

# EFR32xG23 Wireless SoC Reference Manual

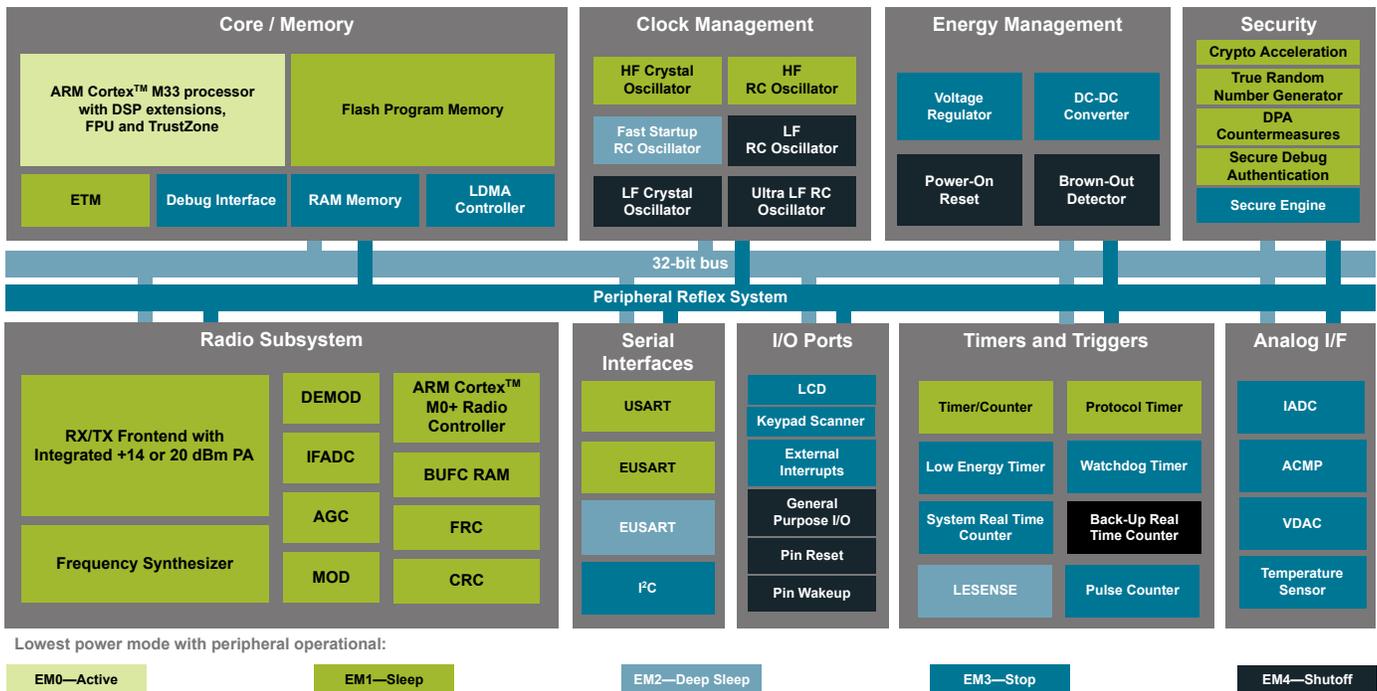

The EFR32xG23 Wireless SoCs include the EFR32FG23 and EFR32ZG23 Wireless SoC device families. The EFR32xG23 SoC is an ideal solution for sub-GHz “Internet of Things” for smart home, security, lighting, building automation, and metering. The high-performance sub-GHz radio provides long range and is not susceptible to 2.4 GHz interference from technologies like Wi-Fi.

The single die, multi-core solution, provides industry leading security, low power consumption with fast wakeup times, and an integrated power amplifier, to enable the next level of secure connectivity for IoT devices.

## KEY FEATURES

- 32-bit ARM® Cortex M33 core with 78 MHz maximum operating frequency
- Up to 512 kB of flash and 64 kB of RAM
- Energy-efficient radio core with low active and sleep currents
- Integrated PA with up to 20 dBm transmit power
- Robust peripheral set and up to 31 GPIO

# Table of Contents

<b>1. About This Document</b>	<b>29</b>
1.1 Introduction	29
1.2 Conventions	30
1.3 Related Documentation	31
<b>2. System Overview</b>	<b>32</b>
2.1 Introduction	32
2.2 Block Diagrams	33
2.3 MCU Features overview	34
<b>3. System Processor</b>	<b>36</b>
3.1 Introduction	36
3.2 Features	37
3.3 Functional Description	37
3.3.1 Interrupt Operation	38
3.3.2 TrustZone	38
3.3.3 Interrupt Request Lines (IRQ)	39
<b>4. Memory and Bus System</b>	<b>42</b>
4.1 Introduction	42
4.2 Functional Description	43
4.2.1 Bus Matrix	44
4.2.2 Flash	45
4.2.3 SRAM	45
4.2.4 Peripherals	45
<b>5. Radio Transceiver</b>	<b>52</b>

13.5.65	PRS_CONSUMER_TIMER1_DTIFS1 - DTI Consumer Register . . . . .	406
13.5.66	PRS_CONSUMER_TIMER1_DTIFS2 - DTI Consumer Register . . . . .	407
13.5.67	PRS_CONSUMER_TIMER2_CC0 - CC0 Consumer Register . . . . .	407
13.5.68	PRS_CONSUMER_TIMER2_CC1 - CC1 Consumer Register . . . . .	408

13.5.69	PRS_CONSUMER_TIMER2_CC2 - CC2 Consumer Register	408
13.5.70	PRS_CONSUMER_TIMER2_DTI - DTI Consumer Register	409
13.5.71	PRS_CONSUMER_TIMER2_DTIFS1 - DTI Consumer Register	409
13.5.72	PRS_CONSUMER_TIMER2_DTIFS2 - DTI Consumer Register	410
13.5.73	PRS_CONSUMER_TIMER3_CC0 - CC0 Consumer Register	410
13.5.74	PRS_CONSUMER_TIMER3_CC1 - CC1 Consumer Register	411
13.5.75	PRS_CONSUMER_TIMER3_CC2 - CC2 Consumer Register	411
13.5.76	PRS_CONSUMER_TIMER3_DTI - DTI Consumer Register	412
13.5.77	PRS_CONSUMER_TIMER3_DTIFS1 - DTI Consumer Register	412
13.5.78	PRS_CONSUMER_TIMER3_DTIFS2 - DTI Consumer Register	413
13.5.79	PRS_CONSUMER_TIMER4_CC0 - CC0 Consumer Register	413
13.5.80	PRS_CONSUMER_TIMER4_CC1 - CC1 Consumer Register	414
13.5.81	PRS_CONSUMER_TIMER4_CC2 - CC2 Consumer Register	414
13.5.82	PRS_CONSUMER_TIMER4_DTI - DTI Consumer Register	415
13.5.83	PRS_CONSUMER_TIMER4_DTIFS1 - DTI Consumer Register	415
13.5.84	PRS_CONSUMER_TIMER4_DTIFS2 - DTI Consumer Register	416
13.5.85	PRS_CONSUMER_USART0_CLK - CLK Consumer Register	416
13.5.86	PRS_CONSUMER_USART0_IR - IR Consumer Register	417
13.5.87	PRS_CONSUMER_USART0_RX - RX Consumer Register	417
13.5.88	PRS_CONSUMER_USART0_TRIGGER - TRIGGER Consumer Register	418
13.5.89	PRS_CONSUMER_VDAC0_ASYNCTRIGCH0 - ASYNCTRIG Consumer Register	418
13.5.90	PRS_CONSUMER_VDAC0_ASYNCTRIGCH1 - ASYNCTRIG Consumer Register	419
13.5.91	PRS_CONSUMER_VDAC0_SYNCTRIGCH0 - SYNCTRIG Consumer Register	419
13.5.92	PRS_CONSUMER_VDAC0_SYNCTRIGCH1 - SYNCTRIG Consumer Register	420
13.5.93	PRS_CONSUMER_WDOG0_SRC0 - SRC0 Consumer Register	420
13.5.94	PRS_CONSUMER_WDOG0_SRC1 - SRC1 Consumer Register	421
13.5.95	PRS_CONSUMER_WDOG1_SRC0 - SRC0 Consumer Register	421
13.5.96	PRS_CONSUMER_WDOG1_SRC1 - SRC1 Consumer Register	422

<b>14. GPCRC - General Purpose Cyclic Redundancy Check</b>	<b>423</b>
14.1 Introduction	423
14.2 Features	423
14.3 Functional Description	424
14.3.1 Polynomial Specification	425
14.3.2 Input and Output Specification	425
14.3.3 Initialization	425
14.3.4 DMA Usage	425
14.3.5 Byte-Level Bit Reversal and Byte Reordering	426
14.4 GPCRC Register Map	429
14.5 GPCRC Register Description	430
14.5.1 GPCRC_IPVERSION - IP Version ID	430
14.5.2 GPCRC_EN - CRC Enable	431
14.5.3 GPCRC_CTRL - Control Register	432
14.5.4 GPCRC_CMD - Command Register	433
14.5.5 GPCRC_INIT - CRC Init Value	433
14.5.6 GPCRC_POLY - CRC Polynomial Value	434
14.5.7 GPCRC_INPUTDATA - Input 32-Bit Data Register	434

14.5.8	GPCRC_INPUTDATAHWORD - Input 16-Bit Data Register	435
14.5.9	GPCRC_INPUTDATABYTE - Input 8-Bit Data Register	435
14.5.10	GPCRC_DATA - CRC Data Register	436
14.5.11	GPCRC_DATAREV - CRC Data Reverse Register	436
14.5.12	GPCRC_DATABYTEREV - CRC Data Byte Reverse Register	437
<b>15.</b>	<b>SYSRTC - System RTC</b>	<b>438</b>
15.1	Introduction	438
15.2	Features	438
15.3	Functional Description	438
15.3.1	Interrupts and Wake Events	439
15.3.2	Counter	439
15.3.3	Compare Events	439
15.3.4	Capture Events	439
15.3.5	SYSRTC Behavior on SWRST/Disablement/STOP	439
15.3.6	Debug Functionality	440
15.4	SYSRTC Register Map	441
15.5	SYSRTC Register Description	443
15.5.1	SYSRTC_IPVERSION - IP VERSION	443
15.5.2	SYSRTC_EN - Module Enable Register	443
15.5.3	SYSRTC_SWRST - Software Reset Register	444
15.5.4	SYSRTC_CFG - Configuration Register	444
15.5.5	SYSRTC_CMD - Command Register	445
15.5.6	SYSRTC_STATUS - Status Register	445
15.5.7	SYSRTC_CNT - Counter Value Register	446
15.5.8	SYSRTC_SYNCBUSY - Synchronization Busy Register	446
15.5.9	SYSRTC_LOCK - Configuration Lock Register	447
15.5.10	SYSRTC_GRP0_IF - Group Interrupt Flags	447
15.5.11	SYSRTC_GRP0_IEN - Group Interrupt Enables	448
15.5.12	SYSRTC_GRP0_CTRL - Group Control Register	449
15.5.13	SYSRTC_GRP0_CMP0VALUE - Compare 0 Value Register	450
15.5.14	SYSRTC_GRP0_CMP1VALUE - Compare 1 Value Register	450
15.5.15	SYSRTC_GRP0_CAP0VALUE - Capture 0 Value Register	451
15.5.16	SYSRTC_GRP0_SYNCBUSY - Synchronization Busy Register	451
<b>16.</b>	<b>BURTC - Back-Up Real Time Counter</b>	<b>452</b>
16.1	Introduction	452
16.2	Features	452
16.3	Functional Description	453
16.3.1	Clock Selection	453
16.3.2	Configuration	453
16.3.3	Debug Features and Description	453
16.3.4	Counter	454
16.3.5	Compare Channel	455
16.3.6	Interrupts	455
16.3.7	Register Lock	455
16.4	BURTC Register Map	456

16.5	BURTC Register Description . . . . .	457
16.5.1	BURTC_IPVERSION - IP Version ID. . . . .	457
16.5.2	BURTC_EN - Module Enable Register . . . . .	458
16.5.3	BURTC_CFG - Configuration Register . . . . .	459
16.5.4	BURTC_CMD - Command Register . . . . .	460
16.5.5	BURTC_STATUS - Status Register . . . . .	461
16.5.6	BURTC_IF - Interrupt Flag Register . . . . .	461
16.5.7	BURTC_IEN - Interrupt Enable Register . . . . .	462
16.5.8	BURTC_PRECNT - Pre-Counter Value Register . . . . .	462
16.5.9	BURTC_CNT - Counter Value Register . . . . .	463
16.5.10	BURTC_EM4WUEN - EM4 Wakeup Request Enable Register . . . . .	463
16.5.11	BURTC_SYNCBUSY - Synchronization Busy Register . . . . .	464
16.5.12	BURTC_LOCK - Configuration Lock Register . . . . .	465
16.5.13	BURTC_COMP - Compare Value Register . . . . .	465
<b>17.</b>	<b>BURAM - Backup RAM . . . . .</b>	<b>466</b>
17.1	Introduction. . . . .	466
17.2	Functional Description . . . . .	466
17.3	BURAM Register Map . . . . .	466
17.4	BURAM Register Description. . . . .	467
17.4.1	BURAM_RET <sub>x</sub> _REG - Retention Register . . . . .	467
<b>18.</b>	<b>LETIMER - Low Energy Timer . . . . .</b>	<b>468</b>
18.1	Introduction. . . . .	468
18.2	Features . . . . .	468
18.3	Functional Description . . . . .	469
18.3.1	Internal Overview . . . . .	470
18.3.2	Free Running Mode . . . . .	471
18.3.3	One-shot Mode . . . . .	472
18.3.4	Buffered Mode . . . . .	473
18.3.5	Double Mode . . . . .	474
18.4	Clock Frequency . . . . .	475
18.5	PRS Input Triggers . . . . .	476
18.6	Debug . . . . .	476
18.7	Output Action . . . . .	477
18.8	PRS Output . . . . .	477
18.9	Interrupts . . . . .	477
18.10	Using the LETIMER in EM3 . . . . .	477
18.11	Register Access. . . . .	477
18.12	Programmer's Model . . . . .	478
18.12.1	Free Running Mode . . . . .	478
18.12.2	One Shot Mode . . . . .	479
18.12.3	DOUBLE Mode . . . . .	479
18.12.4	BUFFERED Mode . . . . .	480
18.12.5	Continuous Output Generation . . . . .	481

18.12.6	PWM Output	482
18.13	LETIMER Register Map	483
18.14	LETIMER Register Description	485
18.14.1	LETIMER_IPVERSION - IP Version	485
18.14.2	LETIMER_EN - Module En	485
18.14.3	LETIMER_SWRST - Software Reset Register	486
18.14.4	LETIMER_CTRL - Control Register	487
18.14.5	LETIMER_CMD - Command Register	489
18.14.6	LETIMER_STATUS - Status Register	490
18.14.7	LETIMER_CNT - Counter Value Register	490
18.14.8	LETIMER_COMP0 - Compare Value Register 0	491
18.14.9	LETIMER_COMP1 - Compare Value Register 1	491
18.14.10	LETIMER_TOP - Counter TOP Value Register	492
18.14.11	LETIMER_TOPBUFF - Buffered Counter TOP Value	492
18.14.12	LETIMER_REP0 - Repeat Counter Register 0	493
18.14.13	LETIMER_REP1 - Repeat Counter Register 1	493
18.14.14	LETIMER_IF - Interrupt Flag Register	494
18.14.15	LETIMER_IEN - Interrupt Enable Register	495
18.14.16	LETIMER_LOCK - Configuration Lock Register	496
18.14.17	LETIMER_SYNCBUSY - Synchronization Busy Register	497
18.14.18	LETIMER_PRSMODE - PRS Input Mode Select Register	498
<b>19.</b>	<b>TIMER - Timer/Counter</b>	<b>500</b>
19.1	Introduction	500
19.2	Features	501
19.3	Functional Description	502
19.3.1	Register Access	502
19.3.2	Counter Modes	503
19.3.3	Compare/Capture Channels	509
19.3.4	Dead-Time Insertion Unit	520
19.3.5	Debug Mode	524
19.3.6	Interrupts, DMA and PRS Output	524
19.3.7	GPIO Input/Output	524
19.4	TIMER Register Map	525
19.5	TIMER Register Description	528
19.5.1	TIMER_IPVERSION - IP Version ID	528
19.5.2	TIMER_CFG - Configuration Register	529
19.5.3	TIMER_CTRL - Control Register	532
19.5.4	TIMER_CMD - Command Register	533
19.5.5	TIMER_STATUS - Status Register	534
19.5.6	TIMER_IF - Interrupt Flag Register	537
19.5.7	TIMER_IEN - Interrupt Enable Register	539
19.5.8	TIMER_TOP - Counter Top Value Register	540
19.5.9	TIMER_TOPB - Counter Top Value Buffer Register	540
19.5.10	TIMER_CNT - Counter Value Register	541
19.5.11	TIMER_LOCK - TIMER Configuration Lock Register	541
19.5.12	TIMER_EN - Module En	542

19.5.13	TIMER_CCx_CFG - CC Channel Configuration Register	543
19.5.14	TIMER_CCx_CTRL - CC Channel Control Register	545
19.5.15	TIMER_CCx_OC - OC Channel Value Register	546
19.5.16	TIMER_CCx_OCB - OC Channel Value Buffer Register	547
19.5.17	TIMER_CCx_ICF - IC Channel Value Register	547
19.5.18	TIMER_CCx_ICOF - IC Channel Value Overflow Register	547
19.5.19	TIMER_DTCFG - DTI Configuration Register	548
19.5.20	TIMER_DTTIMECFG - DTI Time Configuration Register	549
19.5.21	TIMER_DTFCFG - DTI Fault Configuration Register	550
19.5.22	TIMER_DTCTRL - DTI Control Register	551
19.5.23	TIMER DTOGEN - DTI Output Generation Enable Register	552
19.5.24	TIMER_DTFAULT - DTI Fault Register	553
19.5.25	TIMER_DTFAULTC - DTI Fault Clear Register	554
19.5.26	TIMER_DTLOCK - DTI Configuration Lock Register	555
<b>20.</b>	<b>USART - Universal Synchronous Asynchronous Receiver/Transmitter</b>	<b>556</b>
20.1	Introduction	556
20.2	Features	557
20.3	Functional Description	558
20.3.1	Modes of Operation	559
20.3.2	Asynchronous Operation	559
20.3.3	Synchronous Operation	575
20.3.4	Hardware Flow Control	581
20.3.5	Debug Halt	581
20.3.6	PRS-triggered Transmissions	581
20.3.7	PRS RX Input	581
20.3.8	PRS CLK Input	582
20.3.9	DMA Support	582
20.3.10	Timer	583
20.3.11	Interrupts	588
20.3.12	IrDA Modulator/ Demodulator	589
20.4	USART Register Map	590
20.5	USART Register Description	593
20.5.1	USART_IPVERSION - IPVERSION	593
20.5.2	USART_EN - USART Enable	593
20.5.3	USART_CTRL - Control Register	594
20.5.4	USART_FRAME - USART Frame Format Register	599
20.5.5	USART_TRIGCTRL - USART Trigger Control Register	601
20.5.6	USART_CMD - Command Register	602
20.5.7	USART_STATUS - USART Status Register	604
20.5.8	USART_CLKDIV - Clock Control Register	605
20.5.9	USART_RXDATAEXT - RX Buffer Data Extended Register	606
20.5.10	USART_RXDATA - RX Buffer Data Register	606
20.5.11	USART_RXDOUBLEX - RX Buffer Double Data Extended Register	607
20.5.12	USART_RXDOUBLE - RX FIFO Double Data Register	608
20.5.13	USART_RXDATAEXP - RX Buffer Data Extended Peek Register	608
20.5.14	USART_RXDOUBLEXP - RX Buffer Double Data Extended Peek R...	609

