIMER0).
- Configure ADC0 with the desired conversion set-up.
- Set SINGLEPRSEN in ADC0\_SINGLECTRL to 1 to enable single conversions to be started by a high PRS input signal.
- Set SINGLEPRSSEL in ADC0\_SINGLECTRL to 0x5 to select PRS channel 5 as input to start the single conversion.
- Start TIMER0 with the desired TOP value, an overflow PRS signal is output automatically on overflow.

Note that the ADC results needs to be fetched either by the CPU or DMA.

Figure 13.2. TIMER0 overflow starting ADC0 single conversions through PRS channel 5.

# 14 I<sup>2</sup>C - Inter-Integrated Circuit Interface

## Quick Facts

### What?

The I<sup>2</sup>C interface allows communication on I<sup>2</sup>C-buses with the lowest energy consumption possible.

### Why?

I<sup>2</sup>C is a popular serial bus that enables communication with a number of external devices using only two I/O pins.

### How?

With the help of DMA, the I<sup>2</sup>C interface allows I<sup>2</sup>C communication with minimal CPU intervention. Address recognition is available in all energy modes (except EM4), allowing the MCU to wait for data on the I<sup>2</sup>C-bus with sub- $\mu$ A current consumption.

## 14.1 Introduction

The I<sup>2</sup>C module provides an interface between the MCU and a serial I<sup>2</sup>C-bus. It is capable of acting as both master and slave, and supports multi-master buses. Standard-mode, fast-mode and fast-mode plus speeds are supported, allowing transmission rates all the way from 10 kbit/s up to 1 Mbit/s. Slave arbitration and timeouts are also provided to allow implementation of an SMBus compliant system. The interface provided to software by the I<sup>2</sup>C module allows both fine-grained control of the transmission process and close to automatic transfers. Automatic recognition of slave addresses is provided in all energy modes (except EM4).

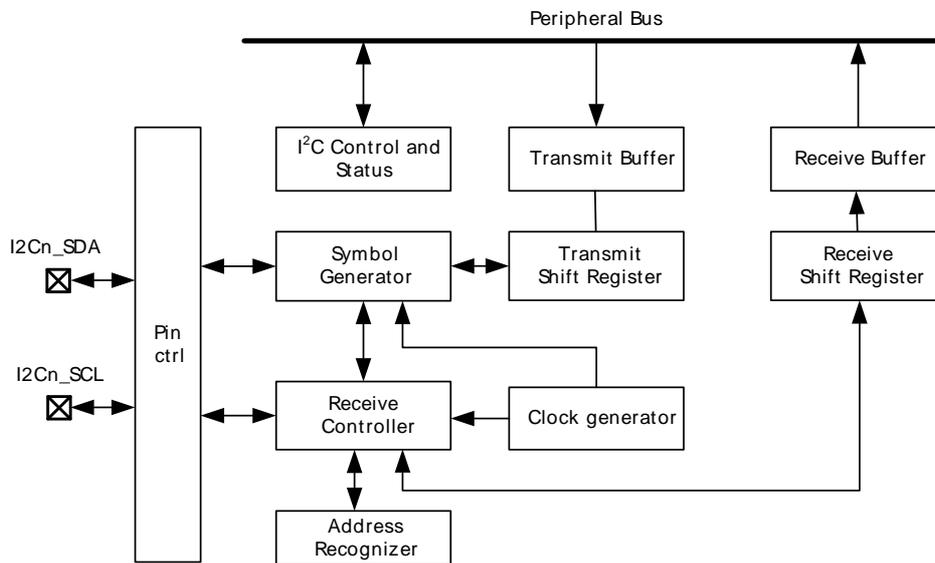

## 14.2 Features

- True multi-master capability
- Support for different bus speeds
  - Standard-mode (Sm) bit rate up to 100 kbit/s
  - Fast-mode (Fm) bit rate up to 400 kbit/s
  - Fast-mode Plus (Fm+) bit rate up to 1 Mbit/s
- Arbitration for both master and slave (allows SMBus ARP)
- Clock synchronization and clock stretching
- Hardware address recognition
  - 7-bit masked address
  - General call address
  - Active in all energy modes (except EM4)
- 10-bit address support
- Error handling
  - Clock low timeout
  - Clock high timeout
  - Arbitration lost
  - Bus error detection
- Double buffered data
- Full DMA support

### 14.3 Functional Description

An overview of the I<sup>2</sup>C module is shown in Figure 14.1 (p. 135) .

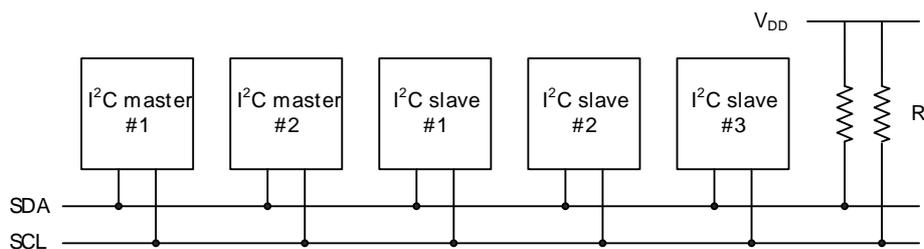

**Figure 14.1. I<sup>2</sup>C Overview**

#### 14.3.1 I<sup>2</sup>C-Bus Overview

The I<sup>2</sup>C-bus uses two wires for communication; a serial data line (SDA) and a serial clock line (SCL) as shown in Figure 14.2 (p. 135) . As a true multi-master bus it includes collision detection and arbitration to resolve situations where multiple masters transmit data at the same time without data loss.

**Figure 14.2. I<sup>2</sup>C-Bus Example**

Each device on the bus is addressable by a unique address, and an I<sup>2</sup>C master can address all the devices on the bus, including other masters.

Both the bus lines are open-drain. The maximum value of the pull-up resistor can be calculated as a function of the maximal rise-time *t<sub>r</sub>* for the given bus speed, and the estimated bus capacitance *C<sub>b</sub>* as shown in Equation 14.1 (p. 135) .

#### I<sup>2</sup>C Pull-up Resistor Equation

$$R_p(\text{max}) = (t_r / 0.8473) \times C_b \tag{14.1}$$

The maximal rise times for 100 kHz, 400 kHz and 1 MHz I<sup>2</sup>C are 1 μs, 300 ns and 120 ns respectively.

#### Note

The GPIO drive strength can be used to control slew rate.

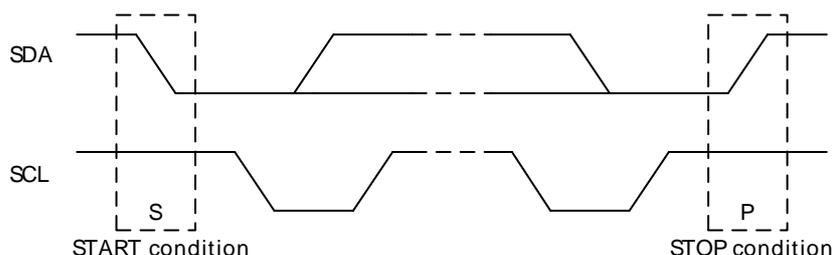

**Note**

If  $V_{dd}$  drops below the voltage on SCL and SDA lines, the MCU could become back powered and pull the SCL and SDA lines low.

**14.3.1.1 START and STOP Conditions**

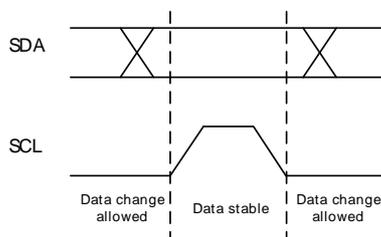

START and STOP conditions are used to initiate and stop transactions on the I<sup>2</sup>C-bus. All transactions on the bus begin with a START condition (S) and end with a STOP condition (P). As shown in Figure 14.3 (p. 136) , a START condition is generated by pulling the SDA line low while SCL is high, and a STOP condition is generated by pulling the SDA line high while SCL is high.

**Figure 14.3. I<sup>2</sup>C START and STOP Conditions**

The START and STOP conditions are easily identifiable bus events as they are the only conditions on the bus where a transition is allowed on SDA while SCL is high. During the actual data transmission, SDA is only allowed to change while SCL is low, and must be stable while SCL is high. One bit is transferred per clock pulse on the I<sup>2</sup>C-bus as shown in Figure 14.2 (p. 135) .

**Figure 14.4. I<sup>2</sup>C Bit Transfer on I<sup>2</sup>C-Bus**

**14.3.1.2 Bus Transfer**

When a master wants to initiate a transfer on the bus, it waits until the bus is idle and transmits a START condition on the bus. The master then transmits the address of the slave it wishes to interact with and a single R/W bit telling whether it wishes to read from the slave (R/W bit set to 1) or write to the slave (R/W bit set to 0).

After the 7-bit address and the R/W bit, the master releases the bus, allowing the slave to acknowledge the request. During the next bit-period, the slave pulls SDA low (ACK) if it acknowledges the request, or keeps it high if it does not acknowledge it (NACK).

Following the address acknowledge, either the slave or master transmits data, depending on the value of the R/W bit. After every 8 bits (one byte) transmitted on the SDA line, the transmitter releases the line to allow the receiver to transmit an ACK or a NACK. Both the data and the address are transmitted with the most significant bit first.

The number of bytes in a bus transfer is unrestricted. The master ends the transmission after a (N)ACK by sending a STOP condition on the bus. After a STOP condition, any master wishing to initiate a transfer

on the bus can try to gain control of it. If the current master wishes to make another transfer immediately after the current, it can start a new transfer directly by transmitting a repeated START condition (Sr) instead of a STOP followed by a START.

Examples of I<sup>2</sup>C transfers are shown in Figure 14.5 (p. 137), Figure 14.6 (p. 137), and Figure 14.7 (p. 137) . The identifiers used are:

- ADDR - Address
- DATA - Data
- S - Start bit
- Sr - Repeated start bit
- P - Stop bit
- W/R - Read(1)/Write(0)
- A - ACK
- N - NACK

**Figure 14.5. I<sup>2</sup>C Single Byte Write to Slave**

**Figure 14.6. I<sup>2</sup>C Double Byte Read from Slave**

**Figure 14.7. I<sup>2</sup>C Single Byte Write, then Repeated Start and Single Byte Read**

### 14.3.1.3 Addresses

I<sup>2</sup>C supports both 7-bit and 10-bit addresses. When using 7-bit addresses, the first byte transmitted after the START-condition contains the address of the slave that the master wants to contact. In the 7-bit address space, several addresses are reserved. These addresses are summarized in Table 14.1 (p. 137) , and include a General Call address which can be used to broadcast a message to all slaves on the I<sup>2</sup>C-bus.

**Table 14.1. I<sup>2</sup>C Reserved I<sup>2</sup>C Addresses**

I <sup>2</sup> C Address	R/W	Description
0000-000	0	General Call address
0000-000	1	START byte
0000-001	X	Reserved for the C-Bus format
0000-010	X	Reserved for a different bus format
0000-011	X	Reserved for future purposes
0000-1XX	X	Reserved for future purposes
1111-1XX	X	Reserved for future purposes
1111-0XX	X	10 Bit slave addressing mode

### 14.3.1.4 10-bit Addressing

To address a slave using a 10-bit address, two bytes are required to specify the address instead of one. The seven first bits of the first byte must then be 1111 0XX, where XX are the two most significant bits of the 10-bit address. As with 7-bit addresses, the eighth bit of the first byte determines whether the master wishes to read from or write to the slave. The second byte contains the eight least significant bits of the slave address.

When a slave receives a 10-bit address, it must acknowledge both the address bytes if they match the address of the slave.

When performing a master transmitter operation, the master transmits the two address bytes and then the remaining data, as shown in Figure 14.8 (p. 138) .

**Figure 14.8. I<sup>2</sup>C Master Transmitter/Slave Receiver with 10-bit Address**

When performing a master receiver operation however, the master first transmits the two address bytes in a master transmitter operation, then sends a repeated START followed by the first address byte and then receives data from the addressed slave. The slave addressed by the 10-bit address in the first two address bytes must remember that it was addressed, and respond with data if the address transmitted after the repeated start matches its own address. An example of this (with one byte transmitted) is shown in Figure 14.9 (p. 138) .

**Figure 14.9. I<sup>2</sup>C Master Receiver/Slave Transmitter with 10-bit Address**

### 14.3.1.5 Arbitration, Clock Synchronization, Clock Stretching

Arbitration and clock synchronization are features aimed at allowing multi-master buses. Arbitration occurs when two devices try to drive the bus at the same time. If one device drives it low, while the other drives it high, the one attempting to drive it high will not be able to do so due to the open-drain bus configuration. Both devices sample the bus, and the one that was unable to drive the bus in the desired direction detects the collision and backs off, letting the other device continue communication on the bus undisturbed.

Clock synchronization is a means of synchronizing the clock outputs from several masters driving the bus at once, and is a requirement for effective arbitration.

Slaves on the bus are allowed to force the clock output on the bus low in order to pause the communication on the bus and give themselves time to process data or perform any real-time tasks they might have. This is called clock stretching.

Arbitration is supported by the I<sup>2</sup>C module for both masters and slaves. Clock synchronization and clock stretching is also supported.

### 14.3.2 Enable and Reset

The I<sup>2</sup>C is enabled by setting the EN bit in the I2Cn\_CTRL register. Whenever this bit is cleared, the internal state of the I<sup>2</sup>C is reset, terminating any ongoing transfers.

**Note**

When enabling the I<sup>2</sup>C, the ABORT command or the Bus Idle Timeout feature must be applied prior to use even if the BUSY flag is not set.

### 14.3.3 Safely Disabling and Changing Slave Configuration

The I<sup>2</sup>C slave is partially asynchronous, and some precautions are necessary to always ensure a safe slave disable or slave configuration change. These measures should be taken, if (while the slave is enabled) the user cannot guarantee that an address match will not occur at the exact time of slave disable or slave configuration change.

Worst case consequences for an address match while disabling slave or changing configuration is that the slave may end up in an undefined state. To reset the slave back to a known state, the EN bit in I2Cn\_CTRL must be reset. This should be done regardless of whether the slave is going to be re-enabled or not.

### 14.3.4 Clock Generation

The SCL signal generated by the I<sup>2</sup>C master determines the maximum transmission rate on the bus. The clock is generated as a division of the peripheral clock, and is given by Equation 14.2 (p. 139) :

#### **I<sup>2</sup>C Maximum Transmission Rate**

$$f_{\text{SCL}} = 1/(T_{\text{low}} + T_{\text{high}}), \quad (14.2)$$

where

$T_{\text{low}}$  and  $T_{\text{high}}$  is the low and high periods of the clock signal respectively, given below. When the clock is not stretched, the low and high periods of the clock signal are:

#### **I<sup>2</sup>C High and Low Cycles Equations**

$$\begin{aligned} T_{\text{high}} &= (N_{\text{high}} \times (\text{CLKDIV} + 1) + 4)/f_{\text{HFPERCLK}}, \\ T_{\text{low}} &= (N_{\text{low}} \times (\text{CLKDIV} + 1) + 4)/f_{\text{HFPERCLK}}. \end{aligned} \quad (14.3)$$

The values of  $N_{\text{low}}$  and  $N_{\text{high}}$  and thus the ratio between the high and low parts of the clock signal is controlled by CLHR in the I2Cn\_CTRL register. The available modes are summarized in Table 14.2 (p. 140) along with the highest I<sup>2</sup>C-bus frequencies in the given modes that can be achieved without violating the timing specifications of the I<sup>2</sup>C-bus. The maximum data hold time is dependent on the DIV and is given by:

#### **Maximum Data Hold Time**

$$t_{\text{HD,DAT-max}} = (5+\text{DIV})/f_{\text{HFPERCLK}}. \quad (14.4)$$

**Note**

DIV must be set to 1 or higher during slave mode operation.

**Table 14.2. I<sup>2</sup>C Clock Mode**

HFPERCLK frequency (MHz)	Clock Low High Ratio (CLHR)	Sm max frequency (kHz)	Fm max frequency (kHz)	Fm+ max frequency (kHz)
24	0	93	400	1000
	1	81	400	685
	2	68	400	571
21	0	93	400	874
	1	80	396	807
	2	70	355	499
14	0	92	400	875
	1	78	400	538
	2	66	333	560
11	0	91	400	687
	1	76	314	647
	2	68	261	439
6.6	0	91	400	412
	1	74	253	388
	2	59	263	263
1.2	0	49	74	74
	1	46	70	70
	2	47	47	47

### 14.3.5 Arbitration

Arbitration is enabled by default, but can be disabled by setting the ARBDIS bit in I2Cn\_CTRL. When arbitration is enabled, the value on SDA is sensed every time the I<sup>2</sup>C module attempts to change its value. If the sensed value is different than the value the I<sup>2</sup>C module tried to output, it is interpreted as a simultaneous transmission by another device, and that the I<sup>2</sup>C module has lost arbitration.

Whenever arbitration is lost, the ARBLOST interrupt flag in I2Cn\_IF is set, any lines held are released, and the I<sup>2</sup>C device goes idle. If an I<sup>2</sup>C master loses arbitration during the transmission of an address, another master may be trying to address it. The master therefore receives the rest of the address, and if the address matches the slave address of the master, the master goes into either slave transmitter or slave receiver mode.

**Note**

Arbitration can be lost both when operating as a master and when operating as a slave.

### 14.3.6 Buffers

#### 14.3.6.1 Transmit Buffer and Shift Register

The I<sup>2</sup>C transmitter is double buffered through the transmit buffer and transmit shift register as shown in Figure 14.1 (p. 135). A byte is loaded into the transmit buffer by writing to I2Cn\_TXDATA. When the transmit shift register is empty and ready for new data, the byte from the transmit buffer is then loaded into the shift register. The byte is then kept in the shift register until it is transmitted. When a byte has been transmitted, a new byte is loaded into the shift register (if available in the transmit buffer). If the transmit buffer is empty, then the shift register also remains empty. The TXC flag in I2Cn\_STATUS and

the TXC interrupt flags in I2Cn\_IF are then set, signaling that the transmit shift register is out of data. TXC is cleared when new data becomes available, but the TXC interrupt flag must be cleared by software.

Whenever a byte is loaded from the transmit buffer to the transmit shift register, the TXBL flag in I2Cn\_STATUS and the TXBL interrupt flag in I2Cn\_IF are set. This indicates that there is room in the buffer for more data. TXBL is cleared automatically when data is written to the buffer.

If a write is attempted to the transmit buffer while it is not empty, the TXOF interrupt flag in I2Cn\_IF is set, indicating the overflow. The data already in the buffer remains preserved, and no new data is written.

The transmit buffer and the transmit shift register can be cleared by setting command bit CLEAR\_TX in I2Cn\_CMD. This will prevent the I<sup>2</sup>C module from transmitting the data in the buffer and the shift register, and will make them available for new data. Any byte currently being transmitted will not be aborted. Transmission of this byte will be completed.

### 14.3.6.2 Receive Buffer and Shift Register

Like the transmitter, the I<sup>2</sup>C receiver is double buffered. The receiver uses the receive buffer and receive shift register as shown in Figure 14.1 (p. 135). When a byte has been fully received by the receive shift register, it is loaded into the receive buffer if there is room for it. Otherwise, the byte waits in the shift register until space becomes available in the buffer.

When a byte becomes available in the receive buffer, the RXDATAV in I2Cn\_STATUS and RXDATAV interrupt flag in I2Cn\_IF are set. The data can now be fetched from the buffer using I2Cn\_RXDATA. Reading from this register will pull a byte out of the buffer, making room for a new byte and clearing RXDATAV in I2Cn\_STATUS and RXDATAV in I2Cn\_IF in the process.

If a read from the receive buffer is attempted through I2Cn\_RXDATA while the buffer is empty, the RXUF interrupt flag in I2Cn\_IF is set, and the data read from the buffer is undefined.

I2Cn\_RXDATAP can be used to read data from the receive buffer without removing it from the buffer. The RXUF interrupt flag in I2Cn\_IF will never be set as a result of reading from I2Cn\_RXDATAP, but the data read through I2Cn\_RXDATAP when the receive buffer is empty is still undefined.

Once a transaction is complete (STOP sent or received), the receive buffer needs to be flushed (all received data must be picked up) before starting a new transaction.

### 14.3.7 Master Operation

A bus transaction is initiated by transmitting a START condition (S) on the bus. This is done by setting the START bit in I2Cn\_CMD. The command schedules a START condition, and makes the I<sup>2</sup>C module generate a start condition whenever the bus becomes free.

The I<sup>2</sup>C-bus is considered busy whenever another device on the bus transmits a START condition. Until a STOP condition is detected, the bus is owned by the master issuing the START condition. The bus is considered free when a STOP condition is transmitted on the bus. After a STOP is detected, all masters that have data to transmit send a START condition and begin transmitting data. Arbitration ensures that collisions are avoided.

When the START condition has been transmitted, the master must transmit a slave address (ADDR) with an R/W bit on the bus. If this address is available in the transmit buffer, the master transmits it immediately, but if the buffer is empty, the master holds the I<sup>2</sup>C-bus while waiting for software to write the address to the transmit buffer.

After the address has been transmitted, a sequence of bytes can be read from or written to the slave, depending on the value of the R/W bit (bit 0 in the address byte). If the bit was cleared, the master has entered a master transmitter role, where it now transmits data to the slave. If the bit was set, it has entered a master receiver role, where it now should receive data from the slave. In either case, an unlimited number of bytes can be transferred in one direction during the transmission.

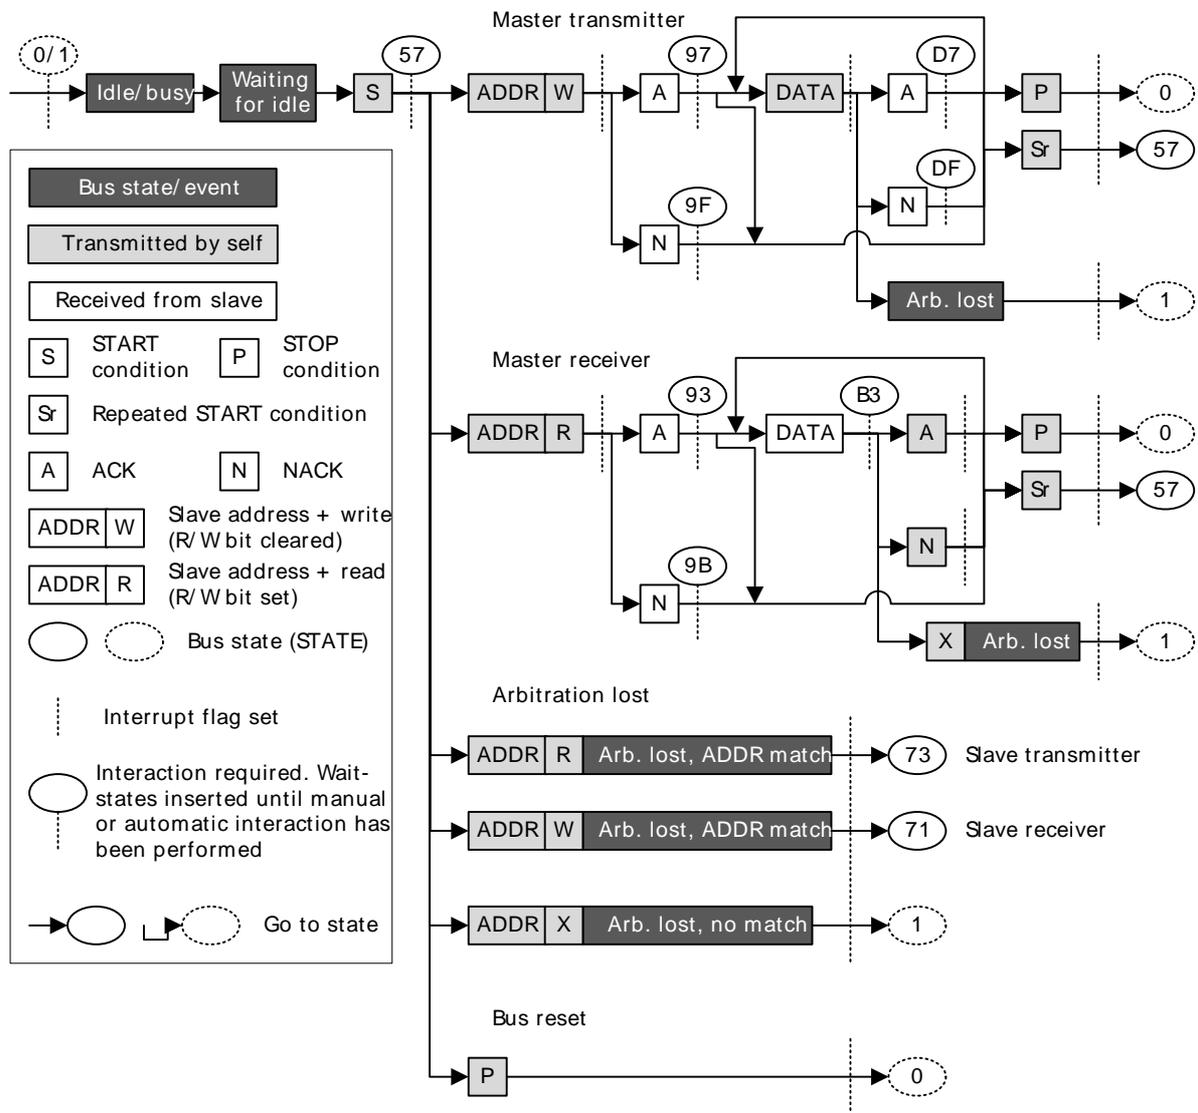

At the end of the transmission, the master either transmits a repeated START condition (Sr) if it wishes to continue with another transfer, or transmits a STOP condition (P) if it wishes to release the bus.

### 14.3.7.1 Master State Machine

The master state machine is shown in Figure 14.10 (p. 142) . A master operation starts in the far left of the state machine, and follows the solid lines through the state machine, ending the operation or continuing with a new operation when arriving at the right side of the state machine.

Branches in the path through the state machine are the results of bus events and choices made by software, either directly or indirectly. The dotted lines show where I<sup>2</sup>C-specific interrupt flags are set along the path and the full-drawn circles show places where interaction may be required by software to let the transmission proceed.

Figure 14.10. I<sup>2</sup>C Master State Machine

### 14.3.7.2 Interactions

Whenever the I<sup>2</sup>C module is waiting for interaction from software, it holds the bus clock SCL low, freezing all bus activities, and the BUSHOLD interrupt flag in I2Cn\_IF is set. The action(s) required by software depends on the current state the of the I<sup>2</sup>C module. This state can be read from the I2Cn\_STATE register.

As an example, Table 14.4 (p. 145) shows the different states the I<sup>2</sup>C goes through when operating as a Master Transmitter, i.e. a master that transmits data to a slave. As seen in the table, when a start condition has been transmitted, a requirement is that there is an address and an R/W bit in the transmit buffer. If the transmit buffer is empty, then the BUSHOLD interrupt flag is set, and the bus is held until data becomes available in the buffer. While waiting for the address, I2Cn\_STATE has a value 0x57, which can be used to identify exactly what the I<sup>2</sup>C module is waiting for.

**Note**

The bus would never stop at state 0x57 if the address was available in the transmit buffer.

The different interactions used by the I<sup>2</sup>C module are listed in Table 14.3 (p. 143) in prioritized order. If a set of different courses of action are possible from a given state, the course of action using the highest priority interactions, that first has everything it is waiting for is the one that is taken.

**Table 14.3. I<sup>2</sup>C Interactions in Prioritized Order**

Interaction	Priority	Software action	Automatically continues if
STOP*	1	Set the STOP command bit in I2Cn_CMD	PSTOP is set (STOP pending) in I2Cn_STATUS
ABORT	2	Set the ABORT command bit in I2Cn_CMD	Never, the transmission is aborted
CONT*	3	Set the CONT command bit in I2Cn_CMD	PCONT is set in I2Cn_STATUS (CONT pending)
NACK*	4	Set the NACK command bit in I2Cn_CMD	PNACK is set in I2Cn_STATUS (NACK pending)
ACK*	5	Set the ACK command bit in I2Cn_CMD	AUTOACK is set in I2Cn_CTRL or PACK is set in I2Cn_STATUS (ACK pending)
ADDR+W -> TXDATA	6	Write an address to the transmit buffer with the R/W bit set	Address is available in transmit buffer with R/W bit set
ADDR+R -> TXDATA	7	Write an address to the transmit buffer with the R/W bit cleared	Address is available in transmit buffer with R/W bit cleared
START*	8	Set the START command bit in I2Cn_CMD	PSTART is set in I2Cn_STATUS (START pending)
TXDATA	9	Write data to the transmit buffer	Data is available in transmit buffer
RXDATA	10	Read data from receive buffer	Space is available in receive buffer
None	11	No interaction is required	

The commands marked with a \* in Table 14.3 (p. 143) can be issued before an interaction is required. When such a command is issued before it can be used/consumed by the I<sup>2</sup>C module, the command is set in a pending state, which can be read from the STATUS register. A pending START command can for instance be identified by PSTART having a high value.

Whenever the I<sup>2</sup>C module requires an interaction, it checks the pending commands. If one or a combination of these can fulfill an interaction, they are consumed by the module and the transmission continues without setting the BUSHOLD interrupt flag in I2Cn\_IF to get an interaction from software. The pending status of a command goes low when it is consumed.

When several interactions are possible from a set of pending commands, the interaction with the highest priority, i.e. the interaction closest to the top of Table 14.3 (p. 143) is applied to the bus.

Pending commands can be cleared by setting the CLEARPC command bit in I2Cn\_CMD.

#### 14.3.7.2.1 Automatic ACK Interaction

When receiving addresses and data, an ACK command in I2Cn\_CMD is normally required after each received byte. When AUTOACK is set in I2Cn\_CTRL, an ACK is always pending, and the ACK-pending bit PACK in I2Cn\_STATUS is thus always set, even after an ACK has been consumed. This can be used to reduce the amount of software interaction required during a transfer.

#### 14.3.7.3 Reset State

After a reset, the state of the I<sup>2</sup>C-bus is unknown. To avoid interrupting transfers on the I<sup>2</sup>C-bus after a reset of the I<sup>2</sup>C module or the entire MCU, the I<sup>2</sup>C-bus is assumed to be busy when coming out of a reset, and the BUSY flag in I2Cn\_STATUS is thus set. To be able to carry through master operations on the I<sup>2</sup>C-bus, the bus must be idle.

The bus goes idle when a STOP condition is detected on the bus, but on buses with little activity, the time before the I<sup>2</sup>C module detects that the bus is idle can be significant. There are two ways of assuring that the I<sup>2</sup>C module gets out of the busy state.

- Use the ABORT command in I2Cn\_CMD. When the ABORT command is issued, the I<sup>2</sup>C module is instructed that the bus is idle. The I<sup>2</sup>C module can then initiate master operations.
- Use the Bus Idle Timeout. When SCL has been high for a long period of time, it is very likely that the bus is idle. Set BITO in I2Cn\_CTRL to an appropriate timeout period and set GIBITO in I2Cn\_CTRL. If activity has not been detected on the bus within the timeout period, the bus is then automatically assumed idle, and master operations can be initiated.

#### Note

If operating in slave mode, the above approach is not necessary.

#### 14.3.7.4 Master Transmitter

To transmit data to a slave, the master must operate as a master transmitter. Table 14.4 (p. 145) shows the states the I<sup>2</sup>C module goes through while acting as a master transmitter. Every state where an interaction is required has the possible interactions listed, along with the result of the interactions. The table also shows which interrupt flags are set in the different states. The interrupt flags enclosed in parenthesis may be set. If the BUSHOLD interrupt in I2Cn\_IF is set, the module is waiting for an interaction, and the bus is frozen. The value of I2Cn\_STATE will be equal to the values given in the table when the BUSHOLD interrupt flag is set, and can be used to determine which interaction is required to make the transmission continue.

The interrupt flag START in I2Cn\_IF is set when the I<sup>2</sup>C module transmits the START.

A master operation is started by issuing a START command by setting START in I2Cn\_CMD. ADDR+W, i.e. the address of the slave to address + the R/W bit is then required by the I<sup>2</sup>C module. If this is not available in the transmit buffer, then the bus is held and the BUSHOLD interrupt flag is set. The value of I2Cn\_STATE will then be 0x57. As seen in the table, the I<sup>2</sup>C module also stops in this state if the address is not available after a repeated start condition.

To continue, write a byte to I2Cn\_TXDATA with the address of the slave in the 7 most significant bits and the least significant bit cleared (ADDR+W). This address will then be transmitted, and the slave will reply with an ACK or a NACK. If no slave replies to the address, the response will also be NACK. If the address was acknowledged, the master now has four choices. It can send a data byte by placing it in I2Cn\_TXDATA (the master should check the TXBL interrupt flag before writing to I2Cn\_TXDATA), this byte is then transmitted. The master can also stop the transmission by sending a STOP, it can send a repeated start by sending START, or it can send a STOP and then a START as soon as possible.

If a NACK was received, the master has to issue a CONT command in addition to providing data in order to continue transmission. This is not standard I<sup>2</sup>C, but is provided for flexibility. The rest of the options are similar to when an ACK was received.

If a new byte was transmitted, an ACK or NACK is received after the transmission of the byte, and the master has the same options as for when the address was sent.

The master may lose arbitration at any time during transmission. In this case, the ARBLOST interrupt flag in I2Cn\_IF is set. If the arbitration was lost during the transfer of an address, and SLAVE in I2Cn\_CTRL is set, the master then checks which address was transmitted. If it was the address of the master, then the master goes to slave mode.

After a master has transmitted a START and won any arbitration, it owns the bus until it transmits a STOP. After a STOP, the bus is released, and arbitration decides which bus master gains the bus next. The MSTOP interrupt flag in I2Cn\_IF is set when a STOP condition is transmitted by the master.

**Table 14.4. I<sup>2</sup>C Master Transmitter**

I2Cn_STA1	Description	I2Cn_IF	Required interaction	Response
0x57	Start transmitted	START interrupt flag (BUSHOLD interrupt flag)	ADDR +W -> TXDATA	ADDR+W will be sent
			STOP	STOP will be sent and bus released.
			STOP + START	STOP will be sent and bus released. Then a START will be sent when bus becomes idle.
0x57	Repeated start transmitted	START interrupt flag (BUSHOLD interrupt flag)	ADDR +W -> TXDATA	ADDR+W will be sent
			STOP	STOP will be sent and bus released.
			STOP + START	STOP will be sent and bus released. Then a START will be sent when bus becomes idle.
-	ADDR+W transmitted	TXBL interrupt flag (TXC interrupt flag)	None	
0x97	ADDR+W transmitted, ACK received	ACK interrupt flag (BUSHOLD interrupt flag)	TXDATA	DATA will be sent
			STOP	STOP will be sent. Bus will be released
			START	Repeated start condition will be sent
			STOP + START	STOP will be sent and the bus released. Then a START will be sent when the bus becomes idle
0x9F	ADDR+W transmitted, NACK received	NACK (BUSHOLD interrupt flag)	CONT + TXDATA	DATA will be sent
			STOP	STOP will be sent. Bus will be released
			START	Repeated start condition will be sent
			STOP + START	STOP will be sent and the bus released. Then a START will be sent when the bus becomes idle
-	Data transmitted	TXBL interrupt flag (TXC interrupt flag)	None	
0xD7	Data transmitted, ACK received	ACK interrupt flag (BUSHOLD interrupt flag)	TXDATA	DATA will be sent
			STOP	STOP will be sent. Bus will be released

I2Cn_STA1	Description	I2Cn_IF	Required interaction	Response
			START	Repeated start condition will be sent
			STOP + START	STOP will be sent and the bus released. Then a START will be sent when the bus becomes idle
0xDF	Data transmitted, NACK received	NACK(BUSHOLD interrupt flag)	CONT + TXDATA	DATA will be sent
			STOP	STOP will be sent. Bus will be released
			START	Repeated start condition will be sent
			STOP + START	STOP will be sent and the bus released. Then a START will be sent when the bus becomes idle
-	Stop transmitted	MSTOP interrupt flag	None	
			START	START will be sent when bus becomes idle
-	Arbitration lost	ARBLOST interrupt flag	None	
			START	START will be sent when bus becomes idle

### 14.3.7.5 Master Receiver

To receive data from a slave, the master must operate as a master receiver, see Table 14.5 (p. 147). This is done by transmitting ADDR+R as the address byte instead of ADDR+W, which is transmitted to become a master transmitter. The address byte loaded into the data register thus has to contain the 7-bit slave address in the 7 most significant bits of the byte, and have the least significant bit set.

When the address has been transmitted, the master receives an ACK or a NACK. If an ACK is received, the ACK interrupt flag in I2Cn\_IF is set, and if space is available in the receive shift register, reception of a byte from the slave begins. If the receive buffer and shift register is full however, the bus is held until data is read from the receive buffer or another interaction is made. Note that the STOP and START interactions have a higher priority than the data-available interaction, so if a STOP or START command is pending, the highest priority interaction will be performed, and data will not be received from the slave.

If a NACK was received, the CONT command in I2Cn\_CMD has to be issued in order to continue receiving data, even if there is space available in the receive buffer and/or shift register.

After a data byte has been received the master must ACK or NACK the received byte. If an ACK is pending or AUTOACK in I2Cn\_CTRL is set, an ACK is sent automatically and reception continues if space is available in the receive buffer.

If a NACK is sent, the CONT command must be used in order to continue transmission. If an ACK or NACK is issued along with a START or STOP or both, then the ACK/NACK is transmitted and the reception is ended. If START in I2Cn\_CMD is set alone, a repeated start condition is transmitted after the ACK/NACK. If STOP in I2Cn\_CMD is set, a stop condition is sent regardless of whether START is set. If START is set in this case, it is set as pending.

As when operating as a master transmitter, arbitration can be lost as a master receiver. When this happens the ARBLOST interrupt flag in I2Cn\_IF is set, and the master has a possibility of being selected as a slave given the correct conditions.

**Table 14.5. I<sup>2</sup>C Master Receiver**

I2Cn_STA1	Description	I2Cn_IF	Required interaction	Response
0x57	START transmitted	START interrupt flag (BUSHOLD interrupt flag)	ADDR +R -> TXDATA	ADDR+R will be sent
			STOP	STOP will be sent and bus released.
			STOP + START	STOP will be sent and bus released. Then a START will be sent when bus becomes idle.
0x57	Repeated START transmitted	START interrupt flag(BUSHOLD interrupt flag)	ADDR +R -> TXDATA	ADDR+R will be sent
			STOP	STOP will be sent and bus released.
			STOP + START	STOP will be sent and bus released. Then a START will be sent when bus becomes idle.
-	ADDR+R transmitted	TXBL interrupt flag (TXC interrupt flag)	None	
0x93	ADDR+R transmitted, ACK received	ACK interrupt flag(BUSHOLD)	RXDATA	Start receiving
			STOP	STOP will be sent and the bus released
			START	Repeated START will be sent
			STOP + START	STOP will be sent and the bus released. Then a START will be sent when the bus becomes idle
0x9B	ADDR+R transmitted,NACK received	NACK(BUSHOLD)	CONT + RXDATA	Continue, start receiving
			STOP	STOP will be sent and the bus released
			START	Repeated START will be sent
			STOP + START	STOP will be sent and the bus released. Then a START will be sent when the bus becomes idle
0xB3	Data received	RXDATA interrupt flag(BUSHOLD interrupt flag)	ACK + RXDATA	ACK will be transmitted, reception continues
			NACK + CONT + RXDATA	NACK will be transmitted, reception continues
			ACK/ NACK + STOP	ACK/NACK will be sent and the bus will be released.
			ACK/ NACK + START	ACK/NACK will be sent, and then a repeated start condition.
			ACK/ NACK + STOP + START	ACK/NACK will be sent and the bus will be released. Then a START will be sent when the bus becomes idle
-	Stop received	MSTOP interrupt flag	None	
			START	START will be sent when bus becomes idle
-	Arbitration lost	ARBLOST interrupt flag	None	

I2Cn_STA1	Description	I2Cn_IF	Required interaction	Response
			START	START will be sent when bus becomes idle

### 14.3.8 Bus States

The I2Cn\_STATE register can be used to determine which state the I<sup>2</sup>C module and the I<sup>2</sup>C bus are in at a given time. The register consists of the STATE bit-field, which shows which state the I<sup>2</sup>C module is at in any ongoing transmission, and a set of single-bits, which reveal the transmission mode, whether the bus is busy or idle, and whether the bus is held by this I<sup>2</sup>C module waiting for a software response.

The possible values of the STATE field are summarized in Table 14.6 (p. 148) . When this field is cleared, the I<sup>2</sup>C module is not a part of any ongoing transmission. The remaining status bits in the I2Cn\_STATE register are listed in Table 14.7 (p. 148) .

**Table 14.6. I<sup>2</sup>C STATE Values**

Mode	Value	Description
IDLE	0	No transmission is being performed by this module.
WAIT	1	Waiting for idle. Will send a start condition as soon as the bus is idle.
START	2	Start being transmitted
ADDR	3	Address being transmitted or has been received
ADDRACK	4	Address ACK/NACK being transmitted or received
DATA	5	Data being transmitted or received
DATAACK	6	Data ACK/NACK being transmitted or received

**Table 14.7. I<sup>2</sup>C Transmission Status**

Bit	Description
BUSY	Set whenever there is activity on the bus. Whether or not this module is responsible for the activity cannot be determined by this byte.
MASTER	Set when operating as a master. Cleared at all other times.
TRANSMITTER	Set when operating as a transmitter; either a master transmitter or a slave transmitter. Cleared at all other times
BUSHOLD	Set when the bus is held by this I <sup>2</sup> C module because an action is required by software.
NACK	Only valid when bus is held and STATE is ADDRACK or DATAACK. In that case it is set if a NACK was received. In all other cases, the bit is cleared.

**Note**

I2Cn\_STATE reflects the internal state of the I<sup>2</sup>C module, and therefore only held constant as long as the bus is held, i.e. as long as BUSHOLD in I2Cn\_STATUS is set.

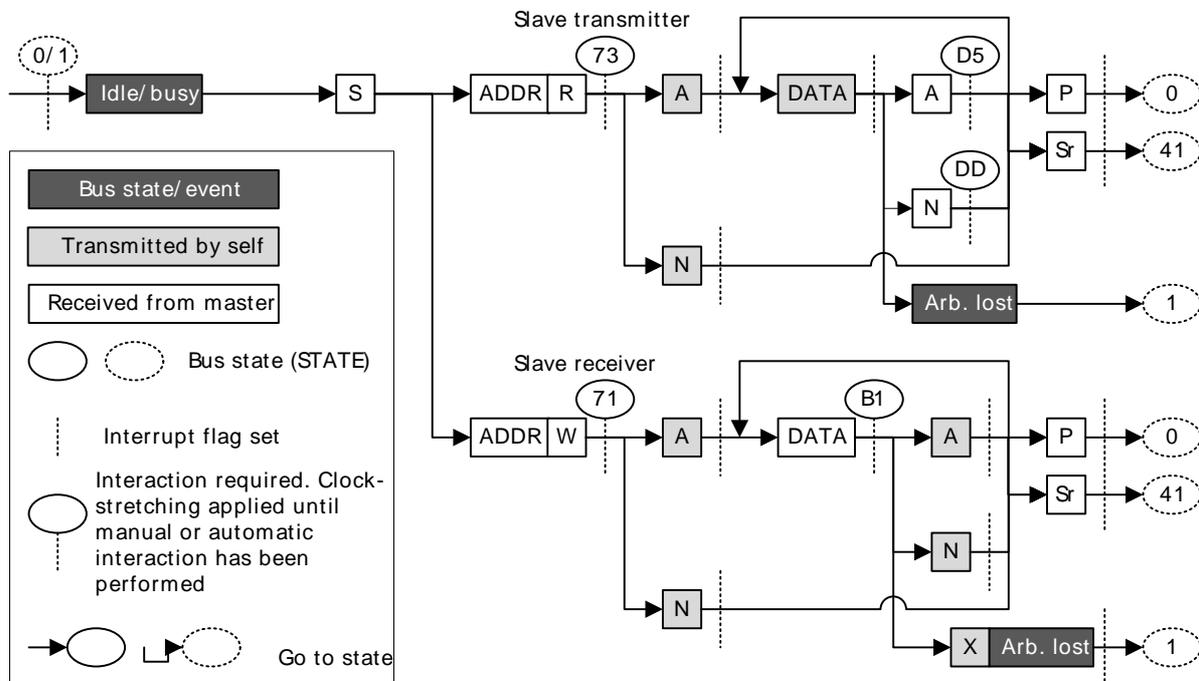

### 14.3.9 Slave Operation

The I<sup>2</sup>C module operates in master mode by default. To enable slave operation, i.e. to allow the device to be addressed as an I<sup>2</sup>C slave, the SLAVE bit in I2Cn\_CTRL must be set. In this case the slave operates in a mixed mode, both capable of starting transmissions as a master, and being addressed as a slave. When operating in the slave mode, HFPERCLK frequency must be higher than 4.2 MHz for Standard-mode, 11 MHz for Fast-mode, and 23 MHz for Fast-mode Plus.

### 14.3.9.1 Slave State Machine

The slave state machine is shown in Figure 14.11 (p. 149). The dotted lines show where I<sup>2</sup>C-specific interrupt flags are set. The full-drawn circles show places where interaction may be required by software to let the transmission proceed.

Figure 14.11. I<sup>2</sup>C Slave State Machine

### 14.3.9.2 Address Recognition

The I<sup>2</sup>C module provides automatic address recognition for 7-bit addresses. 10-bit address recognition is not fully automatic, but can be assisted by the 7-bit address comparator as shown in Section 14.3.11 (p. 153). Address recognition is supported in all energy modes (except EM4).

The slave address, i.e. the address which the I<sup>2</sup>C module should be addressed with, is defined in the I2Cn\_SADDR register. In addition to the address, a mask must be specified, telling the address comparator which bits of an incoming address to compare with the address defined in I2Cn\_SADDR. The mask is defined in I2Cn\_SADDRMASK, and for every zero in the mask, the corresponding bit in the slave address is treated as a don't-care.

An incoming address that fails address recognition is automatically replied to with a NACK. Since only the bits defined by the mask are checked, a mask with a value 0x00 will result in all addresses being accepted. A mask with a value 0x7F will only match the exact address defined in I2Cn\_SADDR, while a mask 0x70 will match all addresses where the three most significant bits in I2Cn\_SADDR and the incoming address are equal.

If GCAMEN in I2Cn\_CTRL is set, the general call address is always accepted regardless of the result of the address recognition. The start-byte, i.e. the general call address with the R/W bit set is ignored unless it is included in the defined slave address.

When an address is accepted by the address comparator, the decision of whether to ACK or NACK the address is passed to software.

### 14.3.9.3 Slave Transmitter

When SLAVE in I2Cn\_CTRL is set, the RSTART interrupt flag in I2Cn\_IF will be set when repeated START conditions are detected. After a START or repeated START condition, the bus master will transmit an address along with an R/W bit. If there is no room in the receive shift register for the address, the bus will be held by the slave until room is available in the shift register. Transmission then continues and the address is loaded into the shift register. If this address does not pass address recognition, it is automatically NACK'ed by the slave, and the slave goes to an idle state. The address byte is in this case discarded, making the shift register ready for a new address. It is not loaded into the receive buffer.

If the address was accepted and the R/W bit was set (R), indicating that the master wishes to read from the slave, the slave now goes into the slave transmitter mode. Software interaction is now required to decide whether the slave wants to acknowledge the request or not. The accepted address byte is loaded into the receive buffer like a regular data byte. If no valid interaction is pending, the bus is held until the slave responds with a command. The slave can reject the request with a single NACK command.

The slave will in that case go to an idle state, and wait for the next start condition. To continue the transmission, the slave must make sure data is loaded into the transmit buffer and send an ACK. The loaded data will then be transmitted to the master, and an ACK or NACK will be received from the master.

Data transmission can also continue after a NACK if a CONT command is issued along with the NACK. This is not standard I<sup>2</sup>C however.

If the master responds with an ACK, it may expect another byte of data, and data should be made available in the transmit buffer. If data is not available, the bus is held until data is available.

If the response is a NACK however, this is an indication of that the master has received enough bytes and wishes to end the transmission. The slave now automatically goes idle, unless CONT in I2Cn\_CMD is set and data is available for transmission. The latter is not standard I<sup>2</sup>C.

The master ends the transmission by sending a STOP or a repeated START. The SSTOP interrupt flag in I2Cn\_IF is set when the master transmits a STOP condition. If the transmission is ended with a repeated START, then the SSTOP interrupt flag is not set.

#### Note

The SSTOP interrupt flag in I2Cn\_IF will be set regardless of whether the slave is participating in the transmission or not, as long as SLAVE in I2Cn\_CTRL is set and a STOP condition is detected

If arbitration is lost at any time during transmission, the ARBLOST interrupt flag in I2Cn\_IF is set, the bus is released and the slave goes idle.

See Table 14.8 (p. 151) for more information.

**Table 14.8. I<sup>2</sup>C Slave Transmitter**

I2Cn_STA <sup>1</sup>	Description	I2Cn_IF	Required interaction	Response
0x41	Repeated START received	RSTART interrupt flag (BUSHOLD interrupt flag)	RXDATA	Receive and compare address
0x75	ADDR + R received	ADDR interrupt flag	ACK + TXDATA	ACK will be sent, then DATA
		RXDATA interrupt flag	NACK	NACK will be sent, slave goes idle
		(BUSHOLD interrupt flag)	NACK + CONT + TXDATA	NACK will be sent, then DATA.
-	Data transmitted	TXBL interrupt flag (TXC interrupt flag)	None	
0xD5	Data transmitted, ACK received	ACK interrupt flag (BUSHOLD interrupt flag)	TXDATA	DATA will be transmitted
0xDD	Data transmitted, NACK received	NACK interrupt flag	None	The slave goes idle
		(BUSHOLD interrupt flag)	CONT + TXDATA	DATA will be transmitted
-	Stop received	SSTOP interrupt flag	None	The slave goes idle
			START	START will be sent when bus becomes idle
-	Arbitration lost	ARBLOST interrupt flag	None	The slave goes idle
			START	START will be sent when the bus becomes idle

#### 14.3.9.4 Slave Receiver

A slave receiver operation is started in the same way as a slave transmitter operation, with the exception that the address transmitted by the master has the R/W bit cleared (W), indicating that the master wishes to write to the slave. The slave then goes into slave receiver mode.

To receive data from the master, the slave should respond to the address with an ACK and make sure space is available in the receive buffer. Transmission will then continue, and the slave will receive a byte from the master.

If a NACK is sent without a CONT, the transmission is ended for the slave, and it goes idle. If the slave issues both the NACK and CONT commands and has space available in the receive buffer, it will be open for continuing reception from the master.

When a byte has been received from the master, the slave must ACK or NACK the byte. The responses here are the same as for the reception of the address byte.

The master ends the transmission by sending a STOP or a repeated START. The SSTOP interrupt flag is set when the master transmits a STOP condition. If the transmission is ended with a repeated START, then the SSTOP interrupt flag in I2Cn\_IF is not set.

#### Note

The SSTOP interrupt flag in I2Cn\_IF will be set regardless of whether the slave is participating in the transmission or not, as long as SLAVE in I2Cn\_CTRL is set and a STOP condition is detected

If arbitration is lost at any time during transmission, the ARBLOST interrupt flag in I2Cn\_IF is set, the bus is released and the slave goes idle.

See Table 14.9 (p. 152) for more information.

**Table 14.9. I<sup>2</sup>C - Slave Receiver**

I2Cn_STAT	Description	I2Cn_IF	Required interaction	Response
-	Repeated START received	RSTART interrupt flag (BUSHOLD interrupt flag)	RXDATA	Receive and compare address
0x71	ADDR + W received	ADDR interrupt flag RXDATA interrupt flag (BUSHOLD interrupt flag)	ACK + RXDATA	ACK will be sent and data will be received
			NACK	NACK will be sent, slave goes idle
			NACK + CONT + RXDATA	NACK will be sent and DATA will be received.
0xB1	Data received	RXDATA interrupt flag (BUSHOLD interrupt flag)	ACK + RXDATA	ACK will be sent and data will be received
			NACK	NACK will be sent and slave will go idle
			NACK + CONT + RXDATA	NACK will be sent and data will be received
-	Stop received	SSTOP interrupt flag	None	The slave goes idle
			START	START will be sent when bus becomes idle
-	Arbitration lost	ARBLOST interrupt flag	None	The slave goes idle
			START	START will be sent when the bus becomes idle

### 14.3.10 Transfer Automation

The I<sup>2</sup>C can be set up to complete transfers with a minimal amount of interaction.

#### 14.3.10.1 DMA

DMA can be used to automatically load data into the transmit buffer and load data out from the receive buffer. When using DMA, software is thus relieved of moving data to and from memory after each transferred byte.

#### 14.3.10.2 Automatic ACK

When AUTOACK in I2Cn\_CTRL is set, an ACK is sent automatically whenever an ACK interaction is possible and no higher priority interactions are pending.

#### 14.3.10.3 Automatic STOP

A STOP can be generated automatically on two conditions. These apply only to the master transmitter.

If AUTOSN in I2Cn\_CTRL is set, the I<sup>2</sup>C module ends a transmission by transmitting a STOP condition when operating as a master transmitter and a NACK is received.

If AUTOSE in I2Cn\_CTRL is set, the I<sup>2</sup>C module always ends a transmission when there is no more data in the transmit buffer. If data has been transmitted on the bus, the transmission is ended after the (N)ACK has been received by the slave. If a START is sent when no data is available in the transmit buffer and AUTOSE is set, then the STOP condition is sent immediately following the START. Software must thus make sure data is available in the transmit buffer before the START condition has been fully transmitted if data is to be transferred.

### 14.3.11 Using 10-bit Addresses

When using 10-bit addresses in slave mode, set the I2Cn\_SADDR register to 1111 0XX where XX are the two most significant bits of the 10-bit address, and set I2Cn\_SADDRMASK to 0xFF. Address matches will now be given on all 10-bit addresses where the two most significant bits are correct.

When receiving an address match, the slave must acknowledge the address and receive the first data byte. This byte contains the second part of the 10-bit address. If it matches the address of the slave, the slave should ACK the byte to continue the transmission, and if it does not match, the slave should NACK it.

When the master is operating as a master transmitter, the data bytes will follow after the second address byte. When the master is operating as a master receiver however, a repeated START condition is sent after the second address byte. The address sent after this repeated START is equal to the first of the address bytes transmitted previously, but now with the R/W byte set, and only the slave that found a match on the entire 10-bit address in the previous message should ACK this address. The repeated start should take the master into a master receiver mode, and after the single address byte sent this time around, the slave begins transmission to the master.

### 14.3.12 Error Handling

#### 14.3.12.1 ABORT Command

Some bus errors may require software intervention to be resolved. The I<sup>2</sup>C module provides an ABORT command, which can be set in I2Cn\_CMD, to help resolve bus errors.

When the bus for some reason is locked up and the I<sup>2</sup>C module is in the middle of a transmission it cannot get out of, or for some other reason the I<sup>2</sup>C wants to abort a transmission, the ABORT command can be used.

Setting the ABORT command will make the I<sup>2</sup>C module discard any data currently being transmitted or received, release the SDA and SCL lines and go to an idle mode. ABORT effectively makes the I<sup>2</sup>C module forget about any ongoing transfers.

#### 14.3.12.2 Bus Reset

A bus reset can be performed by setting the START and STOP commands in I2Cn\_CMD while the transmit buffer is empty. A START condition will then be transmitted, immediately followed by a STOP condition. A bus reset can also be performed by transmitting a START command with the transmit buffer empty and AUTOSE set.

#### 14.3.12.3 I<sup>2</sup>C-Bus Errors

An I<sup>2</sup>C-bus error occurs when a START or STOP condition is misplaced, which happens when the value on SDA changes while SCL is high during bit-transmission on the I<sup>2</sup>C-bus. If the I<sup>2</sup>C module is part of the current transmission when a bus error occurs, any data currently being transmitted or received is discarded, SDA and SCL are released, the BUSERR interrupt flag in I2Cn\_IF is set to indicate the error, and the module automatically takes a course of action as defined in Table 14.10 (p. 153).

**Table 14.10. I<sup>2</sup>C Bus Error Response**

	Misplaced START	Misplaced STOP
In a master/slave operation	Treated as START. Receive address.	Go idle. Perform any pending actions.

#### 14.3.12.4 Bus Lockup

A lockup occurs when a master or slave on the I<sup>2</sup>C-bus has locked the SDA or SCL at a low value, preventing other devices from putting high values on the bus, and thus making communication on the bus impossible.

Many slave-only devices operating on an I<sup>2</sup>C-bus are not capable of driving SCL low, but in the rare case that SCL is stuck LOW, the advice is to apply a hardware reset signal to the slaves on the bus. If this does not work, cycle the power to the devices in order to make them release SCL.

When SDA is stuck low and SCL is free, a master should send 9 clock pulses on SCL while tristating the SDA. This procedure is performed in the GPIO module after clearing the I2C\_ROUTE register and disabling the I2C module. The device that held the bus low should release it sometime within those 9 clocks. If not, use the same approach as for when SCL is stuck, resetting and possibly cycling power to the slaves.

Lockup of SDA can be detected by keeping count of the number of continuous arbitration losses during address transmission. If arbitration is also lost during the transmission of a general call address, i.e. during the transmission of the STOP condition, which should never happen during normal operation, this is a good indication of SDA lockup.

Detection of SCL lockups can be done using the timeout functionality defined in Section 14.3.12.6 (p. 154)

### 14.3.12.5 Bus Idle Timeout

When SCL has been high for a significant amount of time, this is a good indication of that the bus is idle. On an SMBus system, the bus is only allowed to be in this state for a maximum of 50 µs before the bus is considered idle.

The bus idle timeout BITO in I2Cn\_CTRL can be used to detect situations where the bus goes idle in the middle of a transmission. The timeout can be configured in BITO, and when the bus has been idle for the given amount of time, the BITO interrupt flag in I2Cn\_IF is set. The bus can also be set idle automatically on a bus idle timeout. This is enabled by setting GIBITO in I2Cn\_CTRL.

When the bus idle timer times out, it wraps around and continues counting as long as its condition is true. If the bus is not set idle using GIBITO or the ABORT command in I2Cn\_CMD, this will result in periodic timeouts.

#### **Note**

This timeout will be generated even if SDA is held low.

The bus idle timeout is active as long as the bus is busy, i.e. BUSY in I2Cn\_STATUS is set. The timeout can be used to get the I<sup>2</sup>C module out of the busy-state it enters when reset, see Section 14.3.7.3 (p. 144) .

### 14.3.12.6 Clock Low Timeout

The clock timeout, which can be configured in CLTO in I2Cn\_CTRL, starts counting whenever SCL goes low, and times out if SCL does not go high within the configured timeout. A clock low timeout results in CLTOIF in I2Cn\_IF being set, allowing software to take action.

When the timer times out, it wraps around and continues counting as long as SCL is low. An SCL lockup will thus result in periodic clock low timeouts as long as SCL is low.