20.5.15	USART_TXDATAx - TX Buffer Data Extended Register . . . . .	610
20.5.16	USART_TXDATA - TX Buffer Data Register . . . . .	611
20.5.17	USART_TXDOUBLEx - TX Buffer Double Data Extended Register . . . . .	612
20.5.18	USART_TXDOUBLE - TX Buffer Double Data Register . . . . .	613
20.5.19	USART_IF - Interrupt Flag Register. . . . .	614
20.5.20	USART_IEN - Interrupt Enable Register . . . . .	616
20.5.21	USART_IRCTRL - IrDA Control Register . . . . .	617
20.5.22	USART_I2SCTRL - I2S Control Register . . . . .	618
20.5.23	USART_TIMING - Timing Register . . . . .	620
20.5.24	USART_CTRLX - Control Register Extended . . . . .	622
20.5.25	USART_TIMECMP0 - Timer Compare 0 . . . . .	624
20.5.26	USART_TIMECMP1 - Timer Compare 1 . . . . .	626
20.5.27	USART_TIMECMP2 - Timer Compare 2 . . . . .	628
<b>21.</b>	<b>EUSART - Universal Synchronous Asynchronous Receiver/Transmitter . . . . .</b>	<b>630</b>
21.1	Introduction. . . . .	630
21.2	Features . . . . .	631
21.3	Functional Description . . . . .	632
21.3.1	Modes of Operation . . . . .	633
21.3.2	Asynchronous Operation . . . . .	633
21.3.3	Synchronous Operation . . . . .	653
21.3.4	Debug Halt . . . . .	656
21.3.5	PRS-triggered Transmissions . . . . .	656
21.3.6	PRS RX Input . . . . .	657
21.3.7	PRS CLK Input . . . . .	657
21.3.8	DMA Support . . . . .	657
21.4	EUSART Register Map. . . . .	658
21.5	EUSART Register Description . . . . .	660
21.5.1	EUSART_IPVERSION - IP Version ID . . . . .	660
21.5.2	EUSART_EN - Enable Register . . . . .	661
21.5.3	EUSART_CFG0 - Configuration 0 Register . . . . .	662
21.5.4	EUSART_CFG1 - Configuration 1 Register . . . . .	665
21.5.5	EUSART_CFG2 - Configuration 2 Register . . . . .	670
21.5.6	EUSART_FRAMECFG - Frame Format Register . . . . .	672
21.5.7	EUSART_DTXDATCFG - Default TX DATA Register . . . . .	673
21.5.8	EUSART_IRHFCFG - HF IrDA Mod Config Register . . . . .	674
21.5.9	EUSART_IRLFCFG - LF IrDA Pulse Config Register . . . . .	675
21.5.10	EUSART_TIMINGCFG - Timing Register . . . . .	676
21.5.11	EUSART_STARTFRAMECFG - Start Frame Register . . . . .	678
21.5.12	EUSART_SIGFRAMECFG - Signal Frame Register . . . . .	678
21.5.13	EUSART_CLKDIV - Clock Divider Register . . . . .	679
21.5.14	EUSART_TRIGCTRL - Trigger Control Register . . . . .	679
21.5.15	EUSART_CMD - Command Register . . . . .	680
21.5.16	EUSART_RXDATA - RX Data Register . . . . .	681
21.5.17	EUSART_RXDATAP - RX Data Peek Register . . . . .	681
21.5.18	EUSART_TXDATA - TX Data Register . . . . .	682
21.5.19	EUSART_STATUS - Status Register . . . . .	683

21.5.20	EUSART_IF - Interrupt Flag Register	685
21.5.21	EUSART_IEN - Interrupt Enable Register	687
21.5.22	EUSART_SYNCBUSY - Synchronization Busy Register	689
<b>22.</b>	<b>I2C - Inter-Integrated Circuit Interface</b>	<b>691</b>
22.1	Introduction	691
22.2	Features	691
22.3	Functional Description	692
22.3.1	I2C-Bus Overview	693
22.3.2	Enable and Reset	697
22.3.3	Pin Configuration	697
22.3.4	Safely Disabling and Changing Follower Configuration	697
22.3.5	Clock Generation	698
22.3.6	Arbitration	698
22.3.7	Buffers	698
22.3.8	Leader Operation	701
22.3.9	Bus States	709
22.3.10	Follower Operation	709
22.3.11	Transfer Automation	713
22.3.12	Using 10-bit Addresses	714
22.3.13	Error Handling	714
22.3.14	DMA Support	716
22.3.15	Interrupts	716
22.3.16	Wake-up	716
22.4	I2C Register Map	717
22.5	I2C Register Description	719
22.5.1	I2C_IPVERSION - IP VERSION Register	719
22.5.2	I2C_EN - Enable Register	719
22.5.3	I2C_CTRL - Control Register	720
22.5.4	I2C_CMD - Command Register	724
22.5.5	I2C_STATE - State Register	725
22.5.6	I2C_STATUS - Status Register	726
22.5.7	I2C_CLKDIV - Clock Division Register	727
22.5.8	I2C_SADDR - Follower Address Register	727
22.5.9	I2C_SADDRMASK - Follower Address Mask Register	728
22.5.10	I2C_RXDATA - Receive Buffer Data Register	728
22.5.11	I2C_RXDOUBLE - Receive Buffer Double Data Register	729
22.5.12	I2C_RXDATAP - Receive Buffer Data Peek Register	729
22.5.13	I2C_RXDOUBLEP - Receive Buffer Double Data Peek Register	730
22.5.14	I2C_TXDATA - Transmit Buffer Data Register	730
22.5.15	I2C_TXDOUBLE - Transmit Buffer Double Data Register	731
22.5.16	I2C_IF - Interrupt Flag Register	732
22.5.17	I2C_IEN - Interrupt Enable Register	734
<b>23.</b>	<b>IADC - Incremental Analog to Digital Converter</b>	<b>736</b>
23.1	Introduction	736
23.2	Features	737

23.3	Functional Description	738
23.3.1	Register Access.	739
23.3.2	Clocking	740
23.3.3	Conversion Timing	741
23.3.4	Reference Selection and Analog Gain	748
23.3.5	Input and Configuration Selection	749
23.3.6	Gain and Offset Correction	754
23.3.7	Output Data FIFOs.	758

24.2	Features	795
24.3	Functional Description	796
24.3.1	Pin Configuration	797
24.3.2	Alternate Port Control	799
24.3.3	Slew Rate	799
24.3.4	Input Disable	799

24.3.5	Configuration Lock . . . . .	799
24.3.6	EM2 Functionality . . . . .	799
24.3.7	EM4 Functionality . . . . .	799
24.3.8	EM4 Wakeup . . . . .	800
24.3.9	Debug Connections . . . . .	800
24.3.10	Interrupt Generation . . . . .	801
24.3.11	Output to PRS . . . . .	802
24.3.12	Peripheral Resource Routing . . . . .	802
24.4	Synchronization . . . . .	811
24.5	GPIO Register Map . . . . .	812
24.6	GPIO Register Description . . . . .	840
24.6.1	GPIO_IPVERSION - Main . . . . .	840
24.6.2	GPIO_PORTA_CTRL - Port Control . . . . .	841
24.6.3	GPIO_PORTA_MODEL - Mode Low . . . . .	842
24.6.4	GPIO_PORTA_MODEH - Mode High . . . . .	847
24.6.5	GPIO_PORTA_DOUT - Data Out . . . . .	849
24.6.6	GPIO_PORTA_DIN - Data in . . . . .	849
24.6.7	GPIO_PORTB_CTRL - Port Control . . . . .	850
24.6.8	GPIO_PORTB_MODEL - Mode Low . . . . .	851
24.6.9	GPIO_PORTB_DOUT - Data Out . . . . .	855
24.6.10	GPIO_PORTB_DIN - Data in . . . . .	855
24.6.11	GPIO_PORTC_CTRL - Port Control . . . . .	856
24.6.12	GPIO_PORTC_MODEL - Mode Low . . . . .	857
24.6.13	GPIO_PORTC_MODEH - Mode High . . . . .	862
24.6.14	GPIO_PORTC_DOUT - Data Out . . . . .	863
24.6.15	GPIO_PORTC_DIN - Data in . . . . .	864
24.6.16	GPIO_PORTD_CTRL - Port Control . . . . .	865
24.6.17	GPIO_PORTD_MODEL - Mode Low . . . . .	866
24.6.18	GPIO_PORTD_DOUT - Data Out . . . . .	869
24.6.19	GPIO_PORTD_DIN - Data in . . . . .	870
24.6.20	GPIO_LOCK - Lock Register . . . . .	870
24.6.21	GPIO_GPIOLOCKSTATUS - Lock Status . . . . .	871
24.6.22	GPIO_ABUSALLOC - A Bus Allocation . . . . .	872
24.6.23	GPIO_BBUSALLOC - B Bus Allocation . . . . .	874
24.6.24	GPIO_CDBUSALLOC - CD Bus Allocation . . . . .	876
24.6.25	GPIO_EXTIPSELL - External Interrupt Port Select Low . . . . .	878
24.6.26	GPIO_EXTIPSELH - External Interrupt Port Select High . . . . .	881
24.6.27	GPIO_EXTIPINSELL - External Interrupt Pin Select Low . . . . .	883
24.6.28	GPIO_EXTIPINSELH - External Interrupt Pin Select High . . . . .	886
24.6.29	GPIO_EXTIRISE - External Interrupt Rising Edge Trigger . . . . .	887
24.6.30	GPIO_EXTIFALL - External Interrupt Falling Edge Trigger . . . . .	888
24.6.31	GPIO_IF - Interrupt Flag . . . . .	889
24.6.32	GPIO_IEN - Interrupt Enable . . . . .	891
24.6.33	GPIO_EM4WUEN - EM4 Wakeup Enable . . . . .	893
24.6.34	GPIO_EM4WUPOL - EM4 Wakeup Polarity . . . . .	893
24.6.35	GPIO_DBGROUTEPEEN - Debugger Route Pin Enable . . . . .	894
24.6.36	GPIO_TRACEROUTEPEN - Trace Route Pin Enable . . . . .	895

24.6.37	GPIO_LCDSEG - LCD Segment Enable	896
24.6.38	GPIO_LCDCOM - LCD Common Enable	896
24.6.39	GPIO_ACMP0_ROUTEEN - ACMP0 Pin Enable	897
24.6.40	GPIO_ACMP0_ACMPOUTROUTE - ACMPOUT Port/Pin Select	897
24.6.41	GPIO_ACMP1_ROUTEEN - ACMP1 Pin Enable	898
24.6.42	GPIO_ACMP1_ACMPOUTROUTE - ACMPOUT Port/Pin Select	898
24.6.43	GPIO_CMU_ROUTEEN - CMU Pin Enable	899
24.6.44	GPIO_CMU_CLKIN0ROUTE - CLKIN0 Port/Pin Select	899
24.6.45	GPIO_CMU_CLKOUT0ROUTE - CLKOUT0 Port/Pin Select	900
24.6.46	GPIO_CMU_CLKOUT1ROUTE - CLKOUT1 Port/Pin Select	900
24.6.47	GPIO_CMU_CLKOUT2ROUTE - CLKOUT2 Port/Pin Select	901
24.6.48	GPIO_EUSART0_ROUTEEN - EUSART0 Pin Enable	902
24.6.49	GPIO_EUSART0_CSROUTE - CS Port/Pin Select	903
24.6.50	GPIO_EUSART0_CTSROUTE - CTS Port/Pin Select	903
24.6.51	GPIO_EUSART0_RTSMROUTE - RTS Port/Pin Select	904
24.6.52	GPIO_EUSART0_RXROUTE - RX Port/Pin Select	904
24.6.53	GPIO_EUSART0_SCLKROUTE - SCLK Port/Pin Select	905
24.6.54	GPIO_EUSART0_TXROUTE - TX Port/Pin Select	905
24.6.55	GPIO_EUSART1_ROUTEEN - EUSART1 Pin Enable	906
24.6.56	GPIO_EUSART1_CSROUTE - CS Port/Pin Select	907
24.6.57	GPIO_EUSART1_CTSROUTE - CTS Port/Pin Select	907
24.6.58	GPIO_EUSART1_RTSMROUTE - RTS Port/Pin Select	908
24.6.59	GPIO_EUSART1_RXROUTE - RX Port/Pin Select	908
24.6.60	GPIO_EUSART1_SCLKROUTE - SCLK Port/Pin Select	909
24.6.61	GPIO_EUSART1_TXROUTE - TX Port/Pin Select	909
24.6.62	GPIO_EUSART2_ROUTEEN - EUSART2 Pin Enable	910
24.6.63	GPIO_EUSART2_CSROUTE - CS Port/Pin Select	911
24.6.64	GPIO_EUSART2_CTSROUTE - CTS Port/Pin Select	911
24.6.65	GPIO_EUSART2_RTSMROUTE - RTS Port/Pin Select	912
24.6.66	GPIO_EUSART2_RXROUTE - RX Port/Pin Select	912
24.6.67	GPIO_EUSART2_SCLKROUTE - SCLK Port/Pin Select	913
24.6.68	GPIO_EUSART2_TXROUTE - TX Port/Pin Select	913
24.6.69	GPIO_FRC_ROUTEEN - FRC Pin Enable	914
24.6.70	GPIO_FRC_DCLKROUTE - DCLK Port/Pin Select	914
24.6.71	GPIO_FRC_DFRAMERROUTE - DFRAME Port/Pin Select	915
24.6.72	GPIO_FRC_DOUTROUTE - DOUT Port/Pin Select	915
24.6.73	GPIO_I2C0_ROUTEEN - I2C0 Pin Enable	916
24.6.74	GPIO_I2C0_SCLROUTE - SCL Port/Pin Select	916
24.6.75	GPIO_I2C0_SDAROUTE - SDA Port/Pin Select	917
24.6.76	GPIO_I2C1_ROUTEEN - I2C1 Pin Enable	917
24.6.77	GPIO_I2C1_SCLROUTE - SCL Port/Pin Select	918
24.6.78	GPIO_I2C1_SDAROUTE - SDA Port/Pin Select	918
24.6.79	GPIO_KEYSCAN_ROUTEEN - KEYSKAN Pin Enable	919
24.6.80	GPIO_KEYSCAN_COLOUT0ROUTE - COLOUT0 Port/Pin Select	920
24.6.81	GPIO_KEYSCAN_COLOUT1ROUTE - COLOUT1 Port/Pin Select	920
24.6.82	GPIO_KEYSCAN_COLOUT2ROUTE - COLOUT2 Port/Pin Select	921
24.6.83	GPIO_KEYSCAN_COLOUT3ROUTE - COLOUT3 Port/Pin Select	921
24.6.84	GPIO_KEYSCAN_COLOUT4ROUTE - COLOUT4 Port/Pin Select	922

24.6.85	GPIO_KEYSCAN_COLOUT5ROUTE - COLOUT5 Port/Pin Select	.922
24.6.86	GPIO_KEYSCAN_COLOUT6ROUTE - COLOUT6 Port/Pin Select	.923
24.6.87	GPIO_KEYSCAN_COLOUT7ROUTE - COLOUT7 Port/Pin Select	.923
24.6.88	GPIO_KEYSCAN_ROWSENSE0ROUTE - ROWSENSE0 Port/Pin Select	.924
24.6.89	GPIO_KEYSCAN_ROWSENSE1ROUTE - ROWSENSE1 Port/Pin Select	.924
24.6.90	GPIO_KEYSCAN_ROWSENSE2ROUTE - ROWSENSE2 Port/Pin Select	.925
24.6.91	GPIO_KEYSCAN_ROWSENSE3ROUTE - ROWSENSE3 Port/Pin Select	.925
24.6.92	GPIO_KEYSCAN_ROWSENSE4ROUTE - ROWSENSE4 Port/Pin Select	.926
24.6.93	GPIO_KEYSCAN_ROWSENSE5ROUTE - ROWSENSE5 Port/Pin Select	.926
24.6.94	GPIO_LESENSE_ROUTEEN - LESENSE Pin Enable	.927
24.6.95	GPIO_LESENSE_CH0OUTROUTE - CH0OUT Port/Pin Select	.928
24.6.96	GPIO_LESENSE_CH1OUTROUTE - CH1OUT Port/Pin Select	.929
24.6.97	GPIO_LESENSE_CH2OUTROUTE - CH2OUT Port/Pin Select	.929
24.6.98	GPIO_LESENSE_CH3OUTROUTE - CH3OUT Port/Pin Select	.930
24.6.99	GPIO_LESENSE_CH4OUTROUTE - CH4OUT Port/Pin Select	.930
24.6.100	GPIO_LESENSE_CH5OUTROUTE - CH5OUT Port/Pin Select	.931
24.6.101	GPIO_LESENSE_CH6OUTROUTE - CH6OUT Port/Pin Select	.931
24.6.102	GPIO_LESENSE_CH7OUTROUTE - CH7OUT Port/Pin Select	.932
24.6.103	GPIO_LESENSE_CH8OUTROUTE - CH8OUT Port/Pin Select	.932
24.6.104	GPIO_LESENSE_CH9OUTROUTE - CH9OUT Port/Pin Select	.933
24.6.105	GPIO_LESENSE_CH10OUTROUTE - CH10OUT Port/Pin Select	.933
24.6.106	GPIO_LESENSE_CH11OUTROUTE - CH11OUT Port/Pin Select	.934
24.6.107	GPIO_LESENSE_CH12OUTROUTE - CH12OUT Port/Pin Select	.934
24.6.108	GPIO_LESENSE_CH13OUTROUTE - CH13OUT Port/Pin Select	.935
24.6.109	GPIO_LESENSE_CH14OUTROUTE - CH14OUT Port/Pin Select	.935
24.6.110	GPIO_LESENSE_CH15OUTROUTE - CH15OUT Port/Pin Select	.936
24.6.111	GPIO_LETIMER_ROUTEEN - LETIMER Pin Enable	.936
24.6.112	GPIO_LETIMER_OUT0ROUTE - OUT0 Port/Pin Select	.937
24.6.113	GPIO_LETIMER_OUT1ROUTE - OUT1 Port/Pin Select	.937
24.6.114	GPIO_MODEM_ROUTEEN - MODEM Pin Enable	.938
24.6.115	GPIO_MODEM_ANT0ROUTE - ANT0 Port/Pin Select	.939
24.6.116	GPIO_MODEM_ANT1ROUTE - ANT1 Port/Pin Select	.940
24.6.117	GPIO_MODEM_ANTROLLOVERROUTE - ANTROLLOVER Port/Pin Select	.940
24.6.118	GPIO_MODEM_ANTRR0ROUTE - ANTRR0 Port/Pin Select.	.941
24.6.119	GPIO_MODEM_ANTRR1ROUTE - ANTRR1 Port/Pin Select.	.941
24.6.120	GPIO_MODEM_ANTRR2ROUTE - ANTRR2 Port/Pin Select.	.942
24.6.121	GPIO_MODEM_ANTRR3ROUTE - ANTRR3 Port/Pin Select.	.942
24.6.122	GPIO_MODEM_ANTRR4ROUTE - ANTRR4 Port/Pin Select.	.943
24.6.123	GPIO_MODEM_ANTRR5ROUTE - ANTRR5 Port/Pin Select.	.943
24.6.124	GPIO_MODEM_ANTSWENROUTE - ANTSWEN Port/Pin Select	.944
24.6.125	GPIO_MODEM_ANTSWUSROUTE - ANTSWUS Port/Pin Select	.944
24.6.126	GPIO_MODEM_ANTTRIGROUTE - ANTTRIG Port/Pin Select	.945
24.6.127	GPIO_MODEM_ANTTRIGSTOPROUTE - ANTTRIGSTOP Port/Pin Select	.945
24.6.128	GPIO_MODEM_DCLKROUTE - DCLK Port/Pin Select	.946
24.6.129	GPIO_MODEM_DINROUTE - DIN Port/Pin Select	.946
24.6.130	GPIO_MODEM_DOUTROUTE - DOUT Port/Pin Select	.947
24.6.131	GPIO_PCNT0_S0INROUTE - S0IN Port/Pin Select	.947
24.6.132	GPIO_PCNT0_S1INROUTE - S1IN Port/Pin Select	.948