### 14.3.13 DMA Support

The I<sup>2</sup>C module has full DMA support. The DMA controller can write to the transmit buffer using the I2Cn\_TXDATA register, and it can read from the receive buffer using the RXDATA register. A request for the DMA controller to read from the I<sup>2</sup>C receive buffer can come from the following source:

- Data available in the receive buffer

A write request can come from one of the following sources:

- Transmit buffer and shift register empty. No data to send
- Transmit buffer empty

### 14.3.14 Interrupts

The interrupts generated by the I<sup>2</sup>C module are combined into one interrupt vector, I2C\_INT. If I<sup>2</sup>C interrupts are enabled, an interrupt will be made if one or more of the interrupt flags in I2Cn\_IF and their corresponding bits in I2Cn\_IEN are set.

### 14.3.15 Wake-up

The I<sup>2</sup>C receive section can be active all the way down to energy mode EM3, and can wake up the CPU on address interrupt. All address match modes are supported.

## 14.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	I2Cn_CTRL	RW	Control Register
0x004	I2Cn_CMD	W1	Command Register
0x008	I2Cn_STATE	R	State Register
0x00C	I2Cn_STATUS	R	Status Register
0x010	I2Cn_CLKDIV	RW	Clock Division Register
0x014	I2Cn_SADDR	RW	Slave Address Register
0x018	I2Cn_SADDRMASK	RW	Slave Address Mask Register
0x01C	I2Cn_RXDATA	R	Receive Buffer Data Register
0x020	I2Cn_RXDATAP	R	Receive Buffer Data Peek Register
0x024	I2Cn_TXDATA	W	Transmit Buffer Data Register
0x028	I2Cn_IF	R	Interrupt Flag Register
0x02C	I2Cn_IFS	W1	Interrupt Flag Set Register
0x030	I2Cn_IFC	W1	Interrupt Flag Clear Register
0x034	I2Cn_IEN	RW	Interrupt Enable Register
0x038	I2Cn_ROUTE	RW	I/O Routing Register

## 14.5 Register Description

### 14.5.1 I2Cn\_CTRL - Control Register

Offset	Bit Position																																	
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
0x000																																		
<b>Reset</b>															0x0		0			0x0				0x0				0	0	0	0	0	0	
<b>Access</b>															RW		RW			RW				RW				RW		RW		RW		RW
<b>Name</b>															CLTO		GIBITO			BITO				CLHR			GCAMEN	ARBDIS	AUTOSN	AUTOSE	AUTOACK	SLAVE	EN	

Bit	Name	Reset	Access	Description
31:19	Reserved			To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)

18:16 CLTO 0x0 RW **Clock Low Timeout**

Use to generate a timeout when CLK has been low for the given amount of time. Wraps around and continues counting when the timeout is reached.

Value	Mode	Description
0	OFF	Timeout disabled
1	40PCC	Timeout after 40 prescaled clock cycles. In standard mode at 100 kHz, this results in a 50us timeout.
2	80PCC	Timeout after 80 prescaled clock cycles. In standard mode at 100 kHz, this results in a 100us timeout.
3	160PCC	Timeout after 160 prescaled clock cycles. In standard mode at 100 kHz, this results in a 200us timeout.
4	320PPC	Timeout after 320 prescaled clock cycles. In standard mode at 100 kHz, this results in a 400us timeout.
5	1024PPC	Timeout after 1024 prescaled clock cycles. In standard mode at 100 kHz, this results in a 1280us timeout.

15 GIBITO 0 RW **Go Idle on Bus Idle Timeout**

Bit	Name	Reset	Access	Description
-----	------	-------	--------	-------------

When set, the bus automatically goes idle on a bus idle timeout, allowing new transfers to be initiated.

Value	Description
0	A bus idle timeout has no effect on the bus state.
1	A bus idle timeout tells the I <sup>2</sup> C module that the bus is idle, allowing new transfers to be initiated.

14 *Reserved* *To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)*

13:12 **BITO** 0x0 RW **Bus Idle Timeout**

Use to generate a timeout when SCL has been high for a given amount time between a START and STOP condition. When in a bus transaction, i.e. the BUSY flag is set, a timer is started whenever SCL goes high. When the timer reaches the value defined by BITO, it sets the BITO interrupt flag. The BITO interrupt flag will then be set periodically as long as SCL remains high. The bus idle timeout is active as long as BUSY is set. It is thus stopped automatically on a timeout if GIBITO is set. It is also stopped a STOP condition is detected and when the ABORT command is issued. The timeout is activated whenever the bus goes BUSY, i.e. a START condition is detected.

Value	Mode	Description
0	OFF	Timeout disabled
1	40PCC	Timeout after 40 prescaled clock cycles. In standard mode at 100 kHz, this results in a 50us timeout.
2	80PCC	Timeout after 80 prescaled clock cycles. In standard mode at 100 kHz, this results in a 100us timeout.
3	160PCC	Timeout after 160 prescaled clock cycles. In standard mode at 100 kHz, this results in a 200us timeout.

11:10 *Reserved* *To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)*

9:8 **CLHR** 0x0 RW **Clock Low High Ratio**

Determines the ratio between the low and high parts of the clock signal generated on SCL as master.

Value	Mode	Description
0	STANDARD	The ratio between low period and high period counters (N <sub>low</sub> :N <sub>high</sub> ) is 4:4
1	ASYMMETRIC	The ratio between low period and high period counters (N <sub>low</sub> :N <sub>high</sub> ) is 6:3
2	FAST	The ratio between low period and high period counters (N <sub>low</sub> :N <sub>high</sub> ) is 11:6

7 *Reserved* *To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)*

6 **GCAMEN** 0 RW **General Call Address Match Enable**

Set to enable address match on general call in addition to the programmed slave address.

Value	Description
0	General call address will be NACK'ed if it is not included by the slave address and address mask.
1	When a general call address is received, a software response is required.

5 **ARBDIS** 0 RW **Arbitration Disable**

A master or slave will not release the bus upon losing arbitration.

Value	Description
0	When a device loses arbitration, the ARB interrupt flag is set and the bus is released.
1	When a device loses arbitration, the ARB interrupt flag is set, but communication proceeds.

4 **AUTOSN** 0 RW **Automatic STOP on NACK**

Write to 1 to make a master transmitter send a STOP when a NACK is received from a slave.

Value	Description
0	Stop is not automatically sent if a NACK is received from a slave.
1	The master automatically sends a STOP if a NACK is received from a slave.

3 **AUTOSE** 0 RW **Automatic STOP when Empty**

Write to 1 to make a master transmitter send a STOP when no more data is available for transmission.

Value	Description
0	A stop must be sent manually when no more data is to be transmitted.
1	The master automatically sends a STOP when no more data is available for transmission.

2 **AUTOACK** 0 RW **Automatic Acknowledge**

Set to enable automatic acknowledges.

Bit	Name	Reset	Access	Description
8	RXDATAV	0	R	<b>RX Data Valid</b> Set when data is available in the receive buffer. Cleared when the receive buffer is empty.
7	TXBL	1	R	<b>TX Buffer Level</b> Indicates the level of the transmit buffer. Set when the transmit buffer is empty, and cleared when it is full.
6	TXC	0	R	<b>TX Complete</b> Set when a transmission has completed and no more data is available in the transmit buffer. Cleared when a new transmission starts.
5	PABORT	0	R	<b>Pending abort</b> An abort is pending and will be transmitted as soon as possible.
4	PCONT	0	R	<b>Pending continue</b> A continue is pending and will be transmitted as soon as possible.
3	PNACK	0	R	<b>Pending NACK</b> A not-acknowledge is pending and will be transmitted as soon as possible.
2	PACK	0	R	<b>Pending ACK</b> An acknowledge is pending and will be transmitted as soon as possible.
1	PSTOP	0	R	<b>Pending STOP</b> A stop condition is pending and will be transmitted as soon as possible.
0	PSTART	0	R	<b>Pending START</b> A start condition is pending and will be transmitted as soon as possible.

### 14.5.5 I2Cn\_CLKDIV - Clock Division Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x000							
<b>Access</b>																									RW							
<b>Name</b>																									DIV							

Bit	Name	Reset	Access	Description
31:9	Reserved	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
8:0	DIV	0x000	RW	<b>Clock Divider</b> Specifies the clock divider for the I <sup>2</sup> C. Note that DIV must be 1 or higher when slave is enabled.

### 14.5.6 I2Cn\_SADDR - Slave Address Register

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x00							
<b>Access</b>																									RW							
<b>Name</b>																									ADDR							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
7:1	ADDR	0x00	RW	<b>Slave address</b> Specifies the slave address of the device.
0	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		

### 14.5.7 I2Cn\_SADDRMASK - Slave Address Mask Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x00							
<b>Access</b>																									RW							
<b>Name</b>																									MASK							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
7:1	MASK	0x00	RW	<b>Slave Address Mask</b> Specifies the significant bits of the slave address. Setting the mask to 0x00 will match all addresses, while setting it to 0x7F will only match the exact address specified by ADDR.
0	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		

### 14.5.8 I2Cn\_RXDATA - Receive Buffer Data Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x00							
<b>Access</b>																									R							
<b>Name</b>																									RXDATA							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
7:0	RXDATA	0x00	R	<b>RX Data</b> Use this register to read from the receive buffer. Buffer is emptied on read access.

Bit	Name	Reset	Access	Description
				Set on each clock low timeout. The timeout value can be set in CLTO bit field in the I2Cn_CTRL register.
14	BITO	0	R	<b>Bus Idle Timeout Interrupt Flag</b> Set on each bus idle timeout. The timeout value can be set in the BITO bit field in the I2Cn_CTRL register.
13	RXUF	0	R	<b>Receive Buffer Underflow Interrupt Flag</b> Set when data is read from the receive buffer through the I2Cn_RXDATA register while the receive buffer is empty.
12	TXOF	0	R	<b>Transmit Buffer Overflow Interrupt Flag</b> Set when data is written to the transmit buffer while the transmit buffer is full.
11	BUSHOLD	0	R	<b>Bus Held Interrupt Flag</b> Set when the bus becomes held by the I <sup>2</sup> C module.
10	BUSERR	0	R	<b>Bus Error Interrupt Flag</b> Set when a bus error is detected. The bus error is resolved automatically, but the current transfer is aborted.
9	ARBLOST	0	R	<b>Arbitration Lost Interrupt Flag</b> Set when arbitration is lost.
8	MSTOP	0	R	<b>Master STOP Condition Interrupt Flag</b> Set when a STOP condition has been successfully transmitted. If arbitration is lost during the transmission of the STOP condition, then the MSTOP interrupt flag is not set.
7	NACK	0	R	<b>Not Acknowledge Received Interrupt Flag</b> Set when a NACK has been received.
6	ACK	0	R	<b>Acknowledge Received Interrupt Flag</b> Set when an ACK has been received.
5	RXDATAV	0	R	<b>Receive Data Valid Interrupt Flag</b> Set when data is available in the receive buffer. Cleared automatically when the receive buffer is read.
4	TXBL	1	R	<b>Transmit Buffer Level Interrupt Flag</b> Set when the transmit buffer becomes empty. Cleared automatically when new data is written to the transmit buffer.
3	TXC	0	R	<b>Transfer Completed Interrupt Flag</b> Set when the transmit shift register becomes empty and there is no more data in the transmit buffer.
2	ADDR	0	R	<b>Address Interrupt Flag</b> Set when incoming address is accepted, i.e. own address or general call address is received.
1	RSTART	0	R	<b>Repeated START condition Interrupt Flag</b> Set when a repeated start condition is detected.
0	START	0	R	<b>START condition Interrupt Flag</b> Set when a start condition is successfully transmitted.

### 14.5.12 I2Cn\_IFS - Interrupt Flag Set Register

# 15 USART - Universal Synchronous Asynchronous Receiver/Transmitter

## Quick Facts

### What?

The USART handles high-speed UART, SPI-bus, SmartCards, and IrDA communication.

### Why?

Serial communication is frequently used in embedded systems and the USART allows efficient communication with a wide range of external devices.

### How?

The USART has a wide selection of operating modes, frame formats and baud rates. The multi-processor mode allows the USART to remain idle when not addressed. Triple buffering and DMA support makes high data-rates possible with minimal CPU intervention and it is possible to transmit and receive large frames while the MCU remains in EM1.

## 15.1 Introduction

The Universal Synchronous Asynchronous serial Receiver and Transmitter (USART) is a very flexible serial I/O module. It supports full duplex asynchronous UART communication as well as RS-485, SPI, MicroWire and 3-wire. It can also interface with ISO7816 SmartCards, and IrDA devices.

## 15.2 Features

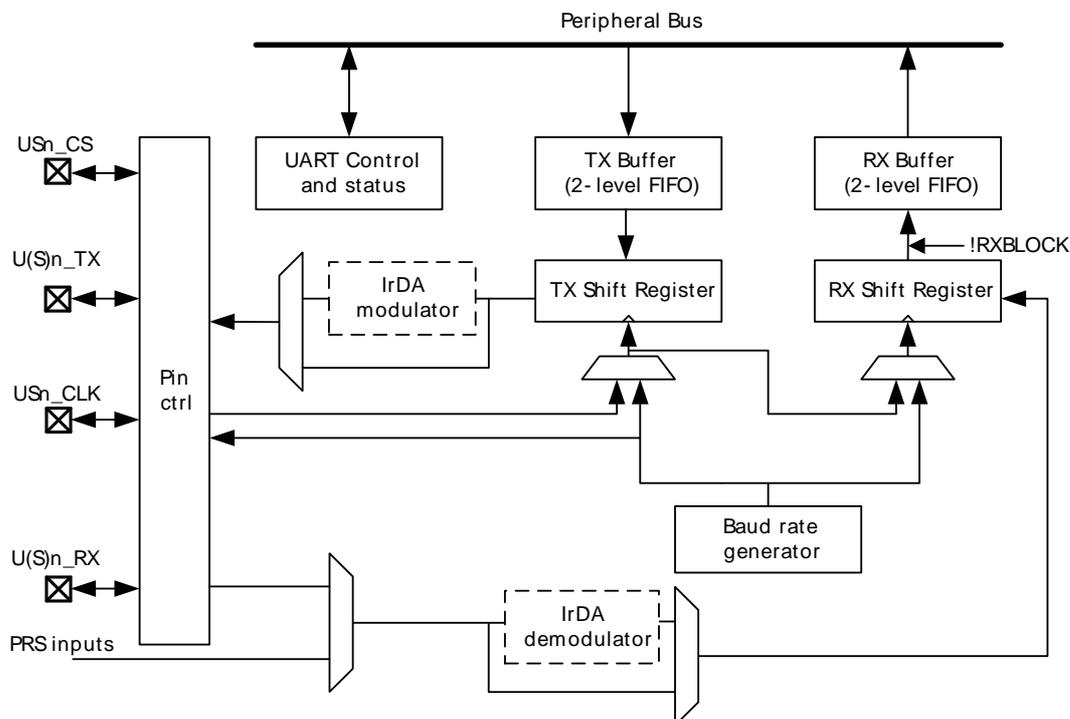

- Asynchronous and synchronous (SPI) communication
- Full duplex and half duplex
- Separate TX/RX enable
- Separate receive / transmit 2-level buffers, with additional separate shift registers
- Programmable baud rate, generated as an fractional division from the peripheral clock ( $\text{HFPERCLK}_{\text{USARTn}}$ )
- Max bit-rate
  - SPI master mode, peripheral clock rate/2
  - SPI slave mode, peripheral clock rate/8
  - UART mode, peripheral clock rate/16, 8, 6, or 4
- Asynchronous mode supports
  - Majority vote baud-reception
  - False start-bit detection
  - Break generation/detection
  - Multi-processor mode
- Synchronous mode supports
  - All 4 SPI clock polarity/phase configurations
  - Master and slave mode
- Data can be transmitted LSB first or MSB first
- Configurable number of data bits, 4-16 (plus the parity bit, if enabled)

- HW parity bit generation and check
- Configurable number of stop bits in asynchronous mode: 0.5, 1, 1.5, 2
- HW collision detection
- Multi-processor mode
- IrDA modulator on USART1
- SmartCard (ISO7816) mode
- I2S mode
- Separate interrupt vectors for receive and transmit interrupts
- Loopback mode
  - Half duplex communication
  - Communication debugging
- PRS RX input

## 15.3 Functional Description

An overview of the USART module is shown in Figure 15.1 (p. 169) .

**Figure 15.1. USART Overview**

### 15.3.1 Modes of Operation

The USART operates in either asynchronous or synchronous mode.

In synchronous mode, a separate clock signal is transmitted with the data. This clock signal is generated by the bus master, and both the master and slave sample and transmit data according to this clock. Both master and slave modes are supported by the USART. The synchronous communication mode is compatible with the Serial Peripheral Interface Bus (SPI) standard.

In asynchronous mode, no separate clock signal is transmitted with the data on the bus. The USART receiver thus has to determine where to sample the data on the bus from the actual data. To make this possible, additional synchronization bits are added to the data when operating in asynchronous mode, resulting in a slight overhead.

Asynchronous or synchronous mode can be selected by configuring SYNC in USARTn\_CTRL. The options are listed with supported protocols in Table 15.1 (p. 170) . Full duplex and half duplex communication is supported in both asynchronous and synchronous mode.

**Table 15.1. USART Asynchronous vs. Synchronous Mode**

SYNC	Communication Mode	Supported Protocols
0	Asynchronous	RS-232, RS-485 (w/external driver), IrDA, ISO 7816
1	Synchronous	SPI, MicroWire, 3-wire

Table 15.2 (p. 170) explains the functionality of the different USART pins when the USART operates in different modes. Pin functionality enclosed in square brackets is optional, and depends on additional configuration parameters. LOOPBK and MASTER are discussed in Section 15.3.2.5 (p. 178) and Section 15.3.3.3 (p. 186) respectively.

**Table 15.2. USART Pin Usage**

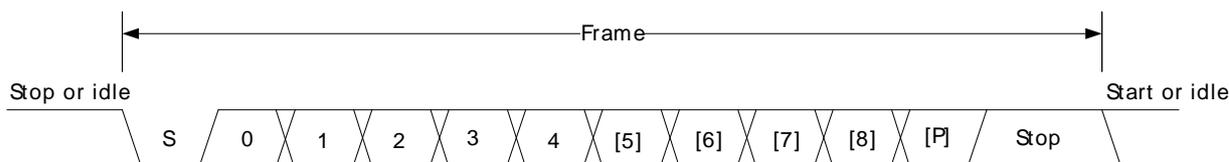

SYNC	LOOPBK	MASTER	Pin functionality			
			U(S)n_TX (MOSI)	U(S)n_RX (MISO)	USn_CLK	USn_CS
0	0	x	Data out	Data in	-	[Driver enable]
1	1	x	Data out/in	-	-	[Driver enable]
1	0	0	Data in	Data out	Clock in	Slave select
1	0	1	Data out	Data in	Clock out	[Auto slave select]
1	1	0	Data out/in	-	Clock in	Slave select
1	1	1	Data out/in	-	Clock out	[Auto slave select]

## 15.3.2 Asynchronous Operation

### 15.3.2.1 Frame Format

The frame format used in asynchronous mode consists of a set of data bits in addition to bits for synchronization and optionally a parity bit for error checking. A frame starts with one start-bit (S), where the line is driven low for one bit-period. This signals the start of a frame, and is used for synchronization. Following the start bit are 4 to 16 data bits and an optional parity bit. Finally, a number of stop-bits, where the line is driven high, end the frame. An example frame is shown in Figure 15.2 (p. 170) .

**Figure 15.2. USART Asynchronous Frame Format**

The number of data bits in a frame is set by DATABITS in USARTn\_FRAME, see Table 15.3 (p. 171) , and the number of stop-bits is set by STOPBITS in USARTn\_FRAME, see Table 15.4 (p. 171) . Whether or not a parity bit should be included, and whether it should be even or odd is defined by PARITY, also in USARTn\_FRAME. For communication to be possible, all parties of an asynchronous transfer must agree on the frame format being used.

**Table 15.3. USART Data Bits**

DATA BITS [3:0]	Number of Data bits
0001	4
0010	5
0011	6
0100	7
0101	8 (Default)
0110	9
0111	10
1000	11
1001	12
1010	13
1011	14
1100	15
1101	16

**Table 15.4. USART Stop Bits**

STOP BITS [1:0]	Number of Stop bits
00	0.5
01	1 (Default)
10	1.5
11	2

The order in which the data bits are transmitted and received is defined by MSBF in USARTn\_CTRL. When MSBF is cleared, data in a frame is sent and received with the least significant bit first. When it is set, the most significant bit comes first.

The frame format used by the transmitter can be inverted by setting TXINV in USARTn\_CTRL, and the format expected by the receiver can be inverted by setting RXINV in USARTn\_CTRL. These bits affect the entire frame, not only the data bits. An inverted frame has a low idle state, a high start-bit, inverted data and parity bits, and low stop-bits.

### 15.3.2.1.1 Parity bit Calculation and Handling

When parity bits are enabled, hardware automatically calculates and inserts any parity bits into outgoing frames, and verifies the received parity bits in incoming frames. This is true for both asynchronous and synchronous modes, even though it is mostly used in asynchronous communication. The possible parity modes are defined in Table 15.5 (p. 172). When even parity is chosen, a parity bit is inserted to make the number of high bits (data + parity) even. If odd parity is chosen, the parity bit makes the total number of high bits odd.

**Table 15.5. USART Parity Bits**

STOP BITS [1:0]	Description
00	No parity bit (Default)
01	Reserved
10	Even parity
11	Odd parity

### 15.3.2.2 Clock Generation

The USART clock defines the transmission and reception data rate. When operating in asynchronous mode, the baud rate (bit-rate) is given by Equation 15.1 (p. 172)

#### USART Baud Rate

$$br = f_{\text{HUPERCLK}} / (\text{oversample} \times (1 + \text{USARTn\_CLKDIV}/256)) \tag{15.1}$$

where  $f_{\text{HUPERCLK}}$  is the peripheral clock ( $\text{HUPERCLK}_{\text{USARTn}}$ ) frequency and oversample is the oversampling rate as defined by OVS in  $\text{USARTn\_CTRL}$ , see Table 15.6 (p. 172) .

**Table 15.6. USART Oversampling**

OVS [1:0]	oversample
00	16
01	8
10	6
11	4

The USART has a fractional clock divider to allow the USART clock to be controlled more accurately than what is possible with a standard integral divider.

The clock divider used in the USART is a 15-bit value, with a 13-bit integral part and a 2-bit fractional part. The fractional part is configured in the two LSBs of DIV in  $\text{USART\_CLKDIV}$ . The lowest achievable baud rate at 32 MHz is about 244 bauds/sec.

Fractional clock division is implemented by distributing the selected fraction over four baud periods. The fractional part of the divider tells how many of these periods should be extended by one peripheral clock cycle.

Given a desired baud rate  $br_{\text{desired}}$ , the clock divider  $\text{USARTn\_CLKDIV}$  can be calculated by using Equation 15.2 (p. 172) :

#### USART Desired Baud Rate

$$\text{USARTn\_CLKDIV} = 256 \times (f_{\text{HUPERCLK}} / (\text{oversample} \times br_{\text{desired}}) - 1) \tag{15.2}$$

Table 15.7 (p. 173) shows a set of desired baud rates and how accurately the USART is able to generate these baud rates when running at a 4 MHz peripheral clock, using 16x or 8x oversampling.

**Table 15.7. USART Baud Rates @ 4MHz Peripheral Clock**

Desired baud rate [baud/s]	USARTn_OVS =00			USARTn_OVS =01		
	USARTn_CLKDIV/256	Actual baud rate [baud/s]	Error %	USARTn_CLKDIV/256	Actual baud rate [baud/s]	Error %
600	415,75	599,88	-0,02	832,25	600,06	0,01
1200	207,25	1200,48	0,04	415,75	1199,76	-0,02
2400	103,25	2398,082	-0,08	207,25	2400,96	0,04
4800	51	4807,692	0,16	103,25	4796,163	-0,08
9600	25	9615,385	0,16	51	9615,385	0,16
14400	16,25	14492,75	0,64	33,75	14388,49	-0,08
19200	12	19230,77	0,16	25	19230,77	0,16
28800	7,75	28571,43	-0,79	16,25	28985,51	0,64
38400	5,5	38461,54	0,16	12	38461,54	0,16
57600	3,25	58823,53	2,12	7,75	57142,86	-0,79
76800	2,25	76923,08	0,16	5,5	76923,08	0,16
115200	1,25	111111,1	-3,55	3,25	117647,1	2,12
230400	0	250000	8,51	1,25	222222,2	-3,55

### 15.3.2.3 Data Transmission

Asynchronous data transmission is initiated by writing data to the transmit buffer using one of the methods described in Section 15.3.2.3.1 (p. 173). When the transmission shift register is empty and ready for new data, a frame from the transmit buffer is loaded into the shift register, and if the transmitter is enabled, transmission begins. When the frame has been transmitted, a new frame is loaded into the shift register if available, and transmission continues. If the transmit buffer is empty, the transmitter goes to an idle state, waiting for a new frame to become available.

Transmission is enabled through the command register USARTn\_CMD by setting TXEN, and disabled by setting TXDIS in the same command register. When the transmitter is disabled using TXDIS, any ongoing transmission is aborted, and any frame currently being transmitted is discarded. When disabled, the TX output goes to an idle state, which by default is a high value. Whether or not the transmitter is enabled at a given time can be read from TXENS in USARTn\_STATUS.

When the USART transmitter is enabled and there is no data in the transmit shift register or transmit buffer, the TXC flag in USARTn\_STATUS and the TXC interrupt flag in USARTn\_IF are set, signaling that the transmitter is idle. The TXC status flag is cleared when a new frame becomes available for transmission, but the TXC interrupt flag must be cleared by software.

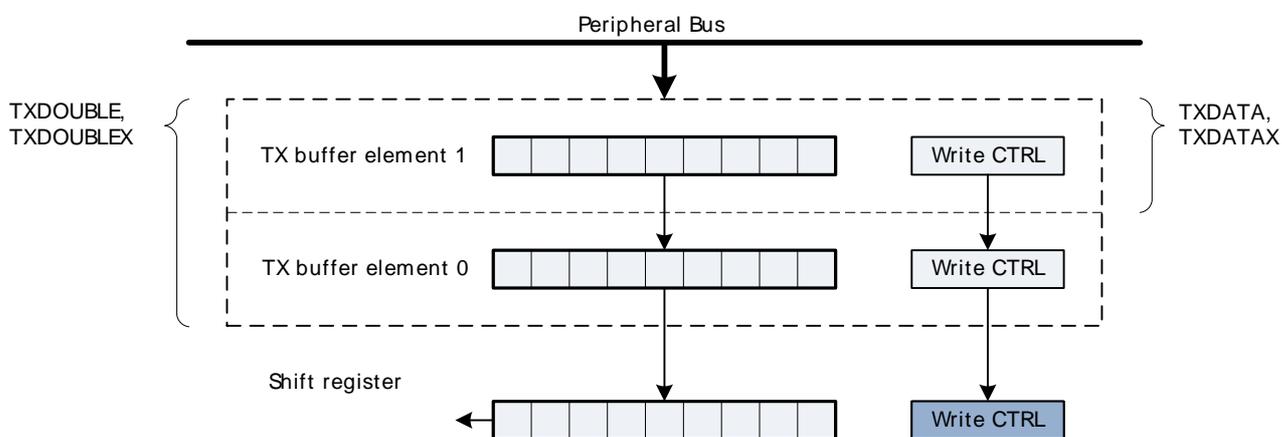

#### 15.3.2.3.1 Transmit Buffer Operation

The transmit-buffer is a 2-level FIFO buffer. A frame can be loaded into the buffer by writing to USARTn\_TXDATA, USARTn\_TXDATAx, USARTn\_TXDOUBLE or USARTn\_TXDOUBLEX. Using USARTn\_TXDATA allows 8 bits to be written to the buffer, while using USARTn\_TXDOUBLE will write 2 frames of 8 bits to the buffer. If 9-bit frames are used, the 9th bit of the frames will in these cases be set to the value of BIT8DV in USARTn\_CTRL.

To set the 9th bit directly and/or use transmission control, USARTn\_TXDATAx and USARTn\_TXDOUBLEX must be used. USARTn\_TXDATAx allows 9 data bits to be written, as well as a set of control bits regarding the transmission of the written frame. Every frame in the buffer is stored with 9 data bits and additional transmission control bits. USARTn\_TXDOUBLEX allows two

frames, complete with control bits to be written at once. When data is written to the transmit buffer using USARTn\_TXDATA and USARTn\_TXDOUBLEX, the 9th bit(s) written to these registers override the value in BIT8DV in USARTn\_CTRL, and alone define the 9th bits that are transmitted if 9-bit frames are used. Figure 15.3 (p. 174) shows the basics of the transmit buffer when DATABITS in USARTn\_FRAME is configured to less than 10 bits.

**Figure 15.3. USART Transmit Buffer Operation**

When writing more frames to the transmit buffer than there is free space for, the TXOF interrupt flag in USARTn\_IF will be set, indicating the overflow. The data already in the transmit buffer is preserved in this case, and no data is written.

In addition to the interrupt flag TXC in USARTn\_IF and status flag TXC in USARTn\_STATUS which are set when the transmitter is idle, TXBL in USARTn\_STATUS and the TXBL interrupt flag in USARTn\_IF are used to indicate the level of the transmit buffer. TXBIL in USARTn\_CTRL controls the level at which these bits are set. If TXBIL is cleared, they are set whenever the transmit buffer becomes empty, and if TXBIL is set, they are set whenever the transmit buffer goes from full to half-full or empty. Both the TXBL status flag and the TXBL interrupt flag are cleared automatically when their condition becomes false.

The transmit buffer, including the transmit shift register can be cleared by setting CLEARTX in USARTn\_CMD. This will prevent the USART from transmitting the data in the buffer and shift register, and will make them available for new data. Any frame currently being transmitted will not be aborted. Transmission of this frame will be completed.

### 15.3.2.3.2 Frame Transmission Control

The transmission control bits, which can be written using USARTn\_TXDATA and USARTn\_TXDOUBLEX, affect the transmission of the written frame. The following options are available:

- **Generate break:** By setting TXBREAK, the output will be held low during the stop-bit period to generate a framing error. A receiver that supports break detection detects this state, allowing it to be used e.g. for framing of larger data packets. The line is driven high before the next frame is transmitted so the next start condition can be identified correctly by the recipient. Continuous breaks lasting longer than a USART frame are thus not supported by the USART. GPIO can be used for this.
- **Disable transmitter after transmission:** If TXDISAT is set, the transmitter is disabled after the frame has been fully transmitted.
- **Enable receiver after transmission:** If RXENAT is set, the receiver is enabled after the frame has been fully transmitted. It is enabled in time to detect a start-bit directly after the last stop-bit has been transmitted.
- **Unblock receiver after transmission:** If UBRXAT is set, the receiver is unblocked and RXBLOCK is cleared after the frame has been fully transmitted.

- Tristate transmitter after transmission: If TXTRIAT is set, TXTRI is set after the frame has been fully transmitted, tristating the transmitter output. Tristating of the output can also be performed automatically by setting AUTOTRI. If AUTOTRI is set TXTRI is always read as 0.

**Note**

When in SmartCard mode with repeat enabled, none of the actions, except generate break, will be performed until the frame is transmitted without failure. Generation of a break in SmartCard mode with repeat enabled will cause the USART to detect a NACK on every frame.

### 15.3.2.4 Data Reception

Data reception is enabled by setting RXEN in USARTn\_CMD. When the receiver is enabled, it actively samples the input looking for a transition from high to low indicating the start baud of a new frame. When a start baud is found, reception of the new frame begins if the receive shift register is empty and ready for new data. When the frame has been received, it is pushed into the receive buffer, making the shift register ready for another frame of data, and the receiver starts looking for another start baud. If the receive buffer is full, the received frame remains in the shift register until more space in the receive buffer is available. If an incoming frame is detected while both the receive buffer and the receive shift register are full, the data in the shift register is overwritten, and the RXOF interrupt flag in USARTn\_IF is set to indicate the buffer overflow.

The receiver can be disabled by setting the command bit RXDIS in USARTn\_CMD. Any frame currently being received when the receiver is disabled is discarded. Whether or not the receiver is enabled at a given time can be read out from RXENS in USARTn\_STATUS.

#### 15.3.2.4.1 Receive Buffer Operation

When data becomes available in the receive buffer, the RXDATAV flag in USARTn\_STATUS, and the RXDATAV interrupt flag in USARTn\_IF are set, and when the buffer becomes full, RXFULL in USARTn\_STATUS and the RXFULL interrupt flag in USARTn\_IF are set. The status flags RXDATAV and RXFULL are automatically cleared by hardware when their condition is no longer true. This also goes for the RXDATAV interrupt flag, but the RXFULL interrupt flag must be cleared by software. When the RXFULL flag is set, notifying that the buffer is full, space is still available in the receive shift register for one more frame.

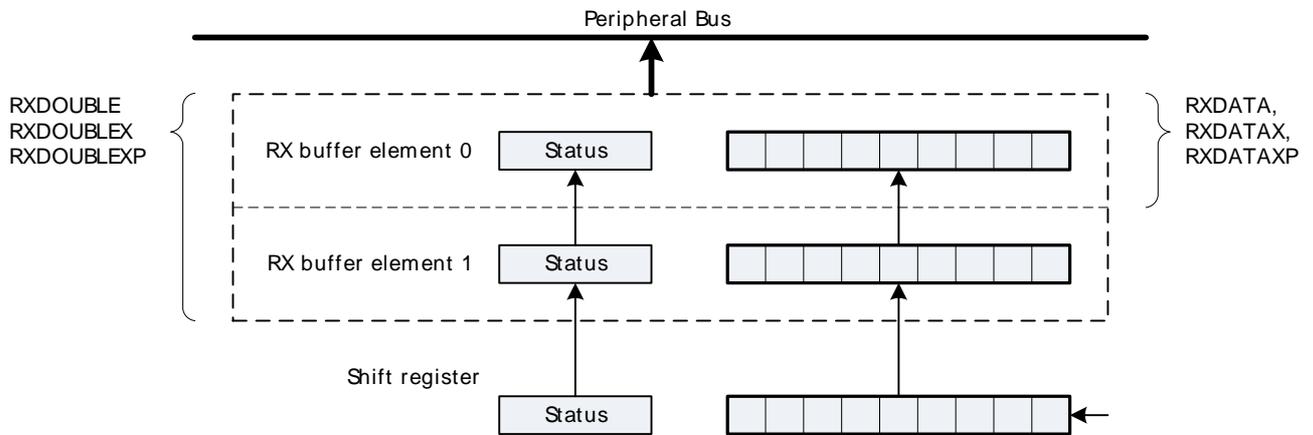

Data can be read from the receive buffer in a number of ways. USARTn\_RXDATA gives access to the 8 least significant bits of the received frame, and USARTn\_RXDOUBLE makes it possible to read the 8 least significant bits of two frames at once, pulling two frames from the buffer. To get access to the 9th, most significant bit, USARTn\_RXDATA\_X must be used. This register also contains status information regarding the frame. USARTn\_RXDOUBLE\_X can be used to get two frames complete with the 9th bits and status bits.

When a frame is read from the receive buffer using USARTn\_RXDATA or USARTn\_RXDATA\_X, the frame is pulled out of the buffer, making room for a new frame. USARTn\_RXDOUBLE and USARTn\_RXDOUBLE\_X pull two frames out of the buffer. If an attempt is done to read more frames from the buffer than what is available, the RXUF interrupt flag in USARTn\_IF is set to signal the underflow, and the data read from the buffer is undefined.

Frames can be read from the receive buffer without removing the data by using USARTn\_RXDATA\_XP and USARTn\_RXDOUBLE\_XP. USARTn\_RXDATA\_XP gives access the first frame in the buffer with status bits, while USARTn\_RXDOUBLE\_XP gives access to both frames with status bits. The data read from these registers when the receive buffer is empty is undefined. If the receive buffer contains one valid frame, the first frame in USARTn\_RXDOUBLE\_XP will be valid. No underflow interrupt is generated by a read using these registers, i.e. RXUF in USARTn\_IF is never set as a result of reading from USARTn\_RXDATA\_XP or USARTn\_RXDOUBLE\_XP.

The basic operation of the receive buffer when DATABITS in USARTn\_FRAME is configured to less than 10 bits is shown in Figure 15.4 (p. 176) .

**Figure 15.4. USART Receive Buffer Operation**

The receive buffer, including the receive shift register can be cleared by setting CLEARRX in USARTn\_CMD. Any frame currently being received will not be discarded.

**15.3.2.4.2 Blocking Incoming Data**

When using hardware frame recognition, as detailed in Section 15.3.2.8 (p. 182) and Section 15.3.2.9 (p. 183), it is necessary to be able to let the receiver sample incoming frames without passing the frames to software by loading them into the receive buffer. This is accomplished by blocking incoming data.

Incoming data is blocked as long as RXBLOCK in USARTn\_STATUS is set. When blocked, frames received by the receiver will not be loaded into the receive buffer, and software is not notified by the RXDATAV flag in USARTn\_STATUS or the RXDATAV interrupt flag in USARTn\_IF at their arrival. For data to be loaded into the receive buffer, RXBLOCK must be cleared in the instant a frame is fully received by the receiver. RXBLOCK is set by setting RXBLOCKEN in USARTn\_CMD and disabled by setting RXBLOCKDIS also in USARTn\_CMD. There is one exception where data is loaded into the receive buffer even when RXBLOCK is set. This is when an address frame is received when operating in multi-processor mode. See Section 15.3.2.8 (p. 182) for more information.

Frames received containing framing or parity errors will not result in the FERR and PERR interrupt flags in USARTn\_IF being set while RXBLOCK in USARTn\_STATUS is set. Hardware recognition is not applied to these erroneous frames, and they are silently discarded.

**Note**

If a frame is received while RXBLOCK in USARTn\_STATUS is cleared, but stays in the receive shift register because the receive buffer is full, the received frame will be loaded into the receive buffer when space becomes available even if RXBLOCK is set at that time.

The overflow interrupt flag RXOF in USARTn\_IF will be set if a frame in the receive shift register, waiting to be loaded into the receive buffer is overwritten by an incoming frame even though RXBLOCK in USARTn\_STATUS is set.

**15.3.2.4.3 Clock Recovery and Filtering**

The receiver samples the incoming signal at a rate 16, 8, 6 or 4 times higher than the given baud rate, depending on the oversampling mode given by OVS in USARTn\_CTRL. Lower oversampling rates make higher baud rates possible, but give less room for errors.

When a high-to-low transition is registered on the input while the receiver is idle, this is recognized as a start-bit, and the baud rate generator is synchronized with the incoming frame.

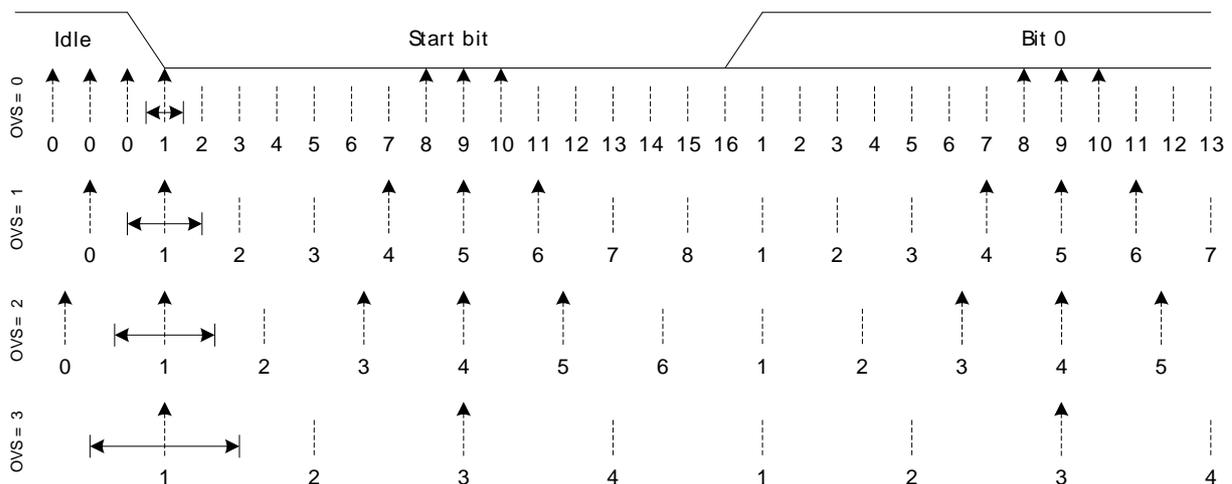

For oversampling modes 16, 8 and 6, every bit in the incoming frame is sampled three times to gain a level of noise immunity. These samples are aimed at the middle of the bit-periods, as visualized in Figure 15.5 (p. 177) . With OVS=0 in USARTn\_CTRL, the start and data bits are thus sampled at locations 8, 9 and 10 in the figure, locations 4, 5 and 6 for OVS=1 and locations 3, 4, and 5 for OVS=2. The value of a sampled bit is determined by majority vote. If two or more of the three bit-samples are high, the resulting bit value is high. If the majority is low, the resulting bit value is low.

Majority vote is used for all oversampling modes except 4x oversampling. In this mode, a single sample is taken at position 3 as shown in Figure 15.5 (p. 177) .

Majority vote can be disabled by setting MVDIS in USARTn\_CTRL.

If the value of the start bit is found to be high, the reception of the frame is aborted, filtering out false start bits possibly generated by noise on the input.

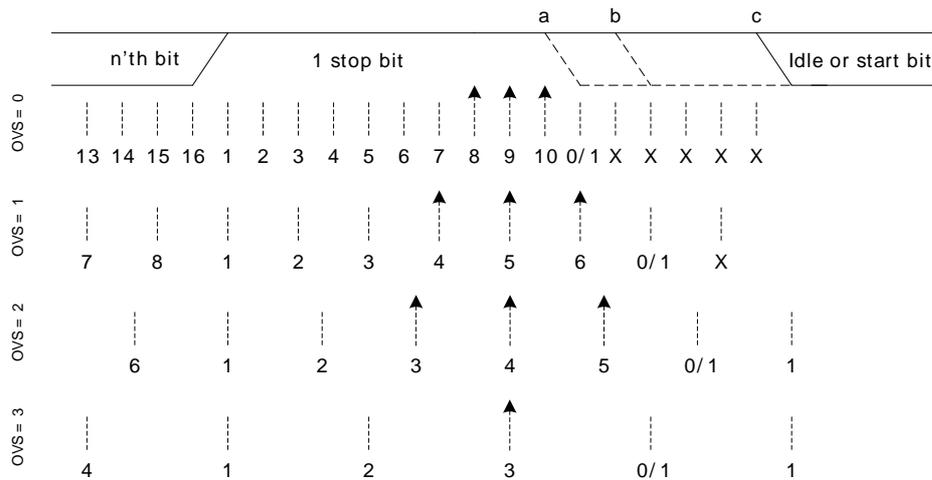

**Figure 15.5. USART Sampling of Start and Data Bits**

If the baud rate of the transmitter and receiver differ, the location each bit is sampled will be shifted towards the previous or next bit in the frame. This is acceptable for small errors in the baud rate, but for larger errors, it will result in transmission errors.

When the number of stop bits is 1 or more, stop bits are sampled like the start and data bits as seen in Figure 15.6 (p. 178) . When a stop bit has been detected by sampling at positions 8, 9 and 10 for normal mode, or 4, 5 and 6 for smart mode, the USART is ready for a new start bit. As seen in Figure 15.6 (p. 178) , a stop-bit of length 1 normally ends at c, but the next frame will be received correctly as long as the start-bit comes after position a for OVS=0 and OVS=3, and b for OVS=1 and OVS=2.

Figure 15.6. USART Sampling of Stop Bits when Number of Stop Bits are 1 or More

When working with stop bit lengths of half a baud period, the above sampling scheme no longer suffices. In this case, the stop-bit is not sampled, and no framing error is generated in the receiver if the stop-bit is not generated. The line must still be driven high before the next start bit however for the USART to successfully identify the start bit.

**15.3.2.4.4 Parity Error**

When parity bits are enabled, a parity check is automatically performed on incoming frames. When a parity error is detected in an incoming frame, the data parity error bit PERR in the frame is set, as well as the interrupt flag PERR in USARTn\_IF. Frames with parity errors are loaded into the receive buffer like regular frames.

PERR can be accessed by reading the frame from the receive buffer using the USARTn\_RXDATAx, USARTn\_RXDATAxP, USARTn\_RXDOUBLEx or USARTn\_RXDOUBLExP registers.

If ERRSTX in USARTn\_CTRL is set, the transmitter is disabled on received parity and framing errors. If ERRSRX in USARTn\_CTRL is set, the receiver is disabled on parity and framing errors.

**15.3.2.4.5 Framing Error and Break Detection**

A framing error is the result of an asynchronous frame where the stop bit was sampled to a value of 0. This can be the result of noise and baud rate errors, but can also be the result of a break generated by the transmitter on purpose.

When a framing error is detected in an incoming frame, the framing error bit FERR in the frame is set. The interrupt flag FERR in USARTn\_IF is also set. Frames with framing errors are loaded into the receive buffer like regular frames.

FERR can be accessed by reading the frame from the receive buffer using the USARTn\_RXDATAx, USARTn\_RXDATAxP, USARTn\_RXDOUBLEx or USARTn\_RXDOUBLExP registers.

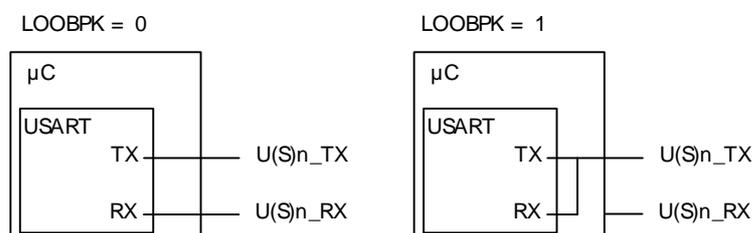

If ERRSTX in USARTn\_CTRL is set, the transmitter is disabled on parity and framing errors. If ERRSRX in USARTn\_CTRL is set, the receiver is disabled on parity and framing errors.

**15.3.2.5 Local Loopback**

The USART receiver samples U(S)n\_RX by default, and the transmitter drives U(S)n\_TX by default. This is not the only option however. When LOOPBK in USARTn\_CTRL is set, the receiver is connected to the U(S)n\_TX pin as shown in Figure 15.7 (p. 179) . This is useful for debugging, as the USART

can receive the data it transmits, but it is also used to allow the USART to read and write to the same pin, which is required for some half duplex communication modes. In this mode, the U(S)n\_TX pin must be enabled as an output in the GPIO.

**Figure 15.7. USART Local Loopback**

### 15.3.2.6 Asynchronous Half Duplex Communication

When doing full duplex communication, two data links are provided, making it possible for data to be sent and received at the same time. In half duplex mode, data is only sent in one direction at a time. There are several possible half duplex setups, as described in the following sections.

#### 15.3.2.6.1 Single Data-link

In this setup, the USART both receives and transmits data on the same pin. This is enabled by setting LOOPBK in USARTn\_CTRL, which connects the receiver to the transmitter output. Because they are both connected to the same line, it is important that the USART transmitter does not drive the line when receiving data, as this would corrupt the data on the line.

When communicating over a single data-link, the transmitter must thus be tristated whenever not transmitting data. This is done by setting the command bit TXTRIEN in USARTn\_CMD, which tristates the transmitter. Before transmitting data, the command bit TXTRIDIS, also in USARTn\_CMD, must be set to enable transmitter output again. Whether or not the output is tristated at a given time can be read from TXTRI in USARTn\_STATUS. If TXTRI is set when transmitting data, the data is shifted out of the shift register, but is not put out on U(S)n\_TX.

When operating a half duplex data bus, it is common to have a bus master, which first transmits a request to one of the bus slaves, then receives a reply. In this case, the frame transmission control bits, which can be set by writing to USARTn\_TXDATAx, can be used to make the USART automatically disable transmission, tristate the transmitter and enable reception when the request has been transmitted, making it ready to receive a response from the slave.

Tristating the transmitter can also be performed automatically by the USART by using AUTOTRI in USARTn\_CTRL. When AUTOTRI is set, the USART automatically tristates U(S)n\_TX whenever the transmitter is idle, and enables transmitter output when the transmitter goes active. If AUTOTRI is set TXTRI is always read as 0.

#### Note

Another way to tristate the transmitter is to enable wired-and or wired-or mode in GPIO. For wired-and mode, outputting a 1 will be the same as tristating the output, and for wired-or mode, outputting a 0 will be the same as tristating the output. This can only be done on buses with a pull-up or pull-down resistor respectively.

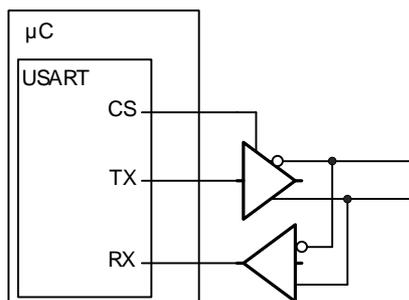

#### 15.3.2.6.2 Single Data-link with External Driver

Some communication schemes, such as RS-485 rely on an external driver. Here, the driver has an extra input which enables it, and instead of tristating the transmitter when receiving data, the external driver must be disabled.

This can be done manually by assigning a GPIO to turn the driver on or off, or it can be handled automatically by the USART. If AUTOCS in USARTn\_CTRL is set, the USn\_CS output is automatically activated one baud period before the transmitter starts transmitting data, and deactivated when the last bit has been transmitted and there is no more data in the transmit buffer to transmit, or the transmitter becomes disabled. This feature can be used to turn the external driver on when transmitting data, and turn it off when the data has been transmitted.

Figure 15.8 (p. 180) shows an example configuration where USn\_CS is used to automatically enable and disable an external driver.

**Figure 15.8. USART Half Duplex Communication with External Driver**

The USn\_CS output is active low by default, but its polarity can be changed with CSINV in USARTn\_CTRL. AUTOCS works regardless of which mode the USART is in, so this functionality can also be used for automatic chip/slave select when in synchronous mode (e.g. SPI).

### 15.3.2.6.3 Two Data-links

Some limited devices only support half duplex communication even though two data links are available. In this case software is responsible for making sure data is not transmitted when incoming data is expected.

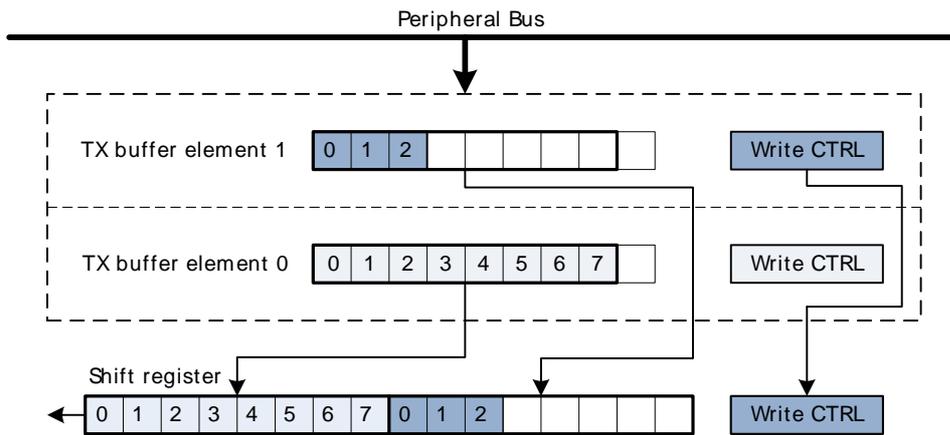

### 15.3.2.7 Large Frames

As each frame in the transmit and receive buffers holds a maximum of 9 bits, both the elements in the buffers are combined when working with USART-frames of 10 or more data bits.

To transmit such a frame, at least two elements must be available in the transmit buffer. If only one element is available, the USART will wait for the second element before transmitting the combined frame. Both the elements making up the frame are consumed when transmitting such a frame.

When using large frames, the 9th bits in the buffers are unused. For an 11 bit frame, the 8 least significant bits are thus taken from the first element in the buffer, and the 3 remaining bits are taken from the second element as shown in Figure 15.9 (p. 181). The first element in the transmit buffer, i.e. element 0 in Figure 15.9 (p. 181) is the first element written to the FIFO, or the least significant byte when writing two bytes at a time using USARTn\_TXDOUBLE.

**Figure 15.9. USART Transmission of Large Frames**

As shown in Figure 15.9 (p. 181), frame transmission control bits are taken from the second element in FIFO.

The two buffer elements can be written at the same time using the USARTn\_TXDOUBLE or USARTn\_TXDOUBLEX register. The TXDATAx0 bitfield then refers to buffer element 0, and TXDATAx1 refers to buffer element 1.

**Figure 15.10. USART Transmission of Large Frames, MSBF**

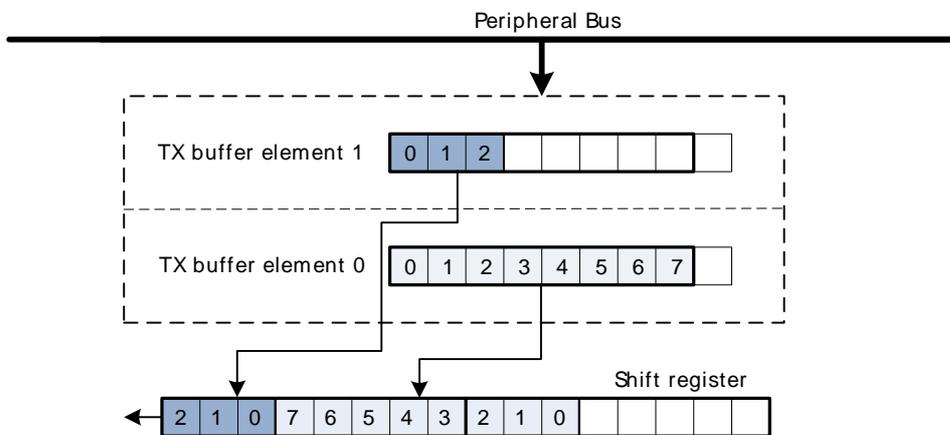

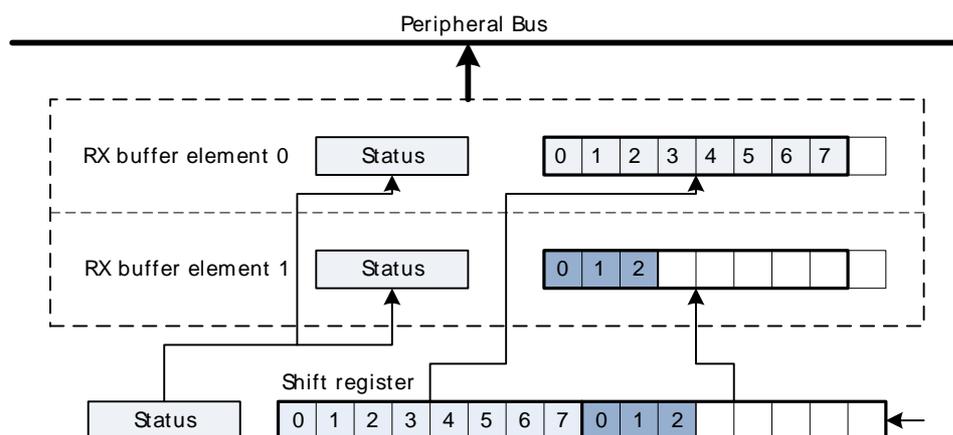

Figure 15.10 (p. 181) illustrates the order of the transmitted bits when an 11 bit frame is transmitted with MSBF set. If MSBF is set and the frame is smaller than 10 bits, only the contents of transmit buffer 0 will be transmitted.

When receiving a large frame, BYTESWAP in USARTn\_CTRL determines the order the way the large frame is split into the two buffer elements. If BYTESWAP is cleared, the least significant 8 bits of the received frame are loaded into the first element of the receive buffer, and the remaining bits are loaded into the second element, as shown in Figure 15.11 (p. 182). The first byte read from the buffer thus contains the 8 least significant bits. Set BYTESWAP to reverse the order.

The status bits are loaded into both elements of the receive buffer. The frame is not moved from the receive shift register before there are two free spaces in the receive buffer.

**Figure 15.11. USART Reception of Large Frames**

The two buffer elements can be read at the same time using the USARTn\_RXDOUBLE or USARTn\_RXDOUBLEX register. RXDATA0 then refers to buffer element 0 and RXDATA1 refers to buffer element 1.

Large frames can be used in both asynchronous and synchronous modes.

### 15.3.2.8 Multi-Processor Mode

To simplify communication between multiple processors, the USART supports a special multi-processor mode. In this mode the 9th data bit in each frame is used to indicate whether the content of the remaining 8 bits is data or an address.

When multi-processor mode is enabled, an incoming 9-bit frame with the 9th bit equal to the value of MPAB in USARTn\_CTRL is identified as an address frame. When an address frame is detected, the MPAF interrupt flag in USARTn\_IF is set, and the address frame is loaded into the receive register. This happens regardless of the value of RXBLOCK in USARTn\_STATUS.

Multi-processor mode is enabled by setting MPM in USARTn\_CTRL, and the value of the 9th bit in address frames can be set in MPAB. Note that the receiver must be enabled for address frames to be detected. The receiver can be blocked however, preventing data from being loaded into the receive buffer while looking for address frames.

Example 15.1 (p. 182) explains basic usage of the multi-processor mode:

#### **Example 15.1. USART Multi-processor Mode Example**

1. All slaves enable multi-processor mode and, enable and block the receiver. They will now not receive data unless it is an address frame. MPAB in USARTn\_CTRL is set to identify frames with the 9th bit high as address frames.
2. The master sends a frame containing the address of a slave and with the 9th bit set.
3. All slaves receive the address frame and get an interrupt. They can read the address from the receive buffer. The selected slave unblocks the receiver to start receiving data from the master.
4. The master sends data with the 9th bit cleared.
5. Only the slave with RX enabled receives the data. When transmission is complete, the slave blocks the receiver and waits for a new address frame.

When a slave has received an address frame and wants to receive the following data, it must make sure the receiver is unblocked before the next frame has been completely received in order to prevent data loss.

BIT8DV in USARTn\_CTRL can be used to specify the value of the 9th bit without writing to the transmit buffer with USARTn\_TXDATAx or USARTn\_TXDOUBLEx, giving higher efficiency in multi-processor mode, as the 9th bit is only set when writing address frames, and 8-bit writes to the USART can be used when writing the data frames.

### 15.3.2.9 Collision Detection

The USART supports a basic form of collision detection. When the receiver is connected to the output of the transmitter, either by using the LOOPBK bit in USARTn\_CTRL or through an external connection, this feature can be used to detect whether data transmitted on the bus by the USART did get corrupted by a simultaneous transmission by another device on the bus.