24.6.133	GPIO_PRS0_ROUTEEN - PRS0 Pin Enable	949
24.6.134	GPIO_PRS0_ASYNC0ROUTE - ASYNCH0 Port/Pin Select	950
24.6.135	GPIO_PRS0_ASYNC1ROUTE - ASYNCH1 Port/Pin Select	951
24.6.136	GPIO_PRS0_ASYNC2ROUTE - ASYNCH2 Port/Pin Select	951
24.6.137	GPIO_PRS0_ASYNC3ROUTE - ASYNCH3 Port/Pin Select	952
24.6.138	GPIO_PRS0_ASYNC4ROUTE - ASYNCH4 Port/Pin Select	952
24.6.139	GPIO_PRS0_ASYNC5ROUTE - ASYNCH5 Port/Pin Select	953
24.6.140	GPIO_PRS0_ASYNC6ROUTE - ASYNCH6 Port/Pin Select	953
24.6.141	GPIO_PRS0_ASYNC7ROUTE - ASYNCH7 Port/Pin Select	954
24.6.142	GPIO_PRS0_ASYNC8ROUTE - ASYNCH8 Port/Pin Select	954
24.6.143	GPIO_PRS0_ASYNC9ROUTE - ASYNCH9 Port/Pin Select	955
24.6.144	GPIO_PRS0_ASYNC10ROUTE - ASYNCH10 Port/Pin Select	955
24.6.145	GPIO_PRS0_ASYNC11ROUTE - ASYNCH11 Port/Pin Select	956
24.6.146	GPIO_PRS0_SYNC0ROUTE - SYNCH0 Port/Pin Select	956
24.6.147	GPIO_PRS0_SYNC1ROUTE - SYNCH1 Port/Pin Select	957
24.6.148	GPIO_PRS0_SYNC2ROUTE - SYNCH2 Port/Pin Select	957
24.6.149	GPIO_PRS0_SYNC3ROUTE - SYNCH3 Port/Pin Select	958
24.6.150	GPIO_SYX00_BUFOUTREQINASYNCROUTE - BUFOUTREQINASYNC Port/Pin Select	958
24.6.151	GPIO_TIMER0_ROUTEEN - TIMER0 Pin Enable	959
24.6.152	GPIO_TIMER0_CC0ROUTE - CC0 Port/Pin Select	960
24.6.153	GPIO_TIMER0_CC1ROUTE - CC1 Port/Pin Select	960
24.6.154	GPIO_TIMER0_CC2ROUTE - CC2 Port/Pin Select	961
24.6.155	GPIO_TIMER0_CDTI0ROUTE - CDTI0 Port/Pin Select	961
24.6.156	GPIO_TIMER0_CDTI1ROUTE - CDTI1 Port/Pin Select	962
24.6.157	GPIO_TIMER0_CDTI2ROUTE - CDTI2 Port/Pin Select	962
24.6.158	GPIO_TIMER1_ROUTEEN - TIMER1 Pin Enable	963
24.6.159	GPIO_TIMER1_CC0ROUTE - CC0 Port/Pin Select	964
24.6.160	GPIO_TIMER1_CC1ROUTE - CC1 Port/Pin Select	964
24.6.161	GPIO_TIMER1_CC2ROUTE - CC2 Port/Pin Select	965
24.6.162	GPIO_TIMER1_CDTI0ROUTE - CDTI0 Port/Pin Select	965
24.6.163	GPIO_TIMER1_CDTI1ROUTE - CDTI1 Port/Pin Select	966
24.6.164	GPIO_TIMER1_CDTI2ROUTE - CDTI2 Port/Pin Select	966
24.6.165	GPIO_TIMER2_ROUTEEN - TIMER2 Pin Enable	967
24.6.166	GPIO_TIMER2_CC0ROUTE - CC0 Port/Pin Select	968
24.6.167	GPIO_TIMER2_CC1ROUTE - CC1 Port/Pin Select	968
24.6.168	GPIO_TIMER2_CC2ROUTE - CC2 Port/Pin Select	969
24.6.169	GPIO_TIMER2_CDTI0ROUTE - CDTI0 Port/Pin Select	969
24.6.170	GPIO_TIMER2_CDTI1ROUTE - CDTI1 Port/Pin Select	970
24.6.171	GPIO_TIMER2_CDTI2ROUTE - CDTI2 Port/Pin Select	970
24.6.172	GPIO_TIMER3_ROUTEEN - TIMER3 Pin Enable	971
24.6.173	GPIO_TIMER3_CC0ROUTE - CC0 Port/Pin Select	972
24.6.174	GPIO_TIMER3_CC1ROUTE - CC1 Port/Pin Select	972
24.6.175	GPIO_TIMER3_CC2ROUTE - CC2 Port/Pin Select	973
24.6.176	GPIO_TIMER3_CDTI0ROUTE - CDTI0 Port/Pin Select	973
24.6.177	GPIO_TIMER3_CDTI1ROUTE - CDTI1 Port/Pin Select	974
24.6.178	GPIO_TIMER3_CDTI2ROUTE - CDTI2 Port/Pin Select	974
24.6.179	GPIO_TIMER4_ROUTEEN - TIMER4 Pin Enable	975
24.6.180	GPIO_TIMER4_CC0ROUTE - CC0 Port/Pin Select	976

24.6.181	GPIO_TIMER4_CC1ROUTE - CC1 Port/Pin Select	976
24.6.182	GPIO_TIMER4_CC2ROUTE - CC2 Port/Pin Select	977
24.6.183	GPIO_TIMER4_CDTI0ROUTE - CDTI0 Port/Pin Select	977
24.6.184	GPIO_TIMER4_CDTI1ROUTE - CDTI1 Port/Pin Select	978
24.6.185	GPIO_TIMER4_CDTI2ROUTE - CDTI2 Port/Pin Select	978
24.6.186	GPIO_USART0_ROUTEEN - USART0 Pin Enable	979
24.6.187	GPIO_USART0_CSROUTE - CS Port/Pin Select	980
24.6.188	GPIO_USART0_CTSROUTE - CTS Port/Pin Select	980
24.6.189	GPIO_USART0_RTSROUTE - RTS Port/Pin Select	981
24.6.190	GPIO_USART0_RXROUTE - RX Port/Pin Select	981
24.6.191	GPIO_USART0_CLKROUTE - SCLK Port/Pin Select	982
24.6.192	GPIO_USART0_TXROUTE - TX Port/Pin Select	982
<b>25.</b>	<b>LDMA - Linked DMA</b>	<b>983</b>
25.1	Introduction	983
25.1.1	Features	984
25.2	Block Diagram	985

## 1. About This Document

### 1.1 Introduction

This document contains reference material for the EFR32xG23 devices. All modules and peripherals in the EFR32xG23 devices are described in general terms. Not all modules are present in all devices and the feature set for each device might vary. Such differences, including pinout, are covered in the device data sheets.

## 1.2 Conventions

### Register Names

Register names are given with a module name prefix followed by the short register name:

TIMERn\_CTRL - Control Register

The "n" denotes the module number for modules which can exist in more than one instance.

Some registers are grouped which leads to a group name following the module prefix:

GPIO\_Px\_DOUT - Port Data Out Register

The "x" denotes the different ports.

### Bit Fields

Registers contain one or more bit fields which can be 1 to 32 bits wide. Bit fields wider than 1 bit are given with start (x) and stop (y) bit [y:x].

Bit fields containing more than one bit are unsigned integers unless otherwise is specified.

Unspecified bit field settings must not be used, as this may lead to unpredictable behaviour.

### Address

The address for each register can be found by adding the base address of the module found in the Memory Map (see [Figure 4.1 System Address Space with Core and Code Space Listing on page 43](#)), and the offset address for the register (found in module Register Map).

### Access Type

The register access types used in the register descriptions are explained in [Table 1.1 Register Access Types on page 30](#).

**Table 1.1. Register Access Types**

Access Type	Description
R	Read only. Writes are ignored
RW	Readable and writable
RW1	Readable and writable. Only writes to 1 have effect
W1	Read value undefined. Only writes to 1 have effect
W	Write only. Read value undefined.
RWH	Readable, writable, and updated by hardware
RW(nB), RWH(nB), etc.	"(nB)" suffix indicates that a bitfield explicitly does not support peripheral bit set/clear/toggle operations (see <a href="#">4. Memory and Bus System</a> )
RW(r), R(r), etc.	"(r)" suffix indicates that reading the register causes an action and may alter the register value.

### Number format

**0x** prefix is used for hexadecimal numbers

**0b** prefix is used for binary numbers

Numbers without prefix are in decimal representation.

### Reserved

Registers and bit fields marked with **reserved** are reserved for future use. These should be written to their reset value unless otherwise stated in the Register Description. Read values for reserved bits may be different in future or prior devices.

### Reset Value

The reset value denotes the value after reset.

Registers denoted with X have unknown value out of reset and need to be initialized before use. Note that read-modify-write operations on these registers before they are initialized results in undefined register values.

### Pin Connections

Pin connections are given with a module prefix followed by a short pin name:

CMU\_CLKOUT1 (Clock management unit, clock output pin number 1)

The location for the pin names given in the module documentation can be found in the device-specific datasheet.

### 1.3 Related Documentation

Further documentation on the EFR32xG23 devices and the ARM Cortex®-M33 can be found at the Silicon Labs and ARM web pages:

[www.silabs.com](http://www.silabs.com)

[www.arm.com](http://www.arm.com)

## 2. System Overview

### Quick Facts

#### What?

The EFR32 Wireless Gecko is a highly integrated, configurable and low power wireless System-on-Chip (SoC) with a robust set of MCU and radio peripherals.

#### Why?

The Radio enables support for protocols in sub-GHz frequency bands while the MCU system allows customized protocols and applications to run efficiently.

#### How?

Dynamic or fixed packet lengths, optional address recognition, and flexible CRC and security schemes makes the EFR32xG23 ideal for many wireless IoT applications. High performance analog and digital peripherals allow complete applications to run on the EFR32xG23 SoC.

### 2.1 Introduction

The high level features of EFR32xG23 include:

- High performance radio transceiver
  - Low power consumption in transmit, receive, and standby modes
  - Excellent receiver performance, including sensitivity, selectivity, and blocking
  - Excellent transmitter performance, including programmable output power, low phase noise, and power-amplifier (PA) ramping
- Configurable protocol support, including standards and customer-developed protocols
  - Preamble and frame synchronization insertion in transmit, and recovery in receive
  - Flexible CRC support, including configurable polynomial and multiple CRCs for single data frames
  - Basic address filtering performed in hardware
- High performance, low power MCU system
  - High Performance 32-bit ARM Cortex®-M33 CPU
  - Flexible and efficient energy management
  - Complete set of digital peripherals
  - Peripheral Reflex System (PRS)
  - Precision analog peripherals
- Low external component count
  - Integrated tunable crystal loading capacitors
- Security
  - Secure Boot with Root of Trust and Secure Loader (RTSL)
  - Hardware Cryptographic Acceleration with DPA countermeasures for AES128/256, SHA-1, SHA-2 (up to 256-bit), ECC (up to 256-bit), ECDSA, ECDH and J-Pake
  - True Random Number Generator (TRNG) compliant with NIST SP800-90 and AIS-31
  - ARM® TrustZone®
  - Secure Debug with lock/unlock

A further introduction to the MCU and radio system is included in the following sections.

**Note:** Detailed performance numbers, current consumption, pinout etc. are available in the device datasheets.

## 2.2 Block Diagrams

The block diagram for the EFR32xG23 System-On-Chip series is shown in (Figure 2.1 EFR32xG23 System-On-Chip Block Diagram on page 33).

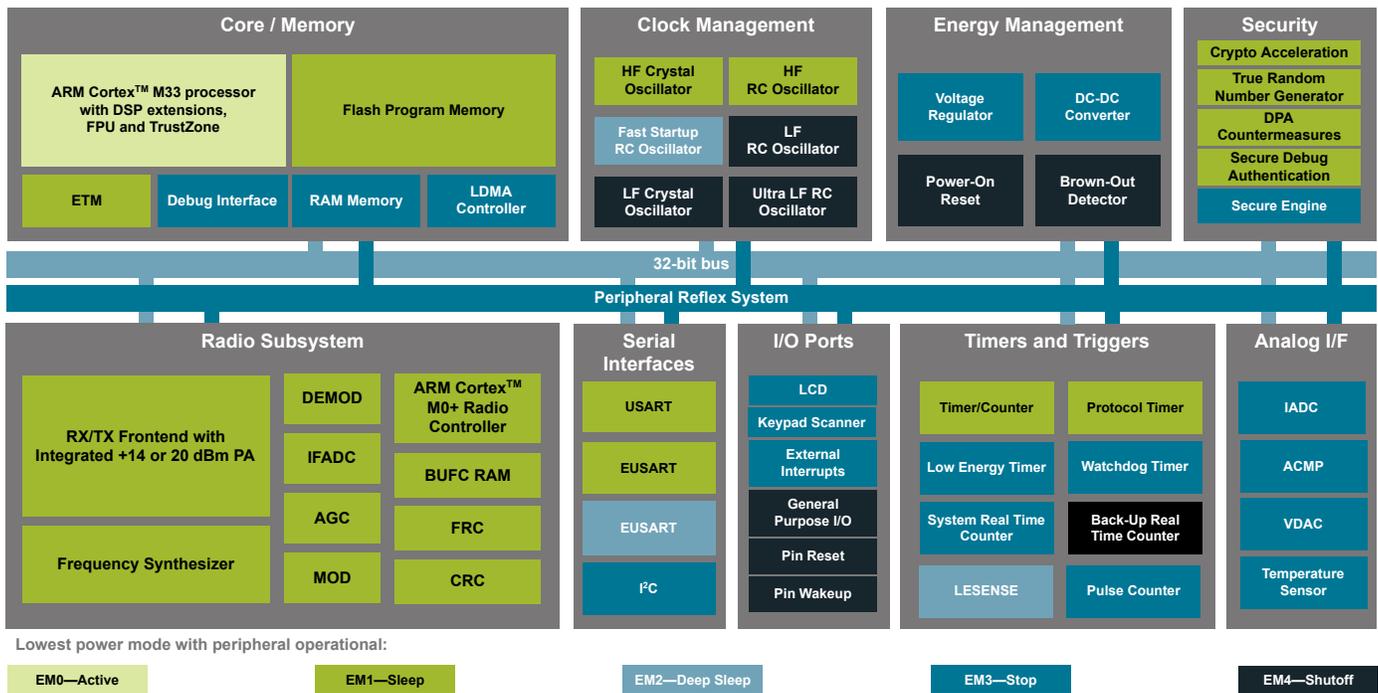

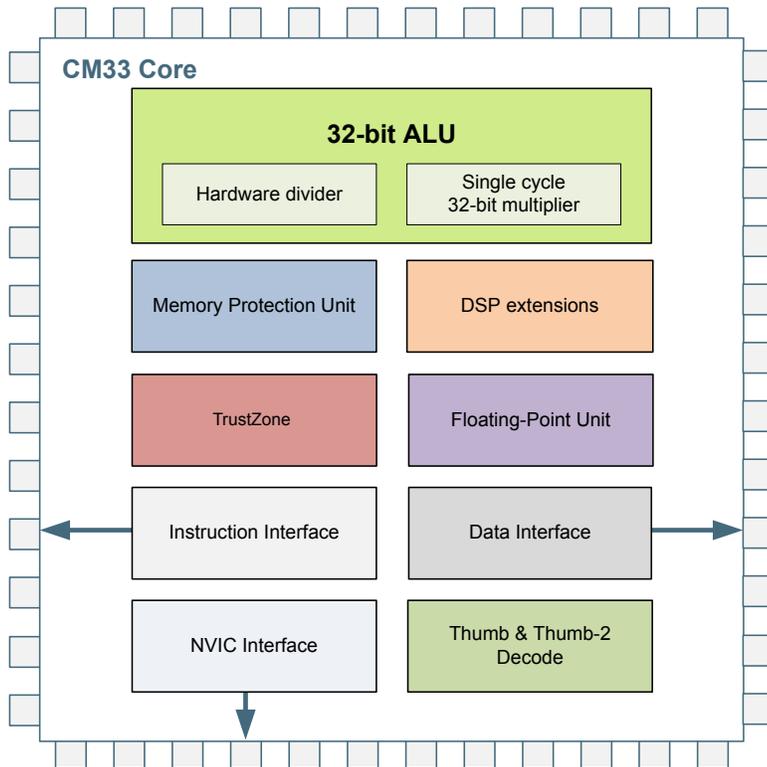

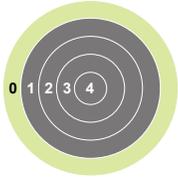

Figure 2.1. EFR32xG23 System-On-Chip Block Diagram

## 2.3 MCU Features overview

- **ARM Cortex®-M33 CPU platform**
  - High Performance 32-bit processor @ up to 80 MHz
  - DSP instruction support and floating-point unit
  - Memory Protection Unit
  - Wake-up Interrupt Controller
- **Flexible Energy Management System**
  - Five Energy Modes from EM0 to EM4 provide flexibility between higher performance and low power
  - Power routing configurations including DCDC control
  - Voltage Monitoring and Brown Out Detection
  - Automatic voltage scaling for additional energy savings
  - State Retention
- **Up to 512 kB Flash**
- **Up to 64 kB RAM**
- **Up to 31 General Purpose I/O pins**
  - Configurable push-pull, open-drain, pull-up/down, input filter, slew rate
  - Configurable peripheral I/O locations
  - 16 asynchronous external interrupts
  - Output state retention and wake-up from Shutoff Mode
- **8 Channel DMA Controller**
  - Alternate/primary descriptors with scatter-gather/ping-pong operation
- **16 Channel Peripheral Reflex System (PRS)**
  - Autonomous inter-peripheral signaling enables smart operation in low energy modes
  - 12 asynchronous channels with configurable logic functionality
  - 4 synchronous channels for high-speed signalling between TIMER, IADC, and VDAC
- **General Purpose Cyclic Redundancy Check (GPCRC)**
  - Programmable 16-bit polynomial, fixed 32-bit polynomial
  - The GPCRC module is in addition to the radio CRC
- **Communication interfaces**
  - 1 × Universal Synchronous/Asynchronous Receiver/Transmitter (USART)
    - UART/SPI/SmartCard (ISO 7816)/IrDA/I2S
    - Triple buffered full/half-duplex operation
    - Hardware flow control
    - 4-16 data bits
  - 3 × Enhanced Universal Synchronous/Asynchronous Receiver/Transmitter (EUSART)
    - UART/SPI/IrDA support
    - High-speed operation in EM0/1 using high-frequency clock source
    - One instance with low-energy operation in EM2 using 32.768 kHz clock source
    - Buffered full/half-duplex operation
    - Hardware flow control
    - 7/8/9 data bits
  - 2 × I<sup>2</sup>C Interface (I2C) with SMBus support
    - Address recognition in EM3 Stop Mode

- **Timers/Counters**
  - 1 × 32-bit and 4 × 16-bit Timer/Counters (TIMER)
    - 3 Compare/Capture/PWM channels
    - Dead-Time Insertion
  - 24-bit Low Energy Timer (LETIMER)
  - 32-bit Real-Time Counter (SYSRTC)
  - 32-bit Ultra Low Energy Backup Real Time Counter (BURTC) for periodic wake-up from any Energy Mode
  - 16-bit Pulse Counter
    - Asynchronous pulse counting/quadrature decoding
  - 2 × Watchdog Timer (WDOG)
- **Ultra low power precision analog peripherals**
  - Incremental Analog to Digital Converter (IADC) with 12-bit resolution at 1 Msps and 16-bit resolution at 76.9 ksps
    - Single ended or differential operation
    - Conversion tailgating for predictable latency
  - 12-bit 500 ksps Digital to Analog Converter (VDAC)
    - 2 single ended channels/1 differential channel
  - 2 × Analog Comparator (ACMP)
    - Programmable speed/current
  - Analog Bus (ABUS) signal routing
  - Accurate die temperature sensor
  - External thermistor interface
- **Low-energy sensor interface**
  - Autonomous sensor monitoring in deep sleep mode
  - Wide range of supported sensors including LC sensors
- **Low-energy keypad scanner**
  - Up to 6 × 8 key switches supported
  - Autonomous keypad scanning in EM0 / EM1
  - Wake on key press from EM2 / EM3
- **Integrated LCD Controller**
  - Up to 4 × 20 segments
  - Voltage boost, contrast and autonomous animation
  - Patented low-energy LCD driver
- **Ultra efficient Power-on Reset (POR) and Brown-Out Detector (BOD)**
- **Debug Interface**
  - 4-pin Joint Test Action Group (JTAG) interface
  - 2-pin serial-wire debug (SWD) interface
  - Embedded Trace (ETM) interface with 4 data lines
- **Security**
  - Secure Boot with Root of Trust and Secure Loader (RTSL)
    - Prevents malware injection and rollback
    - Ensures authentic firmware execution and OTA updates
  - Dedicated Secure Core
    - Delivers faster, more energy efficient hardware crypto with Differential Power Analysis (DPA) countermeasures for AES128/256, SHA-1, SHA-2 (up to 256-bit), ECC (up to 256-bit), ECDSA, ECDH and J-Pake
    - Provides isolation with the application core
    - Provides hardware cryptographic acceleration
    - True Random Number Generator (TRNG) compliant with NIST SP800-90 and AIS-31
  - ARM® TrustZone®
  - Secure Debug with lock/unlock
    - Allows authenticated access for enhanced Failure Analysis (FA)

### 3. System Processor

#### Quick Facts

##### What?

The EFR32xG23 features the industry leading Cortex®-M33 CPU from ARM.

##### Why?

The ARM Cortex®-M33 is designed for exceptionally short response time, high code density, and high 32-bit throughput while maintaining a strict cost and power consumption budget.

##### How?

Combined with the ultra low energy peripherals available in EFR32xG23 devices, the Cortex®-M33 processor's Harvard architecture, 3 stage pipeline, single cycle instructions, Thumb-2 instruction set support, and fast interrupt handling make it perfect for 8-bit, 16-bit, and 32-bit applications.

#### 3.1 Introduction

The ARM Cortex®-M33 32-bit RISC processor provides outstanding computational performance and exceptional system response to interrupts while meeting low cost requirements and low power consumption.

The ARM Cortex®-M33 implemented is revision r0p4.

### 3.2 Features

- Harvard architecture
  - Separate data and program memory buses (No memory bottleneck as in a single bus system)
- 3-stage pipeline
- Thumb-2 instruction set
  - Enhanced levels of performance, energy efficiency, and code density
- Single cycle multiply and hardware divide instructions
  - 32-bit multiplication in a single cycle
  - Signed and unsigned divide operations between 2 and 11 cycles
- 1.5 DMIPS/MHz
- TrustZone
  - Independent Secure and Privileged states
  - Accelerated context switching
- 16 Region MPU
- 24-bit System Tick Timer for Real Time OS
- Excellent 32-bit migration choice for 8/16 bit architecture based designs
  - Simplified stack-based programmer's model is compatible with traditional ARM architecture and retains the programming simplicity of legacy 8-bit and 16-bit architectures
- Aligned or unaligned data storage and access
  - Contiguous storage of data requiring different byte lengths
  - Data access in a single core access cycle
- Integrated power modes
  - Sleep Now mode for immediate transfer to low power state
  - Sleep on Exit mode for entry into low power state after the servicing of an interrupt
  - Ability to extend power savings to other system components
- Optimized for low latency, nested interrupts

### 3.3 Functional Description

For a full functional description of the ARM Cortex®-M33 implementation in the EFR32xG23 family, the reader is referred to the ARM Cortex®-M33 documentation.

### 3.3.1 Interrupt Operation

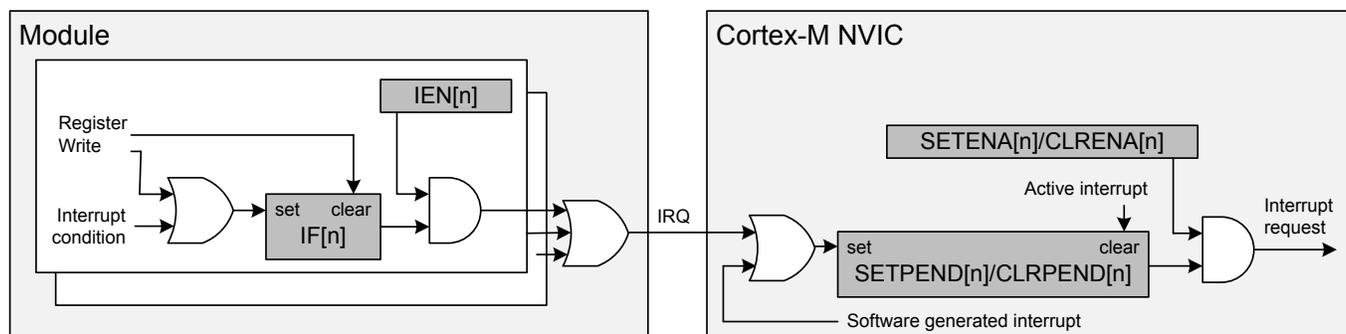

Figure 3.1. Interrupt Operation

The interrupt request (IRQ) lines are connected to the Cortex®-M33. Each of these lines (shown in 3.3.3 [Interrupt Request Lines \(IRQ\)](#)) is connected to one or more interrupt flags in one or more modules. The interrupt flags are set by hardware on an interrupt condition. It is also possible to set/clear the interrupt flags through the IF register interface. When setting or clearing an interrupt through the IF register use of the IF\_SET or IF\_CLR bit operation registers is required; directly writing the main interrupt flag register will have no effect.

Each interrupt flag is then qualified with its own interrupt enable bit (IEN register), before being OR'ed with the other interrupt flags to generate the IRQ. A high IRQ line will set the corresponding pending bit (can also be set/cleared with the SETPEND/CLRPEND bits in ISPRn/ICPRn) in the Cortex®-M33 NVIC. The pending bit is then qualified with an enable bit (set/cleared with SETENA/CLRENA bits in ISERN/ICERN) before generating an interrupt request to the core. [Figure 3.1 Interrupt Operation on page 38](#) illustrates the interrupt system. For more information on how the interrupts are handled inside the Cortex®-M33, the reader is referred to the **ARM Cortex-M33 Processor Technical Reference Manual**.

#### 3.3.1.1 Avoiding Extraneous Interrupts

There can be latencies in the system such that clearing an interrupt flag could take longer than leaving an Interrupt Service Routine (ISR). This can lead to the ISR being re-entered as the interrupt flag has yet to clear immediately after leaving the ISR. To avoid this, when clearing an interrupt flag at the end of an ISR, the user should execute ARM's Data Synchronization Barrier (DSB) instruction. Another approach is to clear the interrupt flag immediately after identifying the interrupt source and then service the interrupt as shown in the pseudo-code below. The ISR typically is sufficiently long to more than cover the few cycles it may take to clear the interrupt status, and also allows the status to be checked for further interrupts before exiting the ISR.

```
irqXServiceRoutine() {
  do {
    clearIrqXStatus();
    serviceIrqX();
  } while(irqXStatusIsActive());
}
```

### 3.3.2 TrustZone

The Cortex®-M33 implements ARM TrustZone which provides the ability to restrict access to peripherals and memory regions based on the CPU security attribute. TrustZone works in combination with the MPU which controls privileged/unprivileged execution of code to provide a full security solution. The Security Management Unit (SMU) is used to configure access restrictions in the various modes. Refer to [10. SMU - Security Management Unit](#) for more information.

For information about TrustZone features in the core or information on TrustZone specific instructions please see the ARM Cortex-M33 Processor Technical Reference Manual provided by ARM

### 3.3.3 Interrupt Request Lines (IRQ)

This table shows all IRQ's for the system processor. M33 High Speed interrupts are indicated by an '\*'.

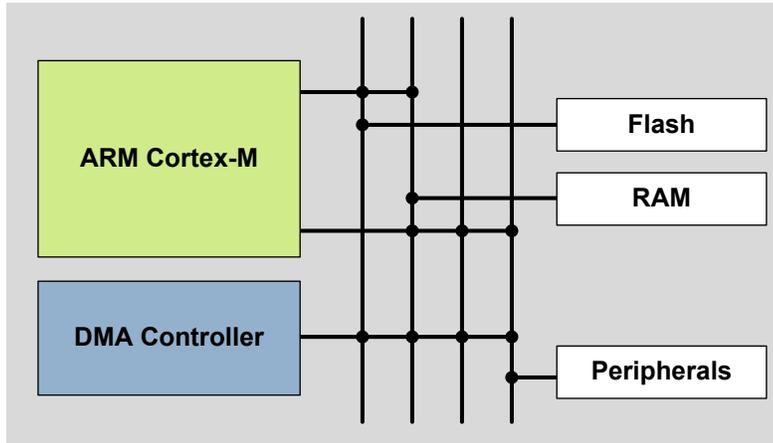

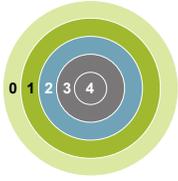

See the individual peripheral chapters for more information on interrupt function.

IRQ #	Name
0*	SMU_SECURE
1*	SMU_S_PRIVILEGED

75*	RFECA1

## 4. Memory and Bus System

### Quick Facts

#### What?

A low latency memory system including low energy Flash and RAM with data retention which makes the low energy modes attractive.

#### Why?

RAM retention reduces the need for storing data in Flash and enables frequent use of the ultra low energy modes EM2 and EM3.

#### How?

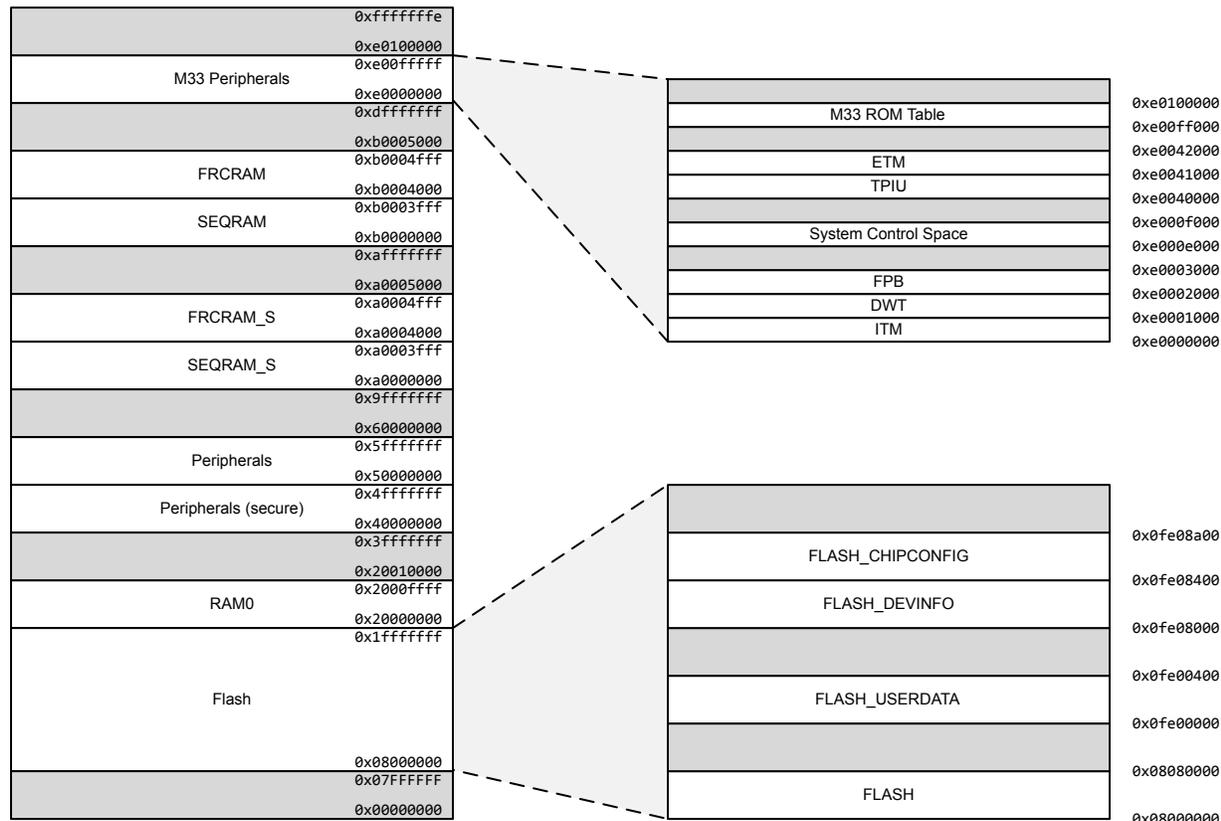

Low energy and non-volatile Flash memory stores program and application data in all energy modes and can easily be reprogrammed in system. Low leakage RAM with data retention in EM0 to EM3 removes the data restore time penalty, and the DMA ensures fast autonomous transfers with predictable response time.

### 4.1 Introduction

The EFR32xG23 contains a set of AMBA buses which move data between peripherals, memory, and the CPU. All memories and register interfaces are memory mapped into a unified address space.

## 4.2 Functional Description

The internal memory segments of the Cortex®-M33 are mapped into the system memory map as shown by [Figure 4.1 System Address Space with Core and Code Space Listing](#) on page 43.

**Figure 4.1. System Address Space with Core and Code Space Listing**

Flash for the main program memory (CODE) is located at address 0x0800000 in the memory map of the EFR32xG23. Flash memory also contains a USERDATA area intended for user-defined data storage, the DEVINFO space with device characteristics and identifying information, and CHIPCONFIG with internal production test and calibration information.

SRAM for the main data memory (RAM) is located at address 0x2000000 in the memory map of the EFR32xG23. When running code located in RAM, the Cortex®-M33 uses the System bus interface to fetch instructions. This results in reduced performance as the Cortex®-M33 accesses stack, other data in SRAM and peripherals using the System bus interface.

The Sequencer RAM (SEQRAM) is located at address 0xA000000 and is used by the Sequencer for both instructions and data. This RAM is also available for general use if not required by the RF subsystem.

### 4.2.1 Bus Matrix

A multilayer AMBA AHB bus matrix connects the manager bus interfaces to the AHB subordinates. The bus matrix allows several AHB subordinates to be accessed simultaneously. An AMBA APB interface is used for the peripherals, which are accessed through an AHB-to-APB bridge connected to the AHB bus matrix.

The CPU has two AHB bus managers (Code and System) so that it may retrieve instructions and data in parallel. The Code manager is used to access all memory below address 0x20000000 and the System manager access addresses 0x20000000 and above.