For collision detection to be enabled, CCEN in USARTn\_CTRL must be set, and the receiver enabled. The data sampled by the receiver is then continuously compared with the data output by the transmitter. If they differ, the CCF interrupt flag in USARTn\_IF is set. The collision check includes all bits of the transmitted frames. The CCF interrupt flag is set once for each bit sampled by the receiver that differs from the bit output by the transmitter. When the transmitter output is disabled, i.e. the transmitter is tristated, collisions are not registered.

### 15.3.2.10 SmartCard Mode

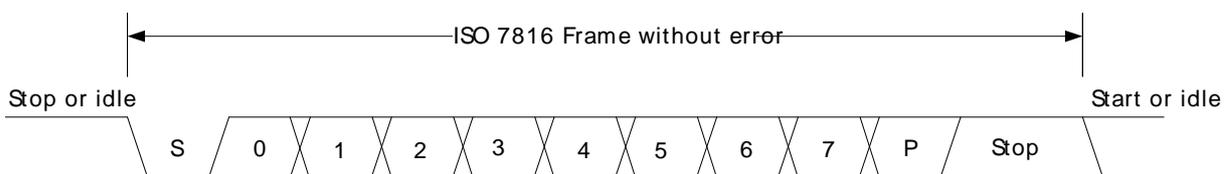

In SmartCard mode, the USART supports the ISO 7816 I/O line T0 mode. With exception of the stop-bits (guard time), the 7816 data frame is equal to the regular asynchronous frame. In this mode, the receiver pulls the line low for one baud, half a baud into the guard time to indicate a parity error. This NAK can for instance be used by the transmitter to re-transmit the frame. SmartCard mode is a half duplex asynchronous mode, so the transmitter must be tristated whenever not transmitting data.

To enable SmartCard mode, set SCMODE in USARTn\_CTRL, set the number of databits in a frame to 8, and configure the number of stopbits to 1.5 by writing to STOPBITS in USARTn\_FRAME.

The SmartCard mode relies on half duplex communication on a single line, so for it to work, both the receiver and transmitter must work on the same line. This can be achieved by setting LOOPBK in USARTn\_CTRL or through an external connection. The TX output should be configured as open-drain in the GPIO module.

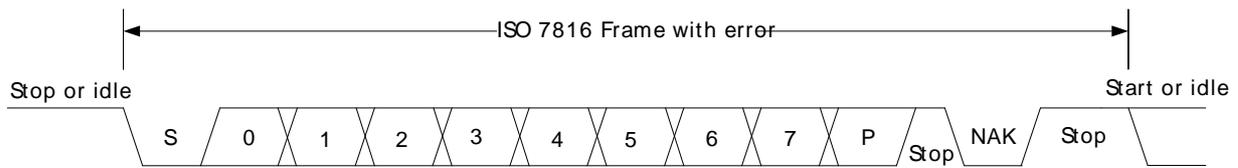

When no parity error is identified by the receiver, the data frame is as shown in Figure 15.12 (p. 183) . The frame consists of 8 data bits, a parity bit, and 2 stop bits. The transmitter does not drive the output line during the guard time.

**Figure 15.12. USART ISO 7816 Data Frame Without Error**

If a parity error is detected by the receiver, it pulls the line I/O line low after half a stop bit, see Figure 15.13 (p. 184) . It holds the line low for one bit-period before it releases the line. In this case, the guard time is extended by one bit period before a new transmission can start, resulting in a total of 3 stop bits.

Figure 15.13. USART ISO 7816 Data Frame With Error

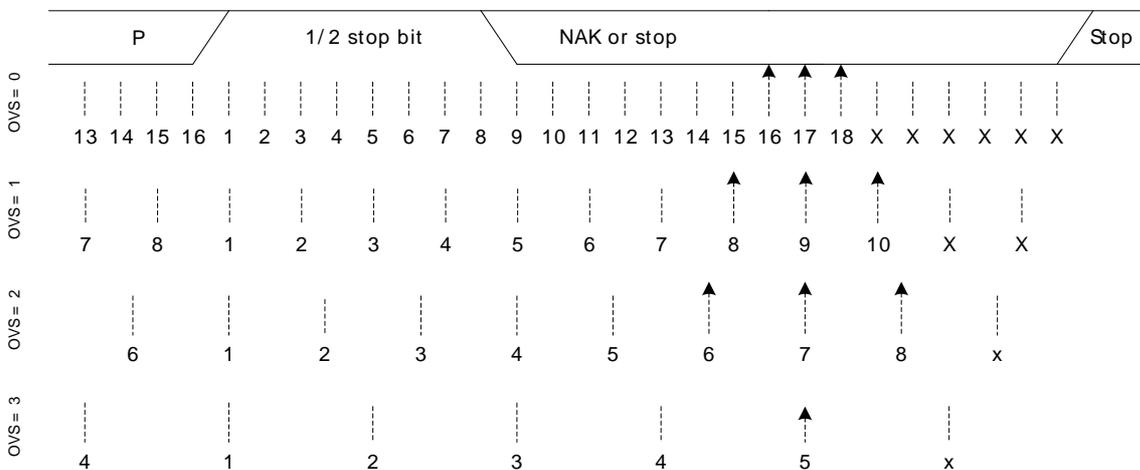

On a parity error, the NAK is generated by hardware. The NAK generated by the receiver is sampled as the stop-bit of the frame. Because of this, parity errors when in SmartCard mode are reported with both a parity error and a framing error.

When transmitting a T0 frame, the USART receiver on the transmitting side samples position 16, 17 and 18 in the stop-bit to detect the error signal when in 16x oversampling mode as shown in Figure 15.14 (p. 184) . Sampling at this location places the stop-bit sample in the middle of the bit-period used for the error signal (NAK).

If a NAK is transmitted by the receiver, it will thus appear as a framing error at the transmitter, and the FERR interrupt flag in USARTn\_IF will be set. If SCRETRANS USARTn\_CTRL is set, the transmitter will automatically retransmit a NACK'ed frame. The transmitter will retransmit the frame until it is ACK'ed by the receiver. This only works when the number of databits in a frame is configured to 8.

Set SKIPPERF in USARTn\_CTRL to make the receiver discard frames with parity errors. The PERR interrupt flag in USARTn\_IF is set when a frame is discarded because of a parity error.

Figure 15.14. USART SmartCard Stop Bit Sampling

For communication with a SmartCard, a clock signal needs to be generated for the card. This clock output can be generated using one of the timers. See the ISO 7816 specification for more info on this clock signal.

SmartCard T1 mode is also supported. The T1 frame format used is the same as the asynchronous frame format with parity bit enabled and one stop bit. The USART must then be configured to operate in asynchronous half duplex mode.

### 15.3.3 Synchronous Operation

Most of the features in asynchronous mode are available in synchronous mode. Multi-processor mode can be enabled for 9-bit frames, loopback is available and collision detection can be performed.

### 15.3.3.1 Frame Format

The frames used in synchronous mode need no start and stop bits since a single clock is available to all parts participating in the communication. Parity bits cannot be used in synchronous mode.

The USART supports frame lengths of 4 to 16 bits per frame. Larger frames can be simulated by transmitting multiple smaller frames, i.e. a 22 bit frame can be sent using two 11-bit frames, and a 21 bit frame can be generated by transmitting three 7-bit frames. The number of bits in a frame is set using DATABITS in USARTn\_FRAME.

The frames in synchronous mode are by default transmitted with the least significant bit first like in asynchronous mode. The bit-order can be reversed by setting MSBF in USARTn\_CTRL.

The frame format used by the transmitter can be inverted by setting TXINV in USARTn\_CTRL, and the format expected by the receiver can be inverted by setting RXINV, also in USARTn\_CTRL.

### 15.3.3.2 Clock Generation

The bit-rate in synchronous mode is given by Equation 15.3 (p. 185). As in the case of asynchronous operation, the clock division factor have a 13-bit integral part and a 2-bit fractional part.

#### USART Synchronous Mode Bit Rate

$$br = f_{\text{HFPERCLK}} / (2 \times (1 + \text{USARTn\_CLKDIV}/256)) \quad (15.3)$$

Given a desired baud rate  $br_{\text{desired}}$ , the clock divider USARTn\_CLKDIV can be calculated using Equation 15.4 (p. 185)

#### USART Synchronous Mode Clock Division Factor

$$\text{USARTn\_CLKDIV} = 256 \times (f_{\text{HFPERCLK}} / (2 \times br_{\text{desired}}) - 1) \quad (15.4)$$

When the USART operates in master mode, the highest possible bit rate is half the peripheral clock rate. When operating in slave mode however, the highest bit rate is an eighth of the peripheral clock:

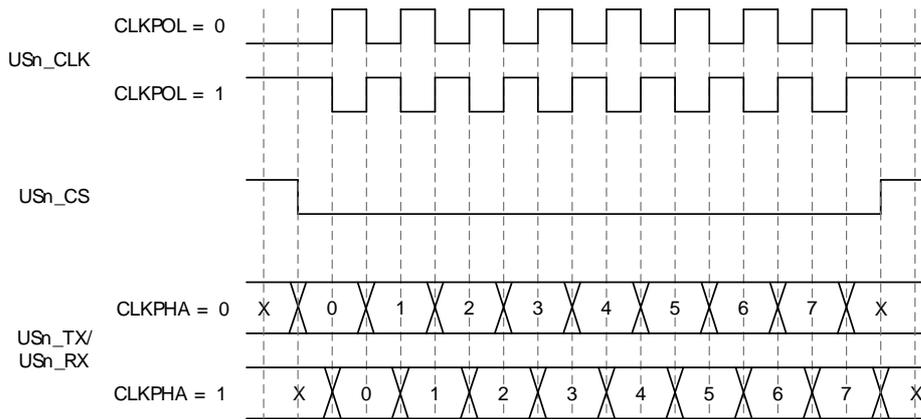

- Master mode:  $br_{\text{max}} = f_{\text{HFPERCLK}}/2$
- Slave mode:  $br_{\text{max}} = f_{\text{HFPERCLK}}/8$

On every clock edge data on the data lines, MOSI and MISO, is either set up or sampled. When CLKPHA in USARTn\_CTRL is cleared, data is sampled on the leading clock edge and set-up is done on the trailing edge. If CLKPHA is set however, data is set-up on the leading clock edge, and sampled on the trailing edge. In addition to this, the polarity of the clock signal can be changed by setting CLKPOL in USARTn\_CTRL, which also defines the idle state of the clock. This results in four different modes which are summarized in Table 15.8 (p. 185). Figure 15.15 (p. 186) shows the resulting timing of data set-up and sampling relative to the bus clock.

**Table 15.8. USART SPI Modes**

SPI mode	CLKPOL	CLKPHA	Leading edge	Trailing edge
0	0	0	Rising, sample	Falling, set-up
1	0	1	Rising, set-up	Falling, sample
2	1	0	Falling, sample	Rising, set-up
3	1	1	Falling, set-up	Rising, sample

Figure 15.15. USART SPI Timing

If CPHA=1, the TX underflow flag, TXUF, will be set on the first setup clock edge of a frame in slave mode if TX data is not available. If CPHA=0, TXUF is set if data is not available in the transmit buffer three HPPERCLK cycles prior to the first sample clock edge. The RXDATAV flag is updated on the last sample clock edge of a transfer, while the RX overflow interrupt flag, RXOF, is set on the first sample clock edge if the receive buffer overflows. When a transfer has been performed, interrupt flags TXBL and TXC are updated on the first setup clock edge of the succeeding frame, or when CS is deasserted.

### 15.3.3.3 Master Mode

When in master mode, the USART is in full control of the data flow on the synchronous bus. When operating in full duplex mode, the slave cannot transmit data to the master without the master transmitting to the slave. The master outputs the bus clock on USn\_CLK.

Communication starts whenever there is data in the transmit buffer and the transmitter is enabled. The USART clock then starts, and the master shifts bits out from the transmit shift register using the internal clock.

When there are no more frames in the transmit buffer and the transmit shift register is empty, the clock stops, and communication ends. When the receiver is enabled, it samples data using the internal clock when the transmitter transmits data. Operation of the RX and TX buffers is as in asynchronous mode.

#### 15.3.3.3.1 Operation of USn\_CS Pin

When operating in master mode, the USn\_CS pin can have one of two functions, or it can be disabled.

If USn\_CS is configured as an output, it can be used to automatically generate a chip select for a slave by setting AUTOCS in USARTn\_CTRL. If AUTOCS is set, USn\_CS is activated when a transmission begins, and deactivated directly after the last bit has been transmitted and there is no more data in the transmit buffer. By default, USn\_CS is active low, but its polarity can be inverted by setting CSINV in USARTn\_CTRL.

When USn\_CS is configured as an input, it can be used by another master that wants control of the bus to make the USART release it. When USn\_CS is driven low, or high if CSINV is set, the interrupt flag SSM in USARTn\_IF is set, and if CSMA in USARTn\_CTRL is set, the USART goes to slave mode.

#### 15.3.3.3.2 AUTOTX

A synchronous master is required to transmit data to a slave in order to receive data from the slave. In some cases, only a few words are transmitted and a lot of data is then received from the slave. In that case, one solution is to keep feeding the TX with data to transmit, but that consumes system bandwidth. Instead AUTOTX can be used.

When AUTOTX in USARTn\_CTRL is set, the USART transmits data as long as there is available space in the RX shift register for the chosen frame size. This happens even though there is no data in the TX buffer. The TX underflow interrupt flag TXUF in USARTn\_IF is set on the first word that is transmitted which does not contain valid data.

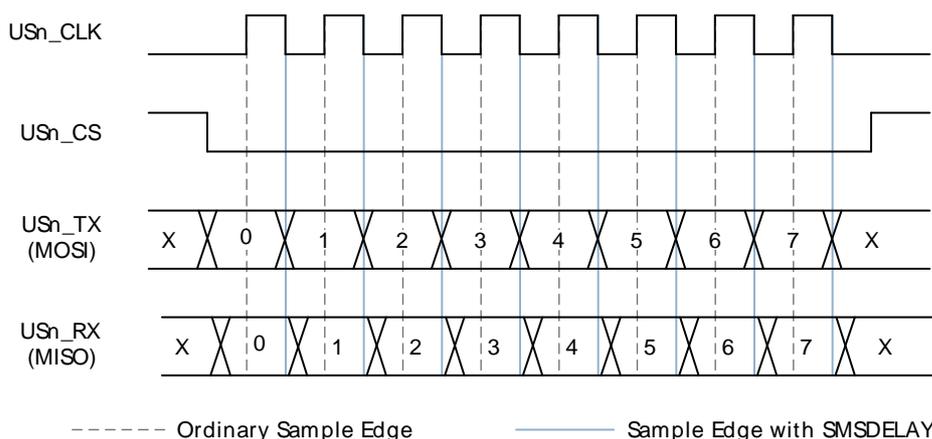

During AUTOTX the USART will always send the previous sent bit, thus reducing the number of transitions on the TX output. So if the last bit sent was a 0, 0's will be sent during AUTOTX and if the last bit sent was a 1, 1's will be sent during AUTOTX.

### 15.3.3.3.3 Synchronous Master Sample Delay

To improve speed in certain conditions by reducing the setup-time requirements for the SPI slave, the master can be configured to sample the data one half SCLK-cycle later, i.e. on the next setup edge, which, in SPI mode 0, is the rising edge. This is enabled by setting SMSDELAY in USARTn\_CTRL and can be used together with all SPI slaves that does not set up new data before the next setup edge, as the propagation delay of SCLK will ensure sufficient hold time.

**Note**  
If used together with another Silicon Laboratories chip utilizing SSSEARLY, a very thorough understanding of the timing is required.

**Figure 15.16. USART SPI timing with SMSDELAY**

### 15.3.3.4 Slave Mode

When the USART is in slave mode, data transmission is not controlled by the USART, but by an external master. The USART is therefore not able to initiate a transmission, and has no control over the number of bytes written to the master.

The output and input to the USART are also swapped when in slave mode, making the receiver take its input from USn\_TX (MOSI) and the transmitter drive USn\_RX (MISO).

To transmit data when in slave mode, the slave must load data into the transmit buffer and enable the transmitter. The data will remain in the USART until the master starts a transmission by pulling the USn\_CS input of the slave low and transmitting data. For every frame the master transmits to the slave, a frame is transferred from the slave to the master. After a transmission, MISO remains in the same state as the last bit transmitted. This also applies if the master transmits to the slave and the slave TX buffer is empty.

If the transmitter is enabled in synchronous slave mode and the master starts transmission of a frame, the underflow interrupt flag TXUF in USARTn\_IF will be set if no data is available for transmission to the master.

If the slave needs to control its own chip select signal, this can be achieved by clearing CSPEN in the ROUTE register. The internal chip select signal can then be controlled through CSINV in the CTRL register. The chip select signal will be CSINV inverted, i.e. if CSINV is cleared, the chip select is active and vice versa.

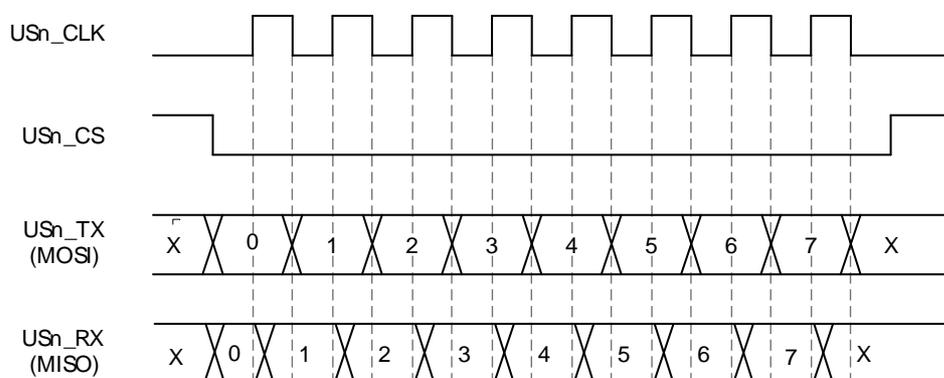

### 15.3.3.4.1 Synchronous Slave Setup Early

To improve speed in certain conditions by improving the setup time when running in slave mode, the slave can be configured to set up data one half SCLK-cycle earlier, i.e. on the previous sample edge, which, for SPI mode 0, is the falling edge. This is enabled by setting SSSEARLY in USARTn\_CTRL and can be used with all SPI masters that samples the data on the sample edge, as the SCLK propagation delay will ensure sufficient hold time.

**Note**

If used together with another Silicon Laboratories chip utilizing SMSDELAY, a very thorough understanding of the timing is required.

**Figure 15.17. USART SPI Slave Timing with SSSEARLY**

### 15.3.3.5 Synchronous Half Duplex Communication

Half duplex communication in synchronous mode is very similar to half duplex communication in asynchronous mode as detailed in Section 15.3.2.6 (p. 179). The main difference is that in this mode, the master must generate the bus clock even when it is not transmitting data, i.e. it must provide the slave with a clock to receive data. To generate the bus clock, the master should transmit data with the transmitter tristated, i.e. TXTRI in USARTn\_STATUS set, when receiving data. If 2 bytes are expected from the slave, then transmit 2 bytes with the transmitter tristated, and the slave uses the generated bus clock to transmit data to the master. TXTRI can be set by setting the TXTRIEN command bit in USARTn\_CMD.

**Note**

When operating as SPI slave in half duplex mode, TX has to be tristated (not disabled) during data reception if the slave is to transmit data in the current transfer.

### 15.3.3.6 I2S

I2S is a synchronous format for transmission of audio data. The frame format is 32-bit, but since data is always transmitted with MSB first, an I2S device operating with 16-bit audio may choose to only process the 16 msb of the frame, and only transmit data in the 16 msb of the frame.

In addition to the bit clock used for regular synchronous transfers, I2S mode uses a separate word clock. When operating in mono mode, with only one channel of data, the word clock pulses once at the start of each new word. In stereo mode, the word clock toggles at the start of new words, and also gives away

whether the transmitted word is for the left or right audio channel; A word transmitted while the word clock is low is for the left channel, and a word transmitted while the word clock is high is for the right.

When operating in I2S mode, the CS pin is used as a the word clock. In master mode, this is automatically driven by the USART, and in slave mode, the word clock is expected from an external master.

**15.3.3.6.1 Word Format**

The general I2S word format is 32 bits wide, but the USART also supports 16-bit and 8-bit words. In addition to this, it can be specified how many bits of the word should actually be used by the USART. These parameters are given by FORMAT in USARTn\_I2SCTRL.

As an example, configuring FORMAT to using a 32-bit word with 16-bit data will make each word on the I2S bus 32-bits wide, but when receiving data through the USART, only the 16 most significant bits of each word can be read out of the USART. Similarly, only the 16 most significant bits have to be written to the USART when transmitting. The rest of the bits will be transmitted as zeroes.

**15.3.3.6.2 Major Modes**

The USART supports a set of different I2S formats as shown in Table 15.9 (p. 189) , but it is not limited to these modes. MONO, JUSTIFY and DELAY in USARTn\_I2SCTRL can be mixed and matched to create an appropriate format. MONO enables mono mode, i.e. one data stream instead of two which is the default. JUSTIFY aligns data within a word on the I2S bus, either left or right which can be seen in figures Figure 15.20 (p. 190) and Figure 15.21 (p. 190). Finally, DELAY specifies whether a new I2S word should be started directly on the edge of the word-select signal, or one bit-period after the edge.

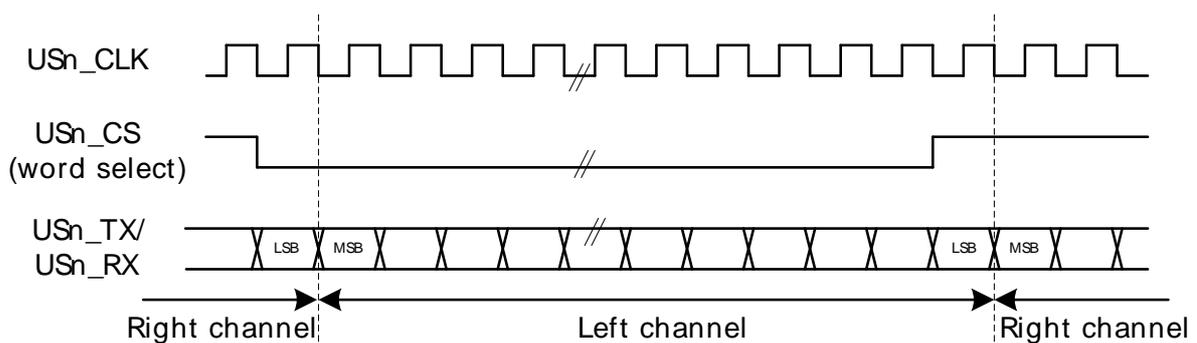

**Table 15.9. USART I2S Modes**

Mode	MONO	JUSTIFY	DELAY	CLKPOL
Regular I2S	0	0	1	0
Left-Justified	0	0	0	1
Right-Justified	0	1	0	1
Mono	1	0	0	0

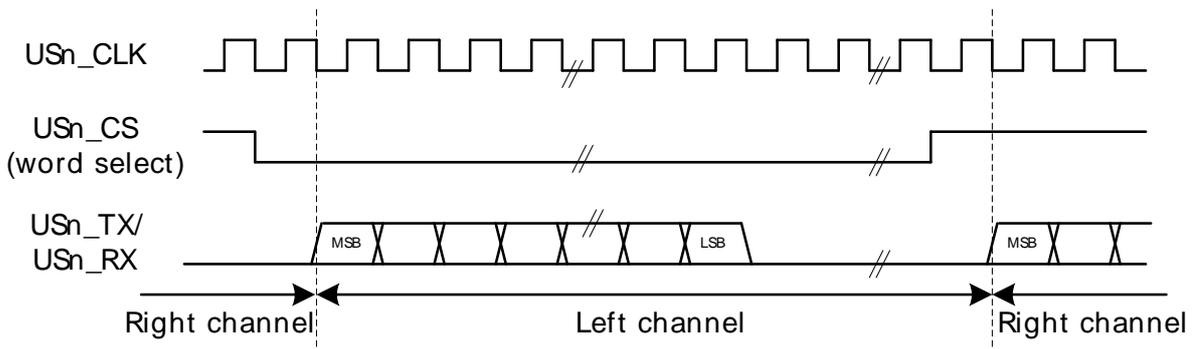

The regular I2S waveform is shown in Figure 15.18 (p. 189) and Figure 15.19 (p. 190) . The first figure shows a waveform transmitted with full accuracy. The wordlength can be configured to 32-bit, 16-bit or 8-bit using FORMAT in USARTn\_I2SCTRL. In the second figure, I2S data is transmitted with reduced accuracy, i.e. the data transmitted has less bits than what is possible in the bus format.

Note that the msb of a word transmitted in regular I2S mode is delayed by one cycle with respect to word select

**Figure 15.18. USART Standard I2S waveform**

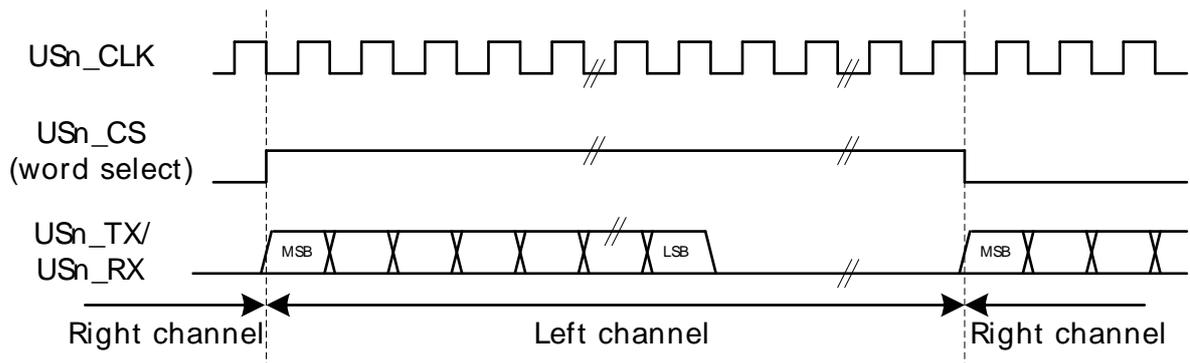

**Figure 15.19. USART Standard I2S waveform (reduced accuracy)**

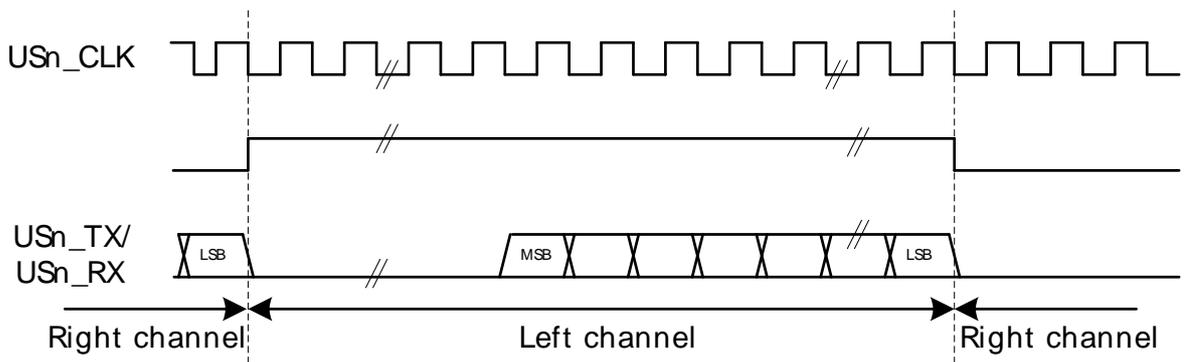

A left-justified stream is shown in Figure 15.20 (p. 190) . Note that the MSB comes directly after the edge on the word-select signal in contradiction to the regular I2S waveform where it comes one bit-period after.

**Figure 15.20. USART Left-justified I2S waveform**

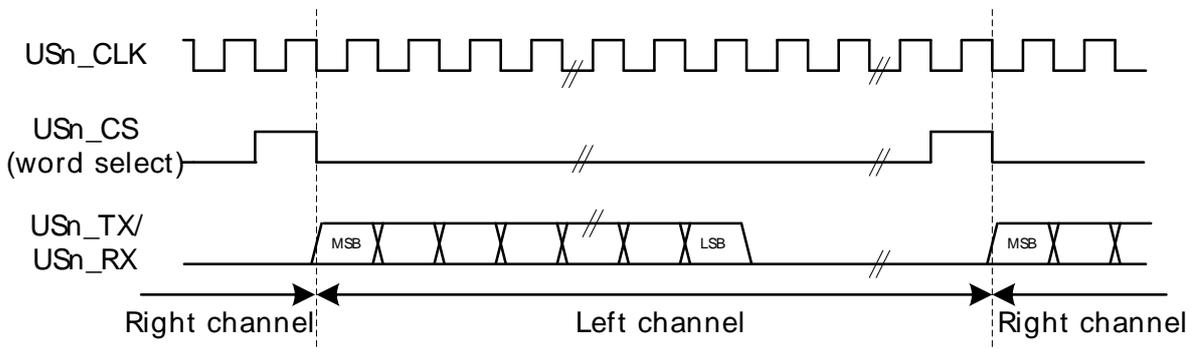

A right-justified stream is shown in Figure 15.21 (p. 190) . The left and right justified streams are equal when the data-size is equal to the word-width.

**Figure 15.21. USART Right-justified I2S waveform**

In mono-mode, the word-select signal pulses at the beginning of each word instead of toggling for each word. Mono I2S waveform is shown in Figure 15.22 (p. 191) .

**Figure 15.22. USART Mono I2S waveform**

### 15.3.3.6.3 Using I2S Mode

When using the USART in I2S mode, `DATABITS` in `USARTn_FRAME` must be set to 8 or 16 data-bits. 8 databits can be used in all modes, and 16 can be used in the modes where the number of bytes in the I2S word is even. In addition to this, `MSBF` in `USARTn_CTRL` should be set, and `CLKPOL` and `CLKPHA` in `USARTn_CTRL` should be cleared.

The USART does not have separate TX and RX buffers for left and right data, so when using I2S in stereo mode, the application must keep track of whether the buffers contain left or right data. This can be done by observing `TXBLRIGHT`, `RXDATAVRIGHT` and `RXFULLRIGHT` in `USARTn_STATUS`. `TXBLRIGHT` tells whether TX is expecting data for the left or right channel. It will be set with `TXBL` if right data is expected. The receiver will set `RXDATAVRIGHT` if there is at least one right element in the buffer, and `RXFULLRIGHT` if the buffer is full of right elements.

When using I2S with DMA, separate DMA requests can be used for left and right data by setting `DMASPLIT` in `USARTn_I2SCTRL`.

In both master and slave mode the USART always starts transmitting on the LEFT channel after being enabled. In master mode, the transmission will stop if TX becomes empty. In that case, `TXC` is set. Continuing the transmission in this case will make the data-stream continue where it left off. To make the USART start on the LEFT channel after going empty, disable and re-enable TX.

### 15.3.4 PRS-triggered Transmissions

If a transmission must be started on an event with very little delay, the PRS system can be used to trigger the transmission. The PRS channel to use as a trigger can be selected using `TSEL` in `USARTn_TRIGCTRL`. When a positive edge is detected on this signal, the receiver is enabled if `RXTEN` in `USARTn_TRIGCTRL` is set, and the transmitter is enabled if `TXTEN` in `USARTn_TRIGCTRL` is set. Only one signal input is supported by the USART.

The `AUTOTX` feature can also be enabled via PRS. If an external SPI device sets a pin high when there is data to be read from the device, this signal can be routed to the USART through the PRS system and be used to make the USART clock data out of the external device. If `AUTOTXTEN` in `USARTn_TRIGCTRL` is set, the USART will transmit data whenever the PRS signal selected by `TSEL` is high given that there is enough room in the RX buffer for the chosen frame size. Note that if there is no data in the TX buffer when using `AUTOTX`, the TX underflow interrupt will be set.

`AUTOTXTEN` can also be combined with `TXTEN` to make the USART transmit a command to the external device prior to clocking out data. To do this, disable TX using the `TXDIS` command, load the

TX buffer with the command and enable AUTOTXTEN and TXTEN. When the selected PRS input goes high, the USART will now transmit the loaded command, and then continue clocking out while both the PRS input is high and there is room in the RX buffer

### 15.3.5 PRS RX Input

The USART can be configured to receive data directly from a PRS channel by setting RXPRS in USARTn\_INPUT. The PRS channel used is selected using RXPRSSEL in USARTn\_INPUT. This way, for example, a differential RX signal can be input to the ACMP and the output routed via PRS to the USART.

### 15.3.6 DMA Support

The USART has full DMA support. The DMA controller can write to the transmit buffer using the registers USARTn\_TXDATA, USARTn\_TXDATAx, USARTn\_TXDOUBLE and USARTn\_TXDOUBLEx, and it can read from the receive buffer using the registers USARTn\_RXDATA, USARTn\_RXDATAx, USARTn\_RXDOUBLE and USARTn\_RXDOUBLEx. This enables single byte transfers, 9 bit data + control/status bits, double byte and double byte + control/status transfers both to and from the USART.

A request for the DMA controller to read from the USART receive buffer can come from the following source:

- Data available in the receive buffer.
- Data available in the receive buffer and data is for the RIGHT I2S channel. Only used in I2S mode.

A write request can come from one of the following sources:

- Transmit buffer and shift register empty. No data to send.
- Transmit buffer has room for more data.
- Transmit buffer has room for RIGHT I2S data. Only used in I2S mode.

Even though there are two sources for write requests to the DMA, only one should be used at a time, since the requests from both sources are cleared even though only one of the requests are used.

In some cases, it may be sensible to temporarily stop DMA access to the USART when an error such as a framing error has occurred. This is enabled by setting ERRSDMA in USARTn\_CTRL.

### 15.3.7 Transmission Delay

By configuring TXDELAY in USARTn\_CTRL, the transmitter can be forced to wait a number of bit-periods from it is ready to transmit data, to it actually transmits the data. This delay is only applied to the first frame transmitted after the transmitter has been idle. When transmitting frames back-to-back the delay is not introduced between the transmitted frames.

This is useful on half duplex buses, because the receiver always returns received frames to software during the first stop-bit. The bus may still be driven for up to 3 baud periods, depending on the current frame format. Using the transmission delay, a transmission can be started when a frame is received, and it is possible to make sure that the transmitter does not begin driving the output before the frame on the bus is completely transmitted.

TXDELAY in USARTn\_CTRL only applies to asynchronous transmission.

### 15.3.8 Interrupts

The interrupts generated by the USART are combined into two interrupt vectors. Interrupts related to reception are assigned to one interrupt vector, and interrupts related to transmission are assigned to the other. Separating the interrupts in this way allows different priorities to be set for transmission and reception interrupts.

The transmission interrupt vector groups the transmission-related interrupts generated by the following interrupt flags:

- TXC
- TXBL
- TXOF
- CCF

The reception interrupt on the other hand groups the reception-related interrupts, triggered by the following interrupt flags:

- RXDATAV
- RXFULL
- RXOF
- RXUF
- PERR
- FERR
- MPAF
- SSM

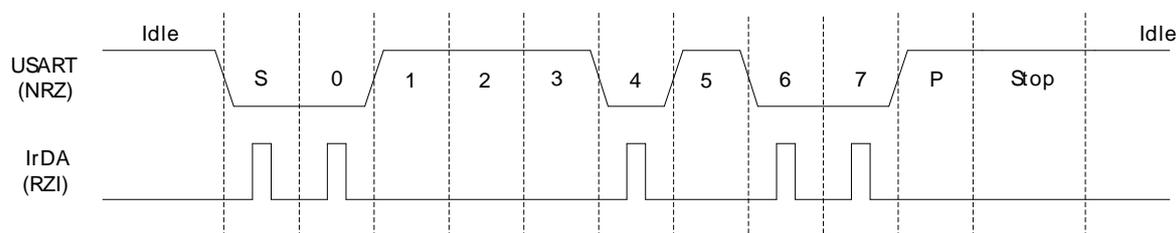

If USART interrupts are enabled, an interrupt will be made if one or more of the interrupt flags in USART\_IF and their corresponding bits in USART\_IEN are set.

### 15.3.9 IrDA Modulator/Demodulator

The IrDA modulator on USART1 implements the physical layer of the IrDA specification, which is necessary for communication over IrDA. The modulator takes the signal output from the USART module, and modulates it before it leaves USART1. In the same way, the input signal is demodulated before it enters the actual USART module. The modulator is only available on USART1, and implements the original Rev. 1.0 physical layer and one high speed extension which supports speeds from 2.4 kbps to 1.152 Mbps.

The data from and to the USART is represented in a NRZ (Non Return to Zero) format, where the signal value is at the same level through the entire bit period. For IrDA, the required format is RZI (Return to Zero Inverted), a format where a “1” is signalled by holding the line low, and a “0” is signalled by a short high pulse. An example is given in Figure 15.23 (p. 193) .

**Figure 15.23. USART Example RZI Signal for a given Asynchronous USART Frame**

The IrDA module is enabled by setting IREN. The USART transmitter output and receiver input is then routed through the IrDA modulator.

The width of the pulses generated by the IrDA modulator is set by configuring IRPW in USARTn\_IRCTRL. Four pulse widths are available, each defined relative to the configured bit period as listed in Table 15.10 (p. 194) .

**Table 15.10. USART IrDA Pulse Widths**

IRPW	Pulse width OVS=0	Pulse width OVS=1	Pulse width OVS=2	Pulse width OVS=3
00	1/16	1/8	1/6	1/4
01	2/16	2/8	2/6	N/A
10	3/16	3/8	N/A	N/A
11	4/16	N/A	N/A	N/A

By default, no filter is enabled in the IrDA demodulator. A filter can be enabled by setting IRFILT in USARTn\_IRCTRL. When the filter is enabled, an incoming pulse has to last for 4 consecutive clock cycles to be detected by the IrDA demodulator.

Note that by default, the idle value of the USART data signal is high. This means that the IrDA modulator generates negative pulses, and the IrDA demodulator expects negative pulses. To make the IrDA module use RZI signalling, both TXINV and RXINV in USARTn\_CTRL must be set.

The IrDA module can also modulate a signal from the PRS system, and transmit a modulated signal to the PRS system. To use a PRS channel as transmitter source instead of the USART, set IRPRSEN in USARTn\_IRCTRL high. The channel is selected by configuring IRPRSSEL in USARTn\_IRCTRL.

## 15.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	USARTn_CTRL	RW	Control Register
0x004	USARTn_FRAME	RW	USART Frame Format Register
0x008	USARTn_TRIGCTRL	RW	USART Trigger Control register
0x00C	USARTn_CMD	W1	Command Register
0x010	USARTn_STATUS	R	USART Status Register
0x014	USARTn_CLKDIV	RW	Clock Control Register
0x018	USARTn_RXDATAx	R	RX Buffer Data Extended Register
0x01C	USARTn_RXDATA	R	RX Buffer Data Register
0x020	USARTn_RXDOUBLEX	R	RX Buffer Double Data Extended Register
0x024	USARTn_RXDOUBLE	R	RX FIFO Double Data Register
0x028	USARTn_RXDATAxP	R	RX Buffer Data Extended Peek Register
0x02C	USARTn_RXDOUBLExP	R	RX Buffer Double Data Extended Peek Register
0x030	USARTn_TXDATAx	W	TX Buffer Data Extended Register
0x034	USARTn_TXDATA	W	TX Buffer Data Register
0x038	USARTn_TXDOUBLEX	W	TX Buffer Double Data Extended Register
0x03C	USARTn_TXDOUBLE	W	TX Buffer Double Data Register
0x040	USARTn_IF	R	Interrupt Flag Register
0x044	USARTn_IFS	W1	Interrupt Flag Set Register
0x048	USARTn_IFC	W1	Interrupt Flag Clear Register
0x04C	USARTn_IEN	RW	Interrupt Enable Register
0x050	USARTn_IRCTRL	RW	IrDA Control Register
0x054	USARTn_ROUTE	RW	I/O Routing Register
0x058	USARTn_INPUT	RW	USART Input Register
0x05C	USARTn_I2SCTRL	RW	I2S Control Register

## 15.5 Register Description

### 15.5.1 USARTn\_CTRL - Control Register

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset	0	0	0	0	0x0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		0x0	0	0	0	0	0	0
Access	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW		RW	RW	RW	RW	RW	RW	
Name	SMSDELAY	MVDIS	AUTOTX	BYTESWAP	TXDELAY	SSSEARLY	ERRSTX	ERRSRX	ERRSDMA	BIT8DV	SKIPERRF	SCRETRANS	SCMODE	AUTOTRI	AUTOCs	CSINV	TXINV	RXINV	TXBIL	CSMA	MSBF	CLKPHA	CLKPOL		OVS	MPAB	MPM	CCEN	LOOPBK	SYNC		

Bit	Name	Reset	Access	Description
31	SMSDELAY	0	RW	<b>Synchronous Master Sample Delay</b> Delay Synchronous Master sample point to the next setup edge to improve timing and allow communication at higher speeds.
30	MVDIS	0	RW	<b>Majority Vote Disable</b> Disable majority vote for 16x, 8x and 6x oversampling modes.

Bit	Name	Reset	Access	Description															
29	AUTOTX	0	RW	<b>Always Transmit When RX Not Full</b> Transmits as long as RX is not full. If TX is empty, underflows are generated.															
28	BYTESWAP	0	RW	<b>Byteswap In Double Accesses</b> Set to switch the order of the bytes in double accesses. <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Normal byte order</td> </tr> <tr> <td>1</td> <td>Byte order swapped</td> </tr> </tbody> </table>	Value	Description	0	Normal byte order	1	Byte order swapped									
Value	Description																		
0	Normal byte order																		
1	Byte order swapped																		
27:26	TXDELAY	0x0	RW	<b>TX Delay Transmission</b> Configurable delay before new transfers. Frames sent back-to-back are not delayed. <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>NONE</td> <td>Frames are transmitted immediately</td> </tr> <tr> <td>1</td> <td>SINGLE</td> <td>Transmission of new frames are delayed by a single baud period</td> </tr> <tr> <td>2</td> <td>DOUBLE</td> <td>Transmission of new frames are delayed by two baud periods</td> </tr> <tr> <td>3</td> <td>TRIPLE</td> <td>Transmission of new frames are delayed by three baud periods</td> </tr> </tbody> </table>	Value	Mode	Description	0	NONE	Frames are transmitted immediately	1	SINGLE	Transmission of new frames are delayed by a single baud period	2	DOUBLE	Transmission of new frames are delayed by two baud periods	3	TRIPLE	Transmission of new frames are delayed by three baud periods
Value	Mode	Description																	
0	NONE	Frames are transmitted immediately																	
1	SINGLE	Transmission of new frames are delayed by a single baud period																	
2	DOUBLE	Transmission of new frames are delayed by two baud periods																	
3	TRIPLE	Transmission of new frames are delayed by three baud periods																	
25	SSSEARLY	0	RW	<b>Synchronous Slave Setup Early</b> Setup data on sample edge in synchronous slave mode to improve MOSI setup time.															
24	ERRSTX	0	RW	<b>Disable TX On Error</b> When set, the transmitter is disabled on framing and parity errors (asynchronous mode only) in the receiver. <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Received framing and parity errors have no effect on transmitter</td> </tr> <tr> <td>1</td> <td>Received framing and parity errors disable the transmitter</td> </tr> </tbody> </table>	Value	Description	0	Received framing and parity errors have no effect on transmitter	1	Received framing and parity errors disable the transmitter									
Value	Description																		
0	Received framing and parity errors have no effect on transmitter																		
1	Received framing and parity errors disable the transmitter																		
23	ERRSRX	0	RW	<b>Disable RX On Error</b> When set, the receiver is disabled on framing and parity errors (asynchronous mode only). <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Framing and parity errors have no effect on receiver</td> </tr> <tr> <td>1</td> <td>Framing and parity errors disable the receiver</td> </tr> </tbody> </table>	Value	Description	0	Framing and parity errors have no effect on receiver	1	Framing and parity errors disable the receiver									
Value	Description																		
0	Framing and parity errors have no effect on receiver																		
1	Framing and parity errors disable the receiver																		
22	ERRSDMA	0	RW	<b>Halt DMA On Error</b> When set, DMA requests will be cleared on framing and parity errors (asynchronous mode only). <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Framing and parity errors have no effect on DMA requests from the USART</td> </tr> <tr> <td>1</td> <td>DMA requests from the USART are blocked while the PERR or FERR interrupt flags are set</td> </tr> </tbody> </table>	Value	Description	0	Framing and parity errors have no effect on DMA requests from the USART	1	DMA requests from the USART are blocked while the PERR or FERR interrupt flags are set									
Value	Description																		
0	Framing and parity errors have no effect on DMA requests from the USART																		
1	DMA requests from the USART are blocked while the PERR or FERR interrupt flags are set																		
21	BIT8DV	0	RW	<b>Bit 8 Default Value</b> The default value of the 9th bit. If 9-bit frames are used, and an 8-bit write operation is done, leaving the 9th bit unspecified, the 9th bit is set to the value of BIT8DV.															
20	SKIPPERRF	0	RW	<b>Skip Parity Error Frames</b> When set, the receiver discards frames with parity errors (asynchronous mode only). The PERR interrupt flag is still set.															
19	SCRETRANS	0	RW	<b>SmartCard Retransmit</b> When in SmartCard mode, a NACK'ed frame will be kept in the shift register and retransmitted if the transmitter is still enabled.															
18	SCMODE	0	RW	<b>SmartCard Mode</b> Use this bit to enable or disable SmartCard mode.															
17	AUTOTRI	0	RW	<b>Automatic TX Tristate</b> When enabled, TXTRI is set by hardware whenever the transmitter is idle, and TXTRI is cleared by hardware when transmission starts. <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>The output on U(S)n_TX when the transmitter is idle is defined by TXINV</td> </tr> <tr> <td>1</td> <td>U(S)n_TX is tristated whenever the transmitter is idle</td> </tr> </tbody> </table>	Value	Description	0	The output on U(S)n_TX when the transmitter is idle is defined by TXINV	1	U(S)n_TX is tristated whenever the transmitter is idle									
Value	Description																		
0	The output on U(S)n_TX when the transmitter is idle is defined by TXINV																		
1	U(S)n_TX is tristated whenever the transmitter is idle																		
16	AUTOCS	0	RW	<b>Automatic Chip Select</b>															

Bit	Name	Reset	Access	Description
				When enabled, the output on USn_CS will be activated one baud-period before transmission starts, and deactivated when transmission ends.
15	CSINV	0	RW	<b>Chip Select Invert</b> Default value is active low. This affects both the selection of external slaves, as well as the selection of the microcontroller as a slave.
	Value	Description		
	0	Chip select is active low		
	1	Chip select is active high		
14	TXINV	0	RW	<b>Transmitter output Invert</b> The output from the USART transmitter can optionally be inverted by setting this bit.
	Value	Description		
	0	Output from the transmitter is passed unchanged to U(S)n_TX		
	1	Output from the transmitter is inverted before it is passed to U(S)n_TX		
13	RXINV	0	RW	<b>Receiver Input Invert</b> Setting this bit will invert the input to the USART receiver.
	Value	Description		
	0	Input is passed directly to the receiver		
	1	Input is inverted before it is passed to the receiver		
12	TXBIL	0	RW	<b>TX Buffer Interrupt Level</b> Determines the interrupt and status level of the transmit buffer.
	Value	Mode	Description	
	0	EMPTY	TXBL and the TXBL interrupt flag are set when the transmit buffer becomes empty. TXBL is cleared when the buffer becomes nonempty.	
	1	HALFFULL	TXBL and TXBLIF are set when the transmit buffer goes from full to half-full or empty. TXBL is cleared when the buffer becomes full.	
11	CSMA	0	RW	<b>Action On Slave-Select In Master Mode</b> This register determines the action to be performed when slave-select is configured as an input and driven low while in master mode.
	Value	Mode	Description	
	0	NOACTION	No action taken	
	1	GOTOSLAVEMODE	Go to slave mode	
10	MSBF	0	RW	<b>Most Significant Bit First</b> Decides whether data is sent with the least significant bit first, or the most significant bit first.
	Value	Description		
	0	Data is sent with the least significant bit first		
	1	Data is sent with the most significant bit first		
9	CLKPHA	0	RW	<b>Clock Edge For Setup/Sample</b> Determines where data is set-up and sampled according to the bus clock when in synchronous mode.
	Value	Mode	Description	
	0	SAMPLELEADING	Data is sampled on the leading edge and set-up on the trailing edge of the bus clock in synchronous mode	
	1	SAMPLETRAILING	Data is set-up on the leading edge and sampled on the trailing edge of the bus clock in synchronous mode	
8	CLKPOL	0	RW	<b>Clock Polarity</b> Determines the clock polarity of the bus clock used in synchronous mode.
	Value	Mode	Description	
	0	IDLELOW	The bus clock used in synchronous mode has a low base value	
	1	IDLEHIGH	The bus clock used in synchronous mode has a high base value	
7	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
6:5	OVS	0x0	RW	<b>Oversampling</b>

Bit	Name	Reset	Access	Description															
				Sets the number of clock periods in a UART bit-period. More clock cycles gives better robustness, while less clock cycles gives better performance.															
				<table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>X16</td> <td>Regular UART mode with 16X oversampling in asynchronous mode</td> </tr> <tr> <td>1</td> <td>X8</td> <td>Double speed with 8X oversampling in asynchronous mode</td> </tr> <tr> <td>2</td> <td>X6</td> <td>6X oversampling in asynchronous mode</td> </tr> <tr> <td>3</td> <td>X4</td> <td>Quadruple speed with 4X oversampling in asynchronous mode</td> </tr> </tbody> </table>	Value	Mode	Description	0	X16	Regular UART mode with 16X oversampling in asynchronous mode	1	X8	Double speed with 8X oversampling in asynchronous mode	2	X6	6X oversampling in asynchronous mode	3	X4	Quadruple speed with 4X oversampling in asynchronous mode
Value	Mode	Description																	
0	X16	Regular UART mode with 16X oversampling in asynchronous mode																	
1	X8	Double speed with 8X oversampling in asynchronous mode																	
2	X6	6X oversampling in asynchronous mode																	
3	X4	Quadruple speed with 4X oversampling in asynchronous mode																	
4	MPAB	0	RW	<b>Multi-Processor Address-Bit</b> Defines the value of the multi-processor address bit. An incoming frame with its 9th bit equal to the value of this bit marks the frame as a multi-processor address frame.															
3	MPM	0	RW	<b>Multi-Processor Mode</b> Multi-processor mode uses the 9th bit of the USART frames to tell whether the frame is an address frame or a data frame.															
				<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>The 9th bit of incoming frames has no special function</td> </tr> <tr> <td>1</td> <td>An incoming frame with the 9th bit equal to MPAB will be loaded into the receive buffer regardless of RXBLOCK and will result in the MPAB interrupt flag being set</td> </tr> </tbody> </table>	Value	Description	0	The 9th bit of incoming frames has no special function	1	An incoming frame with the 9th bit equal to MPAB will be loaded into the receive buffer regardless of RXBLOCK and will result in the MPAB interrupt flag being set									
Value	Description																		
0	The 9th bit of incoming frames has no special function																		
1	An incoming frame with the 9th bit equal to MPAB will be loaded into the receive buffer regardless of RXBLOCK and will result in the MPAB interrupt flag being set																		
2	CCEN	0	RW	<b>Collision Check Enable</b> Enables collision checking on data when operating in half duplex modus.															
				<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Collision check is disabled</td> </tr> <tr> <td>1</td> <td>Collision check is enabled. The receiver must be enabled for the check to be performed</td> </tr> </tbody> </table>	Value	Description	0	Collision check is disabled	1	Collision check is enabled. The receiver must be enabled for the check to be performed									
Value	Description																		
0	Collision check is disabled																		
1	Collision check is enabled. The receiver must be enabled for the check to be performed																		
1	LOOPBK	0	RW	<b>Loopback Enable</b> Allows the receiver to be connected directly to the USART transmitter for loopback and half duplex communication.															
				<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>The receiver is connected to and receives data from U(S)n_RX</td> </tr> <tr> <td>1</td> <td>The receiver is connected to and receives data from U(S)n_TX</td> </tr> </tbody> </table>	Value	Description	0	The receiver is connected to and receives data from U(S)n_RX	1	The receiver is connected to and receives data from U(S)n_TX									
Value	Description																		
0	The receiver is connected to and receives data from U(S)n_RX																		
1	The receiver is connected to and receives data from U(S)n_TX																		
0	SYNC	0	RW	<b>USART Synchronous Mode</b> Determines whether the USART is operating in asynchronous or synchronous mode.															
				<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>The USART operates in asynchronous mode</td> </tr> <tr> <td>1</td> <td>The USART operates in synchronous mode</td> </tr> </tbody> </table>	Value	Description	0	The USART operates in asynchronous mode	1	The USART operates in synchronous mode									
Value	Description																		
0	The USART operates in asynchronous mode																		
1	The USART operates in synchronous mode																		

### 15.5.2 USARTn\_FRAME - USART Frame Format Register

Offset	Bit Position																																
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0x004																																	
<b>Reset</b>																					0x1				0x0							0x5	
<b>Access</b>																					RW				RW							RW	
<b>Name</b>																					STOPBITS				PARITY							DATABITS	

Bit	Name	Reset	Access	Description						
31:14	Reserved			To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)						
13:12	STOPBITS	0x1	RW	<b>Stop-Bit Mode</b> Determines the number of stop-bits used.						
				<table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>HALF</td> <td>The transmitter generates a half stop bit. Stop-bits are not verified by receiver</td> </tr> </tbody> </table>	Value	Mode	Description	0	HALF	The transmitter generates a half stop bit. Stop-bits are not verified by receiver
Value	Mode	Description								
0	HALF	The transmitter generates a half stop bit. Stop-bits are not verified by receiver								

Bit	Name	Reset	Access	Description
	Value	Mode		Description
1	ONE			One stop bit is generated and verified
2	ONEANDAHALF			The transmitter generates one and a half stop bit. The receiver verifies the first stop bit
3	TWO			The transmitter generates two stop bits. The receiver checks the first stop-bit only
11:10	<i>Reserved</i>		<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>	
9:8	PARITY	0x0	RW	<b>Parity-Bit Mode</b>
	Determines whether parity bits are enabled, and whether even or odd parity should be used. Only available in asynchronous mode.			
	Value	Mode		Description
	0	NONE		Parity bits are not used
	2	EVEN		Even parity are used. Parity bits are automatically generated and checked by hardware.
	3	ODD		Odd parity is used. Parity bits are automatically generated and checked by hardware.
7:4	<i>Reserved</i>		<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>	
3:0	DATABITS	0x5	RW	<b>Data-Bit Mode</b>
	This register sets the number of data bits in a USART frame.			
	Value	Mode		Description
	1	FOUR		Each frame contains 4 data bits
	2	FIVE		Each frame contains 5 data bits
	3	SIX		Each frame contains 6 data bits
	4	SEVEN		Each frame contains 7 data bits
	5	EIGHT		Each frame contains 8 data bits
	6	NINE		Each frame contains 9 data bits
	7	TEN		Each frame contains 10 data bits
	8	ELEVEN		Each frame contains 11 data bits
	9	TWELVE		Each frame contains 12 data bits
	10	THIRTEEN		Each frame contains 13 data bits
	11	FOURTEEN		Each frame contains 14 data bits
	12	FIFTEEN		Each frame contains 15 data bits
	13	SIXTEEN		Each frame contains 16 data bits

### 15.5.3 USARTn\_TRIGCTRL - USART Trigger Control register

Offset	Bit Position																																																							
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																								
<b>Reset</b>																									0	0	0																													0x0
<b>Access</b>																									RW	RW	RW																													RW
<b>Name</b>																									AUTOTXTEN	TXTEN	RXTEN																													TSEL

Bit	Name	Reset	Access	Description
31:7	<i>Reserved</i>		<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>	
6	AUTOTXTEN	0	RW	<b>AUTOTX Trigger Enable</b>
	When set, AUTOTX is enabled as long as the PRS channel selected by TSEL has a high value.			
5	TXTEN	0	RW	<b>Transmit Trigger Enable</b>
	When set, the PRS channel selected by TSEL sets TXEN, enabling the transmitter on positive trigger edges.			
4	RXTEN	0	RW	<b>Receive Trigger Enable</b>
	When set, the PRS channel selected by TSEL sets RXEN, enabling the receiver on positive trigger edges.			

Bit	Name	Reset	Access	Description
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
1:0	TSEL	0x0	RW	<b>Trigger PRS Channel Select</b>
Select USART PRS trigger channel. The PRS signal can enable RX and/or TX, depending on the setting of RXTEN and TXTEN.				
	Value	Mode	Description	
	0	PRSCH0	PRS Channel 0 selected	
	1	PRSCH1	PRS Channel 1 selected	
	2	PRSCH2	PRS Channel 2 selected	
	3	PRSCH3	PRS Channel 3 selected	

### 15.5.4 USARTn\_CMD - Command Register

Offset	Bit Position																																																	
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																		
0x00C																					0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
<b>Reset</b>																																																		
<b>Access</b>																					W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1	W1
<b>Name</b>																					CLEARRX	CLEARTX	TXTRIDIS	TXTRIEN	RXBLOCKDIS	RXBLOCKEN	MASTERDIS	MASTEREN	TXDIS	TXEN	RXDIS	RXEN																		

Bit	Name	Reset	Access	Description
31:12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
11	CLEARRX	0	W1	<b>Clear RX</b> Set to clear receive buffer and the RX shift register.
10	CLEARTX	0	W1	<b>Clear TX</b> Set to clear transmit buffer and the TX shift register.
9	TXTRIDIS	0	W1	<b>Transmitter Tristate Disable</b> Disables tristating of the transmitter output.
8	TXTRIEN	0	W1	<b>Transmitter Tristate Enable</b> Tristates the transmitter output.
7	RXBLOCKDIS	0	W1	<b>Receiver Block Disable</b> Set to clear RXBLOCK, resulting in all incoming frames being loaded into the receive buffer.
6	RXBLOCKEN	0	W1	<b>Receiver Block Enable</b> Set to set RXBLOCK, resulting in all incoming frames being discarded.
5	MASTERDIS	0	W1	<b>Master Disable</b> Set to disable master mode, clearing the MASTER status bit and putting the USART in slave mode.
4	MASTEREN	0	W1	<b>Master Enable</b> Set to enable master mode, setting the MASTER status bit. Master mode should not be enabled while TXENS is set to 1. To enable both master and TX mode, write MASTEREN before TXEN, or enable them both in the same write operation.
3	TXDIS	0	W1	<b>Transmitter Disable</b> Set to disable transmission.
2	TXEN	0	W1	<b>Transmitter Enable</b> Set to enable data transmission.
1	RXDIS	0	W1	<b>Receiver Disable</b> Set to disable data reception. If a frame is under reception when the receiver is disabled, the incoming frame is discarded.
0	RXEN	0	W1	<b>Receiver Enable</b>

### 15.5.6 USARTn\_CLKDIV - Clock Control Register

Offset	Bit Position																															
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset																																
Access																	RW															
Name																	DIV															

Bit	Name	Reset	Access	Description
31:21	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
20:6	DIV	0x0000	RW	<b>Fractional Clock Divider</b> Specifies the fractional clock divider for the USART.
5:0	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		

### 15.5.7 USARTn\_RXDATAx - RX Buffer Data Extended Register

Offset	Bit Position																															
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0x018															0	0																
Reset															0	0																
Access															R	R																
Name															FERR	PERR																

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15	FERR	0	R	<b>Data Framing Error</b> Set if data in buffer has a framing error. Can be the result of a break condition.
14	PERR	0	R	<b>Data Parity Error</b> Set if data in buffer has a parity error (asynchronous mode only).
13:9	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
8:0	RXDATA	0x000	R	<b>RX Data</b> Use this register to access data read from the USART. Buffer is cleared on read access.

### 15.5.8 USARTn\_RXDATA - RX Buffer Data Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset																		0	0	0	0	0										0x000
Access																		W	W	W	W	W										W
Name																		RXENAT	TXDISAT	TXBREAK	TXTRIAI	UBRXAT									TXDATAx	

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
15	RXENAT	0	W	<b>Enable RX After Transmission</b> Set to enable reception after transmission.
14	TXDISAT	0	W	<b>Clear TXEN After Transmission</b>

Bit	Name	Reset	Access	Description
				Set to disable transmitter and release data bus directly after transmission.
13	TXBREAK	0	W	<b>Transmit Data As Break</b> Set to send data as a break. Recipient will see a framing error or a break condition depending on its configuration and the value of TXDATA.
12	TXTRIAT	0	W	<b>Set TXTRI After Transmission</b> Set to tristate transmitter by setting TXTRI after transmission.
11	UBRXAT	0	W	<b>Unblock RX After Transmission</b> Set clear RXBLOCK after transmission, unblocking the receiver.
10:9	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
8:0	TXDATA	0x000	W	<b>TX Data</b> Use this register to write data to the USART. If TXEN is set, a transfer will be initiated at the first opportunity.

### 15.5.14 USARTn\_TXDATA - TX Buffer Data Register

Offset	Bit Position																															
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																									0x00							
Access																									W							
Name																									TXDATA							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
7:0	TXDATA	0x00	W	<b>TX Data</b> This frame will be added to TX buffer. Only 8 LSB can be written using this register. 9th bit and control bits will be cleared.

### 15.5.15 USARTn\_TXDOUBLEX - TX Buffer Double Data Extended Register

Offset	Bit Position																																	
0x038	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Name	Reset	Access	Description
31	RXENAT1	0	W	<b>Enable RX After Transmission</b> Set to enable reception after transmission.
30	TXDISAT1	0	W	<b>Clear TXEN After Transmission</b>

Bit	Name	Reset	Access	Description
				Set to disable transmitter and release data bus directly after transmission.
29	TXBREAK1	0	W	<b>Transmit Data As Break</b> Set to send data as a break. Recipient will see a framing error or a break condition depending on its configuration and the value of USARTn_TXDATA.
28	TXTRIAT1	0	W	<b>Set TXTRI After Transmission</b> Set to tristate transmitter by setting TXTRI after transmission.
27	UBRXAT1	0	W	<b>Unblock RX After Transmission</b> Set clear RXBLOCK after transmission, unblocking the receiver.
26:25	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
24:16	TXDATA1	0x000	W	<b>TX Data</b> Second frame to write to FIFO.
15	RXENAT0	0	W	<b>Enable RX After Transmission</b> Set to enable reception after transmission.
14	TXDISAT0	0	W	<b>Clear TXEN After Transmission</b> Set to disable transmitter and release data bus directly after transmission.
13	TXBREAK0	0	W	<b>Transmit Data As Break</b> Set to send data as a break. Recipient will see a framing error or a break condition depending on its configuration and the value of TXDATA.
12	TXTRIAT0	0	W	<b>Set TXTRI After Transmission</b> Set to tristate transmitter by setting TXTRI after transmission.
11	UBRXAT0	0	W	<b>Unblock RX After Transmission</b> Set clear RXBLOCK after transmission, unblocking the receiver.
10:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
8:0	TXDATA0	0x000	W	<b>TX Data</b> First frame to write to buffer.

### 15.5.16 USARTn\_TXDOUBLE - TX Buffer Double Data Register

Offset	Bit Position																															
0x03C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x00						0x00									
<b>Access</b>																	W						W									
<b>Name</b>																	TXDATA1						TXDATA0									

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
15:8	TXDATA1	0x00	W	<b>TX Data</b> Second frame to write to buffer.
7:0	TXDATA0	0x00	W	<b>TX Data</b> First frame to write to buffer.

### 15.5.17 USARTn\_IF - Interrupt Flag Register

Offset	Bit Position																																														
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0															
<b>Reset</b>														0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		
<b>Access</b>														R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
<b>Name</b>														CCF	SSM	MPAF	FERR	PERR	TXUF	TXOF	RXUF	RXOF	RXFULL	RXDATAV	TXBL	TXC																					

Bit	Name	Reset	Access	Description
31:13	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
12	CCF	0	R	<b>Collision Check Fail Interrupt Flag</b> Set when a collision check notices an error in the transmitted data.
11	SSM	0	R	<b>Slave-Select In Master Mode Interrupt Flag</b> Set when the device is selected as a slave when in master mode.
10	MPAF	0	R	<b>Multi-Processor Address Frame Interrupt Flag</b> Set when a multi-processor address frame is detected.
9	FERR	0	R	<b>Framing Error Interrupt Flag</b> Set when a frame with a framing error is received while RXBLOCK is cleared.
8	PERR	0	R	<b>Parity Error Interrupt Flag</b> Set when a frame with a parity error (asynchronous mode only) is received while RXBLOCK is cleared.
7	TXUF	0	R	<b>TX Underflow Interrupt Flag</b> Set when operating as a synchronous slave, no data is available in the transmit buffer when the master starts transmission of a new frame.
6	TXOF	0	R	<b>TX Overflow Interrupt Flag</b> Set when a write is done to the transmit buffer while it is full. The data already in the transmit buffer is preserved.
5	RXUF	0	R	<b>RX Underflow Interrupt Flag</b> Set when trying to read from the receive buffer when it is empty.
4	RXOF	0	R	<b>RX Overflow Interrupt Flag</b> Set when data is incoming while the receive shift register is full. The data previously in the shift register is lost.
3	RXFULL	0	R	<b>RX Buffer Full Interrupt Flag</b> Set when the receive buffer becomes full.
2	RXDATAV	0	R	<b>RX Data Valid Interrupt Flag</b> Set when data becomes available in the receive buffer.
1	TXBL	1	R	<b>TX Buffer Level Interrupt Flag</b> Set when the buffer becomes empty if TXBIL is cleared, and is set whenever the transmit buffer goes from full to half-full or empty if TXBIL is set.
0	TXC	0	R	<b>TX Complete Interrupt Flag</b> This interrupt is used after a transmission when both the TX buffer and shift register are empty.

### 15.5.18 USARTn\_IFS - Interrupt Flag Set Register

Offset	Bit Position																																	
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Name	Reset	Access	Description
31:13	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
12	CCF	0	RW	<b>Collision Check Fail Interrupt Enable</b> Enable interrupt on collision check error detected.
11	SSM	0	RW	<b>Slave-Select In Master Mode Interrupt Enable</b> Enable interrupt on slave-select in master mode.
10	MPAF	0	RW	<b>Multi-Processor Address Frame Interrupt Enable</b> Enable interrupt on multi-processor address frame.
9	FERR	0	RW	<b>Framing Error Interrupt Enable</b> Enable interrupt on framing error.

Bit	Name	Reset	Access	Description
8	PERR	0	RW	<b>Parity Error Interrupt Enable</b> Enable interrupt on parity error (asynchronous mode only).
7	TXUF	0	RW	<b>TX Underflow Interrupt Enable</b> Enable interrupt on TX underflow.
6	TXOF	0	RW	<b>TX Overflow Interrupt Enable</b> Enable interrupt on TX overflow.
5	RXUF	0	RW	<b>RX Underflow Interrupt Enable</b> Enable interrupt on RX underflow.
4	RXOF	0	RW	<b>RX Overflow Interrupt Enable</b> Enable interrupt on RX overflow.
3	RXFULL	0	RW	<b>RX Buffer Full Interrupt Enable</b> Enable interrupt on RX Buffer full.
2	RXDATAV	0	RW	<b>RX Data Valid Interrupt Enable</b> Enable interrupt on RX data.
1	TXBL	0	RW	<b>TX Buffer Level Interrupt Enable</b> Enable interrupt on TX buffer level.
0	TXC	0	RW	<b>TX Complete Interrupt Enable</b> Enable interrupt on TX complete.

### 15.5.21 USARTn\_IRCTRL - IrDA Control Register

Offset	Bit Position																																		
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Reset</b>																										0			0x0	0		0x0	0		
<b>Access</b>																										RW			RW		RW		RW		RW
<b>Name</b>																										IRPRSEN			IRPRSSEL		IRFILT		IRPW		IREN

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
7	IRPRSEN	0	RW	<b>IrDA PRS Channel Enable</b> Enable the PRS channel selected by IRPRSSEL as input to IrDA module instead of TX.
6	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
5:4	IRPRSSEL	0x0	RW	<b>IrDA PRS Channel Select</b> A PRS can be used as input to the pulse modulator instead of TX. This value selects the channel to use.
	Value	Mode	Description	
	0	PRSCH0	PRS Channel 0 selected	
	1	PRSCH1	PRS Channel 1 selected	
	2	PRSCH2	PRS Channel 2 selected	
	3	PRSCH3	PRS Channel 3 selected	
3	IRFILT	0	RW	<b>IrDA RX Filter</b> Set to enable filter on IrDA demodulator.
	Value	Description		
	0	No filter enabled		
	1	Filter enabled. IrDA pulse must be high for at least 4 consecutive clock cycles to be detected		

Bit	Name	Reset	Access	Description
2:1	IRPW	0x0	RW	<b>IrDA TX Pulse Width</b> Configure the pulse width generated by the IrDA modulator as a fraction of the configured USART bit period.
	Value	Mode	Description	
	0	ONE	IrDA pulse width is 1/16 for OVS=0 and 1/8 for OVS=1	
	1	TWO	IrDA pulse width is 2/16 for OVS=0 and 2/8 for OVS=1	
	2	THREE	IrDA pulse width is 3/16 for OVS=0 and 3/8 for OVS=1	
	3	FOUR	IrDA pulse width is 4/16 for OVS=0 and 4/8 for OVS=1	
0	IREN	0	RW	<b>Enable IrDA Module</b> Enable IrDA module and rout USART signals through it.

### 15.5.22 USARTn\_ROUTE - I/O Routing Register

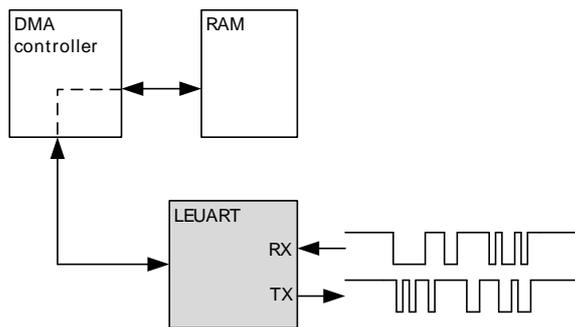

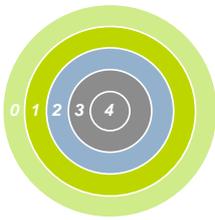

Offset	Bit Position																																					
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset																								0x0							0		0		0		0	
Access																								RW							RW		RW		RW		RW	
Name																								LOCATION							CLKPEN		CSPEN		TXPEN		RXPEN	

Bit	Name	Reset	Access	Description
31:11	Reserved	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
10:8	LOCATION	0x0	RW	<b>I/O Location</b> Decides the location of the USART I/O pins.
	Value	Mode	Description	
	0	LOC0	Location 0	
	1	LOC1	Location 1	
	2	LOC2	Location 2	
	3	LOC3	Location 3	
7:4	Reserved	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
3	CLKPEN	0	RW	<b>CLK Pin Enable</b> When set, the CLK pin of the USART is enabled.
	Value	Description		
	0	The USn_CLK pin is disabled		
	1	The USn_CLK pin is enabled		
2	CSPEN	0	RW	<b>CS Pin Enable</b> When set, the CS pin of the USART is enabled.
	Value	Description		
	0	The USn_CS pin is disabled		
	1	The USn_CS pin is enabled		
1	TXPEN	0	RW	<b>TX Pin Enable</b> When set, the TX/MOSI pin of the USART is enabled
	Value	Description		
	0	The U(S)n_TX (MOSI) pin is disabled		
	1	The U(S)n_TX (MOSI) pin is enabled		
0	RXPEN	0	RW	<b>RX Pin Enable</b>

Bit	Name	Reset	Access	Description
	Value	Mode		Description
2	W32D24			32-bit word, 24-bit data
3	W32D16			32-bit word, 16-bit data
4	W32D8			32-bit word, 8-bit data
5	W16D16			16-bit word, 16-bit data
6	W16D8			16-bit word, 8-bit data
7	W8D8			8-bit word, 8-bit data
7:5	<i>Reserved</i>		<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>	
4	DELAY	0	RW	<b>Delay on I2S data</b> Set to add a one-cycle delay between a transition on the word-clock and the start of the I2S word. Should be set for standard I2S format
3	DMASPLIT	0	RW	<b>Separate DMA Request For Left/Right Data</b> When set DMA requests for right-channel data are put on the TXBLRIGHT and RXDATAVRIGHT DMA requests.
2	JUSTIFY	0	RW	<b>Justification of I2S Data</b> Determines whether the I2S data is left or right justified
	Value	Mode		Description
	0	LEFT		Data is left-justified
	1	RIGHT		Data is right-justified

# 16 LEUART - Low Energy Universal Asynchronous Receiver/Transmitter

## Quick Facts

### What?

The LEUART provides full UART communication using a low frequency 32.768 kHz clock, and has special features for communication without CPU intervention.

### Why?

It allows UART communication to be performed in low energy modes, using only a few  $\mu\text{A}$  during active communication and only 150 nA when waiting for incoming data.

### How?

A low frequency clock signal allows communication with less energy. Using DMA, the LEUART can transmit and receive data with minimal CPU intervention. Special UART-frames can be configured to help control the data flow, further automating data transmission.

## 16.1 Introduction

The unique LEUART<sup>™</sup>, the Low Energy UART, is a UART that allows two-way UART communication on a strict power budget. Only a 32.768 kHz clock is needed to allow UART communication at baud rates up to 9600.

Even when the EFM is in low energy mode EM2 (with most core functionality turned off), the LEUART can wait for an incoming UART frame while having an extremely low energy consumption. When a UART frame is completely received, the CPU can quickly be woken up. Alternatively, multiple frames can be transferred via the Direct Memory Access (DMA) module into RAM memory before waking up the CPU.

Received data can optionally be blocked until a configurable start frame is detected. A signal frame can be configured to generate an interrupt to indicate e.g. the end of a data transmission. The start frame and signal frame can be used in combination for instance to handle higher level communication protocols.

Similarly, data can be transmitted in EM2 either on a frame-by-frame basis with data from the CPU or through use of the DMA.

The LEUART includes all necessary hardware support to make asynchronous serial communication possible with minimum of software intervention and energy consumption.

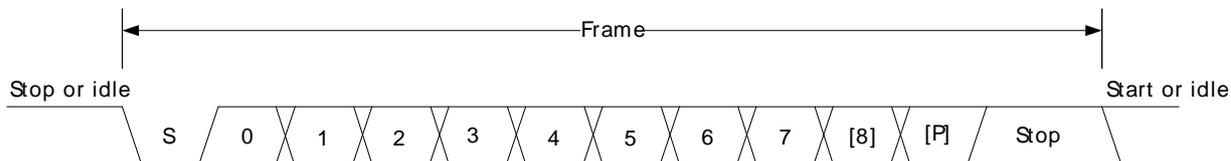

## 16.2 Features

- Low energy asynchronous serial communications
- Full/half duplex communication
- Separate TX / RX enable
- Separate double buffered transmit buffer and receive buffer
- Programmable baud rate, generated as a fractional division of the LFBCLK
  - Supports baud rates from 300 baud/s to 9600 baud/s

low for one bit-period. This signals the start of a frame, and is used for synchronization. Following the start bit are 8 or 9 data bits and an optional parity bit. The data is transmitted with the least significant bit first. Finally, a number of stop-bits, where the line is driven high, end the frame. The frame format is shown in Figure 16.2 (p. 217) .

**Figure 16.2. LEUART Asynchronous Frame Format**

The number of data bits in a frame is set by DATABITS in LEUARTn\_CTRL, and the number of stop-bits is set by STOPBITS in LEUARTn\_CTRL. Whether or not a parity bit should be included, and whether it should be even or odd is defined by PARITY in LEUARTn\_CTRL. For communication to be possible, all parties of an asynchronous transfer must agree on the frame format being used.

The frame format used by the LEUART can be inverted by setting INV in LEUARTn\_CTRL. This affects the entire frame, resulting in a low idle state, a high start-bit, inverted data and parity bits, and low stop-bits. INV should only be changed while the receiver is disabled.

### 16.3.1.1 Parity Bit Calculation and Handling

Hardware automatically inserts parity bits into outgoing frames and checks the parity bits of incoming frames. The possible parity modes are defined in Table 16.1 (p. 217) . When even parity is chosen, a parity bit is inserted to make the number of high bits (data + parity) even. If odd parity is chosen, the parity bit makes the total number of high bits odd. When parity bits are disabled, which is the default configuration, the parity bit is omitted.

**Table 16.1. LEUART Parity Bit**

PARITY [1:0]	Description
00	No parity (default)
01	Reserved
10	Even parity
11	Odd parity

See Section 16.3.5.4 (p. 222) for more information on parity bit handling.

### 16.3.2 Clock Source

The LEUART clock source is selected by the LFB bit field the CMU\_LFCLKSEL register. The clock is prescaled by the LEUARTn bitfield in the CMU\_LFBPRESC0 register and enabled by the LEUARTn bit in the CMU\_LFBCLKEN0.

To use this module, the LE interface clock must be enabled in CMU\_HFCORECLKEN0, in addition to the module clock.

### 16.3.3 Clock Generation

The LEUART clock defines the transmission and reception data rate. The clock generator employs a fractional clock divider to allow baud rates that are not attainable by integral division of the 32.768 kHz clock that drives the LEUART.

The clock divider used in the LEUART is a 12-bit value, with a 7-bit integral part and a 5-bit fractional part. The baud rate of the LEUART is given by :

**LEUART Baud Rate Equation**

$$br = fLEUARTn / (1 + LEUARTn\_CLKDIV / 256) \tag{16.1}$$

where fLEUARTn is the clock frequency supplied to the LEUART. The value of LEUARTn\_CLKDIV thus defines the baud rate of the LEUART. The integral part of the divider is right-aligned in the upper 24 bits of LEUARTn\_CLKDIV and the fractional part is left-aligned in the lower 8 bits. The divider is thus a 256th of LEUARTn\_CLKDIV as seen in the equation.

For a desired baud rate br<sub>DESIRED</sub>, LEUARTn\_CLKDIV can be calculated by using:

**LEUART CLKDIV Equation**

$$LEUARTn\_CLKDIV = 256 \times (fLEUARTn / br_{DESIRED} - 1) \tag{16.2}$$

Table 16.2 (p. 218) lists a set of desired baud rates and the closest baud rates reachable by the LEUART with a 32.768 kHz clock source. It also shows the average baud rate error.

**Table 16.2. LEUART Baud Rates**

Desired baud rate [baud/s]	LEUARTn_CLKDIV	LEUARTn_CLKDIV/256	Actual baud rate [baud/s]	Error [%]
300	27704	108,21875	300,0217	0,01
600	13728	53,625	599,8719	-0,02
1200	6736	26,3125	1199,744	-0,02
2400	3240	12,65625	2399,487	-0,02
4800	1488	5,8125	4809,982	0,21
9600	616	2,40625	9619,963	0,21

### 16.3.4 Data Transmission

Data transmission is initiated by writing data to the transmit buffer using one of the methods described in Section 16.3.4.1 (p. 218) . When the transmission shift register is empty and ready for new data, a frame from the transmit buffer is loaded into the shift register, and if the transmitter is enabled, transmission begins. When the frame has been transmitted, a new frame is loaded into the shift register if available, and transmission continues. If the transmit buffer is empty, the transmitter goes to an idle state, waiting for a new frame to become available. Transmission is enabled through the command register LEUARTn\_CMD by setting TXEN, and disabled by setting TXDIS. When the transmitter is disabled using TXDIS, any ongoing transmission is aborted, and any frame currently being transmitted is discarded. When disabled, the TX output goes to an idle state, which by default is a high value. Whether or not the transmitter is enabled at a given time can be read from TXENS in LEUARTn\_STATUS. After a transmission, when there is no more data in the shift register or transmit buffer, the TXC flag in LEUARTn\_STATUS and the TXC interrupt flag in LEUARTn\_IF are set, signaling that the transmitter is idle. The TXC status flag is cleared when a new byte becomes available for transmission, but the TXC interrupt flag must be cleared by software.

#### 16.3.4.1 Transmit Buffer Operation

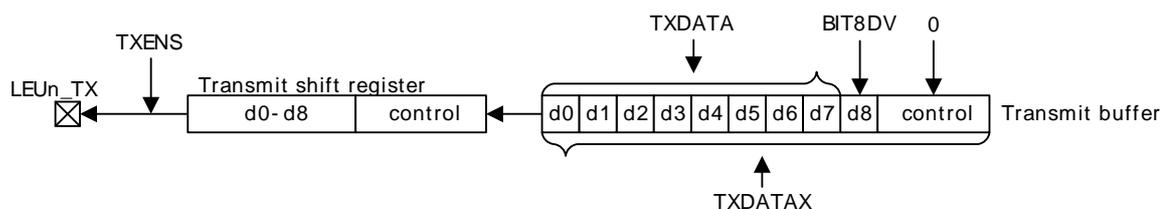

A frame can be loaded into the transmit buffer by writing to LEUARTn\_TXDATA or LEUARTn\_TXDATAX. Using LEUARTn\_TXDATA allows 8 bits to be written to the buffer. If 9 bit frames are used, the 9th bit will in that case be set to the value of BIT8DV in LEUARTn\_CTRL. To set the 9th bit directly and/or use transmission control, LEUARTn\_TXDATAX must be used. When writing data to the transmit buffer using LEUARTn\_TXDATAX, the 9th bit written to LEUARTn\_TXDATAX overrides the value in BIT8DV, and alone defines the 9th bit that is transmitted if 9-bit frames are used.

If a write is attempted to the transmit buffer when it is not empty, the TXOF interrupt flag in LEUARTn\_IF is set, indicating the overflow. The data already in the buffer is in that case preserved, and no data is written.

In addition to the interrupt flag TXC in LEUARTn\_IF and the status flag TXC in LEUARTn\_STATUS which are set when the transmitter becomes idle, TXBL in LEUARTn\_STATUS and the TXBL interrupt flag in LEUARTn\_IF are used to indicate the level of the transmit buffer. Whenever the transmit buffer becomes empty, these flags are set high. Both the TXBL status flag and the TXBL interrupt flag are cleared automatically when data is written to the transmit buffer.

The transmit buffer, including the TX shift register can be cleared by setting command bit CLEAR\_TX in LEUARTn\_CMD. This will prevent the LEUART from transmitting the data in the buffer and shift register, and will make them available for new data. Any frame currently being transmitted will not be aborted. Transmission of this frame will be completed. An overview of the operation of the transmitter is shown in Figure 16.3 (p. 219).

**Figure 16.3. LEUART Transmitter Overview**

### 16.3.4.2 Frame Transmission Control

The transmission control bits, which can be written using LEUARTn\_TXDATAx, affect the transmission of the written frame. The following options are available:

- **Generate break:** By setting WBREAK, the output will be held low during the first stop-bit period to generate a framing error. A receiver that supports break detection detects this state, allowing it to be used e.g. for framing of larger data packets. The line is driven high for one baud period before the next frame is transmitted so the next start condition can be identified correctly by the recipient. Continuous breaks lasting longer than an UART frame are thus not supported by the LEUART. GPIO can be used for this. Note that when AUTOTRI in LEUARTn\_CTRL is used, the transmitter is not tristated before the high-bit after the break has been transmitted.
- **Disable transmitter after transmission:** If TXDISAT is set, the transmitter is disabled after the frame has been fully transmitted.
- **Enable receiver after transmission:** If RXENAT is set, the receiver is enabled after the frame has been fully transmitted. It is enabled in time to detect a start-bit directly after the last stop-bit has been transmitted.

The transmission control bits in the LEUART cannot tristate the transmitter. This is performed automatically by hardware however, if AUTOTRI in LEUARTn\_CTRL is set. See Section 16.3.7 (p. 224) for more information on half duplex operation.

### 16.3.4.3 Jitter in Transmitted Data

Internally the LEUART module uses only the positive edges of the 32.768 kHz clock (LFBCLK) for transmission and reception. Transmitted data will thus have jitter equal to the difference between the optimal data set-up location and the closest positive edge on the 32.768 kHz clock. The jitter in on the location data is set up by the transmitter will thus be no more than half a clock period according to the optimal set-up location. The jitter in the period of a single baud output by the transmitter will never be more than one clock period.

### 16.3.5 Data Reception

Data reception is enabled by setting RXEN in LEUARTn\_CMD. When the receiver is enabled, it actively samples the input looking for a transition from high to low indicating the start baud of a new frame. When a start baud is found, reception of the new frame begins if the receive shift register is empty and ready for new data. When the frame has been received, it is pushed into the receive buffer, making the shift register ready for another frame of data, and the receiver starts looking for another start baud. If the receive buffer is full, the received frame remains in the shift register until more space in the receive buffer is available.

If an incoming frame is detected while both the receive buffer and the receive shift register are full, the data in the receive shift register is overwritten, and the RXOF interrupt flag in LEUARTn\_IF is set to indicate the buffer overflow.

The receiver can be disabled by setting the command bit RXDIS in LEUARTn\_CMD. Any frame currently being received when the receiver is disabled is discarded. Whether or not the receiver is enabled at a given time can be read out from RXENS in LEUARTn\_STATUS.

#### 16.3.5.1 Receive Buffer Operation

When data becomes available in the receive buffer, the RXDATAV flag in LEUARTn\_STATUS and the RXDATAV interrupt flag in LEUARTn\_IF are set. Both the RXDATAV status flag and the RXDATAV interrupt flag are cleared by hardware when data is no longer available, i.e. when data has been read out of the buffer.

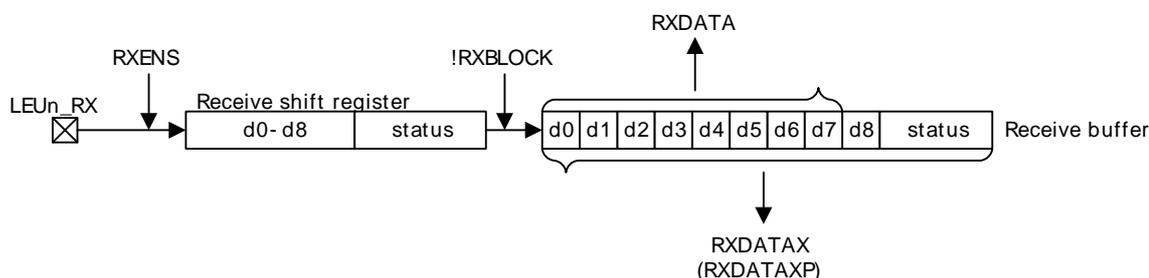

Data can be read from receive buffer using either LEUARTn\_RXDATA or LEUARTn\_RXDATA\_X. LEUARTn\_RXDATA gives access to the 8 least significant bits of the received frame, while LEUARTn\_RXDATA\_X must be used to get access to the 9th, most significant bit. The latter register also contains status information regarding the frame.

When a frame is read from the receive buffer using LEUARTn\_RXDATA or LEUARTn\_RXDATA\_X, the frame is removed from the buffer, making room for a new one. If an attempt is done to read more frames from the buffer than what is available, the RXUF interrupt flag in LEUARTn\_IF is set to signal the underflow, and the data read from the buffer is undefined.

Frames can also be read from the receive buffer without removing the data by using LEUARTn\_RXDATA\_XP, which gives access to the frame in the buffer including control bits. Data read from this register when the receive buffer is empty is undefined. No underflow interrupt is generated by a read using LEUARTn\_RXDATA\_XP, i.e. the RXUF interrupt flag is never set as a result of reading from LEUARTn\_RXDATA\_XP.

An overview of the operation of the receiver is shown in Figure 16.4 (p. 221) .

Figure 16.4. LEUART Receiver Overview

### 16.3.5.2 Blocking Incoming Data

When using hardware frame recognition, as detailed in Section 16.3.5.6 (p. 222), Section 16.3.5.7 (p. 223), and Section 16.3.5.8 (p. 223), it is necessary to be able to let the receiver sample incoming frames without passing the frames to software by loading them into the receive buffer. This is accomplished by blocking incoming data.

Incoming data is blocked as long as `RXBLOCK` in `LEUARTn_STATUS` is set. When blocked, frames received by the receiver will not be loaded into the receive buffer, and software is not notified by the `RXDATAV` bit in `LEUARTn_STATUS` or the `RXDATAV` interrupt flag in `LEUARTn_IF` at their arrival. For data to be loaded into the receive buffer, `RXBLOCK` must be cleared in the instant a frame is fully received by the receiver. `RXBLOCK` is set by setting `RXBLOCKEN` in `LEUARTn_CMD` and disabled by setting `RXBLOCKDIS` also in `LEUARTn_CMD`. There are two exceptions where data is loaded into the receive buffer even when `RXBLOCK` is set. The first is when an address frame is received when in operating in multi-processor mode as shown in Section 16.3.5.8 (p. 223). The other case is when receiving a start-frame when `SFUBRX` in `LEUARTn_CTRL` is set; see Section 16.3.5.6 (p. 222).

Frames received containing framing or parity errors will not result in the `FERR` and `PERR` interrupt flags in `LEUARTn_IF` being set while `RXBLOCK` is set. Hardware recognition is not applied to these erroneous frames, and they are silently discarded.

#### Note

If a frame is received while `RXBLOCK` in `LEUARTn_STATUS` is cleared, but stays in the receive shift register because the receive buffer is full, the received frame will be loaded into the receive buffer when space becomes available even if `RXBLOCK` is set at that time.

The overflow interrupt flag `RXOF` in `LEUARTn_IF` will be set if a frame in the receive shift register, waiting to be loaded into the receive buffer is overwritten by an incoming frame even though `RXBLOCK` is set.

### 16.3.5.3 Data Sampling

The receiver samples each incoming baud as close as possible to the middle of the baud-period. Except for the start-bit, only a single sample is taken of each of the incoming bauds.

The length of a baud-period is given by  $1 + \text{LEUARTn\_CLKDIV}/256$ , as a number of 32.768 kHz clock periods. Let the clock cycle where a start-bit is first detected be given the index 0. The optimal sampling point for each baud in the UART frame is then given by the following equation:

**LEUART Optimal Sampling Point**

$$S_{\text{opt}}(n) = n (1 + \text{LEUARTn\_CLKDIV}/256) + \text{CLKDIV}/512 \quad (16.3)$$

where n is the bit-index.

Since samples are only done on the positive edges of the 32.768 kHz clock, the actual samples are performed on the closest positive edge, i.e. the edge given by the following equation:

**LEUART Actual Sampling Point**

$$S(n) = \text{floor}(n \times (1 + \text{LEUARTn\_CLKDIV}/256) + \text{LEUARTn\_CLKDIV}/512) \quad (16.4)$$

The sampling location will thus have jitter according to difference between  $S_{\text{opt}}$  and S. The start-bit is found at n=0, then follows the data bits, any parity bit, and the stop bits.

If the value of the start-bit is found to be high, then the start-bit is discarded, and the receiver waits for a new start-bit.

**16.3.5.4 Parity Error**

When the parity bit is enabled, a parity check is automatically performed on incoming frames. When a parity error is detected in a frame, the data parity error bit PERR in the frame is set, as well as the interrupt flag PERR. Frames with parity errors are loaded into the receive buffer like regular frames.

PERR can be accessed by reading the frame from the receive buffer using the LEUARTn\_RXDATA register.

**16.3.5.5 Framing Error and Break Detection**

A framing error is the result of a received frame where the stop bit was sampled to a value of 0. This can be the result of noise and baud rate errors, but can also be the result of a break generated by the transmitter on purpose.

When a framing error is detected, the framing error bit FERR in the received frame is set. The interrupt flag FERR in LEUARTn\_IF is also set. Frames with framing errors are loaded into the receive buffer like regular frames.

FERR can be accessed by reading the frame from the receive buffer using the LEUARTn\_RXDATA or LEUARTn\_RXDATA\_P registers.

**16.3.5.6 Programmable Start Frame**

The LEUART can be configured to start receiving data when a special start frame is detected on the input. This can be useful when operating in low energy modes, allowing other devices to gain the attention of the LEUART by transmitting a given frame.

When SFUBRX in LEUARTn\_CTRL is set, an incoming frame matching the frame defined in LEUARTn\_STARTFRAME will result in RXBLOCK in LEUARTn\_STATUS being cleared. This can be used to enable reception when a specified start frame is detected. If the receiver is enabled and blocked, i.e. RXENS and RXBLOCK in LEUARTn\_STATUS are set, the receiver will receive all incoming frames, but unless an incoming frame is a start frame it will be discarded and not loaded into the receive buffer. When a start frame is detected, the block is cleared, and frames received from that point, including the start frame, are loaded into the receive buffer.

An incoming start frame results in the STARTF interrupt flag in LEUARTn\_IF being set, regardless of the value of SFUBRX in LEUARTn\_CTRL. This allows an interrupt to be made when the start frame is detected.

When 8 data-bit frame formats are used, only the 8 least significant bits of LEUARTn\_STARTFRAME are compared to incoming frames. The full length of LEUARTn\_STARTFRAME is used when operating with frames consisting of 9 data bits.

**Note**

The receiver must be enabled for start frames to be detected. In addition, a start frame with a parity error or framing error is not detected as a start frame.

### 16.3.5.7 Programmable Signal Frame

As well as the configurable start frame, a special signal frame can be specified. When a frame matching the frame defined in LEUARTn\_SIGFRAME is detected by the receiver, the SIGF interrupt flag in LEUARTn\_IF is set. As for start frame detection, the receiver must be enabled for signal frames to be detected.

One use of the programmable signal frame is to signal the end of a multi-frame message transmitted to the LEUART. An interrupt will then be triggered when the packet has been completely received, allowing software to process it. Used in conjunction with the programmable start frame and DMA, this makes it possible for the LEUART to automatically begin the reception of a packet on a specified start frame, load the entire packet into memory, and give an interrupt when reception of a packet has completed. The device can thus wait for data packets in EM2, and only be woken up when a packet has been completely received.

A signal frame with a parity error or framing error is not detected as a signal frame.

### 16.3.5.8 Multi-Processor Mode

To simplify communication between multiple processors and maintain compatibility with the USART, the LEUART supports a multi-processor mode. In this mode the 9th data bit in each frame is used to indicate whether the content of the remaining 8 bits is data or an address.

When multi-processor mode is enabled, an incoming 9-bit frame with the 9th bit equal to the value of MPAB in LEUARTn\_CTRL is identified as an address frame. When an address frame is detected, the MPAF interrupt flag in LEUARTn\_IF is set, and the address frame is loaded into the receive register. This happens regardless of the value of RXBLOCK in LEUARTn\_STATUS.

Multi-processor mode is enabled by setting MPM in LEUARTn\_CTRL. The mode can be used in buses with multiple slaves, allowing the slaves to be addressed using the special address frames. An addressed slave, which was previously blocking reception using RXBLOCK, would then unblock reception, receive a message from the bus master, and then block reception again, waiting for the next message. See the USART for a more detailed example.

**Note**

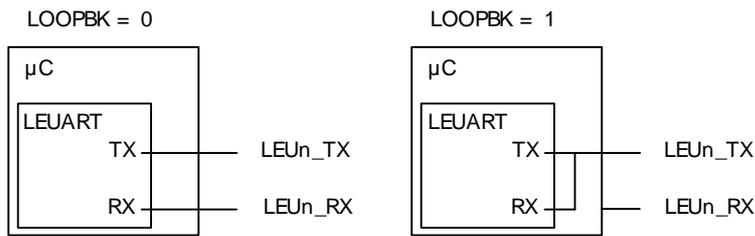

The programmable start frame functionality can be used for automatic address matching, enabling reception on a correctly configured incoming frame.

An address frame with a parity error or a framing error is not detected as an address frame.

### 16.3.6 Loopback

The LEUART receiver samples LEUn\_RX by default, and the transmitter drives LEUn\_TX by default. This is not the only configuration however. When LOOPBK in LEUARTn\_CTRL is set, the receiver is connected to the LEUn\_TX pin as shown in Figure 16.5 (p. 224). This is useful for debugging, as the LEUART can receive the data it transmits, but it is also used to allow the LEUART to read and write to the same pin, which is required for some half duplex communication modes. In this mode, the LEUn\_TX pin must be enabled as an output in the GPIO.

**Figure 16.5. LEUART Local Loopback**

### 16.3.7 Half Duplex Communication

When doing full duplex communication, two data links are provided, making it possible for data to be sent and received at the same time. In half duplex mode, data is only sent in one direction at a time. There are several possible half duplex setups, as described in the following sections.

#### 16.3.7.1 Single Data-link

In this setup, the LEUART both receives and transmits data on the same pin. This is enabled by setting LOOPBK in LEUARTn\_CTRL, which connects the receiver to the transmitter output. Because they are both connected to the same line, it is important that the LEUART transmitter does not drive the line when receiving data, as this would corrupt the data on the line.

When communicating over a single data-link, the transmitter must thus be tristated whenever not transmitting data. If AUTOTRI in LEUARTn\_CTRL is set, the LEUART automatically tristates LEUn\_TX whenever the transmitter is inactive. It is then the responsibility of the software protocol to make sure the transmitter is not transmitting data whenever incoming data is expected.

The transmitter can also be tristated from software by configuring the GPIO pin as an input and disabling the LEUART output on LEUn\_TX.

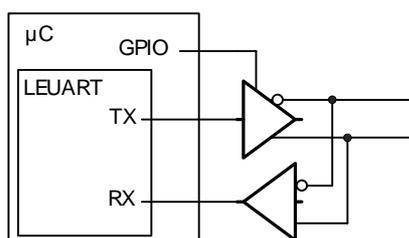

**Note**

Another way to tristate the transmitter is to enable wired-and or wired-or mode in GPIO. For wired-and mode, outputting a 1 will be the same as tristating the output, and for wired-or mode, outputting a 0 will be the same as tristating the output. This can only be done on buses with a pull-up or pull-down resistor respectively.

#### 16.3.7.2 Single Data-link with External Driver

Some communication schemes, such as RS-485 rely on an external driver. Here, the driver has an extra input which enables it, and instead of Tristating the transmitter when receiving data, the external driver must be disabled. The USART has hardware support for automatically turning the driver on and off. When using the LEUART in such a setup, the driver must be controlled by a GPIO. Figure 16.6 (p. 224) shows an example configuration using an external driver.

**Figure 16.6. LEUART Half Duplex Communication with External Driver**

### 16.3.7.3 Two Data-links

Some limited devices only support half duplex communication even though two data links are available. In this case software is responsible for making sure data is not transmitted when incoming data is expected.

### 16.3.8 Transmission Delay

By configuring TXDELAY in LEUARTn\_CTRL, the transmitter can be forced to wait a number of bit-periods from it is ready to transmit data, to it actually transmits the data. This delay is only applied to the first frame transmitted after the transmitter has been idle. When transmitting frames back-to-back the delay is not introduced between the transmitted frames.

This is useful on half duplex buses, because the receiver always returns received frames to software during the first stop-bit. The bus may still be driven for up to 3 baud periods, depending on the current frame format. Using the transmission delay, a transmission can be started when a frame is received, and it is possible to make sure that the transmitter does not begin driving the output before the frame on the bus is completely transmitted.

### 16.3.9 PRS RX Input

The LEUART can be configured to receive data directly from the PRS channel by setting RX\_PRS in LEUARTn\_INPUT. The PRS channel used can be selected using RX\_PRS\_SEL in LEUARTn\_INPUT.

### 16.3.10 DMA Support

The LEUART has full DMA support in energy modes EM0 – EM2. The DMA controller can write to the transmit buffer using the registers LEUARTn\_TXDATA and LEUARTn\_TXDATA\_X, and it can read from receive buffer using the registers LEUARTn\_RXDATA and LEUARTn\_RXDATA\_X. This enables single byte transfers and 9 bit data + control/status bits transfers both to and from the LEUART. The DMA will start up the HFRCO and run from this when it is waken by the LEUART in EM2. The HFRCO is disabled once the transaction is done.

A request for the DMA controller to read from the receive buffer can come from one of the following sources:

- Receive buffer full

A write request can come from one of the following sources:

- Transmit buffer and shift register empty. No data to send.
- Transmit buffer empty

In some cases, it may be sensible to temporarily stop DMA access to the LEUART when a parity or framing error has occurred. This is enabled by setting ERRSDMA in LEUARTn\_CTRL. When this bit is set, the DMA controller will not get requests from the receive buffer if a framing error or parity error is detected in the received byte. The ERRSDMA bit applies only to the RX DMA.

When operating in EM2, the DMA controller must be powered up in order to perform the transfer. This is automatically performed for read operations if RXDMAWU in LEUARTn\_CTRL is set and for write operations if TXDMAWU in LEUARTn\_CTRL is set. To make sure the DMA controller still transfers bits to and from the LEUART in low energy modes, these bits must thus be configured accordingly.

#### Note

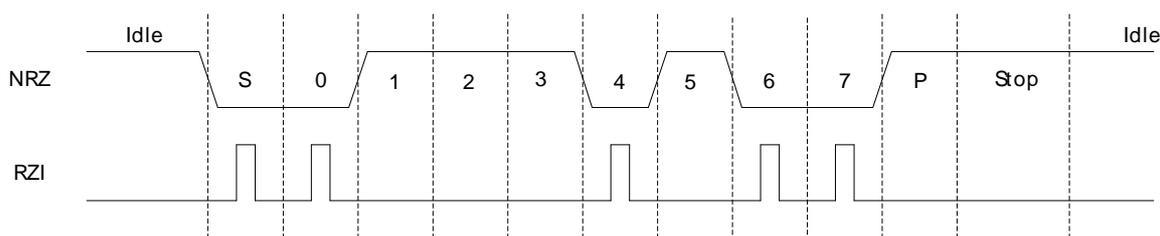

When RXDMAWU or TXDMAWU is set, the system will not be able to go to EM2/EM3 before all related LEUART DMA requests have been processed. This means that if RXDMAWU is set and the LEUART receives a frame, the system will not be able to go to

EM2/EM3 before the frame has been read from the LEUART. In order for the system to go to EM2 during the last byte transmission, LEUART\_CTRL\_TXDMAWU must be cleared in the DMA interrupt service routine. This is because TXBL will be high during that last byte transfer.

### 16.3.11 Pulse Generator/ Pulse Extender

The LEUART has an optional pulse generator for the transmitter output, and a pulse extender on the receiver input. These are enabled by setting PULSEEN in LEUARTn\_PULSECTRL, and with INV in LEUARTn\_CTRL set, they will change the output/input format of the LEUART from NRZ to RZI as shown in Figure 16.7 (p. 226) .

**Figure 16.7. LEUART - NRZ vs. RZI**

If PULSEEN in LEUARTn\_PULSECTRL is set while INV in LEUARTn\_CTRL is cleared, the output waveform will like RZI shown in Figure 16.7 (p. 226) , only inverted.

The width of the pulses from the pulse generator can be configured using PULSEW in LEUARTn\_PULSECTRL. The generated pulse width is PULSEW + 1 cycles of the 32.768 kHz clock, which makes pulse width from 31.25µs to 500µs possible.

Since the incoming signal is only sampled on positive clock edges, the width of the incoming pulses must be at least two 32.768 kHz clock periods wide for reliable detection by the LEUART receiver. They must also be shorter than half a UART baud period.

At 2400 baud/s or lower, the pulse generator is able to generate RZI pulses compatible with the IrDA physical layer specification. The external IrDA device must generate pulses of sufficient length for successful two-way communication.

#### 16.3.11.1 Interrupts

The interrupts generated by the LEUART are combined into one interrupt vector. If LEUART interrupts are enabled, an interrupt will be made if one or more of the interrupt flags in LEUARTn\_IF and their corresponding bits in LEUART\_IEN are set.

### 16.3.12 Register access

Since this module is a Low Energy Peripheral, and runs off a clock which is asynchronous to the HFCORECLK, special considerations must be taken when accessing registers. Please refer to Section 5.3 (p. 17) for a description on how to perform register accesses to Low Energy Peripherals.

## 16.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	LEUARTn_CTRL	RW	Control Register
0x004	LEUARTn_CMD	W1	Command Register
0x008	LEUARTn_STATUS	R	Status Register
0x00C	LEUARTn_CLKDIV	RW	Clock Control Register
0x010	LEUARTn_STARTFRAME	RW	Start Frame Register
0x014	LEUARTn_SIGFRAME	RW	Signal Frame Register
0x018	LEUARTn_RXDATAx	R	Receive Buffer Data Extended Register
0x01C	LEUARTn_RXDATA	R	Receive Buffer Data Register

## 16.5 Register Description

### 16.5.1 LEUARTn\_CTRL - Control Register (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

Offset	Bit Position																																
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
0x000																																	
<b>Reset</b>																	0x0		0	0	0	0	0	0	0	0	0	0	0	0x0	0	0	
<b>Access</b>																	RW		RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	
<b>Name</b>																	TXDELAY		TXDMAWU	RXDMAWU	BIT8DV	MPAB	MPM	SFUBRX	LOOPBK	ERRSDMA	INV	STOPBITS	PARITY	DATABITS	AUTOTRI		

Bit	Name	Reset	Access	Description
31:16	Reserved			To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)
15:14	TXDELAY	0x0	RW	<b>TX Delay Transmission</b>

Configurable delay before new transfers. Frames sent back-to-back are not delayed.

Value	Mode	Description
0	NONE	Frames are transmitted immediately
1	SINGLE	Transmission of new frames are delayed by a single baud period
2	DOUBLE	Transmission of new frames are delayed by two baud periods

Bit	Name	Reset	Access	Description
	Value	Mode		Description
	3	TRIPLE		Transmission of new frames are delayed by three baud periods
13	TXDMAWU	0	RW	<b>TX DMA Wakeup</b> Set to wake the DMA controller up when in EM2 and space is available in the transmit buffer.
	Value	Description		
	0	While in EM2, the DMA controller will not get requests about space being available in the transmit buffer		
	1	DMA is available in EM2 for the request about space available in the transmit buffer		
12	RXDMAWU	0	RW	<b>RX DMA Wakeup</b> Set to wake the DMA controller up when in EM2 and data is available in the receive buffer.
	Value	Description		
	0	While in EM2, the DMA controller will not get requests about data being available in the receive buffer		
	1	DMA is available in EM2 for the request about data in the receive buffer		
11	BIT8DV	0	RW	<b>Bit 8 Default Value</b> When 9-bit frames are transmitted, the default value of the 9th bit is given by BIT8DV. If TXDATA is used to write a frame, then the value of BIT8DV is assigned to the 9th bit of the outgoing frame. If a frame is written with TXDATAx however, the default value is overridden by the written value.
10	MPAB	0	RW	<b>Multi-Processor Address-Bit</b> Defines the value of the multi-processor address bit. An incoming frame with its 9th bit equal to the value of this bit marks the frame as a multi-processor address frame.
9	MPM	0	RW	<b>Multi-Processor Mode</b> Set to enable multi-processor mode.
	Value	Description		
	0	The 9th bit of incoming frames have no special function		
	1	An incoming frame with the 9th bit equal to MPAB will be loaded into the receive buffer regardless of RXBLOCK and will result in the MPAB interrupt flag being set		
8	SFUBRX	0	RW	<b>Start-Frame Unblock RX</b> Clears RXBLOCK when the start-frame is found in the incoming data. The start-frame is loaded into the receive buffer.
	Value	Description		
	0	Detected start-frames have no effect on RXBLOCK		
	1	When a start-frame is detected, RXBLOCK is cleared and the start-frame is loaded into the receive buffer		
7	LOOPBK	0	RW	<b>Loopback Enable</b> Set to connect receiver to LEUn_TX instead of LEUn_RX.
	Value	Description		
	0	The receiver is connected to and receives data from LEUn_RX		
	1	The receiver is connected to and receives data from LEUn_TX		
6	ERRSDMA	0	RW	<b>Clear RX DMA On Error</b> When set, RX DMA requests will be cleared on framing and parity errors.
	Value	Description		
	0	Framing and parity errors have no effect on DMA requests from the LEUART		
	1	RX DMA requests from the LEUART are disabled if a framing error or parity error occurs.		
5	INV	0	RW	<b>Invert Input And Output</b> Set to invert the output on LEUn_TX and input on LEUn_RX.
	Value	Description		
	0	A high value on the input/output is 1, and a low value is 0.		
	1	A low value on the input/output is 1, and a high value is 0.		
4	STOPBITS	0	RW	<b>Stop-Bit Mode</b> Determines the number of stop-bits used. Only used when transmitting data. The receiver only verifies that one stop bit is present.

Bit	Name	Reset	Access	Description
1	RXDIS	0	W1	<b>Receiver Disable</b> Set to disable data reception. If a frame is under reception when the receiver is disabled, the incoming frame is discarded.
0	RXEN	0	W1	<b>Receiver Enable</b> Set to activate data reception on LEUn_RX.

### 16.5.3 LEUARTn\_STATUS - Status Register

Offset	Bit Position																																																												
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																													
<b>Reset</b>																											R	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0					
<b>Access</b>																											R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R					
<b>Name</b>																											RXDATAV	TXBL	TXC	RXBLOCK	TXENS	RXENS																													

Bit	Name	Reset	Access	Description
31:6	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
5	RXDATAV	0	R	<b>RX Data Valid</b> Set when data is available in the receive buffer. Cleared when the receive buffer is empty.
4	TXBL	1	R	<b>TX Buffer Level</b> Indicates the level of the transmit buffer. Set when the transmit buffer is empty, and cleared when it is full.
3	TXC	0	R	<b>TX Complete</b> Set when a transmission has completed and no more data is available in the transmit buffer. Cleared when a new transmission starts.
2	RXBLOCK	0	R	<b>Block Incoming Data</b> When set, the receiver discards incoming frames. An incoming frame will not be loaded into the receive buffer if this bit is set at the instant the frame has been completely received.
1	TXENS	0	R	<b>Transmitter Enable Status</b> Set when the transmitter is enabled.
0	RXENS	0	R	<b>Receiver Enable Status</b> Set when the receiver is enabled. The receiver must be enabled for start frames, signal frames, and multi-processor address bit detection.

### 16.5.4 LEUARTn\_CLKDIV - Clock Control Register (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

Offset	Bit Position																																					
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						
<b>Reset</b>																											0x000											
<b>Access</b>																											RW											
<b>Name</b>																											DIV											

Bit	Name	Reset	Access	Description
31:15	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
14:3	DIV	0x000	RW	<b>Fractional Clock Divider</b> Specifies the fractional clock divider for the LEUART.
2:0	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		

### 16.5.5 LEUARTn\_STARTFRAME - Start Frame Register (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x000							
<b>Access</b>																									RW							
<b>Name</b>																									STARTFRAME							

Bit	Name	Reset	Access	Description
31:9	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
8:0	STARTFRAME	0x000	RW	<b>Start Frame</b> When a frame matching STARTFRAME is detected by the receiver, STARTF interrupt flag is set, and if SFUBRX is set, RXBLOCK is cleared. The start-frame is be loaded into the RX buffer.

### 16.5.6 LEUARTn\_SIGFRAME - Signal Frame Register (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x000							
<b>Access</b>																									RW							
<b>Name</b>																									SIGFRAME							

Bit	Name	Reset	Access	Description
31:9	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
8:0	SIGFRAME	0x000	RW	<b>Signal Frame</b> When a frame matching SIGFRAME is detected by the receiver, SIGF interrupt flag is set.

### 16.5.7 LEUARTn\_RXDATAx - Receive Buffer Data Extended Register

Offset	Bit Position																																		
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
0x018																	0	0																	
Reset																																			
Access																	R	R																	
Name																	FERR	PERR																	RXDATA

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15	FERR	0	R	<b>Receive Data Framing Error</b> Set if data in buffer has a framing error. Can be the result of a break condition.
14	PERR	0	R	<b>Receive Data Parity Error</b> Set if data in buffer has a parity error.
13:9	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
8:0	RXDATA	0x000	R	<b>RX Data</b> Use this register to access data read from the LEUART. Buffer is cleared on read access.

### 16.5.8 LEUARTn\_RXDATA - Receive Buffer Data Register

Offset	Bit Position																																
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset																																	
Access																																	
Name																																	RXDATA

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
7:0	RXDATA	0x00	R	<b>RX Data</b> Use this register to access data read from LEUART. Buffer is cleared on read access. Only the 8 LSB can be read using this register.

### 16.5.9 LEUARTn\_RXDATAXP - Receive Buffer Data Extended Peek Register

Offset	Bit Position																																	
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
0x020																																		
Reset																0	0																0x000	
Access																R	R																R	
Name																FERRP	PERRP																RXDATAP	

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15	FERRP	0	R	<b>Receive Data Framing Error Peek</b> Set if data in buffer has a framing error. Can be the result of a break condition.
14	PERRP	0	R	<b>Receive Data Parity Error Peek</b> Set if data in buffer has a parity error.
13:9	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
8:0	RXDATAP	0x000	R	<b>RX Data Peek</b> Use this register to access data read from the LEUART.

### 16.5.10 LEUARTn\_TXDATAAX - Transmit Buffer Data Extended Register (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

Offset	Bit Position																																		
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Name																RXENAT	TXDISAT	TXBREAK																TXDATA	

Bit	Name	Reset	Access	Description						
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)								
15	RXENAT	0	W	<b>Enable RX After Transmission</b> Set to enable reception after transmission. <table border="1" style="width: 100%; margin-top: 5px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>-</td> </tr> <tr> <td>1</td> <td>The receiver is enabled, setting RXENS after the frame has been transmitted</td> </tr> </tbody> </table>	Value	Description	0	-	1	The receiver is enabled, setting RXENS after the frame has been transmitted
Value	Description									
0	-									
1	The receiver is enabled, setting RXENS after the frame has been transmitted									
14	TXDISAT	0	W	<b>Disable TX After Transmission</b> Set to disable transmitter directly after transmission has competed. <table border="1" style="width: 100%; margin-top: 5px;"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>-</td> </tr> </tbody> </table>	Value	Description	0	-		
Value	Description									
0	-									

Bit	Name	Reset	Access	Description
	Value	Description		
	1	The transmitter is disabled, clearing TXENS after the frame has been transmitted		
13	TXBREAK	0	W	<b>Transmit Data As Break</b>
	Set to send data as a break. Recipient will see a framing error or a break condition depending on its configuration and the value of TXDATA.			
	Value	Description		
	0	The specified number of stop-bits are transmitted		
	1	Instead of the ordinary stop-bits, 0 is transmitted to generate a break. A single stop-bit is generated after the break to allow the receiver to detect the start of the next frame		
12:9	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
8:0	TXDATA	0x000	W	<b>TX Data</b>
	Use this register to write data to the LEUART. If the transmitter is enabled, a transfer will be initiated at the first opportunity.			

### 16.5.11 LEUARTn\_TXDATA - Transmit Buffer Data Register (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

Offset	Bit Position																															
0x028	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

31:8	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)																														
7:0	TXDATA	0x00	W	<b>TX Data</b>																												
	This frame will be added to the transmit buffer. Only 8 LSB can be written using this register. 9th bit and control bits will be cleared.																															

### 16.5.12 LEUARTn\_IF - Interrupt Flag Register

Offset	Bit Position																																																							
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																								
Reset																									0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
Access																									R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Name																									SIGF	STARTF	MPAF	FERR	PERR	TXOF	RXUF	RXOF	RXDATAV	TXBL	TXC																					
Bit	Name	Reset	Access	Description																																																				
31:11	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)																																																						
10	SIGF	0	R	<b>Signal Frame Interrupt Flag</b>																																																				
	Set when a signal frame is detected.																																																							
9	STARTF	0	R	<b>Start Frame Interrupt Flag</b>																																																				
	Set when a start frame is detected.																																																							
8	MPAF	0	R	<b>Multi-Processor Address Frame Interrupt Flag</b>																																																				

Bit	Name	Reset	Access	Description
				Set when a multi-processor address frame is detected.
7	FERR	0	R	<b>Framing Error Interrupt Flag</b> Set when a frame with a framing error is received while RXBLOCK is cleared.
6	PERR	0	R	<b>Parity Error Interrupt Flag</b> Set when a frame with a parity error is received while RXBLOCK is cleared.
5	TXOF	0	R	<b>TX Overflow Interrupt Flag</b> Set when a write is done to the transmit buffer while it is full. The data already in the transmit buffer is preserved.
4	RXUF	0	R	<b>RX Underflow Interrupt Flag</b> Set when trying to read from the receive buffer when it is empty.
3	RXOF	0	R	<b>RX Overflow Interrupt Flag</b> Set when data is incoming while the receive shift register is full. The data previously in shift register is overwritten by the new data.
2	RXDATAV	0	R	<b>RX Data Valid Interrupt Flag</b> Set when data becomes available in the receive buffer.
1	TXBL	1	R	<b>TX Buffer Level Interrupt Flag</b> Set when space becomes available in the transmit buffer for a new frame.
0	TXC	0	R	<b>TX Complete Interrupt Flag</b> Set after a transmission when both the TX buffer and shift register are empty.

### 16.5.13 LEUARTn\_IFS - Interrupt Flag Set Register

Offset	Bit Position																																	
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Name																					PULSEFILT	PULSEEN	PULSEW									

Bit	Name	Reset	Access	Description
31:6	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
5	PULSEFILT	0	RW	<b>Pulse Filter</b> Enable a one-cycle pulse filter for pulse extender
	Value	Description		
	0	Filter is disabled. Pulses must be at least 2 cycles long for reliable detection.		
	1	Filter is enabled. Pulses must be at least 3 cycles long for reliable detection.		
4	PULSEEN	0	RW	<b>Pulse Generator/Extender Enable</b> Filter LEUART output through pulse generator and the LEUART input through the pulse extender.
3:0	PULSEW	0x0	RW	<b>Pulse Width</b> Configure the pulse width of the pulse generator as a number of 32.768 kHz clock cycles.

### 16.5.17 LEUARTn\_FREEZE - Freeze Register

Offset	Bit Position																															
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																																0
Access																																RW
Name																																REGFREEZE

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
0	REGFREEZE	0	RW	<b>Register Update Freeze</b> When set, the update of the LEUART is postponed until this bit is cleared. Use this bit to update several registers simultaneously.
	Value	Mode	Description	
	0	UPDATE	Each write access to a LEUART register is updated into the Low Frequency domain as soon as possible.	
	1	FREEZE	The LEUART is not updated with the new written value.	