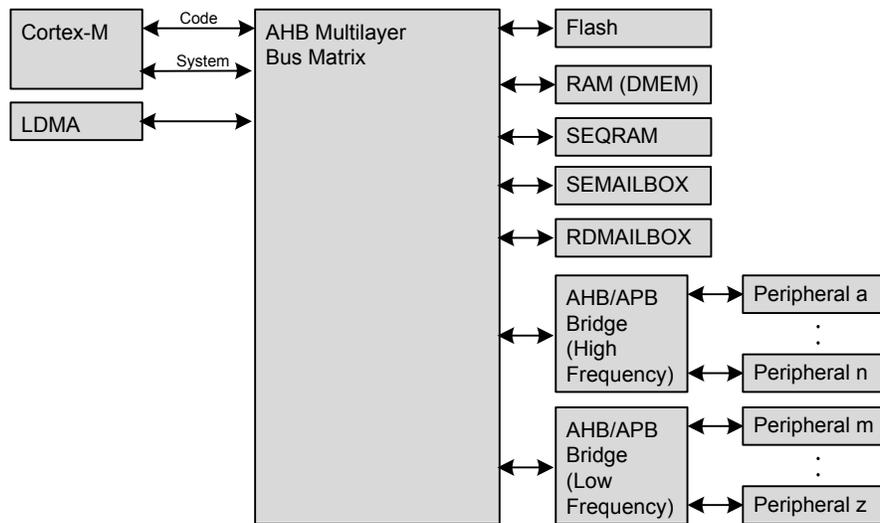

Figure 4.2. EFR32xG23 Bus System

#### 4.2.1.1 Arbitration

The Bus Matrix uses a round-robin arbitration algorithm which enables high throughput and low latency, while starvation of simultaneous accesses to the same bus subordinate are eliminated. Round-robin does not assign a fixed priority to each bus manager. The arbiter does not insert any bus wait-states during peak interaction. However, one wait state is inserted for manager accesses occurring after a prolonged inactive time. This wait state allows for increased power efficiency during manager idle time.

### 4.2.1.2 Bus Faults

System accesses from the core can receive a bus fault in the following condition(s):

- The core attempts to access an address that is not assigned to any peripheral or other system device. These faults can be enabled or disabled by setting the ADDRFAULTEN bit in the SYSCFG\_CTRL register.
- The core attempts to access a peripheral register that is LOCKED.
- The core attempts to access a peripheral or system device that has its clock disabled. This fault can be enabled or disabled by setting the ADDRFAULTEN bit in the SYSCFG\_CTRL register.
- System RAM controller or RADIO RAM controller detects a 2bit ECC error. These faults can be enabled or disabled by setting the RAMECCERRFAULTEN bit in the SYSCFG\_CTRL register.
- Registers with synchronization requirements may generate bus faults if accessed incorrectly. See [4.2.4.4 Peripheral Access Performance](#) for more details on register access types. In particular the following actions can cause bus faults:
  - Config register written while peripheral enabled.
  - Sync register written while peripheral disabled.
  - LfSync register written while a previous write is pending.
  - Peripheral disabled while any LfSync write is pending.
  - Peripheral registers written or module re-enabled while DISABLING is set.
  - Peripheral registers other than write-only fields or SWRST read while RESETTING is set.
  - Peripheral registers other than read-only fields (including SWRST) written while RESETTING is set.

In addition to any condition-specific bus fault control bits, the bus fault interrupt itself can be enabled or disabled in the same way as all other internal core interrupts.

### 4.2.2 Flash

The Flash retains data in any state and typically stores the application code and special user data. The Flash memory is typically programmed through the debug interface, but can also be erased and written to from software.

- Up to 512 kB of memory
- Page size of 8 KB (minimum erase unit)
- Lock registers for memory protection
- Data retention in any state

### 4.2.3 SRAM

The primary task of the SRAM memory is to store application data. Additionally, it is possible to execute instructions from SRAM, and the DMA may be set up to transfer data between the SRAM, Flash and peripherals.

The device contains several blocks of SRAM for various purposes including general data memory (RAM) and various RF subsystem rams (SEQRAM, FRCRAM). For more detailed information see [6. MSC - Memory System Controller](#).

- Up to 64 kB of memory (RAM)
- RAM blocks may be powered down when not in use
- Data retention of the entire memory or selected banks in EM2 and EM3

### 4.2.4 Peripherals

The peripherals are mapped into the peripheral memory segment, each with a fixed size address range shown in the [4.2.4.1 Peripheral Map](#)

#### 4.2.4.1 Peripheral Map

This table shows the address range for each peripheral. In addition it shows the lowest energy mode in which the peripheral is powered. Note that EM3 is defined as EM2 with all clocks disabled. Therefore all peripherals powered in EM2 are also powered in EM3 but may not function if they require a running clock.

See the individual peripheral chapters for more information on low power operation.

Address Range	Module Name	Power Domain
0x40000000 - 0x40003FFF	SCRATCHPAD	EM1
0x40004000 - 0x40007FFF	EMU	EM2 (PD0A)

0xB8034000 - 0xB8037FFF	RFECA1_NS	EM1
0xB8038000 - 0xB803BFFF	ECAIFADC_NS	EM1
0xBA000000 - 0xBA003FFF	BUFC_NS	EM1
<b>Note:</b> 1. Peripherals listed as being in EM2 (PD0A) always remain powered in EM2 and EM3. Other EM2 power domains (PD0B, PD0C, etc.) are powered down in EM2 and EM3 if all peripherals on that domain are unused.		

#### 4.2.4.2 Peripheral non-word access behavior

When writing to peripheral registers, all accesses are treated as 32-bit accesses. This means that writes to a register need to be large enough to cover all bits of register, otherwise, any uncovered bits may become corrupted from the partial-word transfer. Thus, the safest practice is to always do 32-bit writes to peripheral registers.

When reading, there is generally no issue with partial word accesses, however, note that any read action (e.g. FIFO popping) will be triggered regardless of whether the actual FIFO bit-field was included in the transfer size.

#### 4.2.4.3 Peripheral Bit Set and Clear

The EFR32xG23 supports bit set, bit clear, and bit toggle access to most peripheral registers. The bit set and bit clear functionality (also called Bit Access) enables modification of bit fields without the need to perform a read-modify-write. Also, the operation is contained within a single bus access. Bit access registers and their addresses are shown in the register map for each peripheral. Peripherals with no `_SET`, `_CLR`, or `_TGL` registers in the register map do not support these functions.

Each register with Bit Set functionality will have a `_SET` register. Whenever a bit in the SET register is written to a 1 the corresponding bit in its target register is set. The SET register is located at `TARGET + 0x1000` where TARGET is the address of the target register and has the same name as the target register with `'_SET'` appended.

Each register with Bit Clear functionality will have a CLR register. Whenever a bit in the CLR register is written to a 1 the corresponding bit in its target register is cleared. The CLR register is located at `TARGET + 0x2000` where TARGET is the address of the target register and has the same name as the target register with `'_CLR'` appended.

Each register with Bit Toggle functionality will have a TGL register. Whenever a bit in the TGL register is written to a 1 the corresponding bit in its target register is inverted. The TGL register is located at `TARGET + 0x3000` where TARGET is the address of the target register and has the same name as the target register with `'_TGL'` appended.

**Note:** It is possible to combine bit clear and bit set operations in order to arbitrarily modify multi-bit register fields without affecting other fields in the same register. In this case, care should be taken to ensure that the field does not have intermediate values that can lead to erroneous behavior. For example, if bit clear and bit set operations are used to change an analog tuning register field from 0x2 to 0x4 by clearing bit 1 and then setting bit 2, the field would take on a value of zero for short time. If the analog module is active at the time, this could lead to undesired behavior.

#### 4.2.4.4 Peripheral Access Performance

The Cortex®-M33, DMA Controller, and peripherals run on clocks which can be pre-scaled separately. Clocks and pre-scaling are described in more detail in [8. CMU - Clock Management Unit](#). This section describes the access performance for a peripheral register based on its frequency relative to the CPUCLK frequency and its access type. For this discussion, PERCLK refers to a selected peripheral's clock frequency and CPUCLK refers to the core's clock frequency.

The type of each register in a peripheral is indicated in the 'Access' column of the peripherals register table. Register types are: ENABLE, CONFIG, SYNC, LFSYNC, and INTFLAG. If not type is listed then the register is a Generic register.

##### 4.2.4.4.1 Generic Registers

Registers with no type listed are generic registers. They may be read or written to at any time. Access will not stall the CPU.

##### 4.2.4.4.2 CONFIG Registers

CONFIG Registers contain configuration that does not change during peripheral operation.

CONFIG registers may only be written when a peripheral is disabled. Writing to a CONFIG register when a peripheral is enabled will result in a BUSFAULT. CONFIG register writes will not stall the CPU.

CONFIG registers may be read at any time. Reads will not stall the CPU.

##### 4.2.4.4.3 SYNC Registers

SYNC registers are used to communicate with running high-speed peripherals where PERCLK is expected to be either higher or marginally slower (within an order of magnitude) than CPUCLK. For example a timer running at 78 MHz when the core is at 39 MHz or at 9.75 MHz when the core is 78 MHz. In this case CPU stalls of several PERCLK cycles do not significantly impact overall system performance in most systems.

SYNC registers may only be written to when the peripheral is enabled. Writing to a SYNC register when a peripheral is disabled will result in a BUSFAULT. A write will take several (2 - 3) PERCLK cycles to complete (take effect) during which time the entire module will be in a pending state. If a SYNC register is written to while the peripheral is already in a pending state, the CPU is stalled until the previous write finishes. If a SYNC register is written to while the peripheral is not in a pending state, the CPU is not stalled.

SYNC registers may be read at any time. If a SYNC register is read while the peripheral is disabled, the CPU is not stalled. If a SYNC register is read while the peripheral is enabled, the CPU will be stalled for several (2 -3) PERCLK cycles while up to date values are retrieved from the peripheral.

#### 4.2.4.4.4 LFSYNC Registers

LFSYNC registers are used to communicate with running low frequency peripherals where PERCLK is expected to be much lower than the CPU clock and synchronization delays may be long. For example, a LETIMER running at 32 kHz when the core is at 78 MHz. In this case CPU stalls of several PERCLK cycles represent a significant blockage of the CPU and need to be avoided whenever possible. LFSYNC registers accommodate this by allowing the CPU to write the register and continue to do other work while the value is synchronized.

LFSYNC registers may be written at any time. A write will take several (3 -4) PERCLK cycles to complete during which the register will be in a pending state. If a LFSYNC register is written to while it is in a pending state, a BUSFAULT will occur. Each LFSYNC register has a status bit indicating if it is currently pending.

LFSYNC registers may be read at any time. The CPU is never stalled on a read. If a LFSYNC register is read while pending, the pending (recently written) data will be returned even though it has not yet taken effect. Software may use the busy status bit to determine if the read value has been applied to the hardware.

#### 4.2.4.4.5 ENABLE Registers

ENABLE registers contain the enable bit for a peripheral.

ENABLE registers may be written at any time. When the peripheral is enabled it takes some time for the enable to take effect during which time the module is pending. Peripherals will be in the pending state for a few (2 - 3) PERCLK cycles when first enabled. Since the clock source for the peripheral may not be running before the peripheral is enabled, the start up time for the clock source may increase the pending time. See [EFR32xG23 Wireless SoC](#) for more information on on-demand clock sources.

When EN is cleared to 0, the peripheral will be disabled. The DISABLING status bit will be set to 1 until the operation is complete. During disablement, the module will wait for any SYNCBUSY status to clear, reset the core peripheral function, and de-assert the peripheral clock. Entry into low energy modes EM2 and EM3 will be delayed while a peripheral is disabling.

While DISABLING is set, writing to any register in the module, including attempts to re-enable with EN, will cause a bus fault condition. Any register in the module can be read while DISABLING.

#### 4.2.4.4.6 SWRST Registers

SWRST registers are available in some blocks to reset the module back to the initial condition, similar to a power-on reset.

SWRST registers have a SWRST bit, which will reset the peripheral when written to 1. These registers also contain a status bit, RESETTING, which indicates that a reset is in progress.

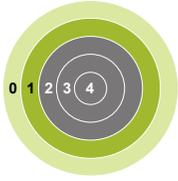

If a peripheral is resetting due to SWRST, entry into low energy modes EM2 and EM3 will be delayed. Writing to the SWRST bit or any other writeable register while a reset is in progress will generate a bus fault condition.

#### 4.2.4.4.7 INTFLAG Registers

INTFLAG registers contain interrupt flags. To set or clear an interrupt flag, the `_SET` or `_CLR` register alias must be used. Writing directly to the INTFLAG register will have no effect.

Note that for an interrupt to occur when a flag is set the IRQ must be enabled in the NVIC.

## 5. Radio Transceiver

### Quick Facts

#### What?

The Radio Transceiver provides access to transmit and receive data, radio settings and control interface.

#### Why?

The Radio Transceiver enables the user to communicate using a wide range of data rates, modulation and frame formats.

#### How?

Dynamic or fixed frame lengths, optional address recognition, flexible CRC and crypto schemes makes the EFR32 Series 2 perfectly suit any application using low or medium data rate radio communication.

## 5.1 Introduction

The Radio Transceiver of the EFR32 Series 2 enables the user to control a wide range of settings and options for tailoring radio operation precisely to the users need. It provides access to the transmit and receive data buffers and supports both dynamic and static frame lengths, as well as automatic address filtering and CRC insertion/verification.

As seen in the Radio Overview illustration (Figure 5.1 Radio Overview on page 53), the radio consists of several modules all responsible for specific tasks. Please refer to the abbreviations section (Appendix 1. Abbreviations) for a comprehensive description of acronyms.

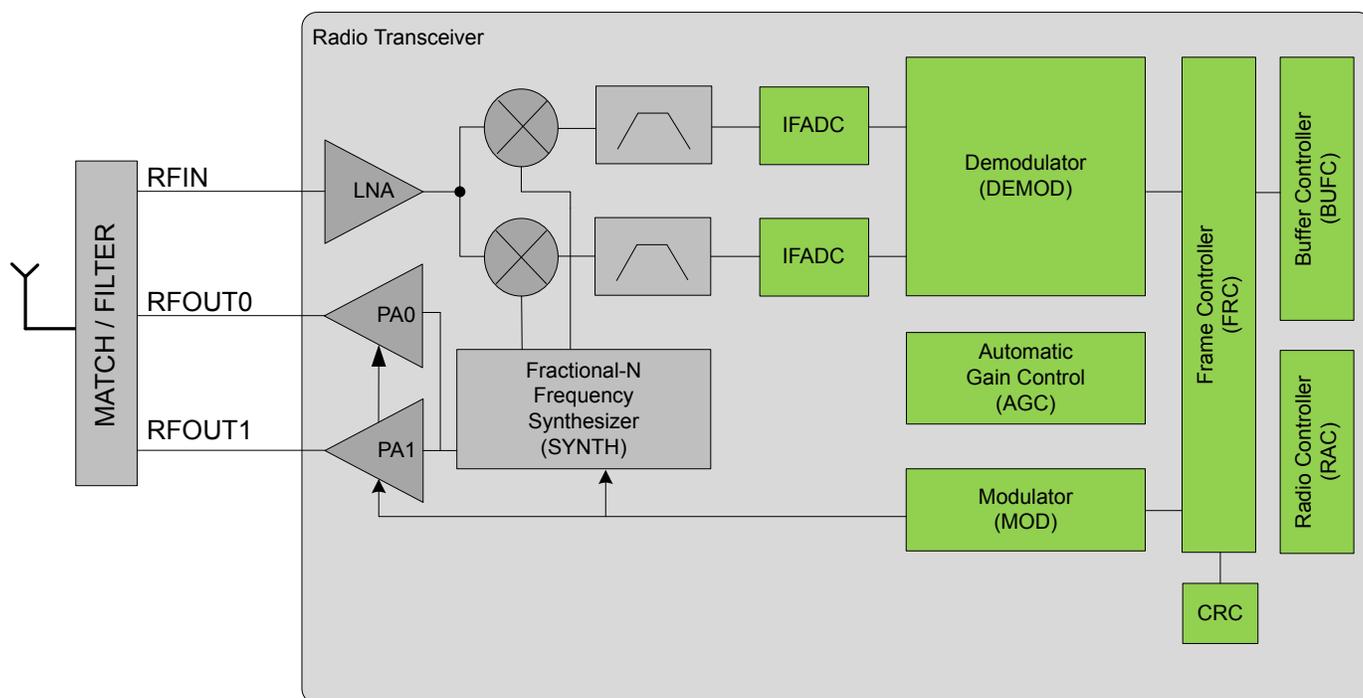

Figure 5.1. Radio Overview

During transmission (TX), the Radio Controller enables the Frequency Synthesizer (SYNTH), Modulator (MOD), and Power Amplifier (PA). The Modulator requests data from the Frame Controller (FRC), which reads data from a buffer. Based upon modulation format and data to send, the Modulator manipulates the SYNTH to output the correct frequency and phase. When the whole frame has been transmitted, the radio can automatically switch to receive mode.

In receive mode (RX), the radio controller enables the Low Noise Amplifier (LNA), Frequency Synthesizer (SYNTH), Mixers, Intermediate Frequency ADCs (IFADC), and Demodulator (DEMOD). The Demodulator searches for valid frames according to modulation format and data rate. If a frame is detected, the demodulated data is handed to the Frame Controller (FRC), which stores the data in the Buffer. When the complete frame has been received (determined by the Frame Controller), it is possible to either go to TX or stay in RX to search for a new frame.

The Radio Transceiver interface is accessible through software drivers provided by Silicon Labs.

### 5.1.1 RF Frequency Synthesizer

The Fractional-N RF Frequency Synthesizer (SYNTH) provides a low phase noise LO signal to be used in both receive and transmit modes.