### 16.5.18 LEUARTn\_SYNCBUSY - Synchronization Busy Register

Offset	Bit Position																															
0x044	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																																0
Access																																R
Name																																PULSECTRL TXDATA TXDATA SIGFRAME STARTFRAME CLKDIV CMD CTRL

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
7	PULSECTRL	0	R	<b>PULSECTRL Register Busy</b> Set when the value written to PULSECTRL is being synchronized.
6	TXDATA	0	R	<b>TXDATA Register Busy</b>

Bit	Name	Reset	Access	Description
				Set when the value written to TXDATA is being synchronized.
5	TXDATA_X	0	R	<b>TXDATA_X Register Busy</b>
				Set when the value written to TXDATA_X is being synchronized.
4	SIGFRAME	0	R	<b>SIGFRAME Register Busy</b>
				Set when the value written to SIGFRAME is being synchronized.
3	STARTFRAME	0	R	<b>STARTFRAME Register Busy</b>
				Set when the value written to STARTFRAME is being synchronized.
2	CLKDIV	0	R	<b>CLKDIV Register Busy</b>
				Set when the value written to CLKDIV is being synchronized.
1	CMD	0	R	<b>CMD Register Busy</b>
				Set when the value written to CMD is being synchronized.
0	CTRL	0	R	<b>CTRL Register Busy</b>
				Set when the value written to CTRL is being synchronized.

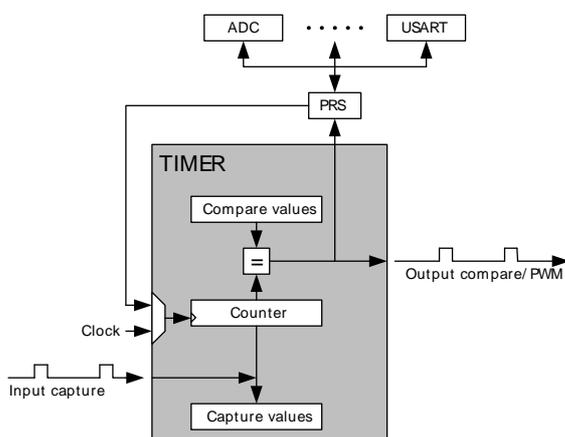

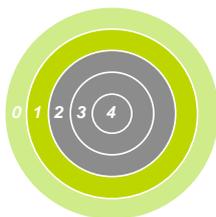

### 16.5.19 LEUARTn\_ROUTE - I/O Routing Register

Offset	Bit Position																																						
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0							
0x054																							0x0															0	0
<b>Reset</b>																																							
<b>Access</b>																							RW															RW	RW
<b>Name</b>																							LOCATION															TXPEN	RXPEN

Bit	Name	Reset	Access	Description
31:11	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
10:8	LOCATION	0x0	RW	<b>I/O Location</b>
				Decides the location of the LEUART I/O pins.
	Value	Mode	Description	
	0	LOC0	Location 0	
	1	LOC1	Location 1	
	2	LOC2	Location 2	
	3	LOC3	Location 3	
	4	LOC4	Location 4	
7:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
1	TXPEN	0	RW	<b>TX Pin Enable</b>
				When set, the TX pin of the LEUART is enabled.
	Value	Description		
	0	The LEUn_TX pin is disabled		
	1	The LEUn_TX pin is enabled		
0	RXPEN	0	RW	<b>RX Pin Enable</b>
				When set, the RX pin of the LEUART is enabled.
	Value	Description		
	0	The LEUn_RX pin is disabled		
	1	The LEUn_RX pin is enabled		

# 17 TIMER - Timer/Counter

## Quick Facts

### What?

The TIMER (Timer/Counter) keeps track of timing and counts events, generates output waveforms and triggers timed actions in other peripherals.

### Why?

Most applications have activities that need to be timed accurately with as little CPU intervention and energy consumption as possible.

### How?

The flexible 16-bit TIMER can be configured to provide PWM waveforms or work as a frequency generator. The Timer can also count events and control other peripherals through the PRS, which offloads the CPU and reduce energy consumption.

## 17.1 Introduction

The 16-bit general purpose Timer has 3 compare/capture channels for input capture and compare/Pulse-Width Modulation (PWM) output.

## 17.2 Features

- 16-bit auto reload up/down counter
  - Dedicated 16-bit reload register which serves as counter maximum
- 3 Compare/Capture channels
  - Individual configurable as either input capture or output compare/PWM
- Multiple Counter modes
  - Count up
  - Count down
  - Count up/down
  - Quadrature Decoder
  - Direction and count from external pins
- 2x Count Mode
- Counter control from PRS or external pin
  - Start
  - Stop
  - Reload and start
- Inter-Timer connection
  - Allows 32-bit counter mode
  - Start/stop synchronization between several Timers
- Input Capture
  - Period measurement
  - Pulse width measurement

1. Up-count: Counter counts up until it reaches the value in `TIMERn_TOP`, where it is reset to 0 before counting up again.
2. Down-count: The counter starts at the value in `TIMERn_TOP` and counts down. When it reaches 0, it is reloaded with the value in `TIMERn_TOP`.
3. Up/Down-count: The counter starts at 0 and counts up. When it reaches the value in `TIMERn_TOP`, it counts down until it reaches 0 and starts counting up again.
4. Quadrature Decoder: Two input channels where one determines the count direction, while the other pin triggers a clock event.

In addition, to the TIMER modes listed above, the TIMER also supports a 2x Count Mode. In this mode the counter increments/decrements by 2. The 2x Count Mode intended use is to generate 2x PWM frequency when the Compare/Capture channel is put in PWM mode. The 2x Count Mode can be enabled by setting the `X2CNT` bitfield in the `TIMERn_CTRL` register.

The counter value can be read or written by software at any time by accessing the `CNT` field in `TIMERn_CNT`.

### 17.3.1.1 Events

Overflow is set when the counter value shifts from `TIMERn_TOP` to the next value when counting up. In up-count mode the next value is 0. In up/down-count mode, the next value is `TIMERn_TOP-1`.

Underflow is set when the counter value shifts from 0 to the next value when counting down. In down-count mode, the next value is `TIMERn_TOP`. In up/down-count mode the next value is 1.

Update event is set on overflow in up-count mode and on underflow in down-count or up/down count mode. This event is used to time updates of buffered values.

### 17.3.1.2 Operation

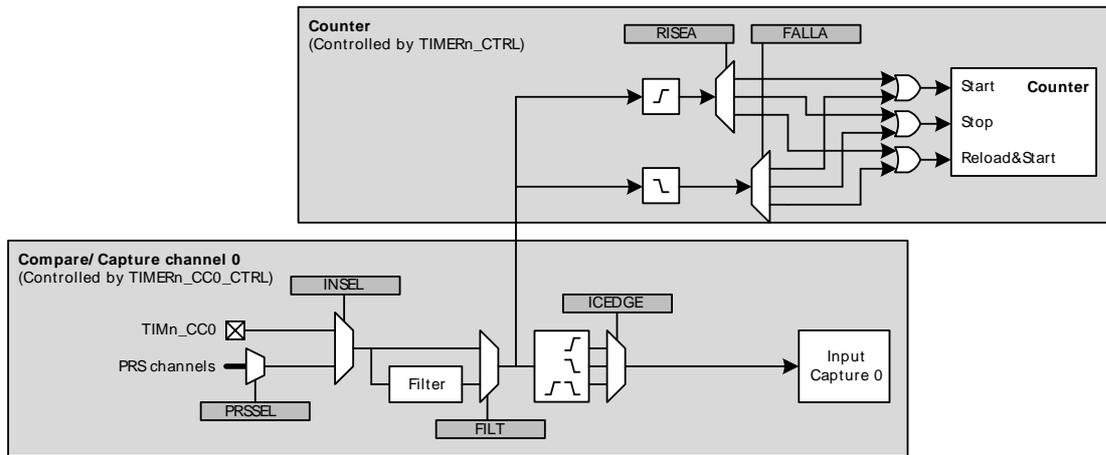

Figure 17.2 (p. 244) shows the hardware Timer/Counter control. Software can start or stop the counter by writing a 1 to the `START` or `STOP` bits in `TIMERn_CMD`. The counter value (`CNT` in `TIMERn_CNT`) can always be written by software to any 16-bit value.

It is also possible to control the counter through either an external pin or PRS input. This is done through the input logic for the Compare/Capture Channel 0. The Timer/Counter allows individual actions (start, stop, reload) to be taken for rising and falling input edges. This is configured in the `RISEA` and `FALLA` fields in `TIMERn_CTRL`. The reload value is 0 in up-count and up/down-count mode and `TOP` in down-count mode.

The `RUNNING` bit in `TIMERn_STATUS` indicates if the Timer is running or not. If the `SYNC` bit in `TIMERn_CTRL` is set, the Timer is started/stopped/reloaded (external pin or PRS) when any of the other timers are started/stopped/reloaded.

The `DIR` bit in `TIMERn_STATUS` indicates the counting direction of the Timer at any given time. The counter value can be read or written by software through the `CNT` field in `TIMERn_CNT`. In Up/Down-Count mode the count direction will be set to up if the `CNT` value is written by software.

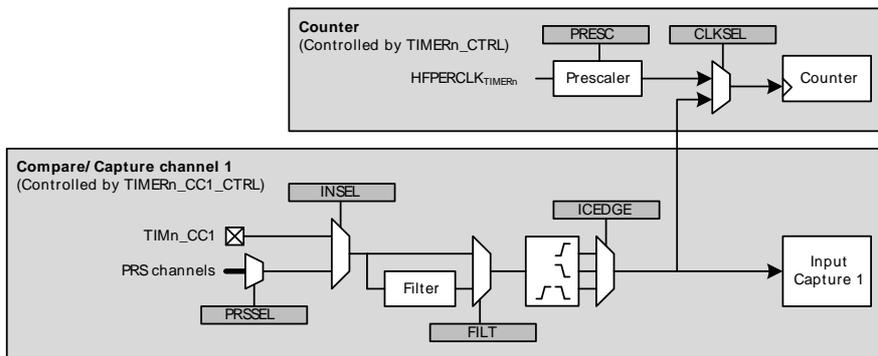

Figure 17.2. TIMER Hardware Timer/Counter Control

### 17.3.1.3 Clock Source

The counter can be clocked from several sources, which are all synchronized with the peripheral clock (HFPERCLK). See Figure 17.3 (p. 244) .

Figure 17.3. TIMER Clock Selection

#### 17.3.1.3.1 Peripheral Clock (HFPERCLK)

The peripheral clock (HFPERCLK) can be used as a source with a configurable prescale factor of  $2^{PRESC}$ , where PRESC is an integer between 0 and 10, which is set in PRESC in TIMERN\_CTRL. However, if 2x Count Mode is enabled and the Compare/Capture channels are put in PWM mode, the CC output is updated on both clock edges so prescaling the peripheral clock will result in incorrect result. The prescaler is stopped and reset when the timer is stopped.

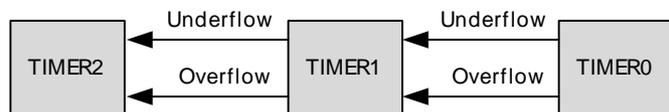

#### 17.3.1.3.2 Compare/ Capture Channel 1 Input

The Timer can also be clocked by positive and/or negative edges on the Compare/Capture channel 1 input. This input can either come from the TIMn\_CC1 pin or one of the PRS channels. The input signal must not have a higher frequency than  $f_{HFPERCLK}/3$  when running from a pin input or a PRS input with FILT enabled in TIMERN\_CCx\_CTRL. When running from PRS without FILT, the frequency can be as high as  $f_{HFPERCLK}$ . Note that when clocking the Timer from the same pulse that triggers a start (through RISEA/FALLA in TIMERN\_CTRL), the starting pulse will not update the Counter Value.

### 17.3.1.3.3 Underflow/Overflow from Neighboring Timer

All Timers are linked together (see Figure 17.4 (p. 245)), allowing timers to count on overflow/underflow from the lower numbered neighbouring timers to form a 32-bit or 48-bit timer. Note that all timers must be set to same count direction and less significant timer(s) can only be set to count up or down.

**Figure 17.4. TIMER Connections**

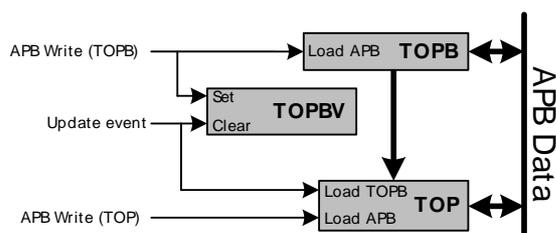

### 17.3.1.4 One-Shot Mode

By default, the counter counts continuously until it is stopped. If the OSMEN bit is set in the TIMERN\_CTRL register, however, the counter is disabled by hardware on the first *update event*. Note that when the counter is running with CC1 as clock source (0b01 in CLKSEL in TIMERN\_CTRL) and OSMEN is set, a CC1 capture event will not take place on the *update event* (CC1 rising edge) that stops the Timer.

### 17.3.1.5 Top Value Buffer

The TIMERN\_TOP register can be altered either by writing it directly or by writing to the TIMER\_TOPB (buffer) register. When writing to the buffer register the TIMERN\_TOPB register will be written to TIMERN\_TOP on the next update event. Buffering ensures that the TOP value is not set below the actual count value. The TOPBV flag in TIMERN\_STATUS indicates whether the TIMERN\_TOPB register contains data that have not yet been written to the TIMERN\_TOP register (see Figure 17.5 (p. 245) ).

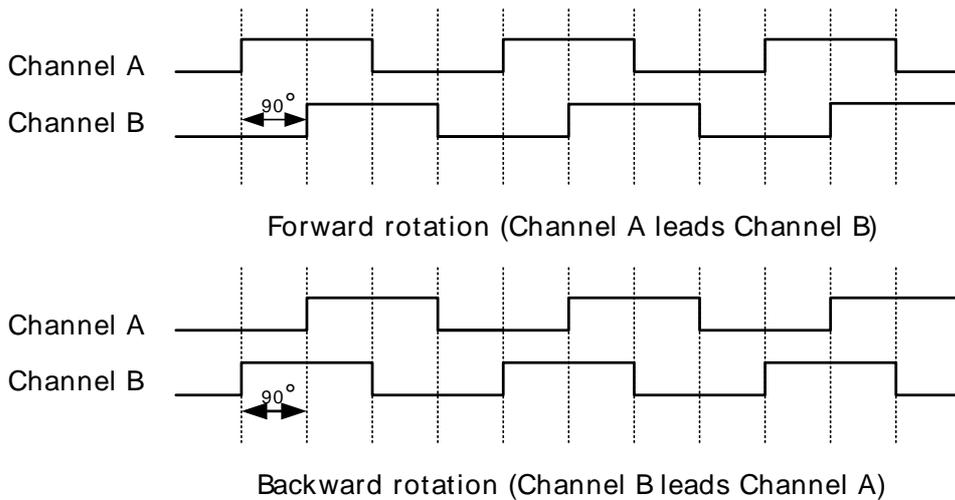

**Figure 17.5. TIMER TOP Value Update Functionality**

### 17.3.1.6 Quadrature Decoder

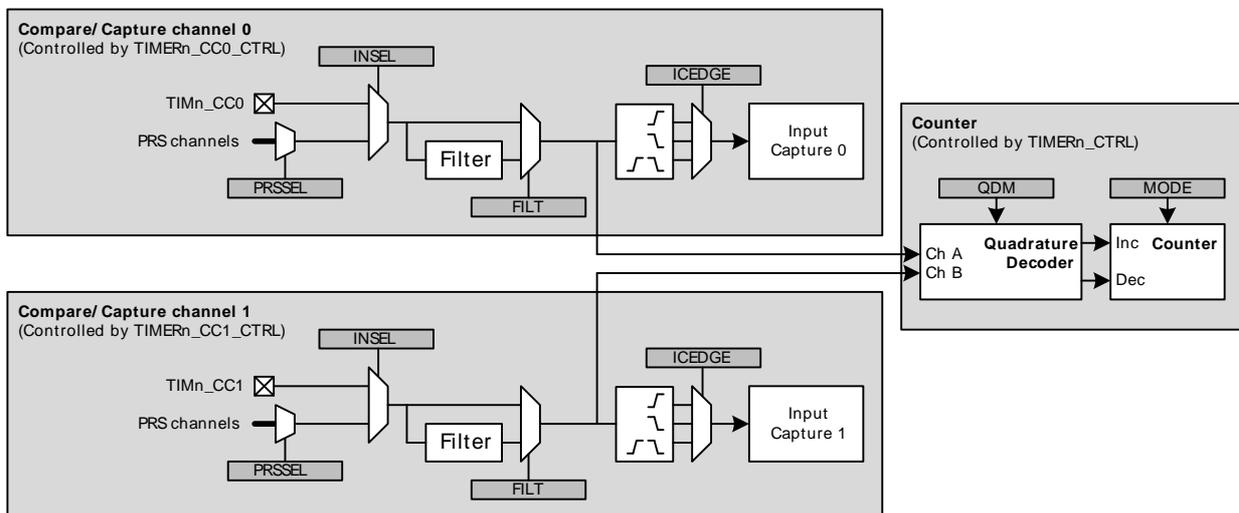

Quadrature Decoding mode is used to track motion and determine both rotation direction and position. The Quadrature Decoder uses two input channels that are 90 degrees out of phase (see Figure 17.6 (p. 246) ).

**Figure 17.6. TIMER Quadrature Encoded Inputs**

In the Timer these inputs are tapped from the Compare/Capture channel 0 (Channel A) and 1 (Channel B) inputs before edge detection. The Timer/Counter then increments or decrements the counter, based on the phase relation between the two inputs. The Quadrature Decoder Mode supports two channels, but if a third channel (Z-terminal) is available, this can be connected to an external interrupt and trigger a counter reset from the interrupt service routine. By connecting a periodic signal from another timer as input capture on Compare/Capture Channel 2, it is also possible to calculate speed and acceleration.

**Figure 17.7. TIMER Quadrature Decoder Configuration**

The Quadrature Decoder can be set in either X2 or X4 mode, which is configured in the QDM bit in `TIMERn_CTRL`. See Figure 17.7 (p. 246)

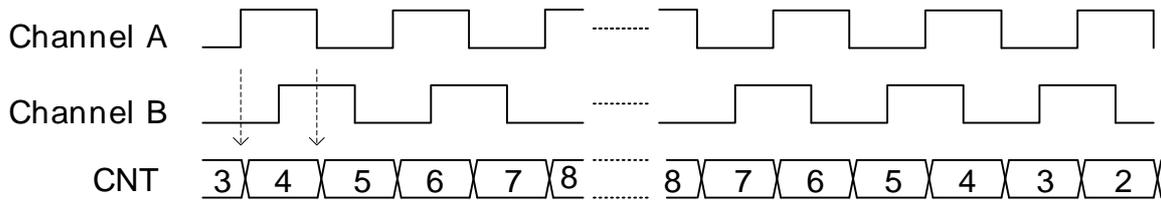

**17.3.1.6.1 X2 Decoding Mode**

In X2 Decoding mode, the counter increments or decrements on every edge of Channel A, see Table 17.1 (p. 247) and Figure 17.8 (p. 247) .

**Table 17.1. TIMER Counter Response in X2 Decoding Mode**

Channel B	Channel A	
	Rising	Falling
0	Increment	Decrement
1	Decrement	Increment

**Figure 17.8. TIMER X2 Decoding Mode**

**17.3.1.6.2 X4 Decoding Mode**

In X4 Decoding mode, the counter increments or decrements on every edge of Channel A and Channel B, see Figure 17.9 (p. 247) and Table 17.2 (p. 247) .

**Table 17.2. TIMER Counter Response in X4 Decoding Mode**

Opposite Channel	Channel A		Channel B	
	Rising	Falling	Rising	Falling
Channel A = 0			Decrement	Increment
Channel A = 1			Increment	Decrement
Channel B = 0	Increment	Decrement		
Channel B = 1	Decrement	Increment		

**Figure 17.9. TIMER X4 Decoding Mode**

**17.3.1.6.3 TIMER Rotational Position**

To calculate a position Equation 17.1 (p. 247) can be used.

**TIMER Rotational Position Equation**

$$\text{pos}^\circ = (\text{CNT}/X \times N) \times 360^\circ \tag{17.1}$$

where X = Encoding type and N = Number of pulses per revolution.

**17.3.2 Compare/Capture Channels**

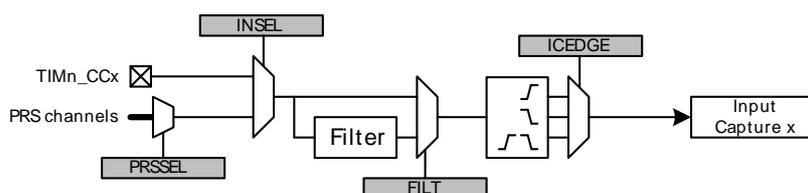

The Timer contains 3 Compare/Capture channels, which can be configured in the following modes:

1. Input Capture
2. Output Compare
3. PWM

### 17.3.2.1 Input Pin Logic

Each Compare/Capture channel can be configured as an input source for the Capture Unit or as external clock source for the Timer (see Figure 17.10 (p. 248)). Compare/Capture channels 0 and 1 are the inputs for the Quadrature Decoder Mode. The input channel can be filtered before it is used, which requires the input to remain stable for 5 cycles in a row before the input is propagated to the output.

**Figure 17.10. TIMER Input Pin Logic**

### 17.3.2.2 Compare/Capture Registers

The Compare/Capture channel registers are prefixed with `TIMERn_CCx_`, where the `x` stands for the channel number. Since the Compare/Capture channels serve three functions (input capture, compare, PWM), the behavior of the Compare/Capture registers (`TIMERn_CCx_CCV`) and buffer registers (`TIMERn_CCx_CCVB`) change depending on the mode the channel is set in.

#### 17.3.2.2.1 Input Capture mode

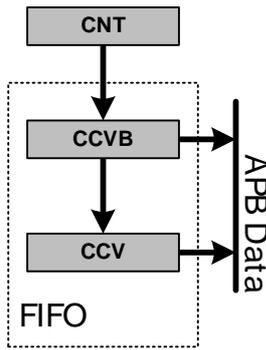

When running in Input Capture mode, `TIMERn_CCx_CCV` and `TIMERn_CCx_CCVB` form a FIFO buffer, and new capture values are added on a capture event, see Figure 17.11 (p. 249). The first capture can always be read from `TIMERn_CCx_CCV`, and reading this address will load the next capture value into `TIMERn_CCx_CCV` from `TIMERn_CCx_CCVB` if it contains valid data. The CC value can be read without altering the FIFO contents by reading `TIMERn_CCx_CCVP`. `TIMERn_CCx_CCVB` can also be read without altering the FIFO contents. The `ICV` flag in `TIMERn_STATUS` indicates if there is a valid unread capture in `TIMERn_CCx_CCV`.

In case a capture is triggered while both `CCV` and `CCVB` contain unread capture values, the buffer overflow interrupt flag (`ICBOF` in `TIMERn_IF`) will be set. New capture values will on overflow overwrite the value in `TIMERn_CCx_CCVB`.

#### Note

In input capture mode, the timer will only trigger interrupts when it is running

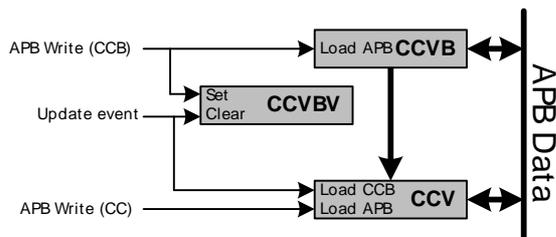

Figure 17.11. TIMER Input Capture Buffer Functionality

### 17.3.2.2.2 Compare and PWM Mode

When running in Output Compare or PWM mode, the value in `TIMERn_CCx_CCv` will be compared against the count value. In Compare mode the output can be configured to toggle, clear or set on compare match, overflow and underflow through the `CMOA`, `COFOA` and `CUFOA` fields in `TIMERn_CCx_CTRL`. `TIMERn_CCx_CCv` can be accessed directly or through the buffer register `TIMERn_CCx_CCvB`, see Figure 17.12 (p. 249). When writing to the buffer register, the value in `TIMERn_CCx_CCvB` will be written to `TIMERn_CCx_CCv` on the next update event. This functionality ensures glitch free PWM outputs. The `CCVBV` flag in `TIMERn_STATUS` indicates whether the `TIMERn_CCx_CCvB` register contains data that have not yet been written to the `TIMERn_CCx_CCv` register. Note that when writing 0 to `TIMERn_CCx_CCvB` the `CCv` value is updated when the timer counts from 0 to 1. Thus, the compare match for the next period will not happen until the timer reaches 0 again on the way down.

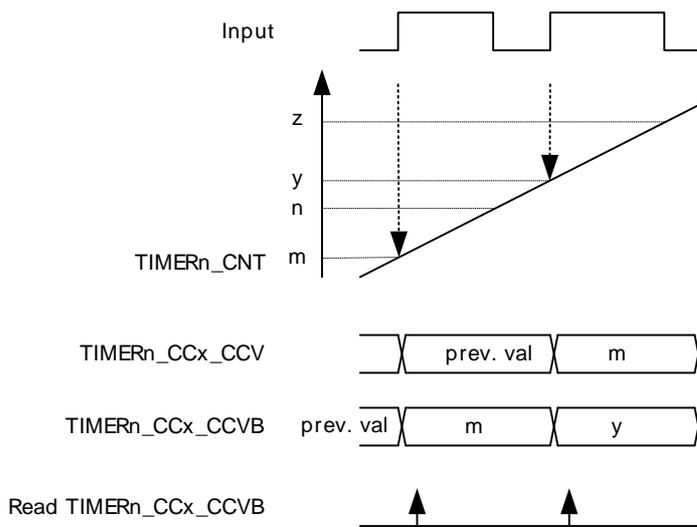

Figure 17.12. TIMER Output Compare/PWM Buffer Functionality

### 17.3.2.3 Input Capture

In Input Capture Mode, the counter value (`TIMERn_CNT`) can be captured in the Compare/Capture Register (`TIMERn_CCx_CCv`), see Figure 17.13 (p. 250). In this mode, `TIMERn_CCx_CCv` is read-only. Together with the Compare/Capture Buffer Register (`TIMERn_CCx_CCvB`) the `TIMERn_CCx_CCv` form a double-buffered capture registers allowing two subsequent capture events to take place before a read-out is required. The `CCPOL` bits in `TIMERn_STATUS` indicate the polarity the edge that triggered the capture in `TIMERn_CCx_CCv`.

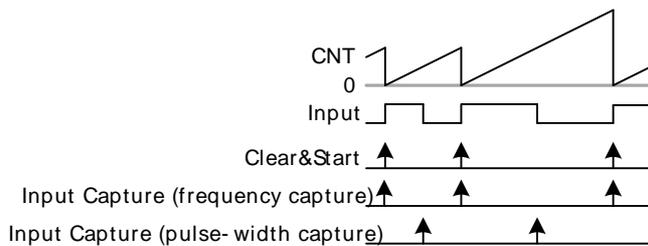

**Figure 17.13. TIMER Input Capture**

**17.3.2.3.1 Period/Pulse-Width Capture**

Period and/or pulse-width capture can be achieved by setting the RISEA field in `TIMERn_CTRL` to Clear&Start, and select the wanted input from either external pin or PRS, see Figure 17.14 (p. 250). For period capture, the Compare/Capture Channel 0 should then be set to input capture on a rising edge of the same input signal. To capture the width of a high pulse, the channel should be set to capture on a falling edge of the input signal. To start the measuring period on either a falling edge or measure the low pulse-width of a signal, opposite polarities should be chosen.

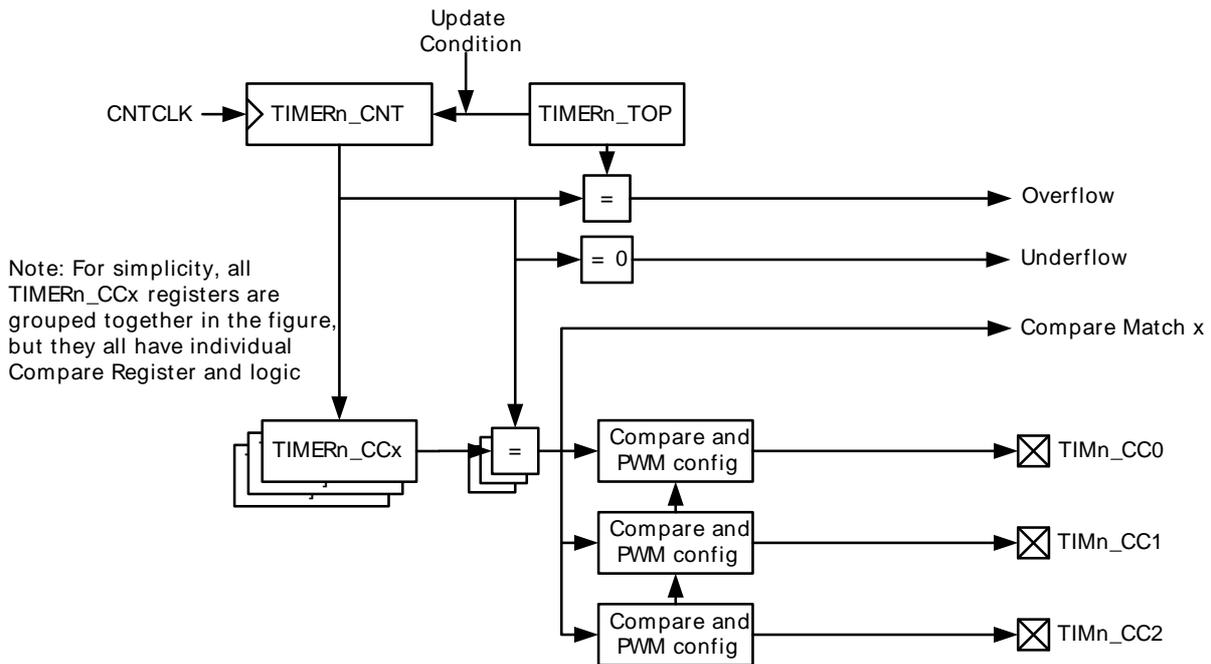

**Figure 17.14. TIMER Period and/or Pulse width Capture**

**17.3.2.4 Compare**

Each Compare/Capture channel contains a comparator which outputs a compare match if the contents of `TIMERn_CCx_CCV` matches the counter value, see Figure 17.15 (p. 251). In compare mode, each compare channel can be configured to either set, clear or toggle the output on an event (compare match, overflow or underflow). The output from each channel is represented as an alternative function on the port it is connected to, which needs to be enabled for the CC outputs to propagate to the pins.

Figure 17.15. TIMER Block Diagram Showing Comparison Functionality

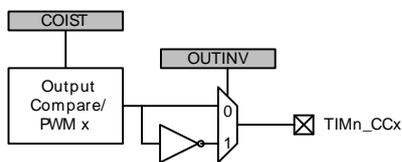

If occurring in the same cycle, match action will have priority over overflow or underflow action.

The input selected (through `PRSEL`, `INSEL` and `FILTSEL` in `TIMERn_CCx_CTRL`) for the CC channel will also be sampled on compare match and the result is found in the `CCPOL` bits in `TIMERn_STATUS`. It is also possible to configure the `CCPOL` to always track the inputs by setting `ATI` in `TIMERn_CTRL`.

The `COIST` bit in `TIMERn_CCx_CTRL` is the initial state of the compare/PWM output. The `COIST` bit can also be used as an initial value to the compare outputs on a reload-start when `RSSCOIST` is set in `TIMERn_CTRL`. Also the resulting output can be inverted by setting `OUTINV` in `TIMERn_CCx_CTRL`. It is recommended to turn off the CC channel before configuring the output state to avoid any pulses on the output. The CC channel can be turned off by setting `MODE` to `OFF` in `TIMERn_CCx_CTRL`.

Figure 17.16. TIMER Output Logic

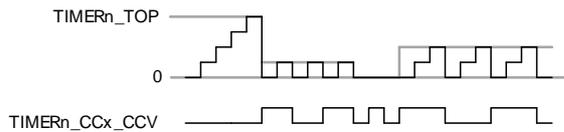

### 17.3.2.4.1 Frequency Generation (FRG)

Frequency generation (see Figure 17.17 (p. 252) ) can be achieved in compare mode by:

- Setting the counter in up-count mode
- Enabling buffering of the TOP value.
- Setting the CC channels overflow action to toggle

**Figure 17.17. TIMER Up-count Frequency Generation**

The output frequency is given by Equation 17.2 (p. 252)

**TIMER Up-count Frequency Generation Equation**

$$f_{FRG} = f_{HFPERCLK} / ( 2^{(PRESC + 1)} \times (TOP + 1) \times 2) \tag{17.2}$$

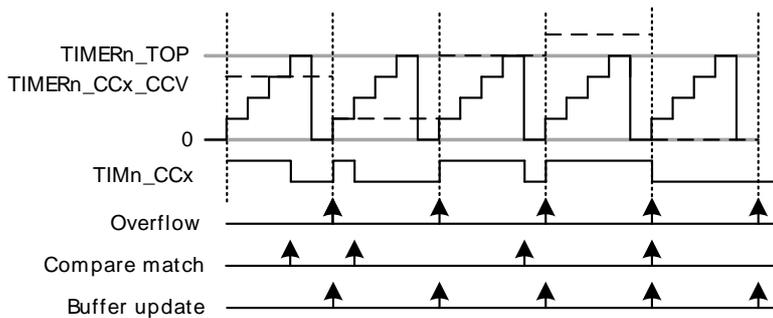

**17.3.2.5 Pulse-Width Modulation (PWM)**

In PWM mode, TIMERn\_CCx\_CCV is buffered to avoid glitches in the output. The settings in the Compare Output Action configuration bits are ignored in PWM mode and PWM generation is only supported for up-count and up/down-count mode.

**17.3.2.6 Up-count (Single-slope) PWM**

If the counter is set to up-count and the Compare/Capture channel is put in PWM mode, single slope PWM output will be generated (see Figure 17.18 (p. 252) ). In up-count mode the PWM period is TOP +1 cycles and the PWM output will be high for a number of cycles equal to TIMERn\_CCx\_CCV. This means that a constant high output is achieved by setting TIMERn\_CCx to TOP+1 or higher. The PWM resolution (in bits) is then given by Equation 17.3 (p. 252) .

**Figure 17.18. TIMER Up-count PWM Generation**

**TIMER Up-count PWM Resolution Equation**

$$R_{PWM_{up}} = \log(TOP+1)/\log(2) \tag{17.3}$$

The PWM frequency is given by Equation 17.4 (p. 252) :

**TIMER Up-count PWM Frequency Equation**

$$f_{PWM_{up/down}} = f_{HFPERCLK} / ( 2^{PRESC} \times (TOP + 1) ) \tag{17.4}$$

The high duty cycle is given by Equation 17.5 (p. 253)

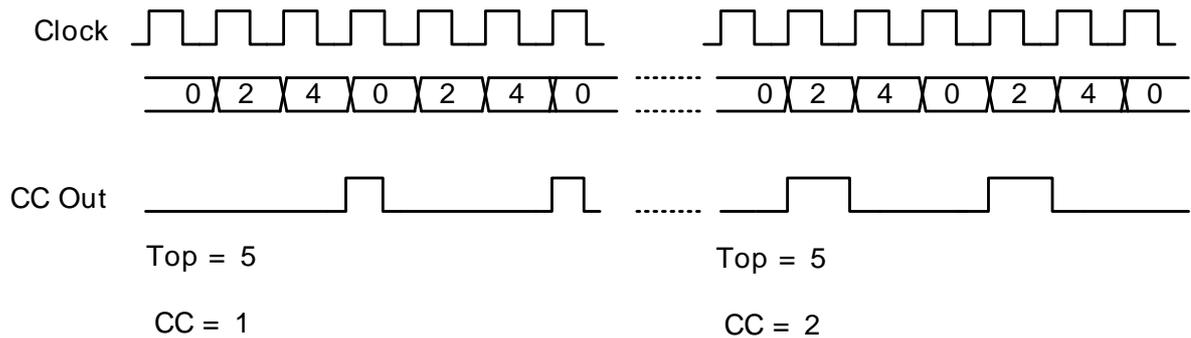

**TIMER Up-count Duty Cycle Equation**

$$DS_{up} = CCVx/TOP \tag{17.5}$$

**17.3.2.6.1 2x Count Mode**

When the Timer is set in 2x mode, the TIMER will count up by two. This will in effect make any odd Top value be rounded down to the closest even number. Similarly, any odd CC value will generate a match on the closest lower even value as shown in Figure 17.19 (p. 253)

**Figure 17.19. TIMER CC out in 2x mode**

The mode is enabled by setting the X2CNT field in TIMERN\_CTRL register. The intended use of the 2x mode is to generate 2x PWM frequency when the Compare/Capture channel is put in PWM mode. Since the PWM output is updated on both edges of the clock, frequency prescaling will result in incorrect result in this mode. The PWM resolution (in bits) is then given by Equation 17.6 (p. 253) .

**TIMER 2x PWM Resolution Equation**

$$R_{PWM_{2xmode}} = \log(TOP/2+1)/\log(2) \tag{17.6}$$

The PWM frequency is given by Equation 17.7 (p. 253) :

**TIMER 2x Mode PWM Frequency Equation( Up-count)**

$$f_{PWM_{2xmode}} = 2 \times f_{HFPERCLK} / \text{floor}(TOP/2)+1 \tag{17.7}$$

The high duty cycle is given by Equation 17.8 (p. 253)

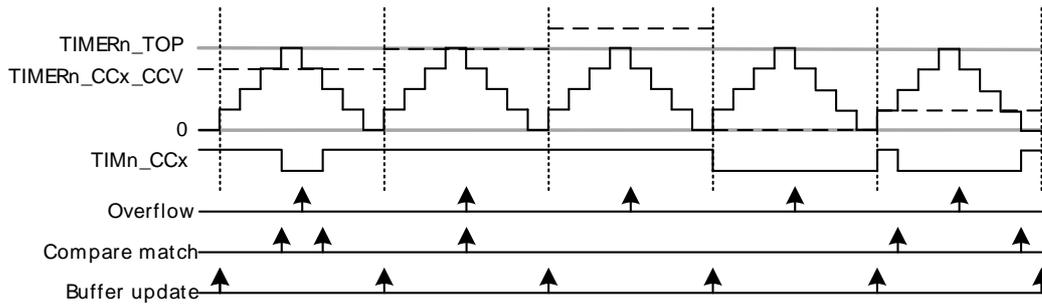

**TIMER 2x Mode Duty Cycle Equation**

$$DS_{2xmode} = CCVx/TOP \tag{17.8}$$

**17.3.2.7 Up/Down-count (Dual-slope) PWM**

If the counter is set to up-down count and the Compare/Capture channel is put in PWM mode, dual slope PWM output will be generated by Figure 17.20 (p. 254) .The resolution (in bits) is given by Equation 17.9 (p. 254) .

**Figure 17.20. TIMER Up/Down-count PWM Generation**

**TIMER Up/Down-count PWM Resolution Equation**

$$R_{PWM_{up/down}} = \log(TOP+1)/\log(2) \tag{17.9}$$

The PWM frequency is given by Equation 17.10 (p. 254) :

**TIMER Up/Down-count PWM Frequency Equation**

$$f_{PWM_{up/down}} = f_{HFPERCLK} / ( 2^{(PRESC+1)} \times TOP) \tag{17.10}$$

The high duty cycle is given by Equation 17.11 (p. 254)

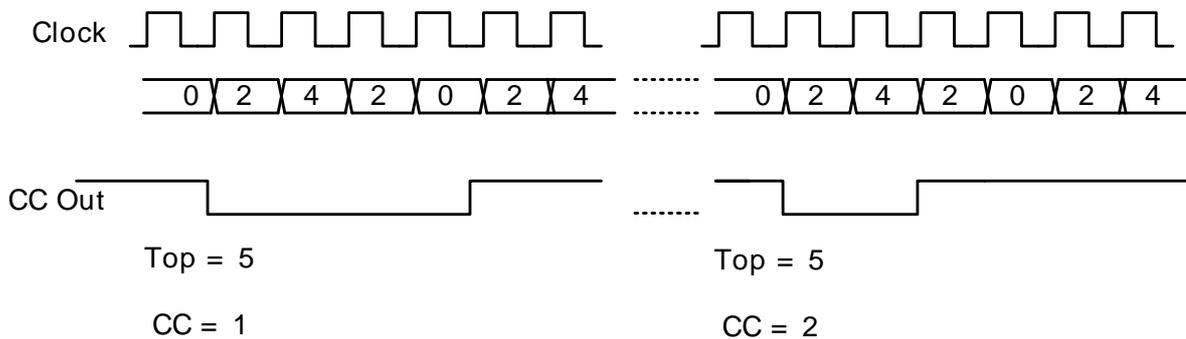

**TIMER Up/Down-count Duty Cycle Equation**

$$DS_{up/down} = CCVx/TOP \tag{17.11}$$

**17.3.2.7.1 2x Count Mode**

When the Timer is set in 2x mode, the TIMER will count up/down by two. This will in effect make any odd Top value be rounded down to the closest even number. Similarly, any odd CC value will generate a match on the closest lower even value as shown in Figure 17.21 (p. 254)

**Figure 17.21. TIMER CC out in 2x mode**

The mode is enabled by setting the X2CNT field in TIMERn\_CTRL register. The intended use of the 2x mode is to generate 2x PWM frequency when the Compare/Capture channel is put in PWM mode. Since the PWM output is updated on both edges of the clock, frequency prescaling will result in incorrect result in this mode. The PWM resolution (in bits) is then given by Equation 17.12 (p. 254) .

**TIMER 2x PWM Resolution Equation**

$$R_{PWM_{2xmode}} = \log(TOP/2+1)/\log(2) \tag{17.12}$$

The PWM frequency is given by Equation 17.7 (p. 253) :

**TIMER 2x Mode PWM Frequency Equation( Up/Down-count)**

$$f_{\text{PWM}_{2\text{xmode}}} = f_{\text{HFPERCLK}} / \text{TOP} \tag{17.13}$$

The high duty cycle is given by Equation 17.14 (p. 255)

**TIMER 2x Mode Duty Cycle Equation**

$$\text{DS}_{2\text{xmode}} = \text{CCVx} / \text{TOP} \tag{17.14}$$

### 17.3.3 Debug Mode

When the CPU is halted in debug mode, the timer can be configured to either continue to run or to be frozen. This is configured in DBGHALT in TIMERN\_CTRL.

### 17.3.4 Interrupts, DMA and PRS Output

The Timer has 5 output events:

- Counter Underflow
- Counter Overflow
- Compare match or input capture (one per Compare/Capture channel)

Each of the events has its own interrupt flag. Also, there is one interrupt flag for each Compare/Capture channel which is set on buffer overflow in capture mode. Buffer overflow happens when a new capture pushes an old unread capture out of the TIMERN\_CCx\_CCv/TIMERN\_CCx\_CCvB register pair.

If the interrupt flags are set and the corresponding interrupt enable bits in TIMERN\_IEN) are set high, the Timer will send out an interrupt request. Each of the events will also lead to a one HFPERCLK<sub>TIMERN</sub> cycle high pulse on individual PRS outputs. Setting PRSOCNF to LEVEL in TIMERN\_CCx\_CTRL will make the compare match PRS output follow the compare match output, instead of outputting one HFPERCLK<sub>TIMERN</sub> cycle high pulse.

Each of the events will also set a DMA request when they occur. The different DMA requests are cleared when certain acknowledge conditions are met, see Table 17.3 (p. 255) . If DMACLRACT is set in TIMERN\_CTRL, the DMA request is cleared when the triggered DMA channel is active, without having to access any timer registers.

**Table 17.3. TIMER Events**

Event	Acknowledge
Underflow/Overflow	Read or write to TIMERN_CNT or TIMERN_TOPB
CC 0	Read or write to TIMERN_CC0_CCv or TIMERN_CC0_CCvB
CC 1	Read or write to TIMERN_CC1_CCv or TIMERN_CC1_CCvB
CC 2	Read or write to TIMERN_CC2_CCv or TIMERN_CC2_CCvB

### 17.3.5 GPIO Input/Output

The TIMn\_CCx inputs/outputs are accessible as alternate functions through GPIO. Each pin connection can be enabled/disabled separately by setting the corresponding CCxPEN bits in TIMERN\_ROUTE. The LOCATION bits in the same register can be used to move all enabled pins to alternate pins.

## 17.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	TIMERn_CTRL	RW	Control Register
0x004	TIMERn_CMD	W1	Command Register
0x008	TIMERn_STATUS	R	Status Register
0x00C	TIMERn_IEN	RW	Interrupt Enable Register
0x010	TIMERn_IF	R	Interrupt Flag Register
0x014	TIMERn_IFS	W1	Interrupt Flag Set Register
0x018	TIMERn_IFC	W1	Interrupt Flag Clear Register
0x01C	TIMERn_TOP	RWH	Counter Top Value Register
0x020	TIMERn_TOPB	RW	Counter Top Value Buffer Register
0x024	TIMERn_CNT	RWH	Counter Value Register
0x028	TIMERn_ROUTE	RW	I/O Routing Register
0x030	TIMERn_CC0_CTRL	RW	CC Channel Control Register
0x034	TIMERn_CC0_CCV	RWH	CC Channel Value Register
0x038	TIMERn_CC0_CCVP	R	CC Channel Value Peek Register
0x03C	TIMERn_CC0_CCVB	RWH	CC Channel Buffer Register
0x040	TIMERn_CC1_CTRL	RW	CC Channel Control Register
0x044	TIMERn_CC1_CCV	RWH	CC Channel Value Register
0x048	TIMERn_CC1_CCVP	R	CC Channel Value Peek Register
0x04C	TIMERn_CC1_CCVB	RWH	CC Channel Buffer Register
0x050	TIMERn_CC2_CTRL	RW	CC Channel Control Register
0x054	TIMERn_CC2_CCV	RWH	CC Channel Value Register
0x058	TIMERn_CC2_CCVP	R	CC Channel Value Peek Register
0x05C	TIMERn_CC2_CCVB	RWH	CC Channel Buffer Register

## 17.5 Register Description

### 17.5.1 TIMERn\_CTRL - Control Register

Offset	Bit Position																																
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>			0	0		0x0									0x0					0		0x0		0x0		0		0		0		0x0	
<b>Access</b>			RW	RW		RW									RW					RW		RW		RW		RW		RW		RW		RW	
<b>Name</b>			RSSCOIST	ATI		PRESC									CLKSEL					X2CNT			FALLA		RISEA		DMACLRACT	DEBUGRUN	QDM	OSMEN	SYNC		MODE

Bit	Name	Reset	Access	Description
31:30	Reserved			To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)
29	RSSCOIST	0	RW	<b>Reload-Start Sets Compare Output initial State</b> When enabled, compare output is set to COIST value at Reload-Start event
28	ATI	0	RW	<b>Always Track Inputs</b> Enable ATI makes CCPOL always track the polarity of the inputs

Bit	Name	Reset	Access	Description
27:24	PRESC	0x0	RW	<b>Prescaler Setting</b>
These bits select the prescaling factor.				
	Value	Mode	Description	
	0	DIV1	The HFPERCLK is undivided	
	1	DIV2	The HFPERCLK is divided by 2	
	2	DIV4	The HFPERCLK is divided by 4	
	3	DIV8	The HFPERCLK is divided by 8	
	4	DIV16	The HFPERCLK is divided by 16	
	5	DIV32	The HFPERCLK is divided by 32	
	6	DIV64	The HFPERCLK is divided by 64	
	7	DIV128	The HFPERCLK is divided by 128	
	8	DIV256	The HFPERCLK is divided by 256	
	9	DIV512	The HFPERCLK is divided by 512	
	10	DIV1024	The HFPERCLK is divided by 1024	
23:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
17:16	CLKSEL	0x0	RW	<b>Clock Source Select</b>
These bits select the clock source for the timer.				
	Value	Mode	Description	
	0	PRESCHFPERCLK	Prescaled HFPERCLK	
	1	CC1	Compare/Capture Channel 1 Input	
	2	TIMEROUF	Timer is clocked by underflow(down-count) or overflow(up-count) in the lower numbered neighbor Timer	
15:14	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
13	X2CNT	0	RW	<b>2x Count Mode</b>
Enable 2x count mode				
12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
11:10	FALLA	0x0	RW	<b>Timer Falling Input Edge Action</b>
These bits select the action taken in the counter when a falling edge occurs on the input.				
	Value	Mode	Description	
	0	NONE	No action	
	1	START	Start counter without reload	
	2	STOP	Stop counter without reload	
	3	RELOADSTART	Reload and start counter	
9:8	RISEA	0x0	RW	<b>Timer Rising Input Edge Action</b>
These bits select the action taken in the counter when a rising edge occurs on the input.				
	Value	Mode	Description	
	0	NONE	No action	
	1	START	Start counter without reload	
	2	STOP	Stop counter without reload	
	3	RELOADSTART	Reload and start counter	
7	DMACLRACT	0	RW	<b>DMA Request Clear on Active</b>
When this bit is set, the DMA requests are cleared when the corresponding DMA channel is active. This enables the timer DMA requests to be cleared without accessing the timer.				
6	DEBUGRUN	0	RW	<b>Debug Mode Run Enable</b>
Set this bit to enable timer to run in debug mode.				
	Value	Description		
	0	Timer is frozen in debug mode		
	1	Timer is running in debug mode		
5	QDM	0	RW	<b>Quadrature Decoder Mode Selection</b>

Bit	Name	Reset	Access	Description
This bit sets the mode for the quadrature decoder.				
	Value	Mode	Description	
	0	X2	X2 mode selected	
	1	X4	X4 mode selected	
4	OSMEN	0	RW	<b>One-shot Mode Enable</b> Enable/disable one shot mode.
3	SYNC	0	RW	<b>Timer Start/Stop/Reload Synchronization</b> When this bit is set, the Timer is started/stopped/reloaded by start/stop/reload commands in the other timers
	Value	Description		
	0	Timer is not started/stopped/reloaded by other timers		
	1	Timer is started/stopped/reloaded by other timers		
2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
1:0	MODE	0x0	RW	<b>Timer Mode</b> These bit set the counting mode for the Timer. Note, when Quadrature Decoder Mode is selected (MODE = 'b11), the CLKSEL is don't care. The Timer is clocked by the Decoder Mode clock output.
	Value	Mode	Description	
	0	UP	Up-count mode	
	1	DOWN	Down-count mode	
	2	UPDOWN	Up/down-count mode	
	3	QDEC	Quadrature decoder mode	

### 17.5.2 TIMERN\_CMD - Command Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0	0
<b>Access</b>																															W1	W1
<b>Name</b>																															STOP	START

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
1	STOP	0	W1	<b>Stop Timer</b> Write a 1 to this bit to stop timer
0	START	0	W1	<b>Start Timer</b> Write a 1 to this bit to start timer

### 17.5.3 TIMERn\_STATUS - Status Register

Offset	Bit Position																																			
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
<b>Reset</b>							0	0	0							0	0	0							0	0	0							0	0	0
<b>Access</b>							R	R	R							R	R	R							R	R	R							R	R	R
<b>Name</b>							CCPOL2	CCPOL1	CCPOL0							ICV2	ICV1	ICV0							CCVBV2	CCVBV1	CCVBV0							TOPBV	DIR	RUNNING

Bit	Name	Reset	Access	Description
31:27	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		

26	CCPOL2	0	R	<b>CC2 Polarity</b>
<p>In Input Capture mode, this bit indicates the polarity of the edge that triggered capture in TIMERn_CC2_CCV. In Compare/PWM mode, this bit indicates the polarity of the selected input to CC channel 2. These bits are cleared when CCMODE is written to 0b00 (Off).</p>				
	Value	Mode	Description	
	0	LOWRISE	CC2 polarity low level/rising edge	
	1	HIGHFALL	CC2 polarity high level/falling edge	

25	CCPOL1	0	R	<b>CC1 Polarity</b>
<p>In Input Capture mode, this bit indicates the polarity of the edge that triggered capture in TIMERn_CC1_CCV. In Compare/PWM mode, this bit indicates the polarity of the selected input to CC channel 1. These bits are cleared when CCMODE is written to 0b00 (Off).</p>				
	Value	Mode	Description	
	0	LOWRISE	CC1 polarity low level/rising edge	
	1	HIGHFALL	CC1 polarity high level/falling edge	

24	CCPOL0	0	R	<b>CC0 Polarity</b>
<p>In Input Capture mode, this bit indicates the polarity of the edge that triggered capture in TIMERn_CC0_CCV. In Compare/PWM mode, this bit indicates the polarity of the selected input to CC channel 0. These bits are cleared when CCMODE is written to 0b00 (Off).</p>				
	Value	Mode	Description	
	0	LOWRISE	CC0 polarity low level/rising edge	
	1	HIGHFALL	CC0 polarity high level/falling edge	

23:19	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
-------	----------	---	--	--

18	ICV2	0	R	<b>CC2 Input Capture Valid</b>
<p>This bit indicates that TIMERn_CC2_CCV contains a valid capture value. These bits are only used in input capture mode and are cleared when CCMODE is written to 0b00 (Off).</p>				
	Value	Description		
	0	TIMERn_CC2_CCV does not contain a valid capture value(FIFO empty)		
	1	TIMERn_CC2_CCV contains a valid capture value(FIFO not empty)		

17	ICV1	0	R	<b>CC1 Input Capture Valid</b>
<p>This bit indicates that TIMERn_CC1_CCV contains a valid capture value. These bits are only used in input capture mode and are cleared when CCMODE is written to 0b00 (Off).</p>				
	Value	Description		
	0	TIMERn_CC1_CCV does not contain a valid capture value(FIFO empty)		
	1	TIMERn_CC1_CCV contains a valid capture value(FIFO not empty)		

16	ICV0	0	R	<b>CC0 Input Capture Valid</b>
<p>This bit indicates that TIMERn_CC0_CCV contains a valid capture value. These bits are only used in input capture mode and are cleared when CCMODE is written to 0b00 (Off).</p>				
	Value	Description		
	0	TIMERn_CC0_CCV does not contain a valid capture value(FIFO empty)		

Bit	Name	Reset	Access	Description
10	ICBOF2	0	RW	<b>CC Channel 2 Input Capture Buffer Overflow Interrupt Enable</b> Enable/disable Compare/Capture ch 2 input capture buffer overflow interrupt.
9	ICBOF1	0	RW	<b>CC Channel 1 Input Capture Buffer Overflow Interrupt Enable</b> Enable/disable Compare/Capture ch 1 input capture buffer overflow interrupt.
8	ICBOF0	0	RW	<b>CC Channel 0 Input Capture Buffer Overflow Interrupt Enable</b> Enable/disable Compare/Capture ch 0 input capture buffer overflow interrupt.
7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
6	CC2	0	RW	<b>CC Channel 2 Interrupt Enable</b> Enable/disable Compare/Capture ch 2 interrupt.
5	CC1	0	RW	<b>CC Channel 1 Interrupt Enable</b> Enable/disable Compare/Capture ch 1 interrupt.
4	CC0	0	RW	<b>CC Channel 0 Interrupt Enable</b> Enable/disable Compare/Capture ch 0 interrupt.
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
1	UF	0	RW	<b>Underflow Interrupt Enable</b> Enable/disable underflow interrupt.
0	OF	0	RW	<b>Overflow Interrupt Enable</b> Enable/disable overflow interrupt.

### 17.5.5 TIMERN\_IF - Interrupt Flag Register

Offset	Bit Position																																																				
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																					
<b>Reset</b>																							0	0	0		0	0	0																								
<b>Access</b>																							R	R	R																												
<b>Name</b>																							ICBOF2	ICBOF1	ICBOF0																												

Bit	Name	Reset	Access	Description
31:11	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
10	ICBOF2	0	R	<b>CC Channel 2 Input Capture Buffer Overflow Interrupt Flag</b> This bit indicates that a new capture value has pushed an unread value out of the TIMERN_CC2_CC0/TIMERN_CC2_CC1 register pair.
9	ICBOF1	0	R	<b>CC Channel 1 Input Capture Buffer Overflow Interrupt Flag</b> This bit indicates that a new capture value has pushed an unread value out of the TIMERN_CC1_CC0/TIMERN_CC1_CC1 register pair.
8	ICBOF0	0	R	<b>CC Channel 0 Input Capture Buffer Overflow Interrupt Flag</b> This bit indicates that a new capture value has pushed an unread value out of the TIMERN_CC0_CC0/TIMERN_CC0_CC1 register pair.
7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
6	CC2	0	R	<b>CC Channel 2 Interrupt Flag</b> This bit indicates that there has been an interrupt event on Compare/Capture channel 2.
5	CC1	0	R	<b>CC Channel 1 Interrupt Flag</b> This bit indicates that there has been an interrupt event on Compare/Capture channel 1.

Bit	Name	Reset	Access	Description
4	CC0	0	R	<b>CC Channel 0 Interrupt Flag</b> This bit indicates that there has been an interrupt event on Compare/Capture channel 0.
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
1	UF	0	R	<b>Underflow Interrupt Flag</b> This bit indicates that there has been an underflow.
0	OF	0	R	<b>Overflow Interrupt Flag</b> This bit indicates that there has been an overflow.

### 17.5.6 TIMERN\_IFS - Interrupt Flag Set Register

Offset	Bit Position																																																						
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	TOP	0xFFFF	RWH	<b>Counter Top Value</b>

Bit	Name	Reset	Access	Description
31:19	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
18:16	LOCATION	0x0	RW	<b>I/O Location</b> Decides the location of the CC pins.
	Value	Mode	Description	
	0	LOC0	Location 0	
	1	LOC1	Location 1	
	2	LOC2	Location 2	
	3	LOC3	Location 3	
	4	LOC4	Location 4	
	5	LOC5	Location 5	
15:3	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
2	CC2PEN	0	RW	<b>CC Channel 2 Pin Enable</b> Enable/disable CC channel 2 output/input connection to pin.
1	CC1PEN	0	RW	<b>CC Channel 1 Pin Enable</b> Enable/disable CC channel 1 output/input connection to pin.
0	CC0PEN	0	RW	<b>CC Channel 0 Pin Enable</b> Enable/disable CC Channel 0 output/input connection to pin.

### 17.5.12 TIMERN\_CCx\_CTRL - CC Channel Control Register

Offset	Bit Position																																		
0x030	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
Reset				0	0x0	0x0						0	0				0x0				0x0	0x0	0x0				0	0	0	0x0	0	0	0x0		
Access				RW	RW	RW						RW	RW				RW				RW	RW	RW				RW	RW	RW				RW	RW	RW
Name				PRSCONF	ICEVCTRL	ICEDGE						FILT	INSEL				PRSSEL				CUFOA	COFOA	CMOA				COIST	OUTINV	MODE						

Bit	Name	Reset	Access	Description
31:29	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
28	PRSCONF	0	RW	<b>PRS Configuration</b> Select PRS pulse or level.
	Value	Mode	Description	
	0	PULSE	Each CC event will generate one HFPERCLK cycle high pulse	
	1	LEVEL	The PRS channel will follow CC out	
27:26	ICEVCTRL	0x0	RW	<b>Input Capture Event Control</b> These bits control when a Compare/Capture PRS output pulse, interrupt flag and DMA request is set.
	Value	Mode	Description	
	0	EVERYEDGE	PRS output pulse, interrupt flag and DMA request set on every capture	
	1	EVERYSECONDEDGE	PRS output pulse, interrupt flag and DMA request set on every second capture	
	2	RISING	PRS output pulse, interrupt flag and DMA request set on rising edge only (if Icedge = BOTH)	
	3	FALLING	PRS output pulse, interrupt flag and DMA request set on falling edge only (if Icedge = BOTH)	
25:24	ICEDGE	0x0	RW	<b>Input Capture Edge Select</b> These bits control which edges the edge detector triggers on. The output is used for input capture and external clock input.
	Value	Mode	Description	
	0	RISING	Rising edges detected	

Bit	Name	Reset	Access	Description
	Value	Mode		Description
	1	FALLING		Falling edges detected
	2	BOTH		Both edges detected
	3	NONE		No edge detection, signal is left as it is
23:22	<i>Reserved</i> To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)			
21	FILT	0	RW	<b>Digital Filter</b> Enable digital filter.
	Value	Mode		Description
	0	DISABLE		Digital filter disabled
	1	ENABLE		Digital filter enabled
20	INSEL	0	RW	<b>Input Selection</b> Select Compare/Capture channel input.
	Value	Mode		Description
	0	PIN		TIMERnCCx pin is selected
	1	PRS		PRS input (selected by PRSSEL) is selected
19:18	<i>Reserved</i> To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)			
17:16	PRSSEL	0x0	RW	<b>Compare/Capture Channel PRS Input Channel Selection</b> Select PRS input channel for Compare/Capture channel.
	Value	Mode		Description
	0	PRSCH0		PRS Channel 0 selected as input
	1	PRSCH1		PRS Channel 1 selected as input
	2	PRSCH2		PRS Channel 2 selected as input
	3	PRSCH3		PRS Channel 3 selected as input
15:14	<i>Reserved</i> To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)			
13:12	CUFOA	0x0	RW	<b>Counter Underflow Output Action</b> Select output action on counter underflow.
	Value	Mode		Description
	0	NONE		No action on counter underflow
	1	TOGGLE		Toggle output on counter underflow
	2	CLEAR		Clear output on counter underflow
	3	SET		Set output on counter underflow
11:10	COFOA	0x0	RW	<b>Counter Overflow Output Action</b> Select output action on counter overflow.
	Value	Mode		Description
	0	NONE		No action on counter overflow
	1	TOGGLE		Toggle output on counter overflow
	2	CLEAR		Clear output on counter overflow
	3	SET		Set output on counter overflow
9:8	CMOA	0x0	RW	<b>Compare Match Output Action</b> Select output action on compare match.
	Value	Mode		Description
	0	NONE		No action on compare match
	1	TOGGLE		Toggle output on compare match
	2	CLEAR		Clear output on compare match
	3	SET		Set output on compare match
7:5	<i>Reserved</i> To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)			
4	COIST	0	RW	<b>Compare Output Initial State</b>

Bit	Name	Reset	Access	Description
				This bit is only used in Output Compare and PWM mode. When this bit is set in compare mode, the output is set high when the counter is disabled. When counting resumes, this value will represent the initial value for the output. If the bit is cleared, the output will be cleared when the counter is disabled. In PWM mode, the output will always be low when disabled, regardless of this bit. However, this bit will represent the initial value of the output, once it is enabled.
3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
2	OUTINV	0	RW	<b>Output Invert</b> Setting this bit inverts the output from the CC channel (Output compare,PWM).
1:0	MODE	0x0	RW	<b>CC Channel Mode</b> These bits select the mode for Compare/Capture channel.
	Value	Mode	Description	
	0	OFF	Compare/Capture channel turned off	
	1	INPUTCAPTURE	Input capture	
	2	OUTPUTCOMPARE	Output compare	
	3	PWM	Pulse-Width Modulation	

### 17.5.13 TIMERN\_CCx\_CCV - CC Channel Value Register

Offset	Bit Position																															
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0000															
<b>Access</b>																	RWH															
<b>Name</b>																	CCV															

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
15:0	CCV	0x0000	RWH	<b>CC Channel Value</b> In input capture mode, this field holds the first unread capture value. When reading this register in input capture mode, then contents of the TIMERN_CCx_CCVB register will be written to TIMERN_CCx_CCV in the next cycle. In compare mode, this fields holds the compare value.

### 17.5.14 TIMERN\_CCx\_CCVP - CC Channel Value Peek Register

Offset	Bit Position																															
0x038	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0000															
<b>Access</b>																	R															
<b>Name</b>																	CCVP															

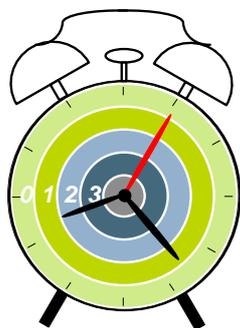

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	CCVP	0x0000	R	<b>CC Channel Value Peek</b> This field is used to read the CC value without pulling data through the FIFO in capture mode.

### 17.5.15 TIMERNn\_CCx\_CCVB - CC Channel Buffer Register

Offset	Bit Position																															
0x03C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0000															
<b>Access</b>																	RWH															
<b>Name</b>																	CCVB															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	CCVB	0x0000	RWH	<b>CC Channel Value Buffer</b> In Input Capture mode, this field holds the last capture value if the TIMERNn_CCx_CCV register already contains an earlier unread capture value. In Output Compare or PWM mode, this field holds the CC buffer value which will be written to TIMERNn_CCx_CCV on an update event if TIMERNn_CCx_CCVB contains valid data.

# 18 RTC - Real Time Counter

## Quick Facts

### What?

The Real Time Counter (RTC) ensures timekeeping in low energy modes. Combined with two low power oscillators (XTAL or RC), the RTC can run in EM2 with total current consumption less than 0.9  $\mu$ A, and in EM3 with total current consumption less than 0.5  $\mu$ A.

### Why?

Timekeeping over long time periods is required in many applications, while using as little power as possible.

### How?

Selectable 1 kHz and 32.768 Hz oscillators that can be used as clock source and two different compare registers that can trigger a wake-up. 24-bit resolution and selectable prescaling allow the system to stay in EM2 or EM3 for a long time and still maintain reliable timekeeping.

## 18.1 Introduction

The Real Time Counter (RTC) contains a 24-bit counter and is clocked either by a 32.768 Hz crystal oscillator, a 32.768 Hz RC oscillator, or a 1 kHz RC oscillator. In addition to energy modes EM0 and EM1, the RTC is also available in EM2. This makes it ideal for keeping track of time since the RTC is enabled in EM2 where most of the device is powered down. Using the 1 kHz ULFRCO as input clock, the RTC can be used for timekeeping all the way down to EM3.

Two compare channels are available in the RTC. These can be used to trigger interrupts and to wake the device up from a low energy mode. They can also be used with the LETIMER to generate various output waveforms.

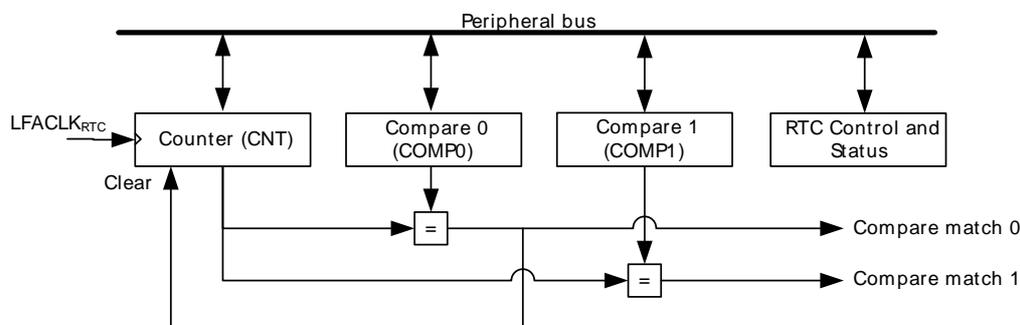

## 18.2 Features

- 24-bit Real Time Counter.
- Prescaler
  - 32.768 kHz/ $2^N$ , N = 0 - 15.
  - Overflow @ 0.14 hours for prescaler setting = 0.
  - Overflow @ 4660 hours (194 days) for prescaler setting = 15 (1 s tick).
- Two compare registers
  - A compare match can potentially wake-up the device from low energy modes EM1 and EM2.
  - Second compare register can be top value for RTC.
  - Both compare channels can trigger LETIMER.
  - Compare match events are available to other peripherals through the Peripheral Reflex System (PRS).

## 18.3 Functional Description

The RTC is a 24-bit counter with two compare channels. The RTC is closely coupled with the LETIMER, and can be configured to trigger it on a compare match on one or both compare channels. An overview of the RTC module is shown in Figure 18.1 (p. 270) .

**Figure 18.1. RTC Overview**

### 18.3.1 Counter

The RTC is enabled by setting the EN bit in the RTC\_CTRL register. It counts up as long as it is enabled, and will on an overflow simply wrap around and continue counting. The RTC is cleared when it is disabled. The timer value is both readable and writable and the RTC always starts counting from 0 when enabled. The value of the counter can be read or modified using the RTC\_CNT register.

#### 18.3.1.1 Clock Source

The RTC clock source and its prescaler value are defined in the Register Description section of the Clock Management Unit (CMU). The clock used by the RTC has a frequency given by Equation 18.1 (p. 270) .

#### RTC Frequency Equation

$$f_{\text{RTC}} = f_{\text{LFACLK}} / 2^{\text{RTC\_PRESC}} \tag{18.1}$$

where  $f_{\text{LFACLK}}$  is the LFACLK frequency (32.768 kHz) and RTC\_PRESC is a 4 bit value. Table 18.1 (p. 271) shows the time of overflow and resolution of the RTC at the available prescaler values.

To use this module, the LE interface clock must be enabled in CMU\_HFCORECLKEN0 in addition to the module clock

**Table 18.1. RTC Resolution Vs Overflow**

RTC_PRESC	Resolution	Overflow
0	30,5 $\mu$ s	512 s
1	61,0 $\mu$ s	1024 s
2	122 $\mu$ s	2048 s
3	244 $\mu$ s	1,14 hours
4	488 $\mu$ s	2,28 hours
5	977 $\mu$ s	4,55 hours
6	1,95 ms	9,10 hours
7	3,91 ms	18,2 hours
8	7,81 ms	1,52 days
9	15,6 ms	3,03 days
10	31,25 ms	6,07 days
11	62,5 ms	12,1 days
12	0,125 s	24,3 days
13	0,25 s	48,5 days
14	0,5 s	97,1 days
15	1 s	194 days

## 18.3.2 Compare Channels

Two compare channels are available in the RTC. The compare values can be set by writing to the RTC compare channel registers RTC\_COMPn, and when RTC\_CNT is equal to one of these, the respective compare interrupt flag COMPn is set.

If COMP0TOP is set, the compare value set for compare channel 0 is used as a top value for the RTC, and the timer is cleared on a compare match with compare channel 0. If using the COMP0TOP setting, make sure to set this bit prior to or at the same time the EN bit is set. Setting COMP0TOP after the EN bit is set may cause unintended operation (i.e. if CNT > COMP0).

### 18.3.2.1 LETIMER Triggers

A compare event on either of the compare channels can start the LETIMER. See the LETIMER documentation for more information on this feature.

### 18.3.2.2 PRS Sources

Both the compare channels of the RTC can be used as PRS sources. They will generate a pulse lasting one RTC clock cycle on a compare match.

## 18.3.3 Interrupts

The interrupts generated by the RTC are combined into one interrupt vector. If interrupts for the RTC is enabled, an interrupt will be made if one or more of the interrupt flags in RTC\_IF and their corresponding bits in RTC\_IEN are set. Interrupt events are overflow and compare match on either compare channels. Clearing of an interrupt flag is performed by writing to the corresponding bit in the RTC\_IFC register.

### 18.3.4 Debugrun

By default, the RTC is halted when code execution is halted from the debugger. By setting the DEBUGRUN bit in the RTC\_CTRL register, the RTC will continue to run even when the debugger is halted.

### 18.3.5 Using the RTC in EM3

The RTC can be enabled all the way down to EM3 by using the ULFRCO as clock source. This is done by clearing CMU\_LFCLKSEL\_LFA and setting CMU\_LFCLKSEL\_LFAE to 1. This will make the RTC use the internal 1 kHz ultra low frequency RC oscillator (ULFRCO), consuming very little energy. Please note that the ULFRCO is not accurate over temperature and voltage, and it should be verified that the ULFRCO fulfills the timekeeping needs of the application before using this in the design.

### 18.3.6 Register access

This module is a Low Energy Peripheral, and supports immediate synchronization. For description regarding immediate synchronization, the reader is referred to Section 5.3.1.1 (p. 18) .

## 18.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	RTC_CTRL	RW	Control Register
0x004	RTC_CNT	RWH	Counter Value Register
0x008	RTC_COMP0	RW	Compare Value Register 0
0x00C	RTC_COMP1	RW	Compare Value Register 1
0x010	RTC_IF	R	Interrupt Flag Register
0x014	RTC_IFS	W1	Interrupt Flag Set Register
0x018	RTC_IFC	W1	Interrupt Flag Clear Register
0x01C	RTC_IEN	RW	Interrupt Enable Register
0x020	RTC_FREEZE	RW	Freeze Register
0x024	RTC_SYNCBUSY	R	Synchronization Busy Register

## 18.5 Register Description

### 18.5.1 RTC\_CTRL - Control Register (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0	0	0			
<b>Access</b>																											RW	RW	RW			
<b>Name</b>																											COMP0TOP	DEBUGRUN	EN			

Bit	Name	Reset	Access	Description
31:3	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
2	COMP0TOP	0	RW	<b>Compare Channel 0 is Top Value</b> When set, the counter is cleared in the clock cycle after a compare match with compare channel 0.
	Value	Mode	Description	
	0	DISABLE	The top value of the RTC is 16777215 (0xFFFFF)	
	1	ENABLE	The top value of the RTC is given by COMP0	
1	DEBUGRUN	0	RW	<b>Debug Mode Run Enable</b> Set this bit to enable the RTC to keep running in debug.
	Value	Description		
	0	RTC is frozen in debug mode		
	1	RTC is running in debug mode		
0	EN	0	RW	<b>RTC Enable</b> When this bit is set, the RTC is enabled and counts up. When cleared, the counter register CNT is reset.

### 18.5.2 RTC\_CNT - Counter Value Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																								0x000000								
<b>Access</b>																								RWH								
<b>Name</b>																								CNT								

Bit	Name	Reset	Access	Description
31:24	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
23:0	CNT	0x000000	RWH	<b>Counter Value</b> Gives access to the counter value of the RTC.

### 18.5.3 RTC\_COMP0 - Compare Value Register 0 (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																								0x000000								
<b>Access</b>																								RW								
<b>Name</b>																								COMP0								

Bit	Name	Reset	Access	Description
31:24	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
23:0	COMP0	0x000000	RW	<b>Compare Value 0</b> A compare match event occurs when CNT is equal to this value. This event sets the COMP0 interrupt flag, and can be used to start the LETIMER. It is also available as a PRS signal.

### 18.5.4 RTC\_COMP1 - Compare Value Register 1 (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x000000							
<b>Access</b>	RW																															
<b>Name</b>	COMP1																															

Bit	Name	Reset	Access	Description
31:24	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
23:0	COMP1	0x000000	RW	<b>Compare Value 1</b> A compare match event occurs when CNT is equal to this value. This event sets COMP1 interrupt flag, and can be used to start the LETIMER. It is also available as a PRS signal.

### 18.5.5 RTC\_IF - Interrupt Flag Register

Offset	Bit Position																																
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																																	
<b>Access</b>																															R	0	2
<b>Name</b>																															COMP1	COMP0	OF

Bit	Name	Reset	Access	Description
31:3	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
2	COMP1	0	R	<b>Compare Match 1 Interrupt Flag</b> Set on a compare match between CNT and COMP1.
1	COMP0	0	R	<b>Compare Match 0 Interrupt Flag</b> Set on a compare match between CNT and COMP0.
0	OF	0	R	<b>Overflow Interrupt Flag</b> Set on a CNT value overflow.

### 18.5.6 RTC\_IFS - Interrupt Flag Set Register

Offset	Bit Position																																
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																																	
<b>Access</b>																															W1	0	2
<b>Name</b>																															COMP1	COMP0	OF

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
2	COMP1	0	W1	<b>Set Compare match 1 Interrupt Flag</b> Write to 1 to set the COMP1 interrupt flag.
1	COMP0	0	W1	<b>Set Compare match 0 Interrupt Flag</b> Write to 1 to set the COMP0 interrupt flag.
0	OF	0	W1	<b>Set Overflow Interrupt Flag</b> Write to 1 to set the OF interrupt flag.

### 18.5.7 RTC\_IFC - Interrupt Flag Clear Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																												0	0	0		
<b>Access</b>																												W1	W1	W1		
<b>Name</b>																												COMP1	COMP0	OF		

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
2	COMP1	0	W1	<b>Clear Compare match 1 Interrupt Flag</b> Write to 1 to clear the COMP1 interrupt flag.
1	COMP0	0	W1	<b>Clear Compare match 0 Interrupt Flag</b> Write to 1 to clear the COMP0 interrupt flag.
0	OF	0	W1	<b>Clear Overflow Interrupt Flag</b> Write to 1 to clear the OF interrupt flag.

### 18.5.8 RTC\_IEN - Interrupt Enable Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																												0	0	0		
<b>Access</b>																												RW	RW	RW		
<b>Name</b>																												COMP1	COMP0	OF		

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
2	COMP1	0	RW	<b>Compare Match 1 Interrupt Enable</b> Enable interrupt on compare match 1.
1	COMP0	0	RW	<b>Compare Match 0 Interrupt Enable</b> Enable interrupt on compare match 0.
0	OF	0	RW	<b>Overflow Interrupt Enable</b>

Bit	Name	Reset	Access	Description
				Enable interrupt on overflow.

### 18.5.9 RTC\_FREEZE - Freeze Register

Offset	Bit Position																																
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																																	
<b>Access</b>																																	
<b>Name</b>																																	
																																	REGFREEZE

Bit	Name	Reset	Access	Description
31:1	Reserved			To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)

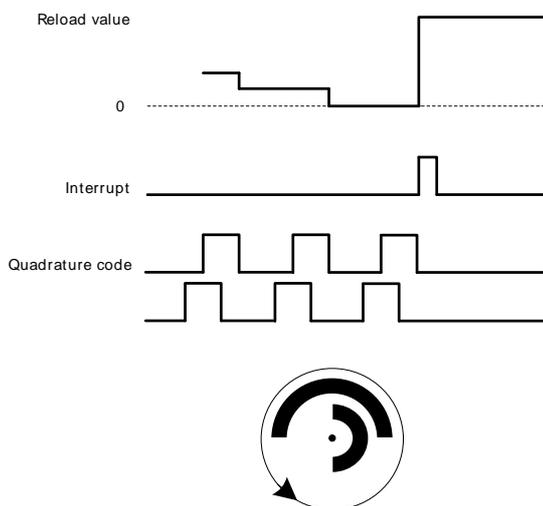

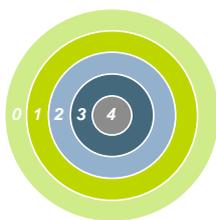

0	REGFREEZE	0	RW	<b>Register Update Freeze</b> When set, the update of the RTC is postponed until this bit is cleared. Use this bit to update several registers simultaneously.
	Value	Mode	Description	
	0	UPDATE	Each write access to an RTC register is updated into the Low Frequency domain as soon as possible.	
	1	FREEZE	The RTC is not updated with the new written value until the freeze bit is cleared.	

### 18.5.10 RTC\_SYNCBUSY - Synchronization Busy Register

Offset	Bit Position																																
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																																	
<b>Access</b>																																	
<b>Name</b>																																	
																																	COMP1
																																	COMP0
																																	CTRL

Bit	Name	Reset	Access	Description
31:3	Reserved			To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)
2	COMP1	0	R	<b>COMP1 Register Busy</b> Set when the value written to COMP1 is being synchronized.
1	COMP0	0	R	<b>COMP0 Register Busy</b> Set when the value written to COMP0 is being synchronized.
0	CTRL	0	R	<b>CTRL Register Busy</b> Set when the value written to CTRL is being synchronized.

# 19 PCNT - Pulse Counter

## Quick Facts

### What?

The Pulse Counter (PCNT) decodes incoming pulses. The module has a quadrature mode which may be used to decode the speed and direction of a mechanical shaft. PCNT can operate in EM0-EM3.

### Why?

The PCNT generates an interrupt after a specific number of pulses (or rotations), eliminating the need for timing- or I/O interrupts and CPU processing to measure pulse widths, etc.

### How?

PCNT uses the LFACLK or may be externally clocked from a pin. The module incorporates an 16-bit up/down-counter to keep track of incoming pulses or rotations.

## 19.1 Introduction

The Pulse Counter (PCNT) can be used for counting incoming pulses on a single input or to decode quadrature encoded inputs. It can run from the internal LFACLK (EM0-EM2) while counting pulses on the PCNTn\_S0IN pin or using this pin as an external clock source (EM0-EM3) that runs both the PCNT counter and register access.

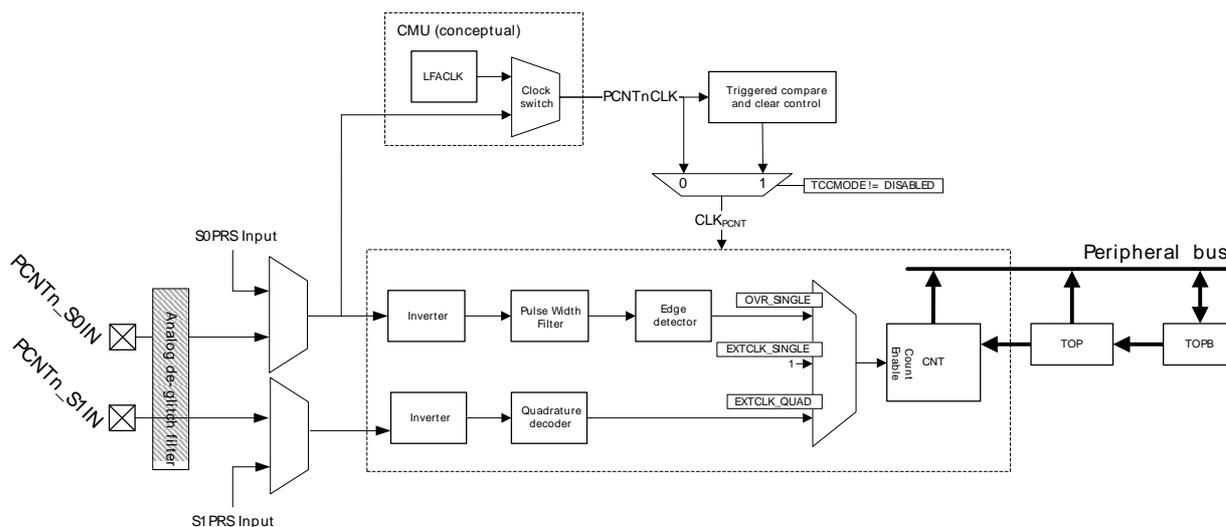

## 19.2 Features

- 16-bit counter with reload register
- Auxiliary counter for counting a single direction
- Single input oversampling up/down counter mode (EM0-EM2)
- Externally clocked single input pulse up/down counter mode (EM0-EM3)
- Externally clocked quadrature decoder mode (EM0-EM3)
- Interrupt on counter underflow and overflow
- Interrupt when a direction change is detected (quadrature decoder mode only)
- Optional pulse width filter
- Optional input inversion/edge detect select
- PRS S0IN and S1IN input
- Asynchronously triggered compare and clear

## 19.3 Functional Description

An overview of the PCNT module is shown in Figure 19.1 (p. 279) .

Figure 19.1. PCNT Overview

### 19.3.1 Pulse Counter Modes

The pulse counter can operate in single input oversampling mode (OVSSINGLE), externally clocked single input counter mode (EXTCLKSINGLE) and externally clocked quadrature decoder mode (EXTCLKQUAD). The following sections describe operation of each of the three modes and how they are enabled. Input timing constraints are described in Section 19.3.6 (p. 283) and Section 19.3.7 (p. 283).

#### 19.3.1.1 Single Input Oversampling Mode

This mode is enabled by writing OVSSINGLE to the MODE field in the PCNTn\_CTRL register and disabled by writing DISABLE to the same field. LFACLK is configured from the registers in the Clock Management Unit (CMU), Chapter 11 (p. 92).

The optional pulse width filter is enabled by setting the FILT bit in the PCNTn\_CTRL register. Additionally, the PCNTn\_S0IN input may be inverted, so that falling edges are counted, by setting the EDGE bit in the PCNTn\_CTRL register.

If S1CDIR is cleared, PCNTn\_S0IN is the only observed input in this mode. The PCNTn\_S0IN input is sampled by the LFACLK and the number of detected positive or negative edges on PCNTn\_S0IN appears in PCNTn\_CNT. The counter may be configured to count down by setting the CNTDIR bit in PCNTn\_CTRL. Default is to count up.

The counting direction can also be controlled externally in this mode by setting S1CDIR in PCNTn\_CTRL. This will make the input value on PCNTn\_S1IN decide the direction counted on a PCNTn\_S0IN edge. If PCNTn\_S1IN is high, the count is done according to CNTDIR in PCNTn\_CTRL. If low, the count direction is opposite.

#### 19.3.1.2 Externally Clocked Single Input Counter Mode

This mode is enabled by writing EXTCLKSINGLE to the MODE field in the PCNTn\_CTRL register and disabled by writing DISABLE to the same field. The external pin clock source must be configured from the registers in the CMU (Chapter 11 (p. 92)).

Positive edges on PCNTn\_S0IN are used to clock the counter. Similar to the oversampled mode, PCNTn\_S1IN is used to determine the count direction if S1CDIR in PCNTn\_CTRL is set. If not, CNTDIR in PCNTn\_CTRL solely defines count direction. As the LFACLK is not used in this mode, the PCNT module can operate in EM3.

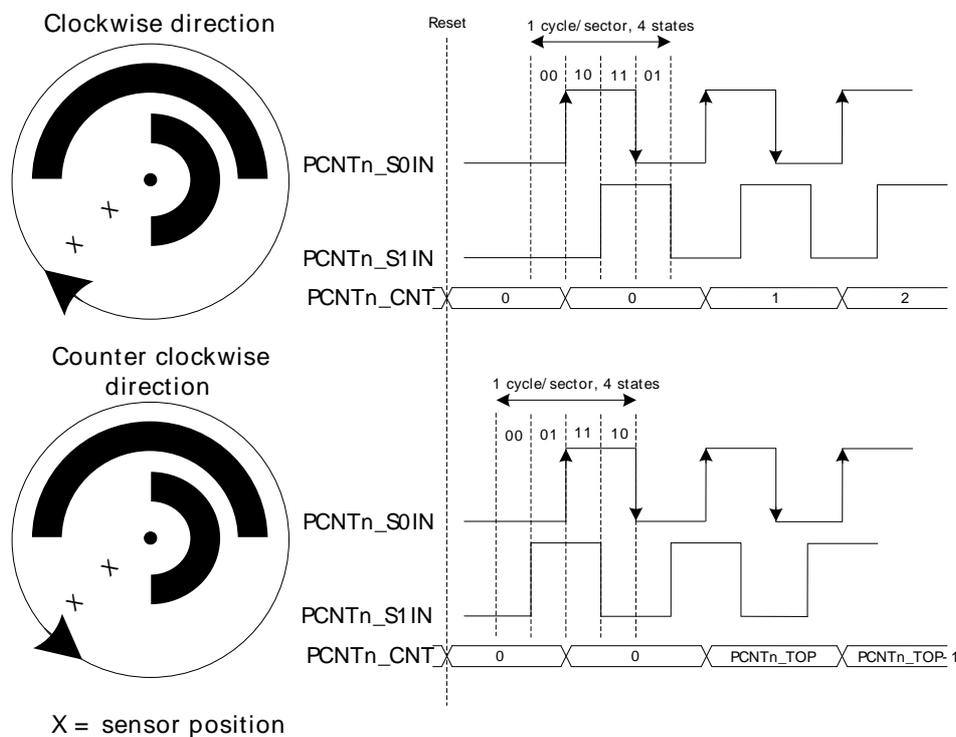

The digital pulse width filter is not available in this mode. The analog de-glitch filter in the GPIO pads is capable of removing some unwanted noise. However, this mode may be susceptible to spikes and unintended pulses from devices such as mechanical switches, and is therefore most suited to take input from electronic sensors etc. that generate single wire pulses.

### 19.3.1.3 Externally Clocked Quadrature Decoder Mode

This mode is enabled by writing EXTCLKQUAD to the MODE field in PCNTn\_CTRL and disabled by writing DISABLE to the same field. The external pin clock source must be configured from the registers in the CMU, (Chapter 11 (p. 92) ).

Both edges on PCNTn\_S0IN pin are used to sample PCNTn\_S1IN pin to decode the quadrature code. Consequently, this mode does not depend on the internal LFACLK and may be operated in EM3. A quadrature coded signal contains information about the relative speed and direction of a rotating shaft as illustrated by Figure 19.2 (p. 280) , hence the direction of the counter register PCNTn\_CNT is controlled automatically.

Figure 19.2. PCNT Quadrature Coding

If PCNTn\_S0IN leads PCNTn\_S1IN in phase, the direction is clockwise, and if it lags in phase the direction is counter-clockwise. Although the direction is automatically detected, the detected direction may be inverted by writing 1 to the EDGE bit in the PCNTn\_CTRL register. Default behavior is illustrated by Figure 19.2 (p. 280) .

The counter direction may be read from the DIR bit in the PCNTn\_STATUS register. Additionally, the DIRCNG interrupt in the PCNTn\_IF register is generated when a direction change is detected. When a change is detected, the DIR bit in the PCNTn\_STATUS register must be read to determine the current new direction.

**Note**

The sector disc illustrated in the figure may be finer grained in some systems. Typically, they may generate 2-4 PCNTn\_S0IN wave periods per 360° rotation.

The direction of the quadrature code and control of the counter is generated by the simple binary function outlined by Table 19.1 (p. 281). Note that this function also filters some invalid inputs that may occur when the shaft changes direction or temporarily toggles direction.

**Table 19.1. PCNT QUAD Mode Counter Control Function**

Inputs		Control/Status	
S1IN posedge	S1IN negedge	Count Enable	CNTDIR status bit
0	0	0	0
0	1	1	0
1	0	1	1
1	1	0	0

**Note**

PCNTn\_S1IN is sampled on both edges of PCNTn\_S0IN.

### 19.3.2 Hysteresis

By default the pulse counter wraps to 0 when passing the configured top value, and wraps to the top value when counting down from 0. On these events, a system will likely want to wake up to store and track the overflow count. This is fine if the pulse counter is tracking a monotonic value or a value that does not change directions frequently. If you have the latter however, and the counter changes directions around the overflow/underflow point, the system will have to wake up a lot to keep track of the rotations, causing high current consumptions

To solve this, the pulse counter has a way of introducing hysteresis to the counter. When HYST in PCNTn\_CTRL is set, the pulse counter will always wrap to TOP/2 on underflows and overflows. This takes the counter away from the area where it might overflow or underflow, removing the problem.

Given a starting value of 0 for the counter, the absolute count value when hysteresis is enabled can be calculated with the equations Equation 19.1 (p. 281) or Equation 19.2 (p. 281), depending on whether the TOP value is even or odd.

**Absolute position with hysteresis and even TOP value**

$$CNT_{abs} = CNT - UF_{CNT} \times (TOP/2+1) + OF_{CNT} \times (TOP/2+1) \quad (19.1)$$

**Absolute position with hysteresis and odd TOP value**

$$CNT_{abs} = CNT - UF_{CNT} \times (TOP/2+1) + OF_{CNT} \times (TOP/2+2) \quad (19.2)$$

### 19.3.3 Auxiliary counter

To be able to keep explicit track of counting in one direction in addition to the regular counter which counts both up and down, the auxiliary counter can be used. The pulse counter can for instance be configured to keep track of the absolute rotation of the wheel, and at the same time the auxiliary counter can keep track of how much the wheel has reversed.

The auxiliary counter is enabled by configuring AUXCNTEV in PCNTn\_CTRL. It will always count up, but it can be configured whether it should count up on up-events, down-events or both, keeping track of rotation either way or general movement. The value of the auxiliary counter can be read from the PCNTn\_AUXCNT register.

Overflows on the auxiliary counter happen when the auxiliary counter passes the top value of the pulse counter, configured in PCNTn\_TOP. In that event, the AUXOF interrupt flag is set, and the auxiliary counter wraps to 0.

As the auxiliary counter, the main counter can be configured to count only on certain events. This is done through CNTEV in PCNTn\_CTRL, and it is possible like for the auxiliary counter, to make the main counter count on only up and down events. The difference between the counters is that where the auxiliary counter will only count up, the main counter will count up or down depending on the direction of the count event.

### 19.3.4 Triggered compare and clear

The pulse counter features triggered compare and clear. When enabled, a configurable trigger will induce a comparison between the main counter, PCNT\_CNT, and the top value, PCNT\_TOP. After the comparison, the counter is cleared. The trigger for a compare and clear event is configured in the TCCMODE bit-field in PCNT\_CTRL. There are two options, LFA and PRS. If LFA is selected, the pulse counter will be compared with the top value, and cleared every  $2^N$  LFA clock cycle. N is configured in TCCPRESC in PCNT\_CTRL. If a PRS trigger is selected, the active PRS channel is configured in TCCPRSEL in PCNT\_CTRL. The PRS input can be inverted by setting TCCPRSPOL, triggering the compare and clear on the negative edge of the PRS input. The PRS input can also be used as a gate for the pulse counter clock. This is enabled by setting PRSGATEEN in PCNT\_CTRL.

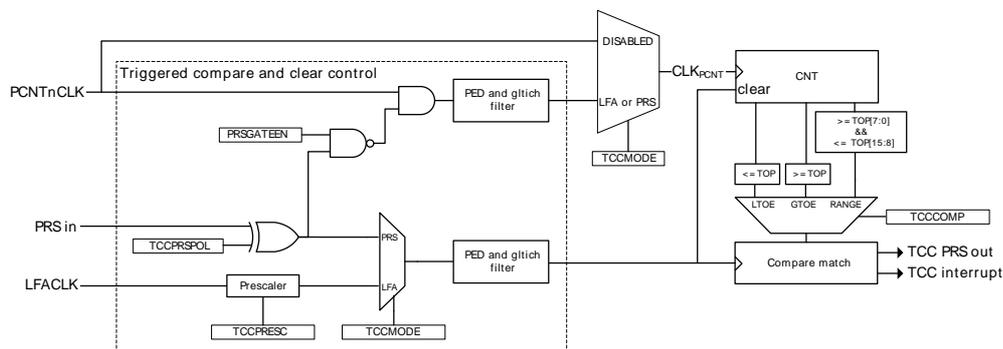

**Note**

When PRSGATEEN is set, the clock to the entire pulse counter will be gated by the PRS input, meaning that register writes will not take effect while the gated clock is inactive.

Comparison with PCNT\_TOP can be performed in three ways; range, greater than or equal, and less than or equal. TCCCOMP in PCNT\_CTRL configures comparison mode. Upon a compare match, the TCC interrupt is set, and the PRS output from the pulse counter is set. The PRS output will remain set until the next compare and clear event. Triggered compare and clear is intended for use when the pulse counter is configured to count up. In this mode, PCNT\_CNT will not wrap to 0 when hitting PCNT\_TOP, it will keep counting. In addition, the counter will not overflow, it will rather stop counting, just setting the overflow interrupt flag.

Figure 19.3 (p. 282) shows an overview of the control circuitry for triggered compare and clear. The control circuitry includes two positive edge detectors (PED) and glitch filters, used to generate clocks for the pulse counter. The two clock outputs are mutually exclusive: If both edge detectors receive a pulse at the same time, the output pulse from one of them will be postponed until the other edge detectors output pulse has completed.

**Figure 19.3. PCNT Triggered compare and clear**

**Note**

TCCMODE, TCCPRESC, PRSGATEEN, TCCPRSPOL, and TCCPRSEL in PCNT\_CTRL should only be altered when PCNT\_CTRL\_RSTEN is set.

### 19.3.5 Register Access

The counter-clock domain may be clocked externally. To update the counter-clock domain registers from software in this mode, 2-3 clock pulses on the external clock are needed to synchronize accesses

to the externally clocked domain. Clock source switching is controlled from the registers in the CMU (Chapter 11 (p. 92) ).

When the RSTEN bit in the PCNTn\_CTRL register is set to 1, the PCNT clock domain is asynchronously held in reset. The reset is synchronously released two PCNT clock edges after the RSTEN bit in the PCNTn\_CTRL register is cleared by software. This asynchronous reset restores the reset values in PCNTn\_TOP, PCNTn\_CNT and other control registers in the PCNT clock domain.

AUXCNRSTEN works in a similar manner as RSTEN, but only resetting the auxiliary counter, AUXCNT. Note that the auxiliary counter is also reset by RSTEN.

Since this module is a Low Energy Peripheral, and runs off a clock which is asynchronous to the HFCORECLK, special considerations must be taken when accessing registers. Please refer to Section 5.3 (p. 17) for a description on how to perform register accesses to Low Energy Peripherals.

**Note**

PCNTn\_TOP and PCNTn\_CNT are read-only registers. When writing to PCNTn\_TOPB, make sure that the counter value, PCNTn\_CNT, can not exceed the value written to PCNTn\_TOPB within two clock cycles.

### 19.3.6 Clock Sources

The 32 kHz LFACLK is one of two possible clock sources. The clock select register is described in Chapter 11 (p. 92) . The default clock source is the LFACLK.

This PCNT module may also use PCNTn\_S0IN as an external clock to clock the counter (EXTCLKSINGLE mode) and to sample PCNTn\_S1IN (EXTCLKQUAD mode). Setup, hold and max frequency constraints for PCNTn\_S0IN and PCNTn\_S1IN for these modes are specified in the device datasheet.

To use this module, the LE interface clock must be enabled in CMU\_HFCORECLKEN0, in addition to the module clock.

**Note**

PCNT Clock Domain Reset, RSTEN, should be set when changing clock source for PCNT. In addition to this, the PCNTn\_SYNCBUSY value should be zero. If changing to an external clock source, the clock pin has to be enabled as input prior to de-asserting RSTEN. Changing clock source without asserting RSTEN results in undefined behaviour.

### 19.3.7 Input Filter

An optional pulse width filter is available in OVSSINGLE mode. The filter is enabled by writing 1 to the FILT bit in the PCNTn\_CTRL register. When enabled, the high and low periods of PCNTn\_S0IN must be stable for 5 consecutive clock cycles before the edge is passed to the edge detector.

In EXTCLKSINGLE and EXTCLKQUAD mode, there is no digital pulse width filter available.

### 19.3.8 Edge Polarity

The edge polarity can be set by configuring the EDGE bit in the PCNTn\_CTRL register. When this bit is cleared, the pulse counter counts positive edges in OVSSINGLE mode and negative edges if the bit is set.

In EXTCLKQUAD mode, the EDGE bit in PCNTn\_CTRL inverts the direction of the counter (which is automatically detected).

**Note**

The EDGE bit in PCNTn\_CTRL has no effect in EXTCLKSINGLE mode.

### 19.3.9 PRS S0IN and S1IN Input

It is possible to receive input from PRS on both S0IN and S1IN by setting S0PRSEN or S1PRSEN in PCNTn\_INPUT. The PRS channel used can be selected using S0PRSSEL in PCNTn\_INPUT.

### 19.3.10 Interrupts

The interrupt generated by PCNT uses the PCNTn\_INT interrupt vector. Software must read the PCNTn\_IF register to determine which module interrupt that generated the vector invocation.

#### 19.3.10.1 Underflow and Overflow Interrupts

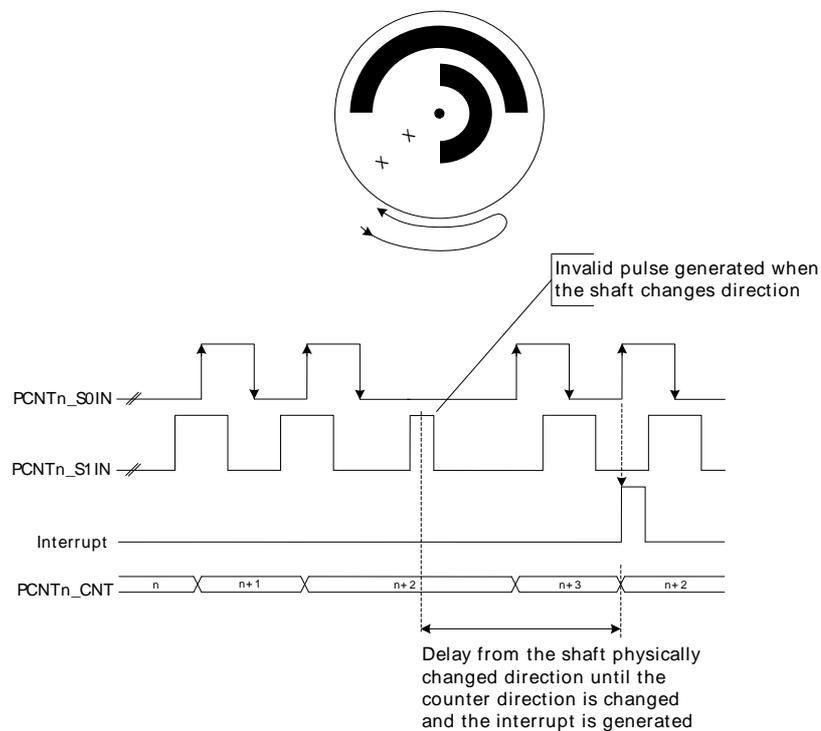

The underflow interrupt flag (UF) is set when the counter counts down from 0. I.e. when the value of the counter is 0 and a new pulse is received. The PCNTn\_CNT register is loaded with the PCNTn\_TOP value after this event.

The overflow interrupt flag (OF) is set when the counter counts up from the PCNTn\_TOP (reload) value. I.e. if PCNTn\_CNT = PCNTn\_TOP and a new pulse is received. The PCNTn\_CNT register is loaded with the value 0 after this event.

#### 19.3.10.2 Direction Change Interrupt

The PCNTn\_PCNT module sets the DIRCNG interrupt flag (PCNTn\_IF register) when the direction of the quadrature code changes. The behavior of this interrupt is illustrated by Figure 19.4 (p. 284) .

**Figure 19.4. PCNT Direction Change Interrupt (DIRCNG) Generation**

## 19.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	PCNTn_CTRL	RW	Control Register
0x004	PCNTn_CMD	W1	Command Register
0x008	PCNTn_STATUS	R	Status Register
0x00C	PCNTn_CNT	R	Counter Value Register
0x010	PCNTn_TOP	R	Top Value Register
0x014	PCNTn_TOPB	RW	Top Value Buffer Register
0x018	PCNTn_IF	R	Interrupt Flag Register
0x01C	PCNTn_IFS	W1	Interrupt Flag Set Register
0x020	PCNTn_IFC	W1	Interrupt Flag Clear Register
0x024	PCNTn_IEN	RW	Interrupt Enable Register
0x028	PCNTn_ROUTE	RW	I/O Routing Register
0x02C	PCNTn_FREEZE	RW	Freeze Register
0x030	PCNTn_SYNCBUSY	R	Synchronization Busy Register
0x038	PCNTn_AUXCNT	RWH	Auxiliary Counter Value Register
0x03C	PCNTn_INPUT	RW	PCNT Input Register

## 19.5 Register Description

### 19.5.1 PCNTn\_CTRL - Control Register (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

Offset	Bit Position																																
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Name	Reset	Access	Description
31	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		

30:29	TCCPRSEL	0x0	RW	<b>TCC PRS Channel Select</b> Select PRS channel used as compare and clear trigger.
	Value	Mode	Description	
	0	PRSCH0	PRS Channel 0 selected.	
	1	PRSCH1	PRS Channel 1 selected.	
	2	PRSCH2	PRS Channel 2 selected.	
	3	PRSCH3	PRS Channel 3 selected.	

28	TCCPRSPOL	0	RW	<b>TCC PRS polarity select</b> Configure which edge on the PRS input is used to trigger a compare and clear event
	Value	Mode	Description	
	0	RISING	Rising edge on PRS trigger compare and clear event.	

Bit	Name	Reset	Access	Description
	Value	Mode		Description
	1	FALLING		Falling edge on PRS trigger compare and clear event.
27	PRSGATEEN	0	RW	<b>PRS gate enable</b> When set, the clock input to the pulse counter will be gated when the selected PRS input is the inverse of TCCPRSPOL.
26:25	TCCCOMP	0x0	RW	<b>Triggered compare and clear compare mode</b> Selects the mode for comparison upon a compare and clear event.
	Value	Mode		Description
	0	LTOE		Compare match if PCNT_CNT is less than, or equal to PCNT_TOP.
	1	GTOE		Compare match if PCNT_CNT is greater than or equal to PCNT_TOP.
	2	RANGE		Compare match if PCNT_CNT is less than, or equal to PCNT_TOP[15:8], and greater than, or equal to PCNT_TOP[7:0].
24	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
23:22	TCCPRESC	0x0	RW	<b>Set the LFA prescaler for triggered compare and clear</b> Selects the prescaler value for LFA compare and clear events
	Value	Mode		Description
	0	DIV1		Compare and clear event each LFA cycle.
	1	DIV2		Compare and clear performed on every other LFA cycle.
	2	DIV4		Compare and clear performed on every 4th LFA cycle.
	3	DIV8		Compare and clear performed on every 8th LFA cycle.
21:20	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
19:18	TCCMODE	0x0	RW	<b>Sets the mode for triggered compare and clear</b> Selects whether compare and clear should be triggered on each LFA clock, or from PRS
	Value	Mode		Description
	0	DISABLED		Triggered compare and clear not enabled.
	1	LFA		Compare and clear performed on each (optionally prescaled) LFA clock cycle.
	2	PRS		Compare and clear performed on positive PRS edges.
17:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
15:14	AUXCNTEV	0x0	RW	<b>Controls when the auxiliary counter counts</b> Selects whether the auxiliary counter responds to up-count events, down-count events or both
	Value	Mode		Description
	0	NONE		Never counts.
	1	UP		Counts up on up-count events.
	2	DOWN		Counts up on down-count events.
	3	BOTH		Counts up on both up-count and down-count events.
13:12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
11:10	CNTEV	0x0	RW	<b>Controls when the counter counts</b> Selects whether the regular counter responds to up-count events, down-count events or both
	Value	Mode		Description
	0	BOTH		Counts up on up-count and down on down-count events.
	1	UP		Only counts up on up-count events.
	2	DOWN		Only counts down on down-count events.
	3	NONE		Never counts.
9	S1CDIR	0	RW	<b>Count direction determined by S1</b> S1 gives the direction of counting when in the OVSSINGLE or EXTCLKSINGLE modes. When S1 is high, the count direction is given by CNTDIR, and when S1 is low, the count direction is the opposite
8	HYST	0	RW	<b>Enable Hysteresis</b> When hysteresis is enabled, the PCNT will always overflow and underflow to TOP/2.
7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		

Bit	Name	Reset	Access	Description															
6	AUXCNTSTEN	0	RW	<b>Enable AUXCNT Reset</b> The auxiliary counter, AUXCNT, is asynchronously held in reset when this bit is set. The reset is synchronously released two PCNT clock edges after this bit is cleared. If external clock used the reset should be performed by setting and clearing the bit without pending for SYNCBUSY bit.															
5	RSTEN	0	RW	<b>Enable PCNT Clock Domain Reset</b> The PCNT clock domain is asynchronously held in reset when this bit is set. The reset is synchronously released two PCNT clock edges after this bit is cleared. If external clock used the reset should be performed by setting and clearing the bit without pending for SYNCBUSY bit.															
4	FILT	0	RW	<b>Enable Digital Pulse Width Filter</b> The filter passes all high and low periods that are at least 5 clock cycles long. This filter is only available in OVSSINGLE mode.															
3	EDGE	0	RW	<b>Edge Select</b> Determines the polarity of the incoming edges. This bit should be written when PCNT is in DISABLE mode, otherwise the behavior is unpredictable. This bit is ignored in EXTCLKSINGLE mode. <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>POS</td> <td>Positive edges on the PCNTn_S0IN inputs are counted in OVSSINGLE mode.</td> </tr> <tr> <td>1</td> <td>NEG</td> <td>Negative edges on the PCNTn_S0IN inputs are counted in OVSSINGLE mode, and the counter direction is inverted in EXTCLKQUAD mode.</td> </tr> </tbody> </table>	Value	Mode	Description	0	POS	Positive edges on the PCNTn_S0IN inputs are counted in OVSSINGLE mode.	1	NEG	Negative edges on the PCNTn_S0IN inputs are counted in OVSSINGLE mode, and the counter direction is inverted in EXTCLKQUAD mode.						
Value	Mode	Description																	
0	POS	Positive edges on the PCNTn_S0IN inputs are counted in OVSSINGLE mode.																	
1	NEG	Negative edges on the PCNTn_S0IN inputs are counted in OVSSINGLE mode, and the counter direction is inverted in EXTCLKQUAD mode.																	
2	CNTDIR	0	RW	<b>Non-Quadrature Mode Counter Direction Control</b> The direction of the counter must be set in the OVSSINGLE and EXTCLKSINGLE modes. This bit is ignored in EXTCLKQUAD mode as the direction is automatically detected. <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>UP</td> <td>Up counter mode.</td> </tr> <tr> <td>1</td> <td>DOWN</td> <td>Down counter mode.</td> </tr> </tbody> </table>	Value	Mode	Description	0	UP	Up counter mode.	1	DOWN	Down counter mode.						
Value	Mode	Description																	
0	UP	Up counter mode.																	
1	DOWN	Down counter mode.																	
1:0	MODE	0x0	RW	<b>Mode Select</b> Selects the mode of operation. The corresponding clock source must be selected from the CMU. <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>DISABLE</td> <td>The module is disabled.</td> </tr> <tr> <td>1</td> <td>OVSSINGLE</td> <td>Single input LFACLK oversampling mode (available in EM0-EM2).</td> </tr> <tr> <td>2</td> <td>EXTCLKSINGLE</td> <td>Externally clocked single input counter mode (available in EM0-EM3).</td> </tr> <tr> <td>3</td> <td>EXTCLKQUAD</td> <td>Externally clocked quadrature decoder mode (available in EM0-EM3).</td> </tr> </tbody> </table>	Value	Mode	Description	0	DISABLE	The module is disabled.	1	OVSSINGLE	Single input LFACLK oversampling mode (available in EM0-EM2).	2	EXTCLKSINGLE	Externally clocked single input counter mode (available in EM0-EM3).	3	EXTCLKQUAD	Externally clocked quadrature decoder mode (available in EM0-EM3).
Value	Mode	Description																	
0	DISABLE	The module is disabled.																	
1	OVSSINGLE	Single input LFACLK oversampling mode (available in EM0-EM2).																	
2	EXTCLKSINGLE	Externally clocked single input counter mode (available in EM0-EM3).																	
3	EXTCLKQUAD	Externally clocked quadrature decoder mode (available in EM0-EM3).																	

### 19.5.2 PCNTn\_CMD - Command Register (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0	0
<b>Access</b>																															W1	W1
<b>Name</b>																															LTOPBIM	LCNTIM

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
1	LTOPBIM	0	W1	<b>Load TOPB Immediately</b> This bit has no effect since TOPB is not buffered and it is loaded directly into TOP.
0	LCNTIM	0	W1	<b>Load CNT Immediately</b> Load PCNTn_TOP into PCNTn_CNT on the next counter clock cycle.

### 19.5.3 PCNTn\_STATUS - Status Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0
<b>Access</b>																																R
<b>Name</b>																																DIR

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
0	DIR	0	R	<b>Current Counter Direction</b> Current direction status of the counter. This bit is valid in EXTCLKQUAD mode only.
	Value	Mode	Description	
	0	UP	Up counter mode (clockwise in EXTCLKQUAD mode with the NEDGE bit in PCNTn_CTRL set to 0).	
	1	DOWN	Down counter mode.	

### 19.5.4 PCNTn\_CNT - Counter Value Register

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0000
<b>Access</b>																																R
<b>Name</b>																																CNT

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	CNT	0x0000	R	<b>Counter Value</b> Gives read access to the counter.

### 19.5.5 PCNTn\_TOP - Top Value Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x00FF
<b>Access</b>																																R
<b>Name</b>																																TOP

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	TOP	0x00FF	R	<b>Counter Top Value</b> When counting down, this value is reloaded into PCNTn_CNT when counting past 0. When counting up, 0 is written to the PCNTn_CNT register when counting past this value.

### 19.5.6 PCNTn\_TOPB - Top Value Buffer Register (Async Reg)

For more information about Asynchronous Registers please see Section 5.3 (p. 17) .

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x00FF															
<b>Access</b>																	RW															
<b>Name</b>																	TOPB															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	TOPB	0x00FF	RW	<b>Counter Top Buffer</b> Loaded automatically to TOP when written.

### 19.5.7 PCNTn\_IF - Interrupt Flag Register

Offset	Bit Position																																						
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0							
<b>Reset</b>																									R	0	4	R	0	3	R	0	2	R	0	1	R	0	0
<b>Access</b>																									R	R	R	R	R										
<b>Name</b>																									TCC	AUXOF	DIRCNG	OF	UF										

Bit	Name	Reset	Access	Description
31:5	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
4	TCC	0	R	<b>Triggered compare Interrupt Read Flag</b> Set upon triggered compare match
3	AUXOF	0	R	<b>Overflow Interrupt Read Flag</b> Set when an Auxiliary CNT overflow occurs
2	DIRCNG	0	R	<b>Direction Change Detect Interrupt Flag</b> Set when the count direction changes. Set in EXTCLKQUAD mode only.
1	OF	0	R	<b>Overflow Interrupt Read Flag</b> Set when a CNT overflow occurs

Bit	Name	Reset	Access	Description
1	OF	0	W1	<b>Overflow Interrupt Clear</b> Write to 1 to clear the overflow interrupt flag
0	UF	0	W1	<b>Underflow Interrupt Clear</b> Write to 1 to clear the underflow interrupt flag

### 19.5.10 PCNTn\_IEN - Interrupt Enable Register

Offset	Bit Position																																
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																													0	0	0	0	0
<b>Access</b>																													RW	RW	RW	RW	RW
<b>Name</b>																													TCC	AUXOF	DIRCNG	OF	UF

Bit	Name	Reset	Access	Description
31:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
4	TCC	0	RW	<b>Triggered compare Interrupt Enable</b> Enable the triggered compare interrupt
3	AUXOF	0	RW	<b>Auxiliary Overflow Interrupt Enable</b> Enable the auxiliary overflow interrupt
2	DIRCNG	0	RW	<b>Direction Change Detect Interrupt Enable</b> Enable the direction change detect interrupt.
1	OF	0	RW	<b>Overflow Interrupt Enable</b> Enable the overflow interrupt
0	UF	0	RW	<b>Underflow Interrupt Enable</b> Enable the underflow interrupt

### 19.5.11 PCNTn\_ROUTE - I/O Routing Register

Offset	Bit Position																															
0x028	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0			
<b>Access</b>																													RW			
<b>Name</b>																													LOCATION			

Bit	Name	Reset	Access	Description
31:11	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
10:8	LOCATION	0x0	RW	<b>I/O Location</b> Defines the location of the PCNT input pins. E.g. PCNTn_S0#0, #1 or #2.

Value	Mode	Description
0	LOC0	Location 0

Bit	Name	Reset	Access	Description
	Value	Mode		Description
1	LOC1			Location 1
2	LOC2			Location 2
3	LOC3			Location 3

7:0 *Reserved* *To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)*

### 19.5.12 PCNTn\_FREEZE - Freeze Register

Offset	Bit Position																															
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																
<b>Access</b>																																
<b>Name</b>																																
	REGFREEZE																															

Bit	Name	Reset	Access	Description
31:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		

0	REGFREEZE	0	RW	<b>Register Update Freeze</b>
<p>When set, the update of the PCNT clock domain is postponed until this bit is cleared. Use this bit to update several registers simultaneously.</p>				
	Value	Mode	Description	
	0	UPDATE	Each write access to a PCNT register is updated into the Low Frequency domain as soon as possible.	
	1	FREEZE	The PCNT clock domain is not updated with the new written value.	

### 19.5.13 PCNTn\_SYNCBUSY - Synchronization Busy Register

	3	PRSCH3		PRS Channel 3 selected.

## 20 ACMP - Analog Comparator

### Quick Facts

#### What?

The ACMP (Analog Comparator) compares two analog signals and returns a digital value telling which is greater.

#### Why?

Applications often do not need to know the exact value of an analog signal, only if it has passed a certain threshold. Often the voltage must be monitored continuously, which requires extremely low power consumption.

#### How?

Available down to Energy Mode 3 and using as little as 100 nA, the ACMP can wake up the system when input signals pass the threshold. The analog comparator can compare two analog signals or one analog signal and a highly configurable internal reference.

### 20.1 Introduction

The Analog Comparator is used to compare the voltage of two analog inputs, with a digital output indicating which input voltage is higher. Inputs can either be one of the selectable internal references or from external pins. Response time and thereby also the current consumption can be configured by altering the current supply to the comparator.