The capabilities of the SYNTH include:

- High performance, low phase noise
- Fast frequency settling
- Fast and fully automated calibration
- Sub 100 Hz frequency resolution across the supported frequency bands

### 5.1.2 Modulation Modes

EFR32xG23 supports a wide range of modulation modes in transmit and receive:

- 2-FSK, 2-GFSK, 4-FSK, MSK, GMSK, O-QPSK with half-sine shaping, ASK / OOK, DBPSK TX
- NRZ or Manchester support
- UART mode over air for legacy protocols
- Baudrates ranging from below 100 Baud/s to 2 MBaud/s, allowing data rates up to 4 MBit/s
- Configurable frequency deviation
- Configurable Direct Sequence Spread Spectrum (DSSS), with spread sequences up to 32 chips encoding up to 4 information bits
- Configurable 4-FSK symbol encoding

### 5.1.3 Transmit Mode

In transmit mode EFR32xG23 performs the following functionality:

- Automatic PA power ramping during the start and end of a frame transmit
- Programmable output power
- Optional preamble and synchronization word insertion
- Accurate transmit frame timing to support time synchronized radio protocols
- Optional Carrier Sense Multiple Access - Collision Avoidance (CSMA-CA) or Listen Before Talk (LBT) hardware support
- Integrated transmit test modes, as described in [5.1.12 RF Test Modes](#)

### 5.1.4 Receive Mode

In receive mode EFR32xG23 performs the following functionality:

- A single-ended LNA amplifies the input RF signal. The amplified signal is then mixed to a low-IF signal through the quadrature down-conversion mixer. Further signal filtering is performed before conversion to a digital signal through the I/Q ADC.
- Digitally configurable receiver bandwidth from 100 Hz to 2.5 MHz
- Timing recovery on received data, including simultaneous support for two different frame synchronization words
- Automatic frequency offset compensation, to compensate for carrier frequency offset between the transmitter and receiver
- Support for a wide range of modulation formats as described in section [5.1.2 Modulation Modes](#)

### 5.1.5 Data Buffering

EFR32xG23 supports buffered transmit and receive modes through its buffer controller (BUFC), with four individually configurable buffers. The BUFC uses the system RAM as storage, and each buffer can be individually configured with parameters such as:

- Buffer size
- Buffer interrupt thresholds
- Buffer RAM location
- Overflow and underflow detection

In receive mode, data following frame synchronization is moved directly from the demodulator to the buffer storage.

In transmit mode, data following the inserted preamble and synchronization word is moved directly from the buffer storage to the modulator.

### 5.1.6 Unbuffered Data Transfer

For most system designs it is recommended to use the data buffering within EFR32xG23 to provide a convenient user interface.

In unbuffered data transfer modes the hardware support provided by EFR32xG23 to perform preamble and frame synchronization insertion in transmit mode and detection in receive mode can still optionally be used.

### 5.1.7 Frame Format Support

EFR32xG23 has an extensive support for frame handling in transmit and receive modes, which allows effective handling of even advanced protocols. The frame format support is controlled by the Frame Controller (FRC). The support includes:

- Preamble and frame synchronization inserted into transmitted frames
- Full frame synchronization of received frames
- Simple address matching of received frames in hardware, further configurable address and frame filtering supported through sequencer
- Support for variable length frames
- Automated CRC calculation and verification
- Configurable bit ordering, with the most or least significant bit transmitted and received first

### 5.1.8 Hardware CRC Support

EFR32xG23 supports a configurable CRC generation in transmit and verification in receive mode:

- 8, 16, 24 or 32 bit CRC value
- Configurable polynomial and initialization value
- Optional inversion of CRC value over air
- Configurable CRC byte ordering
- Support for multiple CRC values calculated and verified per transmitted or received frame
- The CRC module is typically controlled by the Frame Controller (FRC) for in-line operations in transmit and receive modes. Alternatively, the CRC module may be accessed directly from software to calculate and verify CRC data.

### 5.1.9 Convolutional Encoding / Decoding

EFR32xG23 includes hardware support for convolutional encoding and decoding, for forward error correction (FEC). This feature is performed by the Frame Controller (FRC) module:

- Constraint length configurable up to 7, for the highest robustness
- Configurable puncturing, to achieve rates between 1/2 rate and full rate
- Configurable soft decision or hard decision decoding
- Convolutional coding may be used together with the symbol interleaver to improve robustness against burst errors

### 5.1.10 Binary Block Encoding / Decoding

EFR32xG23 includes hardware support for binary block encoding and decoding, both performed real-time in the the transmit and receive path. This is performed in the Frame Controller (FRC) module:

The block coding works on blocks of up to 16 bits of data and adds parity bits to be capable of single or multiple bit corrections by the receiver.

- One or more parity bits can be added and verified
- Bit error correction
- Lookup-codes can be used to implement virtually any block coding scheme

### 5.1.11 Data Encryption and Authentication

EFR32xG23 has hardware support for AES encryption, decryption and authentication modes. These security operations can be performed on data in RAM or any data buffer, without further CPU intervention. The key size is 128 bits.

AES modes of operations directly supported by the EFR32xG23 hardware are listed in [Table 5.1 AES modes of operation with hardware support on page 56](#). In addition to these modes, other modes can also be implemented by using combinations of modes. For example, the CCM mode can be implemented using the CTR and CBC-MAC modes in combination.

**Table 5.1. AES modes of operation with hardware support**

AES Mode	Encryption / Decryption	Authentication	Comment
ECB	Yes	-	Electronic Code Book
CTR	Yes	-	Counter mode
CCM	Yes	Yes	Counter with CBC-MAC
CCM*	Yes	Yes	CCM with encryption-only and integrity-only capabilities
GCM	Yes	Yes	Galois Counter Mode
CBC	Yes	-	Cipher Block Chaining
CBC-MAC	-	Yes	Cipher Block Chaining, Message Authentication Code
CMAC	-	Yes	Cipher-based MAC
CFB	Yes	-	Cipher Feedback
OFB	Yes	-	Output Feedback

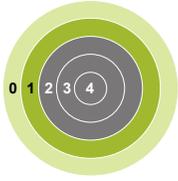

The Cryptographic Acceleration module can operate directly on data buffers provided by the buffer controller (BUFC) module. It is also possible to provide data directly from the embedded Cortex®-M33 or via DMA.

### 5.1.12 RF Test Modes

EFR32xG23 supports a wide range of RF test modes typically used for characterization and regulation compliance testing, including:

- Unmodulated carrier transmit
- Modulated carrier transmit, with internal configurable pseudo random data generator
- Continuous data reception for Bit Error Rate (BER) measurements
- Storing of raw receiver data to RAM
- Transmit of raw frequency data from RAM

### Quick Facts

#### What?

The user can perform flash memory read, read configuration, and write operations through the Memory System Controller (MSC). SRAM operation may be configured through System Configuration (SYSCFG).

#### Why?

The MSC allows the application code and user data to be stored in non-volatile flash memory. Certain memory system functions, such as program memory wait-states and flash lock bits are configured from the MSC peripheral register interface, giving the developer the ability to dynamically customize the memory system performance, security level, energy consumption and error handling capabilities to the requirements at hand.

#### How?

The MSC integrates a low-energy flash IP with a charge pump, enabling minimum energy consumption while eliminating the need for external programming voltage to erase the memory. An easy to use write and erase interface is supported by an internal, fixed-frequency oscillator and autonomous flash timing and control reduces software complexity while not using other timer resources.

A highly efficient low energy instruction cache reduces the number of flash reads significantly, thus saving energy. Performance is also improved when wait-states are used, since many of the wait-states are eliminated. Built-in performance counters can be used to measure the efficiency of the instruction cache.

Instruction prefetcher improves program execution performance by reducing the number of wait-state cycles needed.

### 6.1 Introduction

The Memory System Controller (MSC) is the program memory unit of the EFR32xG23 microcontroller. The flash memory is readable and writable from both the Cortex®-M33 and DMA. The flash memory is divided into two blocks: the main block and the information block. Program code is normally written to the main block. The information block is available for special user data. There is also a read-only page in the information block containing system and device calibration data. Flash read and write operations are supported in energy modes EMO and EM1.

## 6.2 Features

- AHB read interface
  - Scalable access performance to optimize the Cortex®-M33 code interface
    - Advanced energy optimization functionality
      - Conditional branch target prefetch suppression
      - Cortex®-M33 unfolding of if-then (IT) blocks
      - Instruction Cache
      - Instruction Prefetch
  - DMA read support in EM0 and EM1
- Command and status interface
  - Flash write and erase
    - Accessible from Cortex®-M33 in EM0
    - DMA write support in EM0 and EM1
  - Core clock independent flash timing
    - Internal oscillator and internal timers for precise and autonomous flash timing
      - General purpose timers are not occupied during flash erase and write operations
      - No special time scaling registers needed
  - Configurable interrupt erase abort
    - Improved interrupt predictability
  - Memory and bus fault control
- Security features
  - Lockable debug access
  - Page lock registers
  - SW Mass erase and User Data lock bits
- End-of-write and end-of-erase interrupts

## 6.3 Functional Description

The size of the main flash block is device dependent. The largest size available is 512 kB (64 pages). The information block has 1 kB available for user data. The information block also contains chip configuration data located in a reserved area. The main block is mapped to address 0x08000000 and the information block is mapped to address 0x0FE00000. [Table 6.1 MSC Flash Memory Mapping on page 58](#) outlines how the flash is mapped in the memory space. All flash memory is organized into 8 kB pages.

**Table 6.1. MSC Flash Memory Mapping**

Block	Page	Base address	Write/Erase by...	Software Readable?	Purpose/Name	Size
Main	0	0x08000000	Software, debug	Yes	User code and data	16 kB - 512 kB
	1	0x08002000	Software, debug	Yes		
	...		Software, debug	Yes		
	63 <sup>1</sup>	0x0807E000	Software, debug	Yes		
Information	N/A	0x0FE00000	Software, debug	Yes	User Data (UD)	1 kB
	N/A	0x0FE08000	-	Yes	Device Information (DI)	1 kB

**Note:**

1. 64 pages for largest device.

### 6.3.1 RAM Configuration

The SYSCFG and MPAHBRAM modules contain controls for configuring the various RAM blocks on the device. Options include enabling EM2/EM3 data retention, ECC, and RAM port priorities. For a complete description see [6.6 SYSCFG - System Configuration](#).

### 6.3.2 Instruction Cache

The instruction cache improves the speed and power consumption of the Cortex®-M33 by providing fast, low-power access to recently executed instructions. For detailed information see [6.5 ICACHE - Instruction Cache](#)

### 6.3.3 Device Information (DI) Page

This read-only page holds calibration data from the production test, several unique device IDs, and other part specific information. For a complete description see [6.4 DEVINFO - Device Info Page](#).

### 6.3.4 User Data (UD) Page Description

This is the user data page in the information block. The page can be erased and written by software when MISCLOCKWORD.UDLOCKBIT is 0.

### 6.3.5 Bootloader

The EFR32xG23 supports use of the Gecko Bootloader detailed in *UG489: Silicon Labs Gecko Bootloader User's Guide for GSDK 4.0 and Higher* (<https://www.silabs.com/support/resources>). To enable bootloader functionality, the second stage of the bootloader must be configured and programmed into the beginning of flash. The first stage of the bootloader is provided by the SE and is not user accessible. For more details on SE bootloader support, see the SE peripheral documentation.

### 6.3.6 Post-reset Behavior

Calibration values are automatically written to registers by the MSC before application code start-up. The values can also be read from the DI page by software. Other information such as the device ID and production date is also stored in the DI page and is readable from software.

As part of the reset, hardware performs repeated flash reads to determine when flash is fully powered up and available for use by the CPU. PWRUPCKBDFAILCOUNT in MSC\_STATUS contains the number of failed reads during the last reset.

### 6.3.7 Flash Startup

Flash wakeup on demand is supported when waking from EM2/3 to EM0. Set bit FLASHPWRUPONDEMAND of register EMU\_CTRL to enable the power up on demand. When enabled, flash will not be powered up until accessed. In this case it is possible for the MCU to wake, execute out of RAM or cache, and return to sleep mode without ever powering on the flash. Software can force the flash to power up by writing PWRUP in MSC\_CMD. When flash is powered via MSC\_CMD the MSC\_IF.PWRUPF interrupt flag will be set when power up is complete and the CPU will be interrupted if MSC\_IEN.PWRUPF is set.

### 6.3.8 Flash EM0 / EM1 Power Down

It is also possible to put the flash in a power-saving sleep mode when the system is in EM0 or EM1. Flash power down can be configured to happen on entering EM1, radio-only sleep, or with an immediate manual operation.

During EM0, software can instruct the flash to go to power down mode with the MSC\_CMD.PWROFF command. Any system IRQ or flash read will wake the flash. The MSC\_CMD.PWRUP command is used to power the flash back up in the absence of a wake event.

The MSC\_PWRCTRL register allows the flash to be configured to automatically enter sleep mode on entering EM1 or radio-only sleep with the bits PWROFFONEM1ENTRY and PWROFFONEM1PENTRY, respectively. If the flash is configured to sleep during one of these states, it may sometimes be powered back up without processor intervention in EM0 (for example, if DMA reads flash in EM1). By default, the flash will remain powered on after such access. If the PWROFFENTRYAGAIN bit is set, it instructs the flash to re-enter the power down state if no further access is seen during the timeout period defined by PWROFFDLY. Flash must be idle for PWROFFDLY \* 64 bus clocks before it will enter sleep again.

### 6.3.9 Wait-states

Since the CPU may be clocked faster than the flash can respond, it is necessary to configure wait-states for flash accesses at higher CPU clock speeds. See the device Datasheet for information on the maximum allowed frequency for each wait-state setting. To configure the flash wait-states set the MODE field in MSC\_READCTRL.

When changing wait states, care should be taken that the system is never in an invalid state. To ensure this, MODE should be changed after the clock is changed when reducing clock speed and before the clock is changed when increasing clock speed.

### 6.3.10 Cortex®-M33 If-Then Block Folding

The Cortex®-M33 offers a mechanism known as if-then block folding. This is a form of speculative prefetching where small if-then blocks are collapsed in the prefetch buffer if the condition evaluates to false. The instructions in the block then appear to execute in zero cycles. With this scheme, performance is optimized at the cost of higher energy consumption as the processor fetches more instructions from memory than it actually executes. To disable the mode, write a 1 to the DISFOLD bit in the NVIC Auxiliary Control Register; see the Cortex®-M33 Technical Reference Manual for details. Normally, it is expected that this feature is most efficient when operating with 0 wait-states. Folding is enabled by default.

### 6.3.11 Line Buffering (Prefetch)

The MSC reads a 2-word line from flash on any flash access. The data being accessed is returned immediately and the other word locally cached so that it can be provided immediately if accessed. This has the effect of pre-fetching the second word when the first is read, resulting in fewer wait-states when executing sequential code. This feature may be disabled by setting DOUTBUFEN in MSC\_READCTRL.

### 6.3.12 Erase and Write Operations

To erase a page first set WREN in MSC\_WRITECTRL and load any address in the page to be erased into the MSC\_ADDRB register. Next check INVADDR, LOCKED, and WREADY in MSC\_STATUS to ensure that the address is valid, not locked, and the MSC is ready to modify flash. Writing ERASEPAGE in MSC\_WRITECMD will execute the page erase operation. ERASE in MSC\_IF will be set when the page erase is complete. If ERASE in MSC\_IEN is set, the end of a page erase will also trigger an interrupt. Finally, clear WREN to disable flash operations.

In addition to a page erase, a mass erase will clear the entire contents of the main flash array. A mass erase can be initiated by the Secure Engine. User Data page contents are not included in a mass erase.

To perform a programming operation, set WREN and load the address to be programmed into the MSC\_ADDRB register. Next check INVADDR, LOCKED, WREADY, and WDATAREADY in MSC\_STATUS to ensure that the address is valid, not locked, the MSC is ready to modify flash, and the write data buffer is clear. Writing data to MSC\_WDATA will begin the programming operation. If a burst write is being performed, the next data word can be programmed to MSC\_WDATA as soon as WDATAREADY is set. WRITE in MSC\_IF will be set when the programming operation is complete. If WRITE in MSC\_IEN is set, the end of the program operation will also trigger an interrupt. Finally, clear WREN to disable flash operations.

If data is written to the MSC\_WDATA register faster than it can be processed, WDATAOV in MSC\_IF will be set. If WDATAOV in MSC\_IEN is set an interrupt will also be fired.

The MSC\_ADDRB register only has to be written once when writing to sequential words. After each word is written, ADDRb is incremented automatically by 4. The INVADDR bit of the MSC\_STATUS register is set if the loaded address is outside the flash. The LOCKED bit of the MSC\_STATUS register is set if the page addressed is locked. Any attempts to erase or write to the page are ignored if INVADDR or the LOCKED bits of the MSC\_STATUS register are set.

Write and erase operations may be aborted by software. To abort an erase, set the ERASEABORT bit in the MSC\_WRITECMD register. To abort a write, set WRITEEND in MSC\_WRITECMD.

For a DMA write, CLEARWDATA in MSC\_WRITECMD to assert a DMA request and transfer the first word. Alternately the first word may be programmed manually into MSC\_WDATA by code.

By default, if any interrupt occurs during an erase operation, the erase is aborted. This feature may be disabled by clearing IRQERASEABORT in MSC\_WRITECTRL. When an erase is aborted due to an interrupt, ERASEABORTED in MSC\_STAUTS is set by hardware.

Software may observe the status of the MSC via the MSC\_STATUS register. When a flash operation is in progress, BUSY will be set. If a flash operation has been requested but not yet started, PENDING will be set. This may occur if a subsystem is performing MSC operations. When the write buffer underflows, TIMEOUT will be set. Buffer underflow is a normal part of the write procedure since it will occur once the last word has been written and no more data is available.

The flash memory is organized into 64-bit wide double-words. Each 64-bit double-word can be written only twice between erase cycles. The lower and upper 32-bit words may be written sequentially in any order, or one at a time. Each flash bit is 1 after erase. Writing a 0 will clear the bit. Writing a 1 will not change the bit value.

While it is possible to write twice to the lower or upper 32-bit word of the 64-bit double word, then the other 32-bit word cannot be used. In this case, it is permitted to write to either the lower or upper 32-bit word twice between each erase, so long as no bit is ever cleared more than once.

**Note:** The ERASEPAGE bit in WRITECMD and the WDATA register cannot safely be written from code in flash. It is recommended to place a small code section in RAM to set these bits and wait for the operation to complete. Also note that DMA transfers to or from any other address in flash while a write or erase operation is in progress will produce unpredictable results.

**Note:** During a write or erase, flash read accesses will be stalled, effectively halting code execution from flash. Code execution continues upon write/erase completion. Code residing in RAM or ICACHE may be executed during a write/erase operation.

#### 6.3.12.1 Low-Power Write

To limit maximum current, the programming operations can be slowed down. Set LPWRITE in MSC\_WRITECTRL to double the write time and halve the write current.

### 6.3.12.2 Flash Lock

The ability to program or erase individual flash pages may be disabled using the MSC\_PAGELOCKn registers. The bits in these registers may only be set to 1 by software on the device and are cleared when the device is reset. This means that once locked, a page may not be unlocked until a reset occurs. Users wishing to lock accesses to flash should implement code to write to the MSC\_PAGELOCKn registers immediately after a reset. Any page locked in this way cannot be written to or erased.

User Data can be locked by setting MSC\_MISLOCKWORD.UDLOCK to 1. Mass erase is enabled out of reset, however if firmware sets MELOCKBIT in the MSC\_MISLOCKWORD register, then mass erase can only be issued by the SE.