### 20.2 Features

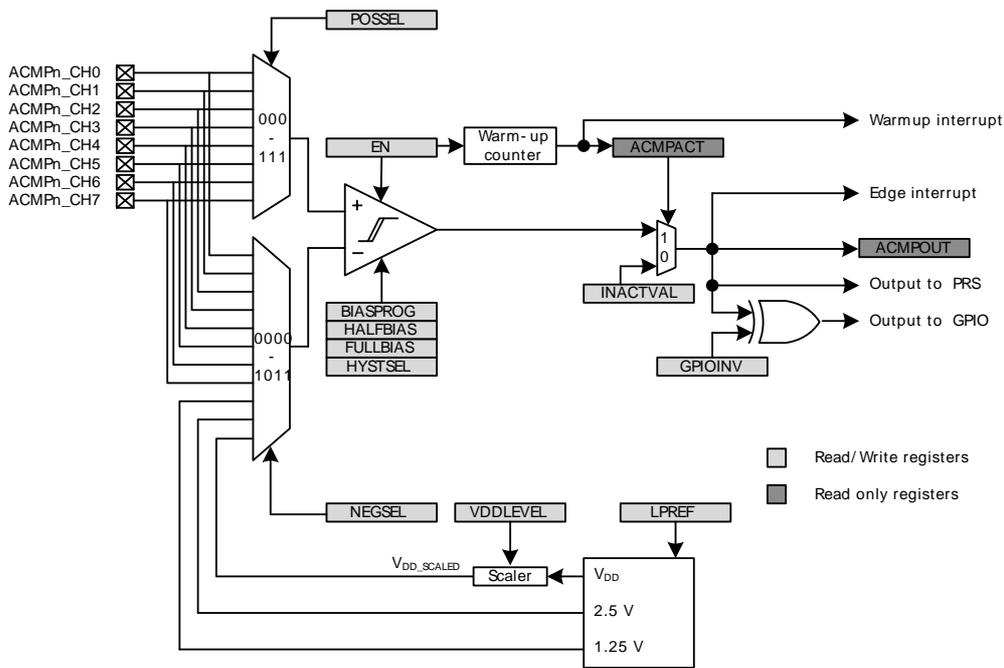

- 8 selectable external positive inputs
- 8 selectable external negative inputs
- 3 selectable internal negative inputs
  - Internal 1.25 V bandgap
  - Internal 2.5 V bandgap
  - $V_{DD}$  scaled by 64 selectable factors
- Low power mode for internal  $V_{DD}$  and bandgap references
- Selectable hysteresis
  - 8 levels between 0 and  $\pm 70$  mV
- Selectable response time
- Asynchronous interrupt generation on selectable edges
  - Rising edge
  - Falling edge
  - Both edges
- Operational in EM0-EM3
- Dedicated capacitive sense mode with up to 8 inputs
  - Adjustable internal resistor
- Configurable inversion of comparator output
- Configurable output when inactive

- Comparator output direct on PRS
- Comparator output on GPIO through alternate functionality
  - Output inversion available

## 20.3 Functional Description

An overview of the ACMP is shown in Figure 20.1 (p. 296) .

**Figure 20.1. ACMP Overview**

The comparator has two analog inputs, one positive and one negative. When the comparator is active, the output indicates which of the two input voltages is higher. When the voltage on the positive input is higher than the voltage on the negative input, the digital output is high and vice versa.

The output of the comparator can be read in the ACMPOUT bit in ACMPn\_STATUS. It is possible to switch inputs while the comparator is enabled, but all other configuration should only be changed while the comparator is disabled.

### 20.3.1 Warm-up Time

The analog comparator is enabled by setting the EN bit in ACMPn\_CTRL. When this bit is set, the comparator must stabilize before becoming active and the outputs can be used. This time period is called the warm-up time. The warm-up time is a configurable number of peripheral clock (HFPERCLK) cycles, set in WARMTIME, which should be set to at least 10 μs but lengthens to up to 1ms if LPREF is enabled. The ACMP should always start in active mode and then enable the LPREF after warm-up time. When the comparator is enabled and warmed up, the ACMPACT bit in ACMPn\_STATUS will indicate that the comparator is active. The output value when the comparator is inactive is set to the value in INACTVAL in ACMPn\_CTRL (see Figure 20.1 (p. 296) ).

An edge interrupt will be generated after the warm-up time if edge interrupt is enabled and the value set in INACTVAL is different from ACMPOUT after warm-up.

One should wait until the warm-up period is over before entering EM2 or EM3, otherwise no comparator interrupts will be detected. EM1 can still be entered during warm-up. After the warm-up period is completed, interrupts will be detected in EM2 and EM3.

## 20.3.2 Response Time

There is a delay from when the actual input voltage changes polarity, to when the output toggles. This period is called the response time and can be altered by increasing or decreasing the bias current to the comparator through the BIASPROG, FULLBIASPROG and HALFBIAS fields in the ACMPn\_CTRL register, as illustrated in Table 20.1 (p. 297). Setting the HALFBIAS bit in ACMPn\_CTRL effectively halves the current. Setting a lower bias current will result in lower power consumption, but a longer response time.

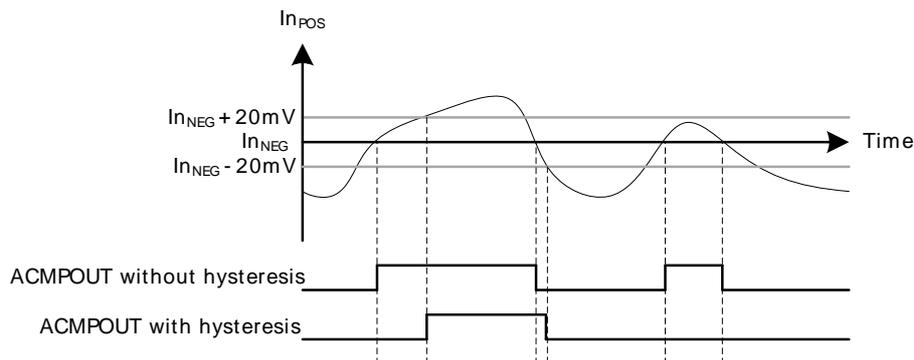

If the FULLBIAS bit is set, the highest hysteresis level should be used to avoid glitches on the output.

**Table 20.1. Bias Configuration**

BIASPROG	Bias Current ( $\mu$ A), HYSTSEL=0			
	FULLBIAS=0, HALFBIAS=1	FULLBIAS=0, HALFBIAS=0	FULLBIAS=1, HALFBIAS=1	FULLBIAS=1, HALFBIAS=0
0b0000	0.05	0.1	3.3	6.5
0b0001	0.1	0.2	6.5	13
0b0010	0.2	0.4	13	26
0b0011	0.3	0.6	20	39
0b0100	0.4	0.8	26	52
0b0101	0.5	1.0	33	65
0b0110	0.6	1.2	39	78
0b0111	0.7	1.4	46	91
0b1000	1.0	2.0	65	130
0b1001	1.1	2.2	72	143
0b1010	1.2	2.4	78	156
0b1011	1.3	2.6	85	169
0b1100	1.4	2.8	91	182
0b1101	1.5	3.0	98	195
0b1110	1.6	3.2	104	208
0b1111	1.7	3.4	111	221

## 20.3.3 Hysteresis

In the analog comparator, hysteresis can be configured to 8 different levels, including off which is level 0, through the HYSTSEL field in ACMPn\_CTRL. When the hysteresis level is set above 0, the digital output will not toggle until the positive input voltage is at a voltage equal to the hysteresis level above or below the negative input voltage (see Figure 20.2 (p. 298)). This feature can be used to filter out uninteresting input fluctuations around zero and only show changes that are big enough to breach the hysteresis threshold. Note that the ACMP current consumption will be influenced by the selected hysteresis level and in general decrease with increasing HYSTSEL values.

**Figure 20.2. 20 mV Hysteresis Selected**

### 20.3.4 Input Selection

The POSSEL and NEGSEL fields in ACMPn\_INPUTSEL controls which signals are connected to the two inputs of the comparator. 8 external pins are available for both the negative and positive input. For the negative input, 3 additional internal reference sources are available; 1.25 V bandgap, 2.5V bandgap and  $V_{DD}$ . The  $V_{DD}$  reference can be scaled by a configurable factor, which is set in VDDLEVEL (in ACMPn\_INPUTSEL) according to the following formula:

#### **$V_{DD}$ Scaled**

$$V_{DD\_SCALED} = V_{DD} \times VDDLEVEL / 63 \quad (20.1)$$

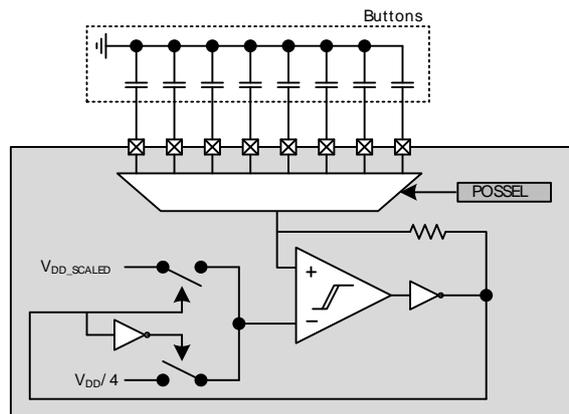

A low power reference mode can be enabled by setting the LPREF bit in ACMPn\_INPUTSEL. In this mode, the power consumption in the reference buffer ( $V_{DD}$  and bandgap) is lowered at the cost of accuracy. Low power mode will only save power if  $V_{DD}$  with VDDLEVEL higher than 0 or a bandgap reference is selected.

Normally the analog comparator input mux is disabled when the EN (in ACMPn\_CTRL) bit is set low. However if the MUXEN bit in ACMPn\_CTRL is set, the mux is enabled regardless of the EN bit. This will minimize kickback noise on the mux inputs when the EN bit is toggled.

### 20.3.5 Capacitive Sense Mode

The analog comparator includes specialized hardware for capacitive sensing of passive push buttons. Such buttons are traces on PCB laid out in a way that creates a parasitic capacitor between the button and the ground node. Because a human finger will have a small intrinsic capacitance to ground, the capacitance of the button will increase when the button is touched. The capacitance is measured by including the capacitor in a free-running RC oscillator (see Figure 20.3 (p. 299) ). The frequency produced will decrease when the button is touched compared to when it is not touched. By measuring the output frequency with a timer (e.g. through PRS), the change in capacitance can be calculated.

The analog comparator contains a complete feedback loop including an optional internal resistor. This resistor is enabled by setting the CSRESEN bit in ACMPn\_INPUTSEL. The resistance can be set to one of four values by configuring the CSRESSEL bits in ACMPn\_INPUTSEL. If the internal resistor is not enabled, the circuit will be open. The capacitive sense mode is enabled by setting the NEGSEL field in ACMPn\_INPUTSEL to CAPSENSE. The input pin is selected through the POSSEL bits in ACMPn\_INPUTSEL. The scaled  $V_{DD}$  in Figure 20.3 (p. 299) can be altered by configuring the VDDLEVEL in ACMPn\_INPUTSEL. It is recommended to set the hysteresis (HYSTSEL in ACMPn\_CTRL) higher than the lowest level when using the analog comparator in capacitive sense mode.

**Figure 20.3. Capacitive Sensing Set-up**

### 20.3.6 Interrupts and PRS Output

The analog comparator includes an edge triggered interrupt flag (EDGE in ACMPn\_IF). If either IRISE and/or IFALL in ACMPn\_CTRL is set, the EDGE interrupt flag will be set on rising and/or falling edge of the comparator output, respectively. An interrupt request will be sent if the EDGE interrupt flag in ACMPn\_IF is set and enabled through the EDGE bit in ACMPn\_IEN. The edge interrupt can also be used to wake up the device from EM3-EM1.

The analog comparator also includes an interrupt flag, WARMUP in ACMPn\_IF, which is set when a warm-up sequence has finished. An interrupt request will be sent if the WARMUP interrupt flag in ACMPn\_IF is set and enabled through the WARMUP bit in ACMPn\_IEN.

The comparator output is also available as a PRS signal.

### 20.3.7 Output to GPIO

The output from the comparator is available as alternate function to the GPIO pins. Set the ACMPn\_PEN bit in ACMPn\_ROUTE to enable output to pin, and the LOCATION bits to select output location. The GPIO-pin must also be set as output. The output to the GPIO can be inverted by setting the GPIOINV bit in ACMPn\_CTRL.

## 20.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	ACMPn_CTRL	RW	Control Register
0x004	ACMPn_INPUTSEL	RW	Input Selection Register
0x008	ACMPn_STATUS	R	Status Register
0x00C	ACMPn_IEN	RW	Interrupt Enable Register
0x010	ACMPn_IF	R	Interrupt Flag Register
0x014	ACMPn_IFS	W1	Interrupt Flag Set Register
0x018	ACMPn_IFC	W1	Interrupt Flag Clear Register
0x01C	ACMPn_ROUTE	RW	I/O Routing Register

## 21 VCMP - Voltage Comparator

### Quick Facts

#### What?

The Voltage Supply Comparator (VCMP) monitors the input voltage supply and generates software interrupts on events using as little as 100 nA.

#### Why?

The VCMP can be used for simple power supply monitoring, e.g. for a battery level indicator.

#### How?

The scaled power supply is compared to a programmable reference voltage, and an interrupt can be generated when the supply is higher or lower than the reference. The VCMP can also be duty-cycled by software to further reduce the energy consumption.

### 21.1 Introduction

The Voltage Supply Comparator is used to monitor the supply voltage from software. An interrupt can be generated when the supply falls below or rises above a programmable threshold.

#### Note

Note that VCMP comes in addition to the Power-on Reset and Brown-out Detector peripherals, that both generate reset signals when the voltage supply is insufficient for reliable operation. VCMP does not generate reset, only interrupt. Also note that the ADC is capable of sampling the input voltage supply.

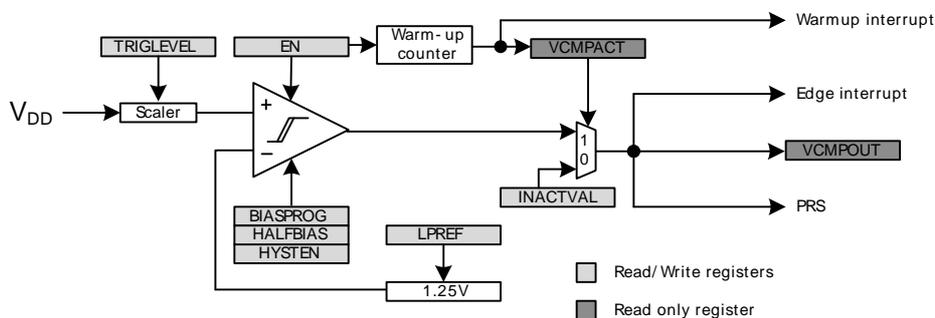

### 21.2 Features

- Voltage supply monitoring
- Scalable  $V_{DD}$  in 64 steps selectable as positive comparator input
- Internal 1.25 V bandgap reference
- Low power mode for internal  $V_{DD}$  and bandgap references
- Selectable hysteresis
  - 0 or  $\pm 20$  mV
- Selectable response time
- Asynchronous interrupt generation on selectable edges
  - Rising edge
  - Falling edge
  - Rising and Falling edges
- Operational in EM0-EM3
- Comparator output direct on PRS
- Configurable output when inactive to avoid unwanted interrupts

## 21.3 Functional Description

An overview of the VCMP is shown in Figure 21.1 (p. 307) .

**Figure 21.1. VCMP Overview**

The comparator has two analog inputs, one positive and one negative. When the comparator is active, the output indicates which of the two input voltages is higher. When the voltage on the positive input is higher than the negative input voltage, the digital output is high and vice versa.

The output of the comparator can be read in the VCMPOUT bit in VCMP\_STATUS. Configuration registers should only be changed while the comparator is disabled.

### 21.3.1 Warm-up Time

VCMP is enabled by setting the EN bit in VCMP\_CTRL. When this bit is set, the comparator must stabilize before becoming active and the outputs can be used. This time period is called the warm-up time. The warm-up time is a configurable number of HFPERCLK cycles, set in WARMTIME, which should be set to at least 10  $\mu$ s. When the comparator is enabled and warmed up, the VCMPACT bit in VCMP\_STATUS will be set to indicate that the comparator is active.

As long as the comparator is not enabled or not warmed up, VCMPACT will be cleared and the comparator output value is set to the value in INACTVAL in VCMP\_CTRL.

One should wait until the warm-up period is over before entering EM2 or EM3, otherwise no comparator interrupts will be detected. EM1 can still be entered during warm-up. After the warm-up period is completed, interrupts will be detected in EM2 and EM3.

### 21.3.2 Response Time

There is a delay from when the actual input voltage changes polarity, to when the output toggles. This period is called the response time and can be altered by increasing or decreasing the bias current to the comparator through the BIAS and HALFBIAS fields in VCMP\_CTRL as shown in Table 21.1 (p. 307) . Setting a lower bias current will result in lower power consumption, but a longer response time.

**Table 21.1. Bias Configuration**

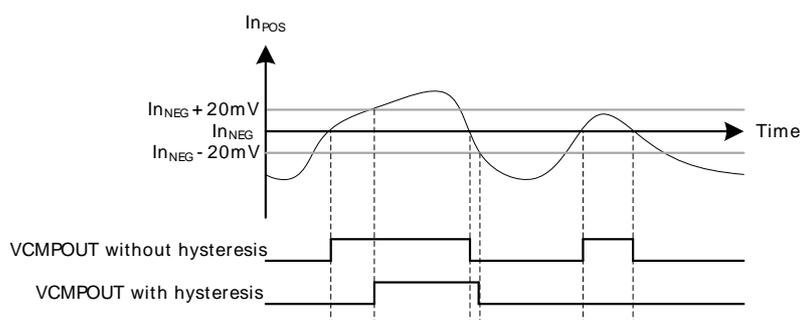

BIAS	Bias Current ( $\mu$ A)	
	HALFBIAS=0	HALFBIAS=1
0b0000	0.1	0.05
0b0001	0.2	0.1
0b0010	0.4	0.2
0b0011	0.6	0.3

BIAS	Bias Current (μA)	
	HALFBIAS=0	HALFBIAS=1
0b0100	0.8	0.4
0b0101	1.0	0.5
0b0110	1.2	0.6
0b0111	1.4	0.7
0b1000	2.0	1.0
0b1001	2.2	1.1
0b1010	2.4	1.2
0b1011	2.6	1.3
0b1100	2.8	1.4
0b1101	3.0	1.5
0b1110	3.2	1.6
0b1111	3.4	1.7

### 21.3.3 Hysteresis

In the voltage supply comparator, hysteresis can be enabled by setting HYSTEN in VCMP\_CTRL. When HYSTEN is set, the digital output will not toggle until the positive input voltage is at least 20mV above or below the negative input voltage. This feature can be used to filter out uninteresting input fluctuations around zero and only show changes that are big enough to breach the hysteresis threshold.

**Figure 21.2. VCMP 20 mV Hysteresis Enabled**

### 21.3.4 Input Selection

The positive comparator input is always connected to the scaled power supply input. The negative comparator input is connected to the internal 1.25 V bandgap reference. The  $V_{DD}$  trigger level can be configured by setting the TRIGLEVEL field in VCMP\_CTRL according to the following formula:

**VCMP  $V_{DD}$  Trigger Level**

$$V_{DD} \text{ Trigger Level} = 1.667V + 0.034V \times \text{TRIGLEVEL} \tag{21.1}$$

A low power reference mode can be enabled by setting the LPREF bit in VCMP\_INPUTSEL. In this mode, the power consumption in the reference buffer ( $V_{DD}$  and bandgap) is lowered at the cost of accuracy.

### 21.3.5 Interrupts and PRS Output

The VCMP includes an edge triggered interrupt flag (EDGE in VCMP\_IF). If either IRISE and/or IFALL in VCMPn\_CTRL is set, the EDGE interrupt flag will be set on rising and/or falling edge of the comparator output respectively. An interrupt request will be sent if the EDGE interrupt flag in VCMP\_IF is set and enabled through the EDGE bit in VCMPn\_IEN. The edge interrupt can also be used to wake up the device from EM3-EM1. VCMP also includes an interrupt flag, WARMUP in VCMP\_IF, which is set when a warm-up sequence has finished. An interrupt request will be sent if the WARMUP interrupt flag in VCMP\_IF is set and enabled through the WARMUP bit in VCMPn\_IEN. The synchronized comparator output is also available as a PRS output signal.

## 21.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	VCMP_CTRL	RW	Control Register
0x004	VCMP_INPUTSEL	RW	Input Selection Register
0x008	VCMP_STATUS	R	Status Register
0x00C	VCMP_IEN	RW	Interrupt Enable Register
0x010	VCMP_IF	R	Interrupt Flag Register
0x014	VCMP_IFS	W1	Interrupt Flag Set Register
0x018	VCMP_IFC	W1	Interrupt Flag Clear Register

## 21.5 Register Description

0	EDGE	0	W1	<b>Edge Triggered Interrupt Flag Clear</b> Write to 1 to clear edge triggered interrupt flag

## 22 ADC - Analog to Digital Converter

### Quick Facts

#### What?

The ADC is used to convert analog signals into a digital representation and features 8 external input channels

#### Why?

In many applications there is a need to measure analog signals and record them in a digital representation, without exhausting your energy source.

#### How?

A low power Successive Approximation Register ADC samples up to 8 input channels in a programmable sequence. With the help of PRS and DMA, the ADC can operate without CPU intervention, minimizing the number of powered up resources. The ADC can further be duty-cycled to reduce the energy consumption.

### 22.1 Introduction

The ADC is a Successive Approximation Register (SAR) architecture, with a resolution of up to 12 bits at up to one million samples per second. The integrated input mux can select inputs from 8 external pins and 6 internal signals.

### 22.2 Features

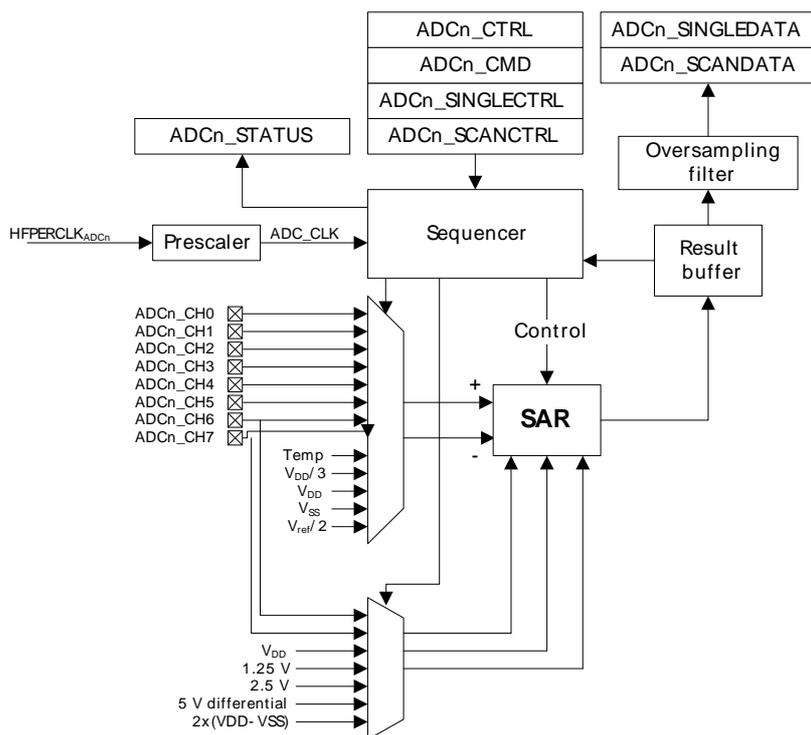

- Programmable resolution (6/8/12-bit)
  - 13 prescaled clock (ADC\_CLK) cycles per conversion
  - Maximum 1 MSPS @ 12-bit
  - Maximum 1.86 MSPS @ 6-bit
- Configurable acquisition time
- Integrated prescaler
  - Selectable clock division factor from 1 to 128
- 13 MHz to 32 kHz allowed for ADC\_CLK
- 18 input channels
  - 8 external single ended channels
  - 6 internal single ended channels
    - Including temperature sensor
  - 4 external differential channels
- Integrated input filter
  - Low pass RC filter
  - Decoupling capacitor
- Left or right adjusted results
  - Results in 2's complement representation
  - Differential results sign extended to 32-bit results

- Programmable scan sequence
  - Up to 8 configurable samples in scan sequence
  - Mask to select which pins are included in the sequence
  - Triggered by software or PRS input
  - One shot or repetitive mode
  - Oversampling available
  - Overflow interrupt flag set when overwriting unread results
  - Conversion tailgating support for predictable periodic scans
- Programmable single conversion
  - Triggered by software or PRS input
  - Can be interleaved between two scan sequences
  - One shot or repetitive mode
  - Oversampling available
  - Overflow interrupt flag set when overwriting unread results
- Hardware oversampling support
  - 1st order accumulate and dump filter
  - From 2 to 4096 oversampling ratio (OSR)
  - Results in 16-bit representation
  - Enabled individually for scan sequence and single sample mode
  - Common OSR select
- Individually selectable voltage reference for scan and single mode
  - Internal 1.25V reference
  - Internal 2.5V reference
  - $V_{DD}$
  - Internal 5 V differential reference
  - Single ended external reference
  - Differential external reference
  - Unbuffered  $2 \times V_{DD}$
- Support for offset and gain calibration
- Interrupt generation and/or DMA request
  - Finished single conversion
  - Finished scan conversion
  - Single conversion results overflow
  - Scan sequence results overflow

## 22.3 Functional Description

An overview of the ADC is shown in Figure 22.1 (p. 316) .

Figure 22.1. ADC Overview

### 22.3.1 Clock Selection

The ADC has an internal prescaler (PRESC bits in ADcn\_CTRL) which can divide the peripheral clock (HFPERCLK) by any factor between 1 and 128. Note that the resulting ADC\_CLK should not be set to a higher frequency than 13 MHz and not lower than 32 kHz.

### 22.3.2 Conversions

A conversion consists of two phases. The input is sampled in the acquisition phase before it is converted to digital representation during the approximation phase. The acquisition time can be configured independently for scan and single conversions (see Section 22.3.7 (p. 320) ) by setting AT in ADcn\_SINGLECTRL/ADcn\_SCANCTRL. The acquisition times can be set to any integer power of 2 from 1 to 256 ADC\_CLK cycles.

**Note**

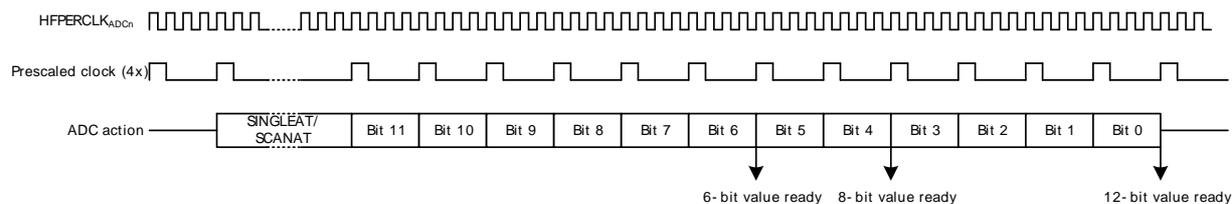

For high impedance sources the acquisition time should be adjusted to allow enough time for the internal sample capacitor to fully charge. The minimum acquisition time for the internal temperature sensor and  $V_{dd}/3$  is given in the electrical characteristics for the device.

The analog to digital converter core uses one clock cycle per output bit in the approximation phase.

**ADC Total Conversion Time (in ADC\_CLK cycles) Per Output**

$$T_{conv} = (T_A + N) \times OSR \tag{22.1}$$

$T_A$  equals the number of acquisition cycles and N is the resolution. OSR is the oversampling ratio (see Section 22.3.7.7 (p. 322)). The minimum conversion time is 7 ADC\_CYCLES with 6 bit resolution and 13 ADC\_CYCLES with 12 bit resolution. The maximum conversion time is 1097728 ADC\_CYCLES with the longest acquisition time, 12 bit resolution and highest oversampling rate.

**Figure 22.2. ADC Conversion Timing**

### 22.3.3 Warm-up Time

The ADC needs to be warmed up some time before a conversion can take place. This time period is called the warm-up time. When enabling the ADC or changing references between samples, the ADC is automatically warmed up for 1  $\mu$ s and an additional 5  $\mu$ s if the bandgap is selected as reference.

Normally, the ADC will be warmed up only when samples are requested and is shut off when there are no more samples waiting. However, if lower latency is needed, configuring the WARMUPMODE field in ADCn\_CTRL allows the ADC and/or reference to stay warm between samples, eliminating the need for warm-up. Figure 22.3 (p. 318) shows the analog power consumption in scenarios using the different WARMUPMODE settings.

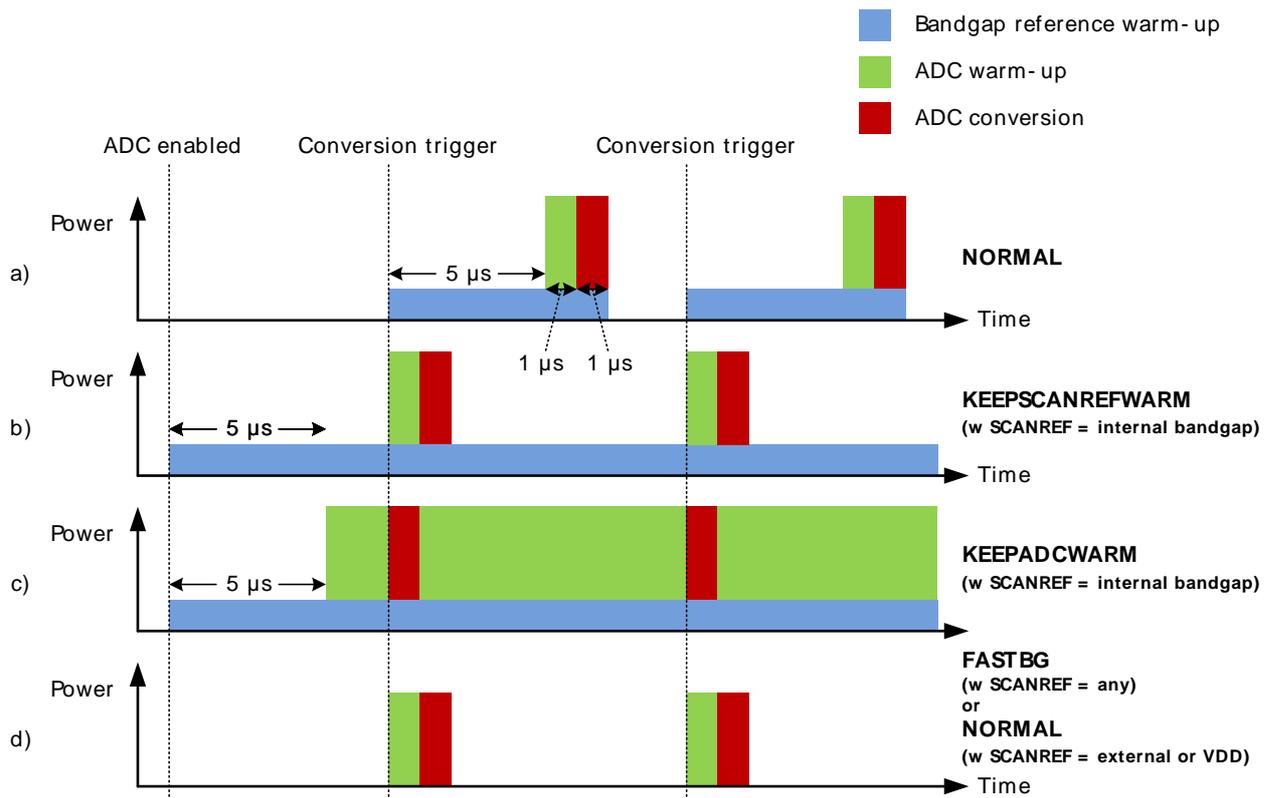

Only the bandgap reference selected for scan mode can be kept warm. If a different bandgap reference is selected for single mode, the warm-up time still applies.

- **NORMAL**: ADC and references are shut off when there are no samples waiting. a) in Figure 22.3 (p. 318) shows this mode used with an internal bandgap reference. Figure d) shows this mode when using VDD or an external reference.
- **FASTBG**: Bandgap warm-up is eliminated, but with reduced reference accuracy. d) in Figure 22.3 (p. 318) shows this mode used with an internal bandgap reference.
- **KEEPSCANREFWARM**: The reference selected for scan mode is kept warm. The ADC will still need to be warmed up before conversion. b) in Figure 22.3 (p. 318) shows this mode used with an internal bandgap reference.
- **KEEPADCWARM**: The ADC and the reference selected for scan mode is kept warm. c) in Figure 22.3 (p. 318) shows this mode used with an internal bandgap reference.

The minimum warm-up times are given in  $\mu$ s. The timing is done automatically by the ADC, given that a proper time base is given in the TIMEBASE bits in ADCn\_CTRL. The TIMEBASE must be set to the number of HFPERCLK which corresponds to at least 1  $\mu$ s. The TIMEBASE only affects the timing of the warm-up sequence and not the ADC\_CLK.

When entering Energy Modes 2 or 3, the ADC must be stopped and WARMUPMODE in ADCn\_CTRL written to 0.

Figure 22.3. ADC Analog Power Consumption With Different WARMUPMODE Settings

### 22.3.4 Input Selection

The ADC is connected to 8 external input pins, which can be selected as 8 different single ended inputs or 4 differential inputs. In addition, 6 single ended internal inputs can be selected. The available selections are given in the register description for ADCn\_SINGLECTRL and ADCn\_SCANCTRL.

For offset calibration purposes it is possible to internally short the differential ADC inputs and thereby measure a 0 V differential. Differential 0 V is selected by writing the DIFF bit to 1 and INPUTSEL to 4 in ADCn\_SINGLECTRL. Calibration is described in detail in Section 22.3.10 (p. 323) .

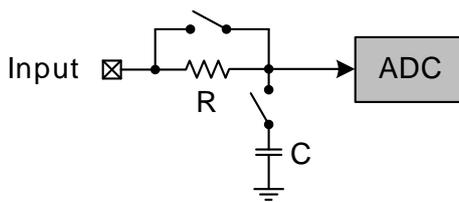

**Note**

When VDD/3 is sampled, the acquisition time should be above a lower limit. The reader is referred to the datasheet for minimum VDD/3 acquisition time.

#### 22.3.4.1 Input Filtering

The selected input signal can be filtered, either through an internal low pass RC filter or an internal decoupling capacitor. The different filter configurations can be enabled through the LPFMODE bits in ADCn\_CTRL. For maximum SNR, LPFMODE is recommended set to DECAP, with a cutoff frequency of 31.5 MHz.

The RC input filter configuration is given in Figure 22.4 (p. 319). The resistance and capacitance values are given in the electrical characteristics for the device, named R<sub>ADCFILT</sub> and C<sub>ADCFILT</sub> respectively.

**Figure 22.4. ADC RC Input Filter Configuration**

### 22.3.4.2 Temperature Measurement

The ADC includes an internal temperature sensor. This sensor is characterized during production and the temperature readout from the ADC at production temperature, `ADC0_TEMP_0_READ_1V25`, is given in the Device Information (DI) page. The production temperature, `CAL_TEMP_0`, is also given in this page. The temperature gradient, `TGRAD_ADCTH` (mV/degree Celsius), for the sensor is found in the datasheet for the devices. By selecting 1.25 V internal reference and measuring the internal temperature sensor with 12 bit resolution, the temperature can be calculated according to the following formula:

#### ADC Temperature Measurement

$$T_{\text{CELSIUS}} = \text{CAL\_TEMP\_0} - (\text{ADC0\_TEMP\_0\_READ\_1V25} - \text{ADC\_result}) \times V_{\text{ref}} / (4096 \times \text{TGRAD\_ADCTH}) \quad (22.2)$$

#### Note

The minimum acquisition time for the temperature reference is found in the electrical characteristics for the device.

### 22.3.5 Reference Selection

The reference voltage can be selected from these sources:

- 1.25 V internal bandgap.
- 2.5 V internal bandgap.
- $V_{\text{DD}}$ .
- 5 V internal differential bandgap.
- External single ended input from Ch. 6.
- Differential input, 2x(Ch. 6 - Ch. 7).
- Unbuffered  $2 \times V_{\text{DD}}$ .
- The 2.5 V reference needs a supply voltage higher than 2.5 V.
- The differential 5 V reference needs a supply voltage higher than 2.75 V.

Since the  $2 \times V_{\text{DD}}$  differential reference is unbuffered, it is directly connected to the ADC supply voltage and more susceptible to supply noise. The  $V_{\text{DD}}$  reference is buffered both in single ended and differential mode.

If a differential reference with a larger range than the supply voltage is combined with single ended measurements, for instance the 5 V internal reference, the full ADC range will not be available because the maximum input voltage is limited by the maximum electrical ratings.

#### Note

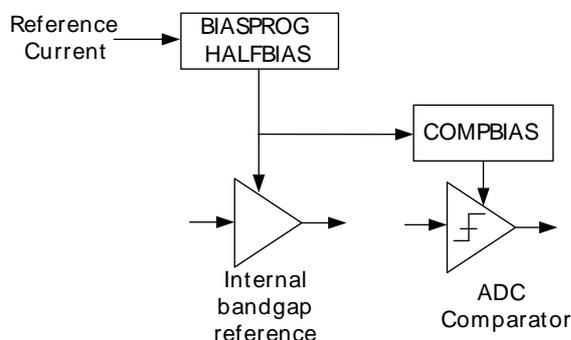

Single ended measurements with the external differential reference are not supported.

### 22.3.6 Programming of Bias Current

The bias current of the bandgap reference and the ADC comparator can be scaled by the `BIASPROG`, `HALFBIAS` and `COMPBIAS` bit fields of the `ADCn_BIASPROG` register. The `BIASPROG` and `HALFBIAS`

bitfields scale the current of ADC bandgap reference, and the COMPBIAS bits provide an additional bias programming for the ADC comparator as illustrated in Figure 22.5 (p. 320). The electrical characteristics given in the datasheet require the bias configuration to be set to the default values, where no other bias values are given.

**Figure 22.5. ADC Bias Programming**

The minimum value of the BIASPROG and COMPBIAS bitfields of the ADCn\_BIASPROG register (i.e. BIASPROG=0b0000, COMPBIAS=0b0000) represent the minimum bias currents. Similarly BIASPROG=0b1111 and COMPBIAS=0b1111 represent the maximum bias currents. Additionally, the bias current defined by the BIASPROG setting can be halved by setting the HALFBIAS bit of the ADCn\_BIASPROG register.

The bias current settings should only be changed while the ADC is disabled.

## 22.3.7 ADC Modes

The ADC contains two separate programmable modes, one single sample mode and one scan mode. Both modes have separate configuration and result registers and can be set up to run only once per trigger or repetitively. The scan mode has priority over the single sample mode. However, if scan sequence is running, a triggered single sample will be interleaved between two scan samples.

### 22.3.7.1 Single Sample Mode

The single sample mode can be used to convert a single sample either once per trigger or repetitively. The configuration of the single sample mode is done in the ADCn\_SINGLECTRL register and the results are found in the ADCn\_SINGLEDATA register. The SINGLEDV bit in ADCn\_STATUS is set high when there is valid data in the result register and is cleared when the data is read. The single mode results can also be read through ADCn\_SINGLEDATAP without SINGLEDV being cleared. DIFF in ADCn\_SINGLECTRL selects whether differential or single ended inputs are used and INPUTSEL selects input pin(s).

### 22.3.7.2 Scan mode

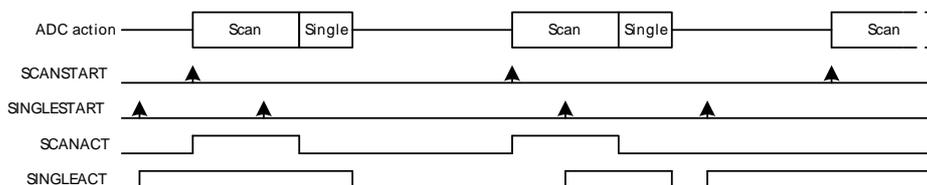

The scan mode is used to perform sweeps of the inputs. The configuration of the scan sequence is done in the ADCn\_SCANCTRL register and the results are found in the ADCn\_SCANDATA register. The SCANDV bit in ADCn\_STATUS is set high when there is valid data in the result register and is cleared when the data is read. The scan mode results can also be read through ADCn\_SCANDATAP without SCANDV being cleared. The inputs included in the sequence are defined by a the mask in INPUTMASK in ADCn\_SCANCTRL. When the scan sequence is triggered, the sequence samples all inputs that are included in the mask, starting at the lowest pin number. DIFF in ADCn\_SCANCTRL selects whether single ended or differential inputs are used.

### 22.3.7.3 Conversion Tailgating

The scan sequence has priority over the single sample mode. However, a scan trigger will not interrupt in the middle of a single conversion. If a scan sequence is triggered by a timer on a periodic basis,

single sample just before a scan trigger can delay the start of the scan sequence, thus causing jitter in sample rate. To solve this, conversion tailgating can be chosen by setting TAILGATE in ADCn\_CTRL. When this bit is set, any triggered single samples will wait for the next scan sequence to finish before activating (see Figure 22.6 (p. 321) ). The single sample will then follow immediately after the scan sequence. In this way, the scan sequence will always start immediately when triggered, if the period between the scan triggers is big enough to allow any single samples that might be triggered to finish in between the scan sequences.

**Figure 22.6. ADC Conversion Tailgating**

### 22.3.7.4 Conversion Trigger

The conversion modes can be activated by writing a 1 to the SINGLESTART or SCANSTART bit in the ADCn\_CMD register. The conversions can be stopped by writing a 1 to the SINGLESTOP or SCANSTOP bit in the ADCn\_CMD register. A START command will have priority over a stop command. When the ADC is stopped in the middle of a conversion, the result buffer is cleared. The SINGLEACT and SCANACT bits in ADCn\_STATUS are set high when the modes are actively converting or have pending conversions.

It is also possible to trigger conversions from PRS signals. The system requires one HPERCLK cycle pulses to trigger conversions. Setting PRSEN in ADCn\_SINGLECTRL/ADCn\_SCANCTRL enables triggering from PRS input. Which PRS channel to listen to is defined by PRSSEL in ADCn\_SINGLECTRL/ADCn\_SCANCTRL. When PRS trigger is selected, it is still possible to trigger the conversion from software. The reader is referred to the PRS datasheet for more information on how to set up the PRS channels.

**Note**

The conversion settings should not be changed while the ADC is running as this can lead to unpredictable behavior.

The prescaled clock phase is always reset by a triggered conversion as long as a conversion is not ongoing. This gives predictable latency from the time of the trigger to the time the conversion starts, regardless of when in the prescaled clock cycle the trigger occur.

### 22.3.7.5 Results

The results are presented in 2's complement form and the format for differential and single ended mode is given in Table 22.1 (p. 321) and Table 22.2 (p. 322). If differential mode is selected, the results are sign extended up to 32-bit (shown in Table 22.4 (p. 323) ).

**Table 22.1. ADC Single Ended Conversion**

Input/Reference	Results	
	Binary	Hex value
1	111111111111	FFF
0.5	011111111111	7FF
1/4096	000000000001	001
0	000000000000	000

**Table 22.2. ADC Differential Conversion**

Input/Reference	Results	
	Binary	Hex value
0.5	011111111111	7FF
0.25	001111111111	3FF
1/2048	000000000001	001
0	000000000000	000
-1/2048	111111111111	FFF
-0.25	101111111111	BFF
-0.5	100000000000	800

### 22.3.7.6 Resolution

The ADC gives out 12-bit results, by default. However, if full 12-bit resolution is not needed, it is possible to speed up the conversion by selecting a lower resolution (N = 6 or 8 bits). For more information on the accuracy of the ADC, the reader is referred to the electrical characteristics section for the device.

### 22.3.7.7 Oversampling

To achieve higher accuracy, hardware oversampling can be enabled individually for each mode (Set RES in ADCn\_SINGLECTRL/ADCn\_SCANCTRL to 0x3). The oversampling rate (OVSRSEL in ADCn\_CTRL) can be set to any integer power of 2 from 2 to 4096 and the configuration is shared between the scan and single sample mode (OVSRSEL field in ADCn\_CTRL).

With oversampling, each selected input is sampled a number (given by the OVSR) of times, and the results are filtered by a first order accumulate and dump filter to form the end result. The data presented in the ADCn\_SINGLEDATA and ADCn\_SCANDATA registers are the direct contents of the accumulation register (sum of samples). However, if the oversampling ratio is set higher than 16x, the accumulated results are shifted to fit the MSB in bit 15 as shown in Table 22.3 (p. 322).

**Table 22.3. Oversampling Result Shifting and Resolution**

Oversampling setting	# right shifts	Result Resolution # bits
2x	0	13
4x	0	14
8x	0	15
16x	0	16
32x	1	16
64x	2	16
128x	3	16
256x	4	16
512x	5	16
1024x	6	16
2048x	7	16
4096x	8	16

### 22.3.7.8 Adjustment

By default, all results are right adjusted, with the LSB of the result in bit position 0 (zero). In differential mode the signed bit is extended up to bit 31, but in single ended mode the bits above the result are read as 0. By setting ADJ in ADCn\_SINGLECTRL/ADCn\_SCANCTRL, the results are left adjusted as shown in Table 22.4 (p. 323) . When left adjusted, the MSB is always placed on bit 15 and sign extended to bit 31. All bits below the conversion result are read as 0 (zero).

**Table 22.4. ADC Results Representation**

Adjustment	Resolution	Bit																																
		31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	OVS	15	15	15	15	15	15	15	15	15	15	15	15	15	15	15	15	15	15	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1

### 22.3.8 Interrupts, PRS Output

The single and scan modes have separate interrupt flags indicating finished conversions. Setting one of these flags will result in an ADC interrupt if the corresponding interrupt enable bit is set in ADCn\_IEN.

In addition to the finished conversion flags, there is a scan and single sample result overflow flag which signals that a result from a scan sequence or single sample has been overwritten before being read.

A finished conversion will result in a one HPPERCLK cycle pulse which is output to the Peripheral Reflex System (PRS).

### 22.3.9 DMA Request

The ADC has two DMA request lines, SINGLE and SCAN, which are set when a single or scan conversion has completed. The request are cleared when the corresponding single or scan result register is read.

### 22.3.10 Calibration

The ADC supports offset and gain calibration to correct errors due to process and temperature variations. This must be done individually for each reference used. The ADC calibration (ADCn\_CAL) register contains four register fields for calibrating offset and gain for both single and scan mode. The gain and offset calibration are done in single mode, but the resulting calibration values can be used for both single and scan mode.

Gain and offset for the 1V25, 2V5 and VDD references are calibrated during production and the calibration values for these can be found in the Device Information page. During reset, the gain and offset calibration registers are loaded with the production calibration values for the 1V25 reference.

The SCANGAIN and SINGLEGAIN calibration fields are not used when the unbuffered differential 2xVDD reference is selected.

The effects of changing the calibration register values are given in Table 22.5 (p. 324) . Step by step calibration procedures for offset and gain are given in Section 22.3.10.1 (p. 324) and Section 22.3.10.2 (p. 324) .

**Table 22.5. Calibration Register Effect**

Calibration Register	ADC Result	Calibration Binary Value	Calibration Hex Value
Offset	Lowest Output	0111111	3F
	Highest Output	1000000	40
Gain	Lowest Output	0000000	00
	Highest Output	1111111	7F

The offset calibration register expects a signed 2's complement value with negative effect. A high value gives a low ADC reading.

The gain calibration register expects an unsigned value with positive effect. A high value gives a high ADC reading.

### 22.3.10.1 Offset Calibration

Offset calibration must be performed prior to gain calibration. Follow these steps for the offset calibration in single mode:

1. Select wanted reference by setting the REF bitfield of the ADCn\_SINGLECTRL register.
2. Set the AT bitfield of the ADCn\_SINGLECTRL register to 16CYCLES.
3. Set the INPUTSEL bitfield of the ADCn\_SINGLECTRL register to DIFF0, and set the DIFF bitfield to 1 for enabling differential input. Since the input voltage is 0, the expected ADC output is the half of the ADC code range as it is in differential mode.
4. A binary search is used to find the offset calibration value. Set the SINGLESTART bit in the ADCn\_CMD register and read the ADCn\_SINGLEDATA register. The result of the binary search is written to the SINGLEOFFSET field of the ADCn\_CAL register.

### 22.3.10.2 Gain Calibration

Offset calibration must be performed prior to gain calibration. The Gain Calibration is done in the following manner:

1. Select an external ADC channel (a differential channel can also be used).
2. Apply an external voltage on the selected ADC input channel. This voltage should correspond to the top of the ADC range.
3. A binary search is used to find the gain calibration value. Set the SINGLESTART bit in the ADCn\_CTRL register and read the ADCn\_SINGLEDATA register. The target value is ideally the top of the ADC range, but it is recommended to use a value a couple of LSBs below in order to avoid overshooting. The result of the binary search is written to the SINGLEGAIN field of the ADCn\_CAL register.

## 22.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	ADCn_CTRL	RW	Control Register
0x004	ADCn_CMD	W1	Command Register
0x008	ADCn_STATUS	R	Status Register
0x00C	ADCn_SINGLECTRL	RW	Single Sample Control Register

11:8	COMPBIAS	0x7	RW	<b>Comparator Bias Value</b> These bits are used to adjust the bias current to the ADC Comparator.
7	Reserved	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
6	HALFBIAS	1	RW	<b>Half Bias Current</b> Set this bit to halve the bias current.
5:4	Reserved	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
3:0	BIASPROG	0x7	RW	<b>Bias Programming Value</b> These bits are used to adjust the bias current.

## 23 IDAC - Current Digital to Analog Converter

### Quick Facts

#### What?

The IDAC can sink, or source a configurable constant current.

#### Why?

The IDAC can be used to bias external circuits or with the ADC measure capacitance by injecting a controlled current into a component.

#### How?

In addition to providing a constant current, the IDAC can be switched on and off with a PRS signal all the way down to EM3.

### 23.1 Introduction

The current digital to analog converter (IDAC) can source or sink a configurable constant current, which can be output on, or sunk from pin or ADC. The current is configurable with several ranges of various step sizes.

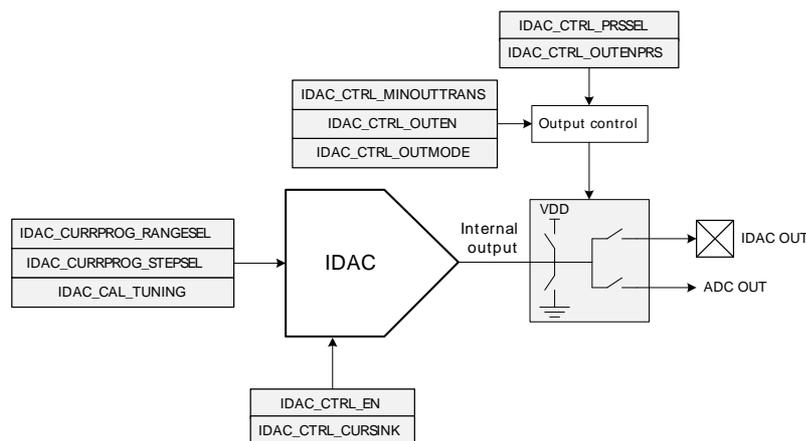

### 23.2 Features

- Can source and sink current
- Programmable constant output current
  - Selectable current range between 0.05 and 64  $\mu$ A
  - Each range is linearly programmable in 32 steps
  - Support for current calibration
- Can charge ADC channels
- Support for manual and PRS triggered output enable
- Available in EM0-EM3

### 23.3 Functional Description

An overview of the IDAC module is shown in Figure 23.1 (p. 339). The IDAC is designed to source or sink a programmable current which can be controlled by setting the range and the step in RANGESEL and STEPSEL bitfields in IDAC\_CURRPROG register. The IDAC output enable to pin and ADC can be controlled by software or PRS. Output enable is controlled by software by setting OUTEN, or by PRS by setting OUTENPRS in IDAC\_CTRL. The OUTMODE bitfield in IDAC\_CTRL can be configured to choose either pin or ADC. The IDAC is enabled by setting IDACEN in IDAC\_CTRL.

Figure 23.1. IDAC Overview

### 23.3.1 Current Programming

The 4 different current ranges can be selected by configuring the RANGESEL bitfield in IDAC\_CURRPROG. Each range is linearly programmable in 32 steps, which is configured by the STEPSEL bitfield in IDAC\_CURRPROG. These current ranges with their step sizes are shown in Table 23.1 (p. 339).

Table 23.1. Range Selection

Range Select	Range Value [ $\mu$ A]	Step Size [nA]	Step Counts
0	0.05 - 1.6	50	32
1	1.6 - 4.7	100	32
2	0.5 - 16	500	32
3	2 - 64	2000	32

### 23.3.2 Output Control

The IDAC output can be controlled either by software or PRS. After configuring the desired output mode, setting OUTENPRS in IDAC\_CTRL enables PRS control over outenable, while setting OUTEN in IDAC\_CTRL for enabling via software.

### 23.3.3 Output Modes

The IDAC can output current either to pin, or to the currently selected ADC channel. Setting OUTMODE to PIN in IDAC\_CTRL will output current to the IDAC\_OUT pin, while setting OUTMODE to ADC will direct the current to one of the ADC channels. In ADC mode, the pin being charged depends on the channel selected for sampling by the ADC. Thus, if channel 1 is being sampled by ADC, the current from IDAC will charge the same pin.

### 23.3.4 Minimizing Output Transition

If the internal output of the IDAC is at a different voltage than the output pin, enabling the output can cause an unwanted output transition. To minimize this output transition it is possible to charge or discharge the internal output before enabling the output. Setting MINOUTTRANS in IDAC\_CTRL when the IDAC is sourcing lowers the internal node to GND. When sinking, the internal output node is risen to VDD. Setting OUTEN when MINOUTTRANS is set will stop the charge/discharging until OUTEN is cleared, or when MINOUTTRANS is cleared.

### 23.3.5 Duty Cycle Configuration

The references for the IDAC can be duty-cycled at 4 Hz, meaning that it can source current at very low overhead current consumption at the cost of response time. By default duty-cycling is enabled in EM2 and EM3 and disabled in EM0 and EM1 but this is configurable. Setting DUTYCYCLEEN in IDAC\_DUTYCONFIG will force duty cycling on in all energy modes, while setting EM2DUTYCYCLEDIS in the same register will disable duty cycling in EM2 and EM3, if DUTYCYCLEEN is not set. Note that sinking current can not be done with duty-cycled references so measures needs to be taken to always disable duty-cycling while sinking current.

### 23.3.6 Calibration

The IDAC can be calibrated to accurately compensate for process, supply voltage and temperature variations. During the production test, the middle step of each range is calibrated at room temperature. The TUNING bitfield in the IDAC\_CAL register can be used to do further calibration of each step with an external resistor connected to IDAC\_OUT. The calibrated tuning value for each band can be read from the Device Information (DI) page.

### 23.3.7 PRS Input

The IDAC can be configured to control output enable directly from the PRS channel by setting OUTENPRS in IDAC\_CTRL. Also, the desired outmode (pin or ADC) must be configured in IDAC\_CTRL. The PRS channel is selected using PRSSEL in the IDAC\_CTRL register.

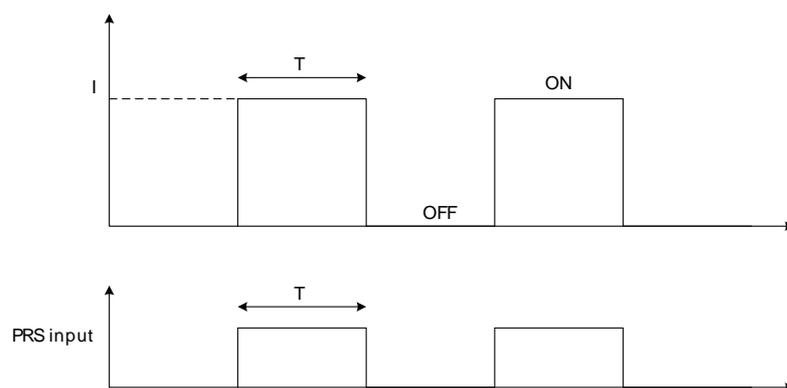

### 23.3.8 PRS Triggered Charge Injection

The amount of charge sourced or sunk by the IDAC can be controlled through PRS (e.g. with a Timer as producer) via the output switch. Figure 23.2 (p. 340) shows a case where the IDAC is configured to periodically supply charge using the PRS. The amount of charge injected is proportional to the the period the IDAC is on. The total charge injected is the current times the time the output switch is enabled.

The PRS system is enabled by setting OUTENPRS in IDAC\_CTRL, and the PRS channel is selected by PRSSEL in IDAC\_CTRL. Also OUTMODE must be set to ADC in IDAC\_CTRL. To generate the periodic control signal, the TIMER module can be used, by configuring for example a CC channel to compare match with PRSLEVEL selected.

It is possible to observe the charge injection on the corresponding pin on the ADC inputmux. However, during normal ADC operations, the inputmux is shutdown between conversions, making it not possible to observe the charge injection correctly. Setting CHCONIDLE to KEEPON in ADC\_CTRL will enable the inputmux between conversions as well. The ADC\_CTRL register description can be found Section 22.4 (p. 325)

**Figure 23.2. IDAC Charge Injection Example**

## 23.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	IDAC_CTRL	RW	Control Register
0x004	IDAC_CURPROG	RW	Current Programming Register
0x008	IDAC_CAL	RW	Calibration Register
0x00C	IDAC_DUTYCONFIG	RW	Duty Cycle Configuration Register

## 23.5 Register Description

### 23.5.1 IDAC\_CTRL - Control Register

Offset	Bit Position																															
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Access																	RW								RW							
Name																	STEPSEL								RANGESEL							

Bit	Name	Reset	Access	Description
31:13	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
12:8	STEPSEL	0x00	RW	<b>Current Step Size Select</b> Select the step within each range. Please see Table 23.1 (p. 339) for step details.
7:2	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
1:0	RANGESEL	0x0	RW	<b>Current Range Select</b> Selects current range of the output.

Value	Mode	Description
0	RANGE0	Current range set to 0 - 1.6 uA.
1	RANGE1	Current range set to 1.6 - 4.7 uA.
2	RANGE2	Current range set to 0.5 - 16 uA.
3	RANGE3	Current range set to 2 - 64 uA.

### 23.5.3 IDAC\_CAL - Calibration Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																									0x00							
Access																									RW							
Name																									TUNING							

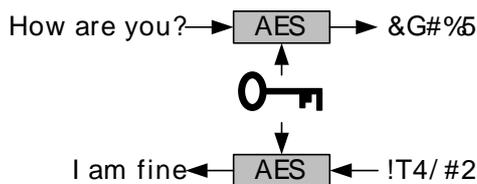

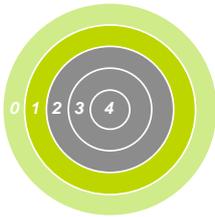

Bit	Name	Reset	Access	Description
31:7	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
6:0	TUNING	0x00	RW	<b>Tune the current to given accuracy</b> In production test the middle step (16) of each range is calibrated and can be read from the Device Information (DI) page.

### 23.5.4 IDAC\_DUTYCONFIG - Duty Cycle Configuration Register

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																													0	1	0	
Access																													RW	RW	RW	
Name																													EM2DUTYCYCLEDIS		DUTYCYCLEEN	

Bit	Name	Reset	Access	Description
31:2	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
1	EM2DUTYCYCLEDIS	0	RW	<b>EM2/EM3 Duty Cycle Disable.</b> Set to disable duty cycling in EM2 and EM3.
0	DUTYCYCLEEN	0	RW	<b>Duty Cycle Enable.</b> Set to always enable duty cycling. Will override EM2DUTYCYCLEDIS.

## 24 AES - Advanced Encryption Standard Accelerator

### Quick Facts

#### What?

A fast and energy efficient hardware accelerator for AES-128 encryption and decryption.

#### Why?

Efficient encryption/decryption with little or no CPU intervention helps to meet the speed and energy demands of the application.