## 6.4 DEVINFO - Device Info Page

The Device Info Page holds factory programmed information about the device. It contains the following data:

- Calibration values for reconfiguring the device
- Unique ID's
- OPN identifiers (family, feature set, flash size, etc.)

### 6.4.1 DEVINFO Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	DEVINFO_INFO	R	DI Information

### 6.4.2 DEVINFO Register Description

#### 6.4.2.1 DEVINFO\_INFO - DI Information

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0xC								0x0								0x0															
<b>Access</b>	R								R								R															
<b>Name</b>	DEVINFOREV								PRODREV								CRC															

Bit	Name	Reset	Access	Description
31:24	DEVINFOREV	0xC	R	<b>DI Page Version</b> DEVINFO layout revision as unsigned integer (initially 1)
23:16	PRODREV	0x0	R	<b>Production Revision</b> Production revision as unsigned integer
15:0	CRC	0x0	R	<b>CRC</b> CRC of DI-page (CRC-16-CCITT)

### 6.4.2.2 DEVINFO\_PART - Part Info

Offset	Bit Position																																
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>					0x0								0x0												0x0								
<b>Access</b>					R								R												R								
<b>Name</b>					FAMILY								FAMILYNUM												DEVICENUM								

Bit	Name	Reset	Access	Description
31:30	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
29:24	FAMILY	0x0	R	<b>Device Family</b> Encoded portion of the Device Family
	Value	Mode		Description
	0	FG		Flex Gecko
	3	ZG		Z-Wave Gecko
	5	PG		Pearl Gecko
	8	SG		Sidewalk Gecko
23:22	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
21:16	FAMILYNUM	0x0	R	<b>Device Family</b> Numeric portion of the Device Family
15:0	DEVICENUM	0x0	R	<b>Device Number</b> Device Number. The device number is one letter and 3 digits. NUMBER = (alpha-'A')*1000 + numeric. 0 = A000; 1123 = B123

### 6.4.2.3 DEVINFO\_MEMINFO - Memory Info

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																0x0								0x0							
<b>Access</b>	R																R								R							
<b>Name</b>	DILEN																UDPAGESIZE								FLASHPAGESIZE							

Bit	Name	Reset	Access	Description
31:16	DILEN	0x0	R	<b>Length of DI Page</b> Length of DI area (number of 32-bit words included in CRC)
15:8	UDPAGESIZE	0x0	R	<b>User Data Page Size</b> User Data page size
7:0	FLASHPAGESIZE	0x0	R	<b>Flash Page Size</b> Flash page size in bytes coded as $2^{((MEMINFO.PAGESIZE + 10) \& 0xFF)}$ . For example, the value of 0xFF = 512 bytes

### 6.4.2.4 DEVINFO\_MSIZ - Memory Size

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0								0x0							
<b>Access</b>																	R								R							
<b>Name</b>																	SRAM								FLASH							

Bit	Name	Reset	Access	Description
31:27	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
26:16	SRAM	0x0	R	<b>Sram Size</b> Ram size, kbyte count as unsigned integer (eg 16)
15:0	FLASH	0x0	R	<b>Flash Size</b> Flash size, kbyte count as unsigned integer (eg. 128)

### 6.4.2.5 DEVINFO\_PKGINFO - Misc Device Info

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>									0x0								0x0								0x0							
<b>Access</b>									R								R								R							
<b>Name</b>									PINCOUNT								PKGTYPE								TEMPGRADE							

Bit	Name	Reset	Access	Description
31:24	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
23:16	PINCOUNT	0x0	R	<b>Pin Count</b> Device pin count as unsigned integer (eg. 48)
15:8	PKGTYPE	0x0	R	<b>Package Type</b> Package identifier as character
	Value	Mode		Description
	74	WLCSP		WLCSP package
	76	BGA		BGA package
	77	QFN		QFN package
	81	QFP		QFP package
7:0	TEMPGRADE	0x0	R	<b>Temperature Grade</b> Temperature Grade of product as unsigned integer enumeration
	Value	Mode		Description
	0	N40TO85		-40 to 85 degC
	1	N40TO125		-40 to 125 degC
	2	N40TO105		-40 to 105 degC
	3	N0TO70		0 to 70 degC

### 6.4.2.6 DEVINFO\_CUSTOMINFO - Custom Part Info

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	R																															
<b>Name</b>	PARTNO																															

Bit	Name	Reset	Access	Description
31:16	PARTNO	0x0	R	<b>Part Number</b> Custom part identifier as unsigned integer (eg. 903). 65535 for standard product
15:0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

### 6.4.2.7 DEVINFO\_SWFIX - SW Fix Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0xFFFFFFFF															
<b>Access</b>																	R															
<b>Name</b>																	RSV															

Bit	Name	Reset	Access	Description
31:0	RSV	0xFFFFFFFF FF	R	<b>Reserved</b> Reserved for future use

## 6.4.2.8 DEVINFO\_SWCAPA0 - Software Restriction

Offset	Bit Position																																																							
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																								
<b>Reset</b>					0x0								0x0								0x0								0x0																											
<b>Access</b>					R								R								R								R																											
<b>Name</b>					ZWAVE								SRI								CONNECT								BTSMART								RF4CE								THREAD								ZIGBEE			

Bit	Name	Reset	Access	Description
31:27	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
26:24	ZWAVE	0x0	R	<b>Z-Wave Capability</b>
	Z-Wave Stack Capability			
	Value	Mode	Description	
	0	LEVEL0	Z-Wave stack capability not available	
	1	LEVEL1	Z-Wave Gateway	
	2	LEVEL2	Z-Wave End Device	
	3	LEVEL3	Z-Wave Sensor	
	4	LEVEL4	Z-Wave Lighting	
23:22	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
21:20	SRI	0x0	R	<b>RAIL Capability</b>
	RAIL capability not available			
	Value	Mode	Description	
	0	LEVEL0	RAIL capability not available	
	1	LEVEL1	RAIL enabled	
	2	LEVEL2	N/A	
	3	LEVEL3	N/A	
19:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
17:16	CONNECT	0x0	R	<b>Connect Capability</b>
	Connect stack capability level			
	Value	Mode	Description	
	0	LEVEL0	Connect stack capability not available	
	1	LEVEL1	Connect enabled	
	2	LEVEL2	N/A	
	3	LEVEL3	N/A	

Bit	Name	Reset	Access	Description
15:14	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
13:12	BTSMART	0x0	R	<b>Bluetooth Smart Capability</b>
	Bluetooth SMART stack capability level			
	Value	Mode	Description	
	0	LEVEL0	Bluetooth SMART stack capability not available	
	1	LEVEL1	Bluetooth SMART enabled	
	2	LEVEL2	N/A	
	3	LEVEL3	N/A	
11:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9:8	RF4CE	0x0	R	<b>RF4CE Capability</b>
	RF4CE stack capability level			
	Value	Mode	Description	
	0	LEVEL0	Thread stack capability not available	
	1	LEVEL1	Thread stack enabled	
	2	LEVEL2	N/A	
	3	LEVEL3	N/A	
7:6	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
5:4	THREAD	0x0	R	<b>Thread Capability</b>
	Thread stack capability level			
	Value	Mode	Description	
	0	LEVEL0	RF4CE stack capability not available	
	1	LEVEL1	RF4CE stack enabled	
	2	LEVEL2	N/A	
	3	LEVEL3	N/A	
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	ZIGBEE	0x0	R	<b>Zigbee Capability</b>
	ZigBee stack capability level			
	Value	Mode	Description	
	0	LEVEL0	ZigBee stack capability not available	
	1	LEVEL1	GreenPower only	
	2	LEVEL2	ZigBee and GreenPower	
	3	LEVEL3	ZigBee Only	

### 6.4.2.10 DEVINFO\_EXTINFO - External Component Info

Offset	Bit Position																															
0x028	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15:8	CONNECTION Connection protocol to external interface	0x0	R	<b>Connection</b>
	Value	Mode		Description
	0	SPI		SPI control interface
	255	NONE		No interface
7:0	TYPE External Component	0x0	R	<b>Type</b>
	Value	Mode		Description
	255	NONE		

### 6.4.2.11 DEVINFO\_EUI48L - EUI 48 Low

Offset	Bit Position																															
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																0x0															
<b>Access</b>	R																R															
<b>Name</b>	OUI48L																UNIQUEID															

Bit	Name	Reset	Access	Description
31:24	OUI48L	0x0	R	<b>OUI48L</b> Lower Octet of EUI48 Organizationally Unique Identifier
23:0	UNIQUEID	0x0	R	<b>Unique ID</b> Unique identifier

### 6.4.2.12 DEVINFO\_EUI48H - EUI 48 High

Offset	Bit Position																															
0x044	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0xFFFF																0x0															
<b>Access</b>	R																R															
<b>Name</b>	RESERVED																OUI48H															

Bit	Name	Reset	Access	Description
31:16	RESERVED	0xFFFF	R	<b>RESERVED</b> Reserved
15:0	OUI48H	0x0	R	<b>OUI48H</b> Upper two Octets of EUI48 OUI

### 6.4.2.13 DEVINFO\_EUI64L - EUI64 Low

Offset	Bit Position																															
0x048	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	R															
<b>Name</b>																	UNIQUEL															

Bit	Name	Reset	Access	Description
31:0	UNIQUEL	0x0	R	<b>UNIQUEL</b> Lower 32 bits of EUI64 Unique Identifier

### 6.4.2.14 DEVINFO\_EUI64H - EUI64 High

Offset	Bit Position																															
0x04C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0								0x0							
<b>Access</b>																	R								R							
<b>Name</b>																	OUI64								UNIQUEH							

Bit	Name	Reset	Access	Description
31:8	OUI64	0x0	R	<b>OUI64</b> 24-bit OUI identifier
7:0	UNIQUEH	0x0	R	<b>UNIQUEH</b> Upper 8 bits of EUI64 unique identifier

## 6.4.2.15 DEVINFO\_CALTEMP - Calibration Temperature

Offset	Bit Position																															
0x050	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									R							
<b>Name</b>																									TEMP							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	TEMP	0x0	R	<b>Cal Temp</b> Calibration temperature as an unsigned int in DegC. (0x19 = 25DegC)

## 6.4.2.16 DEVINFO\_EMUTEMP - EMU Temp

Offset	Bit Position																															
0x054	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									R							
<b>Name</b>																									EMUTEMPROOM							

Bit	Name	Reset	Access	Description
31:11	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
10:2	EMUTEMPROOM	0x0	R	<b>Emu Room Temperature</b> EMU_TEMP temperature reading at room (calibration) temperature.
1:0	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		

## 6.4.2.17 DEVINFO\_HFRCODPLLCALn - HFRCODPLL Calibration

Offset	Bit Position																															
0x058	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### 6.5 ICACHE - Instruction Cache

The ICACHE provides fast access to recently executed instructions, improving both speed and power consumption of code execution. The instruction cache is enabled by default, but can be disabled by setting CACHEDIS in ICACHE\_CTRL. When enabled, the instruction cache typically reduces the number of flash reads significantly, thus saving energy. In most cases, a cache hit-rate of more than 70 % is achievable. When a 32-bit instruction fetch hits in the cache, the data is returned to the processor in one clock cycle, bypassing the flash access wait-states. The cache content is retained in EM2 and EM3.

The instruction cache is connected directly to the CODE bus on the ARM core and functions as a memory access filter between the processor and the memory system, as illustrated in [Figure 6.1 Instruction Cache Block Diagram on page 93](#). The cache consists of an access filter, lookup logic, SRAM, and three performance counters. The access filter checks if a transfer is an instruction fetch located in a cacheable region. If it is the cache lookup logic and SRAM is enabled. Otherwise, the cache is bypassed and the access is forwarded to the memory system. If lookup is enabled data is either returned from the cache (hit) or fetch from the memory system and cached (miss).

**Figure 6.1. Instruction Cache Block Diagram**

Note that while all access to code spaces use the CODE bus only instruction fetches are cached. Data accesses to the CODE region are passed through the ICACHE.

### 6.5.1 Cache Operation

It is highly recommended to keep the cache enabled. To improve cache-efficiency, sections of code with very low cache hit rate should not be cached. This is achieved by placing these code sections in non-cacheable MPU regions and setting USEMPU in ICACHE\_CTRL. When USEMPU is set, instruction fetches to non-cacheable MPU regions will not be looked up or saved in cache. This feature may also be used to avoid instructions from low-power memory taking up space from more power-hungry memory. For more information on the MPU see the ARM Cortex®-M33 MPU documentation.

The optional loop-cache is optimized to store smaller code-loops efficiently. The loop-cache is enabled when LPLEVEL in ICACHE\_LPMODE is set to ADVANCED or MINACTIVITY. The difference between the two settings is that when MINACTIVITY is selected loop-cache outputs may be gated off to reduce power at the cost of more wait-states due to loop-cache misses. Having LPLEVEL set to BASIC disables the loop-cache functionality completely. NESTFACTOR in ICACHE\_LPMODE is used to decide when to stick with the currently detected loop rather than start tracking a new loop. Optimal value will depend on the actual code running, meaning that this setting may be tuned for optimal performance.

By default, the instruction cache is automatically invalidated when the contents of the flash are changed (i.e. written or erased). In many cases, however, the application only makes changes to data in the flash, not code. In this case, the automatic invalidate feature can be disabled by setting AUTOFLUSHDIS in ICACHE\_CTRL. The cache can also be manually invalidated by writing 1 to FLUSH in ICACHE\_CMD.

In the event that a parity error in the cache is detected, the RAMERROR flag will be set in ICACHE\_IF. The data is automatically reloaded when this occurs so no action is required by software. This flag is informational only and can be used to detect the rate of corruption events. If RAMERROR in ICACHE\_IEN is set, an interrupt will be triggered.

The cache is automatically flushed whenever a bus fault occurs. If this occurs during performance counting the counts will be effected.

### 6.5.2 Performance Measurement

To measure the hit-rate of a code-section, the built-in performance counters can be used. Before the section, start the performance counters by setting STARTPC in ICACHE\_CMD register. This starts the performance counters, counting from 0. At the end of the section, stop the performance counters by setting STOPPC in ICACHE\_CMD. The number of cache hits and cache misses for that section can then be read from PCHITS and PCMISSSES. The cache hit-ratio can be calculated as  $PCHITS / (PCHITS + PCMISSSES)$ . PCAHITS contains the loopcache hits only. Any hits in PCAHITS are also counted in PCHITS. The loopcache hit-ratio can be calculated as  $PCAHITS / (PCHITS + PCMISSSES)$ . When PCHITS/PCAHITS/PCMISSSES overflow, the HITOF/AHITOF/MISSOF interrupt flags are set respectively. These flags must be cleared by software. The range of the performance counters can be extended by increasing a counter in the interrupt routine. The performance counters only count when a cache lookup is performed. Access to non-cacheable regions, data fetches, and access made while the ICACHE is disabled do not increment PCMISSSES.

Software may check the if the performance counters are running using PCRUNNING in ICACHE\_STATUS.

### 6.5.3 ICACHE Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	ICACHE_IPVERSION	R	IP Version
0x004	ICACHE_CTRL	RW	Control Register
0x008	ICACHE_PCHITS	RH	Performance Counter Hits

## 6.5.4 ICACHE Register Description

### 6.5.4.1 ICACHE\_IPVERSION - IP Version

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	R																															
<b>Name</b>	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x0	R	<b>IP version ID</b>

The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.

### 6.5.4.2 ICACHE\_CTRL - Control Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0	0x0			
<b>Access</b>																											RW	RW	RW			
<b>Name</b>																											AUTOFLUSHDIS	USEMPU	CACHEDIS			

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	AUTOFLUSHDIS	0x0	RW	<b>Automatic Flushing Disable</b> Disables automatic flushing based on Internal Flash write/erase
1	USEMPU	0x0	RW	<b>Use MPU</b> Use MPU to select non/cacheable regions
0	CACHEDIS	0x0	RW	<b>Cache Disable</b> Disables caching for all regions

### 6.5.4.3 ICACHE\_PCHITS - Performance Counter Hits

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	R																															
<b>Name</b>	PCHITS																															

Bit	Name	Reset	Access	Description
31:0	PCHITS	0x0	R	<b>Performance Counter Hits</b> Hit counter value

#### 6.5.4.4 ICACHE\_PCMISESSES - Performance Counter Misses

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	R															
<b>Name</b>																	PCMISESSES															

Bit	Name	Reset	Access	Description
31:0	PCMISESSES	0x0	R	<b>Performance Counter Misses</b> Miss counter value

#### 6.5.4.5 ICACHE\_PCAHITS - Performance Counter Advanced Hits

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	R															
<b>Name</b>																	PCHITS															

Bit	Name	Reset	Access	Description
31:0	PCHITS	0x0	R	<b>Performance Counter Advanced Hits</b> Hit counter value for hits due to Advanced Buffering mode. These hits are also represented in PCHITS.

### 6.5.4.6 ICACHE\_STATUS - Status Register

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0
<b>Access</b>																																R
<b>Name</b>																																PCRUNNING

Bit	Name	Reset	Access	Description
31:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	PCRUNNING	0x0	R	<b>PC Running</b> Performance Counters are running

### 6.5.4.7 ICACHE\_CMD - Command Register

Offset	Bit Position																																	
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
<b>Reset</b>																																0x0	0x0	0x0
<b>Access</b>																																W(nB)	W(nB)	W(nB)
<b>Name</b>																																STOPPC	STARTPC	FLUSH

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	STOPPC	0x0	W(nB)	<b>Stop Performance Counters</b> Stops the Performance Counters
1	STARTPC	0x0	W(nB)	<b>Start Performance Counters</b> Starts the Performance Counters
0	FLUSH	0x0	W(nB)	<b>Flush</b> Clears Cached Data

### 6.5.4.8 ICACHE\_LPMODE - Low Power Mode

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x2						0x3	
<b>Access</b>																									RW						RW	
<b>Name</b>																									NESTFACTOR						LPLEVEL	

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:4	NESTFACTOR	0x2	RW	<b>Low Power Nest Factor</b>  Parameter used in the advanced buffering mode to control its estimation when a branch access is likely to be accssed in the near future. In general, a higher number will improve performance in code with deeply nested loops.
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	LPLEVEL	0x3	RW	<b>Low Power Level</b>  Controls the low-power level of the cache. In general, the default setting is best for most applications.
	Value	Mode	Description	
	0	BASIC	Base instruction cache functionality	
	1	ADVANCED	Advanced buffering mode, where the cache uses the fetch pattern to predict highly accessed data and store it in low-energy memory	
	3	MINACTIVITY	Minimum activity mode, which allows the cache to minimize activity in logic that it predicts has a low probability being used. This mode can introduce wait-states into the instruction fetch stream when the cache exits one of its low-activity states. The number of wait-states introduced is small, but users running with 0-wait-state memory and wishing to reduce the variability that the cache might introduce with additional wait-states may wish to lower the cache low-power level. Note, this mode includes the advanced buffering mode functionality.	