#### How?

High AES throughput allows the EFM32ZG to spend more time in lower energy modes. In addition, specialized data access functions allow autonomous DMA/AES operation in both EM0 and EM1.

### 24.1 Introduction

The Advanced Encryption Standard (FIPS-197) is a symmetric block cipher operating on 128-bit blocks of data and 128-bit keys.

The AES accelerator performs AES encryption and decryption with 128-bit keys. Encrypting or decrypting one 128-bit data block takes 54 HFCORECLK cycles with 128-bit keys. The AES module is an AHB slave which enables efficient access to the data and key registers. All write accesses to the AES module must be 32-bit operations, i.e. 8- or 16-bit operations are not supported.

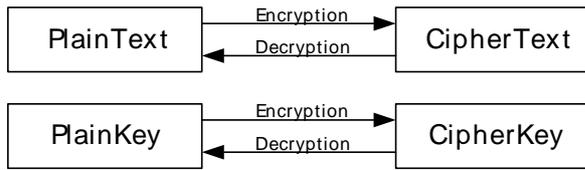

### 24.2 Features

- AES hardware encryption/decryption
  - 128-bit key (54 HFCORECLK cycles)
- Efficient CPU/DMA support
- Interrupt on finished encryption/decryption
- DMA request on finished encryption/decryption
- Optional XOR on Data write
- Configurable byte ordering

### 24.3 Functional Description

Some data and a key must be loaded into the KEY and DATA registers before an encryption or decryption can take place. The input data before encryption is called the PlainText and output from the encryption is called CipherText. For encryption, the key is called PlainKey. After one encryption, the resulting key in the KEY registers is the CipherKey. This key must be loaded into the KEY registers before every decryption. After one decryption, the resulting key will be the PlainKey. The resulting PlainKey/CipherKey is only dependent on the value in the KEY registers before encryption/decryption. The resulting keys and data are shown in Figure 24.1 (p. 346) .

Figure 24.1. AES Key and Data Definitions

### 24.3.1 Encryption/Decryption

The AES module can be set to encrypt or decrypt by clearing/setting the DECRYPT bit in AES\_CTRL. The AES\_CTRL register should not be altered while AES is running, as this may lead to unpredictable behaviour.

An AES encryption/decryption can be started in the following ways:

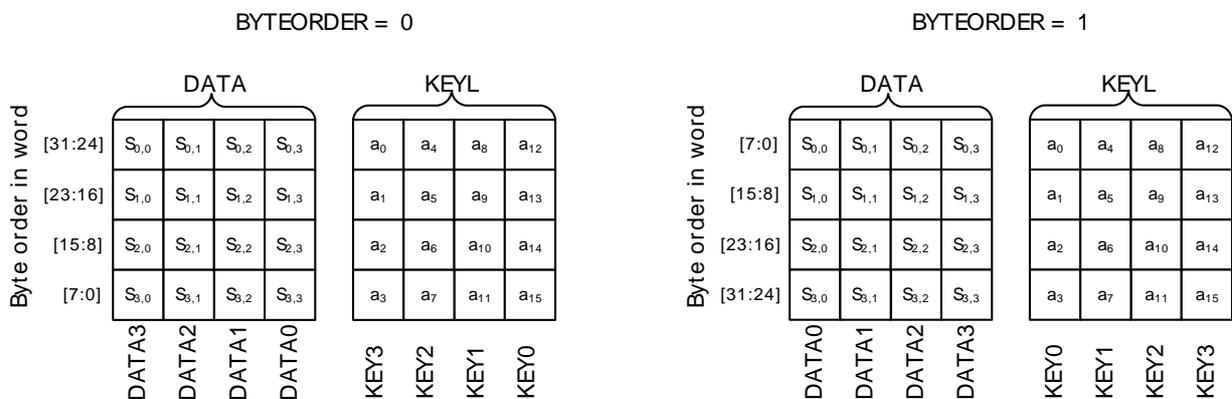

- Writing a 1 to the START bit in AES\_CMD
- Writing 4 times 32 bits to AES\_DATA when the DATASTART control bit is set
- Writing 4 times 32 bits to AES\_XORDATA when the XORSTART control bit is set

An AES encryption/decryption can be stopped by writing a 1 to the STOP bit in AES\_CMD. The RUNNING bit in AES\_STATUS indicates that an AES encryption/decryption is ongoing.

### 24.3.2 Data and Key Access

The AES module contains a 128-bit DATA (State) register and a 128-bit KEY register defined as DATA3-DATA0 and KEY3-KEY0 (KEYL). The AES module has configurable byte ordering which is configured in BYTEORDER in AES\_CTRL. Figure 24.2 (p. 346) illustrates how data written to the AES registers is mapped to the key and state defined in the Advanced Encryption Standard (FIPS-197). AES encryption/decryption takes two extra cycles when BYTEORDER is set. BYTEORDER has to be set prior to loading the data and key registers.

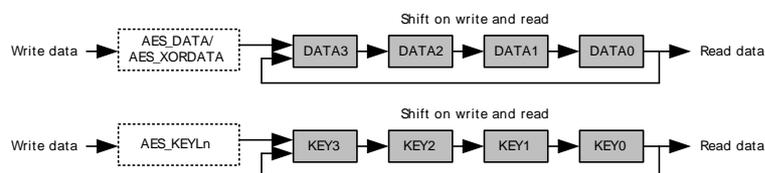

Figure 24.2. AES Data and Key Orientation as Defined in the Advanced Encryption Standard

The registers DATA3-DATA0, are not memory mapped directly, but can be written/read by accessing AES\_DATA or AES\_XORDATA. The same applies for the key registers, KEY3-KEY0 which are accessed through AES\_KEYLn (n=A, B, C or D). Writing DATA3-DATA0 is then done through 4

consecutive writes to AES\_DATA (or AES\_XORDATA), starting with the word which is to be written to DATA0. For each write, the words will be word wise barrel shifted towards the least significant word. Accessing the KEY registers is done in the same fashion through KEYLn. See Figure 24.3 (p. 347). Note that KEYLA, KEYLB, KEYLC and KEYLD are really the same register, just mapped to four different addresses. You can then choose freely which of these addresses you want to use to update the KEY3-KEY0 registers. Mapping the same registers to multiple addresses like this, allows the DMA controller to write a full 128-bit key in one sweep, when incrementing the address between each word write.

**Figure 24.3. AES Data and Key Register Operation**

#### Note

When encrypting multiple blocks of data in a row, the PlainKey must be written to the key register between each encryption, since the contents of the key registers will be turned into the CipherKey during the encryption. The opposite applies when decrypting, where you have to re-supply the CipherKey between each block.

#### 24.3.2.1 Data Write XOR

The AES module contains an array of XOR gates connected to the DATA registers, which can be used during a data write to XOR the existing contents of the registers with the new data written. To use the XOR function, the data must be written to AES\_XORDATA location.

Reading data from AES\_XORDATA is equivalent to reading data from AES\_DATA.

#### 24.3.2.2 Start on Data Write

The AES module can be configured to start an encryption/decryption when the new data has been written to AES\_DATA and/or AES\_XORDATA. A 2-bit counter is incremented each time the AES\_DATA or AES\_XORDATA registers are written. This counter indicates which data word is written. If DATASTART/XORSTART in AES\_CTRL is set, an encryption will start each time the counter overflows (DATA3 is written). Writing to the AES\_CTRL register will reset the counter to 0.

#### 24.3.3 Interrupt Request

The DONE interrupt flag is set when an encryption/ decryption has finished.

#### 24.3.4 DMA Request

The AES module has 4 DMA requests which are all set on a finished encryption/decryption and cleared on the following conditions:

- DATAWR: Cleared on a AES\_DATA write or AES\_CTRL write
- XORDATAWR: Cleared on a AES\_XORDATA write or AES\_CTRL write
- DATARD: Cleared on a AES\_DATA read or AES\_CTRL write
- KEYWR: Cleared on a AES\_KEYLn write or AES\_CTRL write

#### 24.3.5 Block Chaining Example

Example 24.1 (p. 348) below illustrates how the AES module could be configured to perform Cipher Block Chaining with 128-bit keys.

**Example 24.1. AES Cipher Block Chaining**

1. Configure module to encryption and XORSTART in AES\_CTRL.
2. Write 128-bit initialization vector to AES\_DATA, starting with least significant word.
3. Write PlainKey to AES\_KEYLn, starting with least significant word.
4. Write PlainText to AES\_XORDATA, starting with least significant word. Encryption will be started when the DATA3 is written.
5. When encryption is finished, read CipherText from AES\_DATA, starting with least significant word.
6. Loop to step 3, if new PlainText is available.

## 24.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	AES_CTRL	RW	Control Register
0x004	AES_CMD	W1	Command Register
0x008	AES_STATUS	R	Status Register
0x00C	AES_IEN	RW	Interrupt Enable Register
0x010	AES_IF	R	Interrupt Flag Register
0x014	AES_IFS	W1	Interrupt Flag Set Register
0x018	AES_IFC	W1	Interrupt Flag Clear Register
0x01C	AES_DATA	RW	DATA Register
0x020	AES_XORDATA	RW	XORDATA Register
0x030	AES_KEYLA	RW	KEY Low Register
0x034	AES_KEYLB	RW	KEY Low Register
0x038	AES_KEYLC	RW	KEY Low Register
0x03C	AES_KEYLD	RW	KEY Low Register

## 24.5 Register Description

### 24.5.1 AES\_CTRL - Control Register

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0	0	0				0	
<b>Access</b>																									RW	RW	RW				RW	
<b>Name</b>																									BYTEORDER	XORSTART	DATASTART				DECRYPT	

Bit	Name	Reset	Access	Description
31:7	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
6	BYTEORDER	0	RW	<b>Configure byte order in data and key registers</b> When set, the byte orders in the data and key registers are swapped before and after encryption/decryption.
5	XORSTART	0	RW	<b>AES_XORDATA Write Start</b> Set this bit to start encryption/decryption when DATA3 is written through AES_XORDATA.
4	DATASTART	0	RW	<b>AES_DATA Write Start</b> Set this bit to start encryption/decryption when DATA3 is written through AES_DATA.
3:1	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
0	DECRYPT	0	RW	<b>Decryption/Encryption Mode</b> Select encryption or decryption.
Value		Description		
0		AES Encryption		
1		AES Decryption		

### 24.5.2 AES\_CMD - Command Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Access																																W1
Name																																DONE

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
0	DONE	0	W1	<b>Encryption/Decryption Done Interrupt Flag Set</b> Write to 1 to set encryption/decryption done interrupt flag

### 24.5.7 AES\_IFC - Interrupt Flag Clear Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																																0
Access																																W1
Name																																DONE

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
0	DONE	0	W1	<b>Encryption/Decryption Done Interrupt Flag Clear</b> Write to 1 to clear encryption/decryption done interrupt flag

### 24.5.8 AES\_DATA - DATA Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x00000000															
<b>Access</b>																	RW															
<b>Name</b>																	DATA															

Bit	Name	Reset	Access	Description
31:0	DATA	0x00000000	RW	<b>Data Access</b> Access data through this register.

### 24.5.9 AES\_XORDATA - XORDATA Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x00000000															
<b>Access</b>																	RW															
<b>Name</b>																	XORDATA															

Bit	Name	Reset	Access	Description
31:0	XORDATA	0x00000000	RW	<b>XOR Data Access</b> Access data with XOR function through this register.

### 24.5.10 AES\_KEYLA - KEY Low Register

Offset	Bit Position																															
0x030	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x00000000															
<b>Access</b>																	RW															
<b>Name</b>																	KEYLA															

Bit	Name	Reset	Access	Description
31:0	KEYLA	0x00000000	RW	<b>Key Low Access A</b> Access the low key words through this register.

### 24.5.11 AES\_KEYLB - KEY Low Register

Offset	Bit Position																																
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																	0x00000000																
<b>Access</b>																	RW																
<b>Name</b>																	KEYLB																

Bit	Name	Reset	Access	Description
31:0	KEYLB	0x00000000	RW	<b>Key Low Access B</b> Access the low key words through this register.

### 24.5.12 AES\_KEYLC - KEY Low Register

Offset	Bit Position																																
0x038	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																	0x00000000																
<b>Access</b>																	RW																
<b>Name</b>																	KEYLC																

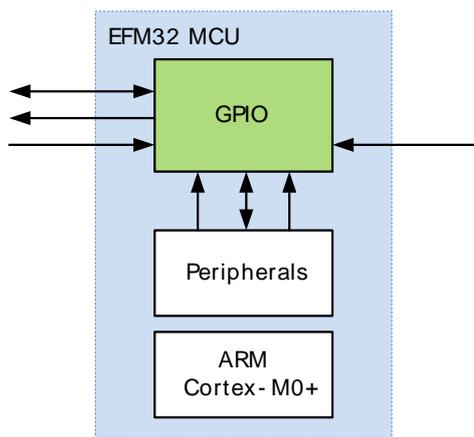

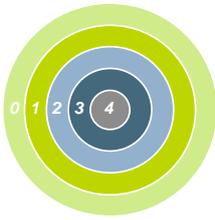

Bit	Name	Reset	Access	Description
31:0	KEYLC	0x00000000	RW	<b>Key Low Access C</b> Access the low key words through this register.

### 24.5.13 AES\_KEYLD - KEY Low Register

Offset	Bit Position																																
0x03C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																	0x00000000																
<b>Access</b>																	RW																
<b>Name</b>																	KEYLD																

Bit	Name	Reset	Access	Description
31:0	KEYLD	0x00000000	RW	<b>Key Low Access D</b> Access the low key words through this register.

# 25 GPIO - General Purpose Input/Output

## Quick Facts

### What?

The GPIO (General Purpose Input/Output) is used for pin configuration and direct pin manipulation and sensing as well as routing for peripheral pin connections.

### Why?

Easy to use and highly configurable input/output pins are important to fit many communication protocols as well as minimizing software control overhead. Flexible routing of peripheral functions helps to ease PCB layout.

### How?

Each pin on the device can be individually configured as either an input or an output with several different drive modes. Also, individual bit manipulation registers minimizes control overhead. Peripheral connections to pins can be routed to several different locations, thus solving congestion issues that may arise with multiple functions on the same pin. Fully asynchronous interrupts can also be generated from any pin.

## 25.1 Introduction

In the EFM32ZG devices the General Purpose Input/Output (GPIO) pins are organized into ports with up to 16 pins each. These pins can individually be configured as either an output or input. More advanced configurations like open-drain, filtering and drive strength can also be configured individually for the pins. The GPIO pins can also be overridden by peripheral pin connections, like Timer PWM outputs or USART communication, which can be routed to several locations on the device. The GPIO supports up to 16 asynchronous external pin interrupts, which enables interrupts from any pin on the device. Also, the input value of a pin can be routed through the Peripheral Reflex System to other peripherals.

## 25.2 Features

- Single-cycle I/O interface providing high speed access to GPIO
- Individual configuration for each pin
  - Tristate (reset state)
  - Push-pull
  - Open-drain
  - Pull-up resistor
  - Pull-down resistor
  - Four drive strength modes
    - HIGH
    - STANDARD
    - LOW

- LOWEST
- EM4 IO pin retention. This includes
  - Output enable
  - Output value
  - Pull enable
  - Pull direction
- EM4 wake-up on selected GPIO pins
- Glitch suppression input filter.
- Analog connection to e.g. ADC.
- Alternate functions (e.g. peripheral outputs and inputs)
  - Routed to several locations on the device
  - Pin connections can be enabled individually
  - Output data can be overridden by peripheral
  - Output enable can be overridden by peripheral
- Toggle, set and clear registers for output data
- Dedicated data input register (read-only)
- Interrupts
  - 2 interrupt lines from up to 16 pending sources
    - All GPIO pins are selectable
  - Separate enable, status, set and clear registers
  - Asynchronous sensing
  - Rising, falling or both edges
  - Wake up from EM0-EM3
- Peripheral Reflex System producer
  - All GPIO pins are selectable
- Configuration lock functionality to avoid accidental changes

## 25.3 Functional Description

An overview of the GPIO module is shown in Figure 25.1 (p. 357). The GPIO pins are grouped into 16-pin ports. Each individual GPIO pin is called P<sub>xn</sub> where x indicates the port (A, B, C ...) and n indicates the pin number (0,1,...,15). Fewer than 16 bits may be available on some ports, depending on the total number of I/O pins on the package. After a reset both input and output is disabled for all pins on the device, except for debug pins. To use a pin, the port GPIO\_P<sub>x</sub>\_MODEL/GPIO\_P<sub>x</sub>\_MODEH registers must be configured for the pin to make it an input or output. These registers can also do more advanced configuration, which is covered in Section 25.3.1 (p. 357). When the port is either configured as an input or an output, the Data In Register (GPIO\_P<sub>x</sub>\_DIN) can be used to read the level of each pin in the port (bit n in the register is connected to pin n on the port). When configured as an output, the value of the Data Out Register (GPIO\_P<sub>x</sub>\_DOUT) will be driven to the pin.

The DOUT value can be changed in 4 different ways

- Writing to the GPIO\_P<sub>x</sub>\_DOUT register.
- Writing a 1 to a bit in the GPIO\_P<sub>x</sub>\_DOUTSET register sets the corresponding DOUT bit
- Writing a 1 to a bit in the GPIO\_P<sub>x</sub>\_DOUTCLR register clears the corresponding DOUT bit
- Writing a 1 to a bit in the GPIO\_P<sub>x</sub>\_DOUTTGL register toggles the corresponding DOUT bit

Reading the GPIO\_P<sub>x</sub>\_DOUT register will return its contents. Reading the GPIO\_P<sub>x</sub>\_DOUTSET, GPIO\_P<sub>x</sub>\_CLR or GPIO\_P<sub>x</sub>\_TGL will return 0.

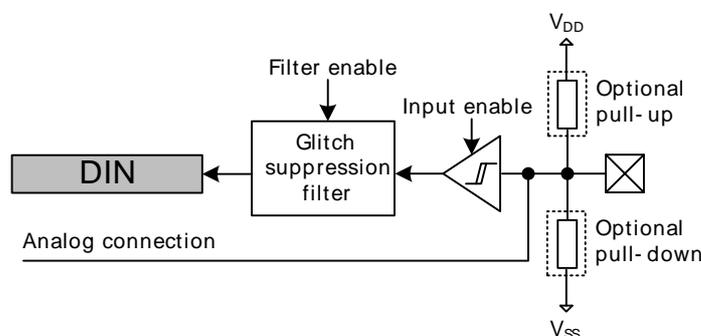

MODEn	Input	Output	DOUT	Pull-down	Pull-up	Alt. strength	Input Filter	Description
0b0011			0	On			On	Input enabled with pull-down and filter
			1		On		On	Input enabled with pull-up and filter
0b0100		Push-pull	x					Push-pull
0b0101			x			On		Push-pull with alt. drive strength
0b0110		Open Source (Wired-OR)	x					Open-source
0b0111			x	On				Open-source with pull-down
0b1000		Open Drain (Wired-AND)	x					Open-drain
0b1001			x				On	Open-drain with filter
0b1010			x		On			Open-drain with pull-up
0b1011			x		On		On	Open-drain with pull-up and filter
0b1100			x			On		Open-drain with alt. drive strength
0b1101			x			On	On	Open-drain with alt. drive strength and filter
0b1110			x		On	On		Open-drain with alt. drive strength and pull-up
0b1111			x		On	On	On	Open-drain with alt. drive strength, pull-up and filter

MODEn determines which mode the pin is in at a given time. Setting MODEn to 0b0000 disables the pin, reducing power consumption to a minimum. When the output driver is disabled, the pin can be used as a connection for an analog module (e.g. ADC). Input is enabled by setting MODEn to any value other than 0b0000. The pull-up, pull-down and filter function can optionally be applied to the input, see Figure 25.2 (p. 358) .

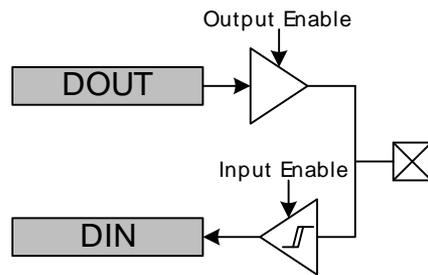

The internal pull-up resistance,  $R_{PU}$ , and pull-down resistance,  $R_{PD}$ , are defined in the device datasheet. When the filter is enabled it suppresses glitches with pulse widths as defined by the parameter  $t_{IOGLITCH}$  in the device datasheet.

**Figure 25.2. Tristated Output with Optional Pull-up or Pull-down**

When MODEn=0b0100 or MODEn=0b0101, the pin operates in push-pull mode. In this mode, the pin is driven either high or low, dependent on the value of GPIO\_Px\_DOUT. The push-pull configuration is shown in Figure 25.3 (p. 359) .

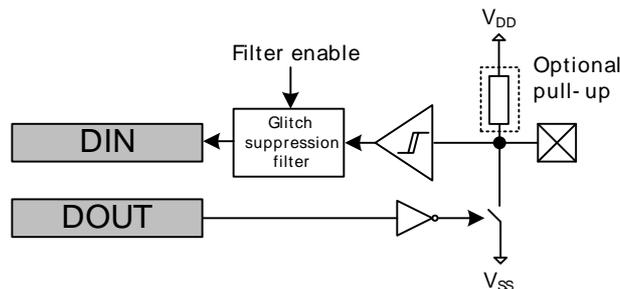

**Figure 25.3. Push-Pull Configuration**

When MODEn is 0110 or 0111, the pin operates in open-source mode, the latter with a pull-down resistor. When driving a high value in open-source mode, the pull-down is disconnected to save power.

For the remaining MODEn values, i.e. MODEn >= 1000, the pin operates in open-drain mode as shown in Figure 25.4 (p. 359). In open-drain mode, the pin can have an input filter, a pull-up, different driver strengths or any combination of these. When driving a low value in open-drain mode, the pull-up is disconnected to save power.

**Figure 25.4. Open-drain**

When MODEn=0b0101 or 0b11xx, the output driver uses the drive strength specified in DRIVEMODE in GPIO\_Px\_CTRL. In all other output modes, the drive strength is set to STANDARD.

### 25.3.1.1 Configuration Lock

GPIO\_Px\_MODEL, GPIO\_Px\_MODEH, GPIO\_Px\_CTRL, GPIO\_Px\_PINLOCKN, GPIO\_EXTIPSELL, GPIO\_EXTIPSELH, GPIO\_INSENSE and GPIO\_ROUTE can be locked by writing any other value than 0xA534 to GPIO\_LOCK. Writing the value 0xA534 to the GPIOx\_LOCK register unlocks the configuration registers.

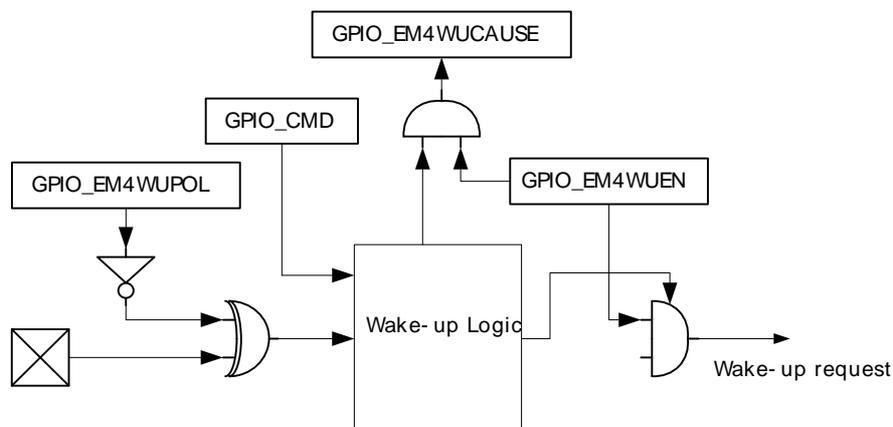

In addition to configuration lock, GPIO\_Px\_MODEL, GPIO\_Px\_MODEH, GPIO\_Px\_DOUT, GPIO\_Px\_DOUTSET, GPIO\_Px\_DOUTCLR, and GPIO\_Px\_DOUTTGL can be locked individually for each pin by clearing the corresponding bit in GPIO\_Px\_PINLOCKN. Bits in the GPIO\_Px\_PINLOCKN register can only be cleared, they are set high again after reset.

### 25.3.2 EM4 Wake-up

It is possible to wake-up from EM4 through reset triggered from any of up to 6 selectable GPIO pins. For the wake-up logic to work correctly, EM4 retention needs to be enabled before entering EM4, as described in Section 25.3.3 (p. 360) The wake-up request can be triggered through the pins by enabling the corresponding bit in the GPIO\_EM4WUEN register. When EM4 wake-up is enabled for the

pin, the input filter is enabled during EM4. This is done to avoid false wake-up caused by glitches. In addition, the polarity of the EM4 wake-up request can be selected using the GPIO\_EM4WUPOL register.

**Figure 25.5. EM4 Wake-up Logic**

The pins used for EM4 wake-up must be configured as inputs using the GPIO\_Px\_MODEL/ GPIO\_Px\_MODEH register. Before going down to EM4, it is important to clear the wake-up logic by setting the EM4WUCLR bitfield in the GPIO\_CMD register, which clears the complete wake-up logic, including the GPIO\_EM4WUCAUSE register. When the chip comes out of reset, it is possible to determine what caused the reset by reading the RMU\_RSTCAUSE register. If an EM4 wake-up reset occurred, the EM4RST (indicating the chip was in EM4) and the EM4WU (indicating the EM4 wake-up reset) bits should be set. It is possible to determine which pin caused the reset by reading the GPIO\_EM4WUCAUSE register. The mapping between pins and the bits in the GPIO\_EM4WUEN, GPIO\_EM4WUPOL, and GPIO\_EM4WUCAUSE registers are described in Table 25.2 (p. 360)

**Table 25.2. EM4 WU Register bits to pin mapping**

Wake-up Registers Bits	Pin
bit 0	A0
bit 2	C9
bit 3	F1
bit 4	F2
bit 5	E13

### 25.3.3 EM4 Retention

It is possible to enable retention of output enable, output value, pull enable and pull direction when in EM4. EM4 retention also makes it possible to wake up from EM4 on pin reset as described in Section 25.3.2 (p. 359) EM4 retention can be enabled by setting the EM4RET field in GPIO\_CTRL register before going down in EM4.

### 25.3.4 Alternate Functions

Alternate functions are connections to pins from Timers, USARTs etc. These modules contain route registers, where the pin connections are enabled. In addition, these registers contain a location bit field, which configures which pins the outputs of that module will be connected to if they are enabled. If an alternate signal output is enabled for a pin and output is enabled for the pin, the alternate function's output data and output enable signals override the data output and output enable signals from the GPIO. However, the pin configuration stays as set in GPIO\_Px\_MODEL, GPIO\_Px\_MODEH

and GPIO\_Px\_DOUT registers. I.e. the pin configuration must be set to output enable in GPIO for a peripheral to be able to use the pin as an output.

It is possible, but not recommended to select two or more peripherals as output on the same pin. These signals will then be OR'ed together. However, TIMER CCx outputs, which are routed as alternate functions, have priority, and will never be OR'ed with other alternate functions. The reader is referred to the pin map section of the device datasheet for more information on the possible locations of each alternate function and any priority settings.

### 25.3.4.1 Serial Wire Debug Port Connection

The SW Debug Port is routed as an alternate function and the SWDIO and SWCLK pin connections are enabled by default with internal pull-up and pull-down resistors, respectively. It is possible to disable these pin connections (and disable the pull resistors) by setting the SWDIOPEN and SWCLKPEN bits in GPIO\_ROUTE to 0.

**WARNING:** When the debug pins are disabled, the device can no longer be accessed by a debugger. A reset will set the debug pins back to their default state as enabled. If you do disable the debug pins, make sure you have at least a 3 second timeout at the start of your program code before you disable the debug pins. This way the debugger will have time to halt the device after a reset before the pins are disabled.

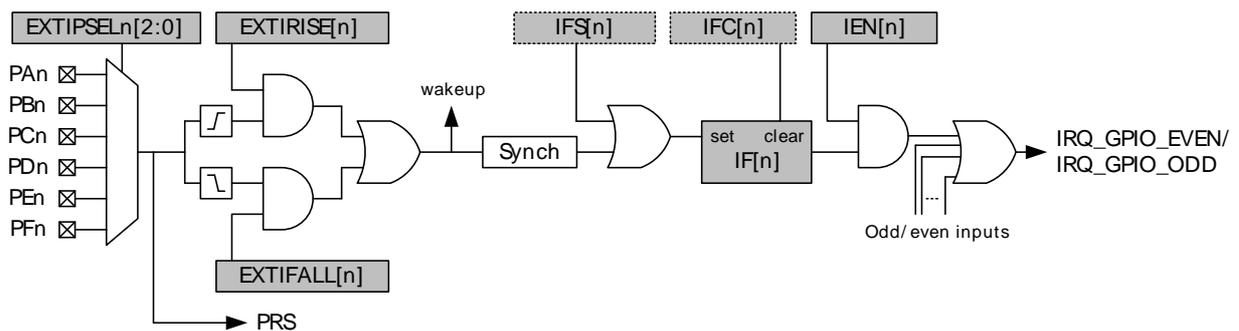

### 25.3.4.2 Analog Connections

When using the GPIO pin for analog functionality, it is recommended to disable the digital output and set the MODEN in GPIO\_Px\_MODEL/GPIO\_Px\_MODEH equal to 0b0000 to disable the input sense and pull resistors.

## 25.3.5 Interrupt Generation

The GPIO can generate an interrupt from the input of any GPIO pin on a device. The interrupts have asynchronous sense capability, enabling wake-up from energy modes as low as EM3, see Figure 25.6 (p. 361) .

**Figure 25.6. Pin n Interrupt Generation**

All pins with the same pin number (n) are grouped together to trigger one interrupt flag (EXT[n] in GPIO\_IF). The EXTIPSELn[2:0] bits in GPIO\_EXTIPSELL or GPIO\_EXTIPSELH select which port will trigger the interrupt flag. The GPIO\_EXTIRISE[n] and GPIO\_EXTIFALL[n] registers enables sensing of rising and falling edges. By setting the EXT[n] bit in GPIO\_IEN, a high interrupt flag n, will trigger one of two interrupt lines. The even interrupt line is triggered by any enabled even numbered interrupt flag, while the odd is triggered by odd flags. The interrupt flags can be set and cleared by software by writing the GPIO\_IFS and GPIO\_IFC registers, see Example 25.1 (p. 362) . Since the external interrupts are asynchronous, they are sensitive to noise. To increase noise tolerance, the MODEL and MODEH fields in the GPIO\_Px\_MODEL and GPIO\_Px\_MODEH registers, respectively, should be set to include filtering for pins that have external interrupts enabled.

### Example 25.1. GPIO Interrupt Example

Setting EXTIPSEL3 in GPIO\_EXTIPSELL to 2 (Port C) and setting the GPIO\_EXTIRISE[3] bit, the interrupt flag EXT[3] in GPIO\_IF will be triggered by a rising edge on pin 3 on PORT C. If EXT[3] in GPIO\_IEN is set as well, a interrupt request will be sent on IRQ\_GPIO\_ODD.

## 25.3.6 Output to PRS

All pins with the same pin number (n) are grouped together to form one PRS producer output, giving a total of 16 outputs to the PRS. The port on which the output n should be taken is selected by the EXTIPSELn[3:0] bits in the GPIO\_EXTIPSELL or the GPIO\_EXTIPSELH registers.

## 25.3.7 Synchronization

The EFM32ZG devices are equipped with a single-cycle I/O interface providing high speed access to the GPIO. To avoid metastability in the synchronous logic connected to the pins, all inputs are synchronized with double flip-flops. The flip-flops for the input data run on the HFCORECLK. The first flip-flop is active whenever the pin is enabled and the second flip-flop is triggered on the negative edge of the HFCORECLK during a read operation. Consequently, when a pin changes state, the change is propagated to GPIO\_Px\_DIN in a single HFCORECLK cycle. To save power when a certain GPIO pin is not in use, the synchronizing flip-flop for this pin can be turned off by clearing the respective mode field in the GPIO\_Px\_MODEL/GPIO\_Px\_MODEH registers.

Synchronization (also running on the HFCORECLK) is also added for interrupt input. The input to the PRS generation is also synchronized, but these flip-flops run on the HFPERCLK. To save power when the external interrupts or PRS generation is not used, the synchronization flip-flops for these can be turned off by clearing the INTSENSE or PRSSENSE, respectively, in GPIO\_INSENSE register.

### Note

To use the GPIO, the GPIO clock must first be enabled in CMU\_HFPERCLKEN0. Setting this bit enables the HFCORECLK and the HFPERCLK for the GPIO. HFCORECLK is used for updating registers, while HFPERCLK is only used to synchronize PRS and interrupts. The PRS and interrupt synchronization can also be disabled through GPIO\_INSENSE, if these are not used.

### Note

GPIO is not accessible from the DMA.

## 25.4 Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	GPIO_PA_CTRL	RW	Port Control Register

31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	DOUTCLR	0x0000	W1	<b>Data Out Clear</b> Write bits to 1 to clear corresponding bits in GPIO_Px_DOUT. Bits written to 0 will have no effect.

### 25.5.7 GPIO\_Px\_DOUTTGL - Port Data Out Toggle Register

Offset	Bit Position																																
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																																	0x0000
<b>Access</b>																																	W1
<b>Name</b>																																	DOUTTGL

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	DOUTTGL	0x0000	W1	<b>Data Out Toggle</b> Write bits to 1 to toggle corresponding bits in GPIO_Px_DOUT. Bits written to 0 will have no effect.

### 25.5.8 GPIO\_Px\_DIN - Port Data In Register

Offset	Bit Position																																
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																																	0x0000
<b>Access</b>																																	R
<b>Name</b>																																	DIN

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	DIN	0x0000	R	<b>Data In</b> Port data input.

### 25.5.9 GPIO\_Px\_PINLOCKN - Port Unlocked Pins Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0xFFFF															
<b>Access</b>																	RW															
<b>Name</b>																	PINLOCKN															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	PINLOCKN	0xFFFF	RW	<b>Unlocked Pins</b> Shows unlocked pins in the port. To lock pin n, clear bit n. The pin is then locked until reset.

### 25.5.10 GPIO\_EXTIPSELL - External Interrupt Port Select Low Register

Offset	Bit Position																															
0x100	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### 25.5.12 GPIO\_EXTIRISE - External Interrupt Rising Edge Trigger Register

Offset	Bit Position																															
0x108	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0000															
<b>Access</b>																	RW															
<b>Name</b>																	EXTIRISE															

Bit	Name	Reset	Access	Description
31:16	Reserved	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
15:0	EXTIRISE	0x0000	RW	<b>External Interrupt n Rising Edge Trigger Enable</b>
Set bit n to enable triggering of external interrupt n on rising edge.				
	Value			Description
	EXTIRISE[n] = 0			Rising edge trigger disabled
	EXTIRISE[n] = 1			Rising edge trigger enabled

### 25.5.13 GPIO\_EXTIFALL - External Interrupt Falling Edge Trigger Register

Offset	Bit Position																															
0x10C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0000															
<b>Access</b>																	RW															
<b>Name</b>																	EXTIFALL															

Bit	Name	Reset	Access	Description
31:16	Reserved	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
15:0	EXTIFALL	0x0000	RW	<b>External Interrupt n Falling Edge Trigger Enable</b>

Bit	Name	Reset	Access	Description
Set bit n to enable triggering of external interrupt n on falling edge.				
Value		Description		
EXTIFALL[n] = 0		Falling edge trigger disabled		
EXTIFALL[n] = 1		Falling edge trigger enabled		

### 25.5.14 GPIO\_IEN - Interrupt Enable Register

Offset	Bit Position																															
0x110	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0000															
<b>Access</b>																	RW															
<b>Name</b>																	EXT															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	EXT	0x0000	RW	<b>External Interrupt n Enable</b>
Set bit n to enable external interrupt from pin n.				
Value		Description		
EXT[n] = 0		Pin n external interrupt disabled		
EXT[n] = 1		Pin n external interrupt enabled		

### 25.5.15 GPIO\_IF - Interrupt Flag Register

Offset	Bit Position																															
0x114	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0000															
<b>Access</b>																	R															
<b>Name</b>																	EXT															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	EXT	0x0000	R	<b>External Interrupt Flag n</b>
Pin n external interrupt flag.				
Value		Description		
EXT[n] = 0		Pin n external interrupt flag cleared		

Bit	Name	Reset	Access	Description
	Value			Description
	EXT[n] = 1			Pin n external interrupt flag set

### 25.5.16 GPIO\_IFS - Interrupt Flag Set Register

Offset	Bit Position																															
0x118	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0000															
<b>Access</b>																	W1															
<b>Name</b>																	EXT															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	EXT	0x0000	W1	<b>External Interrupt Flag n Set</b> Write bit n to 1 to set interrupt flag n.
	Value			Description
	EXT[n] = 0			Pin n external interrupt flag unchanged
	EXT[n] = 1			Pin n external interrupt flag set

### 25.5.17 GPIO\_IFC - Interrupt Flag Clear Register

Offset	Bit Position																															
0x11C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0000															
<b>Access</b>																	W1															
<b>Name</b>																	EXT															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	EXT	0x0000	W1	<b>External Interrupt Flag Clear</b> Write bit n to 1 to clear external interrupt flag n.
	Value			Description
	EXT[n] = 0			Pin n external interrupt flag unchanged
	EXT[n] = 1			Pin n external interrupt flag cleared

### 25.5.18 GPIO\_ROUTE - I/O Routing Register

Offset	Bit Position																															
0x120	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											1	1				
<b>Access</b>																											RW	RW				
<b>Name</b>																											SWDIOPEN	SWCLKPEN				

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
1	SWDIOPEN	1	RW	<b>Serial Wire Data Pin Enable</b> Enable Serial Wire Data connection to pin. WARNING: When this pin is disabled, the device can no longer be accessed by a debugger. A reset will set the pin back to a default state as enabled. If you disable this pin, make sure you have at least a 3 second timeout at the start of you program code before you disable the pin. This way, the debugger will have time to halt the device after a reset before the pin is disabled.
0	SWCLKPEN	1	RW	<b>Serial Wire Clock Pin Enable</b> Enable Serial Wire Clock connection to pin. WARNING: When this pin is disabled, the device can no longer be accessed by a debugger. A reset will set the pin back to a default state as enabled. If you disable this pin, make sure you have at least a 3 second timeout at the start of you program code before you disable the pin. This way, the debugger will have time to halt the device after a reset before the pin is disabled.

### 25.5.19 GPIO\_INSENSE - Input Sense Register

Offset	Bit Position																															
0x124	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											1	1				
<b>Access</b>																											RW	RW				
<b>Name</b>																											PRS	INT				

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)</i>		
1	PRS	1	RW	<b>PRS Sense Enable</b> Set this bit to enable input sensing for PRS.
0	INT	1	RW	<b>Interrupt Sense Enable</b> Set this bit to enable input sensing for interrupts.

### 25.5.20 GPIO\_LOCK - Configuration Lock Register

Offset	Bit Position																															
0x128	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0000															
<b>Access</b>																	RW															
<b>Name</b>																	LOCKKEY															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
15:0	LOCKKEY	0x0000	RW	<b>Configuration Lock Key</b> Write any other value than the unlock code to lock MODEL, MODEH, CTRL, PINLOCKN, EPISELL, EIPSELH, INSENSE and SWDPROUTE from editing. Write the unlock code to unlock. When reading the register, bit 0 is set when the lock is enabled.
	Mode	Value	Description	
	Read Operation			
	UNLOCKED	0	GPIO registers are unlocked	
	LOCKED	1	GPIO registers are locked	
	Write Operation			
	LOCK	0	Lock GPIO registers	
	UNLOCK	0xA534	Unlock GPIO registers	

### 25.5.21 GPIO\_CTRL - GPIO Control Register

Offset	Bit Position																															
0x12C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0
<b>Access</b>																																RW
<b>Name</b>																																EM4RET

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
0	EM4RET	0	RW	<b>Enable EM4 retention</b> Set to enable EM4 retention of output enable, output value and pull enable.

### 25.5.22 GPIO\_CMD - GPIO Command Register

Offset	Bit Position																															
0x130	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																																0
Access																																W1
Name																																EM4WUCLR

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
0	EM4WUCLR	0	W1	<b>EM4 Wake-up clear</b> Write 1 to clear all wake-up requests.

### 25.5.23 GPIO\_EM4WUEN - EM4 Wake-up Enable Register

Offset	Bit Position																															
0x134	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																																0x00
Access																																RW
Name																																EM4WUEN

Bit	Name	Reset	Access	Description
31:6	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
5:0	EM4WUEN	0x00	RW	<b>EM4 Wake-up enable</b> Write 1 to enable wake-up request, write 0 to disable wake-up request.

Value	Mode	Description
0x01	A0	Enable em4 wakeup on pin A0
0x04	C9	Enable em4 wakeup on pin C9
0x08	F1	Enable em4 wakeup on pin F1
0x10	F2	Enable em4 wakeup on pin F2
0x20	E13	Enable em4 wakeup on pin E13

### 25.5.24 GPIO\_EM4WUPOL - EM4 Wake-up Polarity Register

Offset	Bit Position																															
0x138	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																																0x00
Access																																RW
Name																																EM4WUPOL

Bit	Name	Reset	Access	Description
31:6	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
5:0	EM4WUPOL	0x00	RW	<b>EM4 Wake-up Polarity</b>
Write bit n to 1 for high wake-up request. Write bit n to 0 for low wake-up request				
	Value	Mode	Description	
	0x01	A0	Determines polarity on pin A0	
	0x04	C9	Determines polarity on pin C9	
	0x08	F1	Determines polarity on pin F1	
	0x10	F2	Determines polarity on pin F2	
	0x20	E13	Determines polarity on pin E13	

### 25.5.25 GPIO\_EM4WUCAUSE - EM4 Wake-up Cause Register

Offset	Bit Position																															
0x13C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x00					
<b>Access</b>																											R					
<b>Name</b>																											EM4WUCAUSE					

Bit	Name	Reset	Access	Description
31:6	Reserved	To ensure compatibility with future devices, always write bits to 0. More information in Section 2.1 (p. 3)		
5:0	EM4WUCAUSE	0x00	R	<b>EM4 wake-up cause</b>
Bit n indicates which pin the wake-up request occurred.				
	Value	Mode	Description	
	0x01	A0	This bit indicates an em4 wake-up request occurred on pin A0	
	0x04	C9	This bit indicates an em4 wake-up request occurred on pin C9	
	0x08	F1	This bit indicates an em4 wake-up request occurred on pin F1	
	0x10	F2	This bit indicates an em4 wake-up request occurred on pin F2	
	0x20	E13	This bit indicates an em4 wake-up request occurred on pin E13	

## 26 Revision History

### 26.1 Revision 1.10

February 20th, 2015

Updated memory system map.

Replaced static bit write instruction with reference to the respective Cortex reference manual.

Updated memory system peripheral tables.

Removed references to LCD.

Corrected AES section. Zero Gecko supports only 128-bit AES keys.

Corrected bit alignment in PID0 register in the System Overview section.

Removed SWO and Debug Trace from CMU and GPIO chapters as this is not supported by Zero Gecko.

Changes in the I<sup>2</sup>C section:

- Updated notes.
- Updated Clock Generation section.
- Corrected the minimum HFPERCLK frequency limit for I<sup>2</sup>C Fast-mode Plus.

Added HFXO Pin Connection figure.

Updated PRS Reflex Consumers table.

Added notes in the DMA Controller section.

Added and modified notes in the WDOG Clock Source and Register Access sections.

Modified a note in the PCNT Clock Sources section.

Corrected the RMU Reset Input Sources and Connections figure.

Corrected the USART instance for IrDA Modulator/Demodulator.

Updated the MSC Erase and Write Operations section.

Updated the EMU Entering a Low Energy Mode section.

Updated the register descriptions of:

- MSC\_WDATA and MSC\_WRITECTRL
- EMU\_CTRL
- CMU\_CTRL
- USARTn\_IF, USARTn\_TXDATA and USARTn\_TXDOUBLEX
- LEUARTn\_CTRL
- ADCn\_SINGLECTRL and ADCn\_SCANCTRL

Removed DTI description from TIMER as this is not supported by Zero Gecko.

Updated the Block Diagram.

Corrected typos.

## **26.2 Revision 1.00**

July 2nd, 2014

Removed "Preliminary" markings.

Updated current numbers and voltage supply range.

Moved chapter "Device Revision" to section 3.

## **26.3 Revision 0.90**

August 22nd, 2013

Initial preliminary revision.

# A Abbreviations

## A.1 Abbreviations

This section lists abbreviations used in this document.

**Table A.1. Abbreviations**

Abbreviation	Description
ACMP	Analog Comparator
ADC	Analog to Digital Converter
AHB	AMBA Advanced High-performance Bus. AMBA is short for "Advanced Microcontroller Bus Architecture".
APB	AMBA Advanced Peripheral Bus. AMBA is short for "Advanced Microcontroller Bus Architecture".
ALE	Address Latch Enable
AUXHFRCO	Auxiliary High Frequency RC Oscillator.
CC	Compare / Capture
CLK	Clock
CMD	Command
CMU	Clock Management Unit
CTRL	Control
DAC	Digital to Analog Converter
DBG	Debug
DMA	Direct Memory Access
DRD	Dual Role Device
EFM	Energy Friendly Microcontroller
EM	Energy Mode
EM0	Energy Mode 0 (also called active mode)
EM1 to EM4	Energy Mode 1 to Energy Mode 4 (also called low energy modes)
EMU	Energy Management Unit
ENOB	Effective Number of Bits
FS	Full-speed
GPIO	General Purpose Input / Output
HFRCO	High Frequency RC Oscillator
HFXO	High Frequency Crystal Oscillator
HW	Hardware
I <sup>2</sup> C	Inter-Integrated Circuit interface
LETIMER	Low Energy Timer
LEUART	Low Energy Universal Asynchronous Receiver Transmitter
LFRCO	Low Frequency RC Oscillator
LFXO	Low Frequency Crystal Oscillator

Abbreviation	Description
LS	Low-speed
MAC	Media Access Controller
NVIC	Nested Vector Interrupt Controller
OSR	Oversampling Ratio
OTG	On-the-go
PCNT	Pulse Counter
PHY	Physical Layer
PRS	Peripheral Reflex System
PWM	Pulse Width Modulation
RC	Resistance and Capacitance
RMU	Reset Management Unit
RTC	Real Time Clock
SAR	Successive Approximation Register
SOF	Start of Frame
SPI	Serial Peripheral Interface
SW	Software
USART	Universal Synchronous Asynchronous Receiver Transmitter
USB	Universal Serial Bus
VCMP	Voltage supply Comparator
WDOG	Watchdog timer
XTAL	Crystal

## B Disclaimer and Trademarks

### B.1 Disclaimer

*Silicon Laboratories intends to provide customers with the latest, accurate, and in-depth documentation of all peripherals and modules available for system and software implementers using or intending to use the Silicon Laboratories products. Characterization data, available modules and peripherals, memory sizes and memory addresses refer to each specific device, and "Typical" parameters provided can and do vary in different applications. Application examples described herein are for illustrative purposes only. Silicon Laboratories reserves the right to make changes without further notice and limitation to product information, specifications, and descriptions herein, and does not give warranties as to the accuracy or completeness of the included information. Silicon Laboratories shall have no liability for the consequences of use of the information supplied herein. This document does not imply or express copyright licenses granted hereunder to design or fabricate any integrated circuits. The products must not be used within any Life Support System without the specific written consent of Silicon Laboratories. A "Life Support System" is any product or system intended to support or sustain life and/or health, which, if it fails, can be reasonably expected to result in significant personal injury or death. Silicon Laboratories products are generally not intended for military applications. Silicon Laboratories products shall under no circumstances be used in weapons of mass destruction including (but not limited to) nuclear, biological or chemical weapons, or missiles capable of delivering such weapons.*

### B.2 Trademark Information

Silicon Laboratories Inc., Silicon Laboratories, Silicon Labs, SiLabs and the Silicon Labs logo, CMEMS<sup>®</sup>, EFM, EFM32, EFR, Energy Micro, Energy Micro logo and combinations thereof, "the world's most energy friendly microcontrollers", Ember<sup>®</sup>, EZLink<sup>®</sup>, EZMac<sup>®</sup>, EZRadio<sup>®</sup>, EZRadioPRO<sup>®</sup>, DSPLL<sup>®</sup>, ISOmodem<sup>®</sup>, Precision32<sup>®</sup>, ProSLIC<sup>®</sup>, SiPHY<sup>®</sup>, USBXpress<sup>®</sup> and others are trademarks or registered trademarks of Silicon Laboratories Inc. 9.3. RMU Brown-out Detector Operation .....	81
10.1. EMU Overview .....	85
10.2. EMU Energy Mode Transitions .....	86
11.1. CMU Overview .....	93
11.2. CMU Switching from HFRCO to HFXO before HFXO is ready .....	96
11.3. CMU Switching from HFRCO to HFXO after HFXO is ready .....	97
11.4. HFXO Pin Connection .....	97
11.5. LFXO Pin Connection .....	98
11.6. HW-support for RC Oscillator Calibration .....	99
11.7. Single Calibration (CONT=0) .....	99
11.8. Continuous Calibration (CONT=1) .....	99
13.1. PRS Overview .....	126
13.2. TIMER0 overflow starting ADC0 single conversions through PRS channel 5. ....	129
14.1. I <sup>2</sup> C Overview .....	135
14.2. I <sup>2</sup> C-Bus Example .....	135
14.3. I <sup>2</sup> C START and STOP Conditions .....	136
14.4. I <sup>2</sup> C Bit Transfer on I <sup>2</sup> C-Bus .....	136
14.5. I <sup>2</sup> C Single Byte Write to Slave .....	137
14.6. I <sup>2</sup> C Double Byte Read from Slave .....	137
14.7. I <sup>2</sup> C Single Byte Write, then Repeated Start and Single Byte Read .....	137
14.8. I <sup>2</sup> C Master Transmitter/Slave Receiver with 10-bit Address .....	138
14.9. I <sup>2</sup> C Master Receiver/Slave Transmitter with 10-bit Address .....	138
14.10. I <sup>2</sup> C Master State Machine .....	142
14.11. I <sup>2</sup> C Slave State Machine .....	149
15.1. USART Overview .....	169
15.2. USART Asynchronous Frame Format .....	170
15.3. USART Transmit Buffer Operation .....	174
15.4. USART Receive Buffer Operation .....	176
15.5. USART Sampling of Start and Data Bits .....	177
15.6. USART Sampling of Stop Bits when Number of Stop Bits are 1 or More .....	178
15.7. USART Local Loopback .....	179
15.8. USART Half Duplex Communication with External Driver .....	180
15.9. USART Transmission of Large Frames .....	181
15.10. USART Transmission of Large Frames, MSBF .....	181
15.11. USART Reception of Large Frames .....	182
15.12. USART ISO 7816 Data Frame Without Error .....	183
15.13. USART ISO 7816 Data Frame With Error .....	184
15.14. USART SmartCard Stop Bit Sampling .....	184
15.15. USART SPI Timing .....	186
15.16. USART SPI timing with SMSDELAY .....	187
15.17. USART SPI Slave Timing with SSSEARLY .....	188
15.18. USART Standard I2S waveform .....	189
15.19. USART Standard I2S waveform (reduced accuracy) .....	190
15.20. USART Left-justified I2S waveform .....	190
15.21. USART Right-justified I2S waveform .....	190
15.22. USART Mono I2S waveform .....	191
15.23. USART Example RZI Signal for a given Asynchronous USART Frame .....	193
16.1. LEUART Overview .....	216
16.2. LEUART Asynchronous Frame Format .....	217

16.3. LEUART Transmitter Overview .....	219
16.4. LEUART Receiver Overview .....	221
16.5. LEUART Local Loopback .....	224
16.6. LEUART Half Duplex Communication with External Driver .....	224
16.7. LEUART - NRZ vs. RZI .....	226
17.1. TIMER Block Overview .....	242
17.2. TIMER Hardware Timer/Counter Control .....	244
17.3. TIMER Clock Selection .....	244
17.4. TIMER Connections .....	245
17.5. TIMER TOP Value Update Functionality .....	245
17.6. TIMER Quadrature Encoded Inputs .....	246
17.7. TIMER Quadrature Decoder Configuration .....	246
17.8. TIMER X2 Decoding Mode .....	247
17.9. TIMER X4 Decoding Mode .....	247
17.10. TIMER Input Pin Logic .....	248
17.11. TIMER Input Capture Buffer Functionality .....	249
17.12. TIMER Output Compare/PWM Buffer Functionality .....	249
17.13. TIMER Input Capture .....	250
17.14. TIMER Period and/or Pulse width Capture .....	250
17.15. TIMER Block Diagram Showing Comparison Functionality .....	251
17.16. TIMER Output Logic .....	251
17.17. TIMER Up-count Frequency Generation .....	252
17.18. TIMER Up-count PWM Generation .....	252
17.19. TIMER CC out in 2x mode .....	253
17.20. TIMER Up/Down-count PWM Generation .....	254
17.21. TIMER CC out in 2x mode .....	254
18.1. RTC Overview .....	270
19.1. PCNT Overview .....	279
19.2. PCNT Quadrature Coding .....	280
19.3. PCNT Triggered compare and clear .....	282
19.4. PCNT Direction Change Interrupt (DIRCNG) Generation .....	284
20.1. ACMP Overview .....	296
20.2. 20 mV Hysteresis Selected .....	298
20.3. Capacitive Sensing Set-up .....	299
21.1. VCMP Overview .....	307
21.2. VCMP 20 mV Hysteresis Enabled .....	308

8.2. DMA channel priority .....	46
8.3. DMA cycle types .....	47
8.4. channel_cfg for a primary data structure, in memory scatter-gather mode .....	51
8.5. channel_cfg for a primary data structure, in peripheral scatter-gather mode .....	53
8.6. Address bit settings for the channel control data structure .....	56
8.7. src_data_end_ptr bit assignments .....	57
8.8. dst_data_end_ptr bit assignments .....	58
8.9. channel_cfg bit assignments .....	58
8.10. DMA cycle of six words using a word increment .....	61
8.11. DMA cycle of 12 bytes using a halfword increment .....	62
9.1. RMU Reset Cause Register Interpretation .....	80
10.1. EMU Energy Mode Overview .....	87
10.2. EMU Entering a Low Energy Mode .....	88
10.3. EMU Wakeup Triggers from Low Energy Modes .....	89
13.1. Reflex Producers .....	127
13.2. Reflex Consumers .....	128
14.1. I <sup>2</sup> C Reserved I <sup>2</sup> C Addresses .....	137
14.2. I <sup>2</sup> C Clock Mode .....	140
14.3. I <sup>2</sup> C Interactions in Prioritized Order .....	143
14.4. I <sup>2</sup> C Master Transmitter .....	145
14.5. I <sup>2</sup> C Master Receiver .....	147
14.6. I <sup>2</sup> C STATE Values .....	148
14.7. I <sup>2</sup> C Transmission Status .....	148
14.8. I <sup>2</sup> C Slave Transmitter .....	151
14.9. I <sup>2</sup> C - Slave Receiver .....	152
14.10. I <sup>2</sup> C Bus Error Response .....	153
15.1. USART Asynchronous vs. Synchronous Mode .....	170
15.2. USART Pin Usage .....	170
15.3. USART Data Bits .....	171
15.4. USART Stop Bits .....	171
15.5. USART Parity Bits .....	172
15.6. USART Oversampling .....	172
15.7. USART Baud Rates @ 4MHz Peripheral Clock .....	173
15.8. USART SPI Modes .....	185
15.9. USART I2S Modes .....	189
15.10. USART IrDA Pulse Widths .....	194
16.1. LEUART Parity Bit .....	217
16.2. LEUART Baud Rates .....	218
17.1. TIMER Counter Response in X2 Decoding Mode .....	247
17.2. TIMER Counter Response in X4 Decoding Mode .....	247
17.3. TIMER Events .....	255
18.1. RTC Resolution Vs Overflow .....	271
19.1. PCNT QUAD Mode Counter Control Function .....	281
20.1. Bias Configuration .....	297
21.1. Bias Configuration .....	307
22.1. ADC Single Ended Conversion .....	321
22.2. ADC Differential Conversion .....	322
22.3. Oversampling Result Shifting and Resolution .....	322
22.4. ADC Results Representation .....	323
22.5. Calibration Register Effect .....	324
23.1. Range Selection .....	339
25.1. Pin Configuration .....	357
25.2. EM4 WU Register bits to pin mapping .....	360
A.1. Abbreviations .....	382

## List of Examples

8.1. DMA Transfer .....	63
15.1. USART Multi-processor Mode Example .....	182
24.1. AES Cipher Block Chaining .....	348
25.1. GPIO Interrupt Example .....	362

## List of Equations

5.1. Memory Wait Cycles with Clock Equal or Faster than HFCORECLK .....	17
5.2. Memory Wait Cycles with Clock Slower than CPU .....	17
12.1. WDOG Timeout Equation .....	121
14.1. I <sup>2</sup> C Pull-up Resistor Equation .....	135
14.2. I <sup>2</sup> C Maximum Transmission Rate .....	139
14.3. I <sup>2</sup> C High and Low Cycles Equations .....	139
14.4. Maximum Data Hold Time .....	139
15.1. USART Baud Rate .....	172
15.2. USART Desired Baud Rate .....	172
15.3. USART Synchronous Mode Bit Rate .....	185
15.4. USART Synchronous Mode Clock Division Factor .....	185
16.1. LEUART Baud Rate Equation .....	218
16.2. LEUART CLKDIV Equation .....	218
16.3. LEUART Optimal Sampling Point .....	222
16.4. LEUART Actual Sampling Point .....	222
17.1. TIMER Rotational Position Equation .....	247
17.2. TIMER Up-count Frequency Generation Equation .....	252
17.3. TIMER Up-count PWM Resolution Equation .....	252
17.4. TIMER Up-count PWM Frequency Equation .....	252
17.5. TIMER Up-count Duty Cycle Equation .....	253
17.6. TIMER 2x PWM Resolution Equation .....	253
17.7. TIMER 2x Mode PWM Frequency Equation( Up-count) .....	253
17.8. TIMER 2x Mode Duty Cycle Equation .....	253
17.9. TIMER Up/Down-count PWM Resolution Equation .....	254
17.10. TIMER Up/Down-count PWM Frequency Equation .....	254
17.11. TIMER Up/Down-count Duty Cycle Equation .....	254
17.12. TIMER 2x PWM Resolution Equation .....	254
17.13. TIMER 2x Mode PWM Frequency Equation( Up/Down-count) .....	255
17.14. TIMER 2x Mode Duty Cycle Equation .....	255
18.1. RTC Frequency Equation .....	270
19.1. Absolute position with hysteresis and even TOP value .....	281
19.2. Absolute position with hysteresis and odd TOP value .....	281
20.1. V <sub>DD</sub> Scaled .....	298
21.1. VCMP V <sub>DD</sub> Trigger Level .....	308
22.1. ADC Total Conversion Time (in ADC_CLK cycles) Per Output .....	316
22.2. ADC Temperature Measurement .....	319