### 6.5.4.9 ICACHE\_IF - Interrupt Flag

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																								0x0				0x0	0x0	0x0		
<b>Access</b>																								RW								
<b>Name</b>																								RAMERROR								
																											AHITOF	MISOF	HITOF			

Bit	Name	Reset	Access	Description
31:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8	RAMERROR RAM parity error detected	0x0	RW	<b>RAM error Interrupt Flag</b>
7:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	AHITOF Advanced hit performance counter has overflowed	0x0	RW	<b>Advanced Hit Overflow Interrupt Flag</b>
1	MISOF Miss performance counter has overflowed	0x0	RW	<b>Miss Overflow Interrupt Flag</b>
0	HITOF Hit performance counter has overflowed	0x0	RW	<b>Hit Overflow Interrupt Flag</b>

### 6.5.4.10 ICACHE\_IEN - Interrupt Enable

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																								0x0				0x0	0x0	0x0		
<b>Access</b>																								RW								
<b>Name</b>																								RAMERROR				AHITOF	MISSOF	HITOF		

Bit	Name	Reset	Access	Description
31:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8	RAMERROR Enable RAMERROR interrupt	0x0	RW	<b>RAM error Interrupt Enable</b>
7:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	AHITOF Enable AHITOF interrupt	0x0	RW	<b>Advanced Hit Overflow Interrupt Enable</b>
1	MISSOF Enable MISSOF interrupt	0x0	RW	<b>Miss Overflow Interrupt Enable</b>
0	HITOF Enable HITOF interrupt	0x0	RW	<b>Hit Overflow Interrupt Enable</b>

## 6.6 SYSCFG - System Configuration

The SYSCFG block is used to configure SRAM. It also contains some interrupt flags for software use. The system has the following major SRAM blocks:

- DMEM0 - Primary system data memory (RAM)
- FRCRAM - Frame Rate Controller SRAM
- SEQRAM - Sequencer SRAM
- DEMODRAM - Demodulator SRAM

### 6.6.1 RAM Retention

DMEM0 is broken into 16 KB banks. By default all banks are retained in EM2/EM3. Sleep mode current can be significantly reduced by fully powering down banks that do not need to be retained. To select the amount of RAM to be powered down in EM2/EM3, set RAMRETNCTRL in SYSCFG\_DMEM0RETNCTRL to the desired value.

FRCRAM and SEQRAM may be powered down in EM2/EM3 if not required. To disable retention, set FRCRAMRETNCTRL or SEQRAMRETNCTRL in SYSCFG\_RADIORAMRETNCTRL.

## 6.6.2 ECC

DMEM0, FRGRAM, and SEQRAM support one bit correction and two bit detection ECC.

To enable error detection for FRGRAM and SEQRAM, set FRGRAMECCCHKEN and SEQRAMECCCHKEN in SYSCFG\_RADIO-ECCCTRL. To enable auto-correction of one bit errors in FRGRAM and SEQRAM, set FRGRAMECCCEWEN and SEQRAMECCCEWEN in SYSCFG\_RADIOECCCTRL. When ECC error events in FRGRAM and SEQRAM are detected, the corresponding flags in SYSCFG\_IF are set. When a flag is set, an interrupt will be triggered if the corresponding interrupt enable bit is set in SYSCFG\_IEN. When an error occurs, the address of the detected error is written to SYSCFG\_FRGRAMECCADDR or SYSCF\_SEQRAMECCERR depending on the source of the error.

To enable error detection for DMEM0, set ECCEN in MPAHBRAM\_CTRL. To enable auto-correction of one bit errors in DMEM0, set ECCWEN in MPAHBRAM\_CTRL.

When ECC error events in DMEM0 are detected, the corresponding bits in MPAHBRAM\_IF are set. Errors arising from a specific port 'x' will be indicated by the AHBxERR1B or AHBxERR2B flags. When a flag is set, an interrupt will be triggered if the corresponding interrupt enable bit is set in MPAHBRAM\_IEN. When an error occurs, the address of the detected error is written to MPAHBRAM\_EC-CERRADDRx for the respective port 'x'. The address registers are sticky and will not be loaded with a new address until they are cleared through MPAHBRAM\_CMD.CLEARECCADDRx. If multiple ECC errors occur without ECCERRADDRn being cleared, the Px bit in MPAHBRAM\_ECCMERRIND will be set. These status bits are also sticky, and are cleared with MPAHBRAM\_CMD.CLEAREC-CADDRx.

Upon a two bit ECC error in DMEM, MPAHBRAM can also issue a bus fault. To enable this, set the ECCERRFAULTEN bit in MPAHBRAM\_CTRL.

The recommend procedure for initializing ECC RAM is to first enable ECC, then write zeros to all locations. This will clear the RAM and initialize the syndrome. If the ECC RAM is not written as described, then any reads to uninitialized RAM locations will result in an ECC error.

**Note:** The RAM ECC feature must be enabled to achieve good long term reliability. The long term reliability of the RAM is only specified with ECC enabled.

## 6.6.3 Software Interrupts

The SYSCFG block also provides some software interrupts that can be used to communicate between software tasks. To trigger a software interrupt set the corresponding bit in SYSCFG\_IF.

## 6.6.4 Bus faults

By default, two bit ECC errors and reads to unmapped addresses trigger a BusFault. These bus fault sources can be disabled by clearing RAMECCERRFAULTEN and ADDRFAULTEN in SYSCFG\_CTRL.

### 6.6.5 SYSCFG Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x004	SYSCFG_IPVERSION	R	IP Version ID
0x008	SYSCFG_IF	RWH INTFLAG	Interrupt Flag

0	SW0	0x0	RW	<b>Software Interrupt Enable</b> Set to enable the Software Interrupts

#### 6.6.6.4 SYSCFG\_CHIPREVVHW - Chip Revision, Hard-Wired

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0								0x38								0x1			
<b>Access</b>													RW								RW								RW			
<b>Name</b>													MINOR								FAMILY								MAJOR			

Bit	Name	Reset	Access	Description
31:20	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:12	MINOR	0x0	RW	<b>Hardwired Chip Revision Minor value</b> Hardwired Chip Revision Minor signal value
11:6	FAMILY	0x38	RW	<b>Hardwired Chip Family value</b> Hardwired Chip Family signal value
5:0	MAJOR	0x1	RW	<b>Hardwired Chip Revision Major value</b> Hardwired Chip Revision Major signal value

### 6.6.6.5 SYSCFG\_CHIPREV - Part Family and Revision Values

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0				0x0				0x0											
<b>Access</b>													RW				RW				RW											
<b>Name</b>													MINOR				FAMILY				MAJOR											

Bit	Name	Reset	Access	Description
31:20	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:12	MINOR Chip Revision Minor value	0x0	RW	<b>Chip Revision Minor value</b>
11:6	FAMILY Chip Family value	0x0	RW	<b>Chip Family value</b>
	Value	Mode		Description
	26	PG23		Product is in PG23 family
	56	FG23		Product is in FG23 family
	57	ZG23		Product is in ZG23 family
	58	SG23		Product is in SG23 family
5:0	MAJOR Chip Revision Major value	0x0	RW	<b>Chip Revision Major value</b>

6.6.6.6 SYSCFG\_CFGSYSTIC - SysTick Clock Source

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0
<b>Access</b>																																RW
<b>Name</b>																																SYSTICEXTCLKEN

Bit	Name	Reset	Access	Description
31:1	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	SYSTICEXTCLKEN	0x0	RW	<b>SysTick External Clock Enable</b> Set 1 to use an external clock as the M33 SysTick.

6.6.6.7 SYSCFG\_CTRL - Control

Offset	Bit Position																															
0x200	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																											0x1				0x1	0x1
Access																											RW				RW	RW
Name																											RAMECCERRFAULTEN				CLKDISFAULTEN	ADDRFAULTEN

Bit	Name	Reset	Access	Description
31:6	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
5	RAMECCERRFAULTEN	0x1	RW	<b>Two bit ECC error bus fault response ena</b> When this bit is set, busfaults are generated if 2-bit ECC error occurs.
4:2	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
1	CLKDISFAULTEN	0x1	RW	<b>Disabled Ckbus Bus Fault Enable</b> When this bit is set, busfaults are generated on accesses to peripherals with disabled bus clock
0	ADDRFAULTEN	0x1	RW	<b>Invalid Address Bus Fault Response Enabl</b> When this bit is set, busfaults are generated on accesses to unmapped parts of system and code address space

6.6.6.8 SYSCFG\_DMEM0RETCTRL - DMEM0 Retention Control

Offset	Bit Position																															
0x208	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0					
<b>Access</b>																											RW					
<b>Name</b>																											RAMRETCTRL					

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2:0	RAMRETCTRL	0x0	RW	<b>DMEM0 blockset retention control</b> DMEM0 RAM blockset retention controls in EM23 with full access in EM01.
	Value	Mode		Description
	0	ALLON		None of the RAM blocks powered down
	4	BLK3		Power down RAM block 3 (address range 0x2000C000-0x20010000)
	6	BLK2TO3		Power down RAM blocks 2 and above (address range 0x20008000-0x20010000)
	7	BLK1TO3		Power down RAM blocks 1 and above (address range 0x20004000-0x20010000)

### 6.6.6.9 SYSCFG\_RAMBIASCONF - RAM Bias Configuration

Offset	Bit Position																															
0x30C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x2			
<b>Access</b>																													RW			
<b>Name</b>																													RAMBIASCTRL			

Bit	Name	Reset	Access	Description
31:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
3:0	RAMBIASCTRL	0x2	RW	<b>RAM Bias Control</b> RAM blockset Bias control. Voltage Source Bias control setting
	Value	Mode	Description	
	0	NO	None	
	1	VSB100	Voltage Source Bias 100mV	
	2	VSB200	Voltage Source Bias 200mV	
	4	VSB300	Voltage Source Bias 300mV	
	8	VSB400	Voltage Source Bias 400mV	

### 6.6.6.10 SYSCFG\_RADIORAMRETNCTRL - RADIO RAM Retention Control Register

Offset	Bit Position																															
0x400	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																								0x0				0x0				
<b>Access</b>																								RW				RW				
<b>Name</b>																								FRCRAMRETNCTRL				SEQRAMRETNCTRL				

Bit	Name	Reset	Access	Description
31:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8	FRCRAMRETNCTRL	0x0	RW	<b>FRCRAM Retention Control</b> FRC RAM power-down in EM23 with full access in EM01
	Value	Mode		Description
	0	ALLON		FRCRAM not powered down
	1	ALLOFF		Power down FRCRAM
7:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	SEQRAMRETNCTRL	0x0	RW	<b>SEQRAM Retention Control</b> SEQUENCER RAM power-down in EM23 with full access in EM01
	Value	Mode		Description
	0	ALLON		SEQRAM not powered down
	1	BLK0		Power down SEQRAM block 0
	2	BLK1		Power down SEQRAM block 1
	3	ALLOFF		Power down all SEQRAM blocks

### 6.6.6.11 SYSCFG\_RADIOECCCTRL - RADIO RAM ECC Control Register

Offset	Bit Position																																							
0x408	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0								
<b>Reset</b>																							0x0	0x0															0x0	0x0
<b>Access</b>																							RW	RW															RW	RW
<b>Name</b>																							FRCRAMECCEWEN	FRCRAMECCEN															SEQRAMECCEWEN	SEQRAMECCEN

Bit	Name	Reset	Access	Description
31:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9	FRCRAMECCEWEN	0x0	RW	<b>FRCRAM ECC Error Writeback Enable</b> FRC ECC Error Writeback Enable. When set, errors will be corrected when encountered.
8	FRCRAMECCEN	0x0	RW	<b>FRCRAM ECC Enable</b> FRCRAM ECC Enable.
7:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	SEQRAMECCEWEN	0x0	RW	<b>SEQRAM ECC Error Writeback Enable</b> SEQRAM ECC Error Writeback Enable. When set, errors will be corrected when encountered.
0	SEQRAMECCEN	0x0	RW	<b>SEQRAM ECC Enable</b> SEQRAM ECC Enable.

### 6.6.6.12 SYSCFG\_SEQRAMECCADDR - SEQRAM ECC Address

Offset	Bit Position																															
0x410	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	R																															
<b>Name</b>	SEQRAMECCADDR																															

Bit	Name	Reset	Access	Description
31:0	SEQRAMECCADDR	0x0	R	<b>SEQRAM ECC Address</b> Indicates Address of SEQRAM at which ECC error occurred

### 6.6.6.13 SYSCFG\_FRCRAMECCADDR - FRCRAM ECC Address

Offset	Bit Position																															
0x414	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	R																															
<b>Name</b>	FRCRAMECCADDR																															

Bit	Name	Reset	Access	Description
31:0	FRCRAMECCADDR	0x0	R	<b>FRCRAM ECC Error Address</b> Indicates Address of FRCRAM at which ECC error occurred

6.6.6.14 SYSCFG\_ICACHERAMRETCTRL - HOST ICACHERAM Retention Control

Offset	Bit Position																															
0x418	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0
<b>Access</b>																																RW
<b>Name</b>																																RAMRETCTRL

Bit	Name	Reset	Access	Description
31:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	RAMRETCTRL	0x0	RW	<b>ICACHERAM Retention control</b> Host ICACHE RAM power-down in EM23 with full access in EM01.
	Value	Mode	Description	
	0	ALLON	None of the Host ICACHE RAM blocks powered down	
	1	ALLOFF	Power down all Host ICACHE RAM blocks	

### 6.6.6.15 SYSCFG\_DMEMP0PORTMAPSEL - DMEMP0 Port Remap Selection

Offset	Bit Position																															
0x41C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x1	0x0	0x0	0x1	0x1	
<b>Access</b>																											RW	RW	RW	RW	RW	
<b>Name</b>																											SRWECA1PORTSEL	SRWECA0PORTSEL	AHBSRWPORTSEL	SRWAESPORTSEL	LDMAPORTSEL	

Bit	Name	Reset	Access	Description
31:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	SRWECA1PORTSEL	0x1	RW	<b>SRWECA1 portmap selection</b> SRWECA1 address remap selection, default configured to MPAHBRAM1
3	SRWECA0PORTSEL	0x0	RW	<b>SRWECA0 portmap selection</b> SRWECA0 address remap selection, default configured to MPAHBRAM0
2	AHBSRWPORTSEL	0x0	RW	<b>AHBSRW portmap selection</b> AHBSRW address remap selection, default configured to MPAHBRAM0
1	SRWAESPORTSEL	0x1	RW	<b>SRWAES portmap selection</b> SRWAES address remap selection, default configured to MPAHBRAM1
0	LDMAPORTSEL	0x1	RW	<b>LDMA portmap selection</b> LDMA address remap selection, default configured to MPAHBRAM1

### 6.6.6.16 SYSCFG\_ROOTDATA0 - Data Register 0

Offset	Bit Position																															
0x600	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0					
<b>Access</b>																											RW					
<b>Name</b>																											DATA					

Bit	Name	Reset	Access	Description
31:0	DATA	0x0	RW	<b>Data</b> Generic data space for user to pass to root, e.g., address of struct in mem

6.6.6.17 SYSCFG\_ROOTDATA1 - Data Register 1

Offset	Bit Position																															
0x604	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	RW																															
<b>Name</b>	DATA																															

Bit	Name	Reset	Access	Description
31:0	DATA	0x0	RW	<b>Data</b> Generic data space for user to pass to root, e.g., address of struct in mem

## 6.6.6.18 SYSCFG\_ROOTLOCKSTATUS - Lock Status

Offset	Bit Position																																
0x608	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Access	R									R	R	R	R	R	R	R								R						R	R	R	
Name	EFUSEUNLOCKED									RADIONIDBGLOCK	RADIOIDBGLOCK	USERSPNIDLOCK	USERSPIDLOCK	USERNIDLOCK	USERDBGLOCK	USERDBGAPLOCK								ROOTDBGLOCK							MFRLOCK	REGLOCK	BUSLOCK

Bit	Name	Reset	Access	Description
31	EFUSEUNLOCKED	0x0	R	<b>E-Fuse Unlocked</b> E-Fuse Unlocked when 1; Locked when 0.
30:23	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
22	RADIONIDBGLOCK	0x1	R	<b>Radio Non-invasive Debug Lock</b> Locked when 1; unlocked when 0.
21	RADIOIDBGLOCK	0x1	R	<b>Radio Invasive Debug Lock</b> Locked when 1; unlocked when 0.
20	USERSPNIDLOCK	0x1	R	<b>User Secure Non-invasive Debug Lock</b> Locked when 1; unlocked when 0.
19	USERSPIDLOCK	0x1	R	<b>User Secure Invasive Debug Lock</b> Locked when 1; unlocked when 0.
18	USERNIDLOCK	0x1	R	<b>User Non-invasive Debug Lock</b> Locked when 1; unlocked when 0.
17	USERDBGLOCK	0x1	R	<b>User Invasive Debug Lock</b> Locked when 1; unlocked when 0.
16	USERDBGAPLOCK	0x1	R	<b>User Debug Access Port Lock</b> Locked when 1; unlocked when 0.
15:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8	ROOTDBGLOCK	0x1	R	<b>Root Debug Lock</b> Locked when 1; unlocked when 0.
7:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	MFRLOCK	0x1	R	<b>Manufacture Lock</b> Locked when 1; unlocked when 0.
1	REGLOCK	0x1	R	<b>Register Lock</b>

Bit	Name	Reset	Access	Description
				Locked when 1; unlocked when 0.
0	BUSLOCK	0x1	R	<b>Bus Lock</b> Locked when 1; unlocked when 0.

**6.6.6.19 SYSCFG\_ROOTSESWVERSION - SE SW Version**

Offset	Bit Position																															
0x60C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	RW																															
<b>Name</b>	SWVERSION																															

Bit	Name	Reset	Access	Description
31:0	SWVERSION	0x0	RW	<b>SW Version</b> Location for SE to write the Firmware version and host to read it

### 6.6.7 MPAHBRAM Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	MPAHBRAM_IPVERSION	R	IP Version ID
0x004	MPAHBRAM_CMD	W	Command Register
0x008	MPAHBRAM_CTRL	RW	Control Register
0x00C	MPAHBRAM_ECCERRADDR0	RH	ECC Error Address 0
0x010	MPAHBRAM_ECCERRADDR1	RH	ECC Error Address 1
0x01C	MPAHBRAM_ECCMERRIND	RH	Multiple ECC Error Indication
0x020	MPAHBRAM_IF	RWH INTFLAG	Interrupt Flags
0x024	MPAHBRAM_IEN	RW	Interrupt Enable
0x1000	MPAHBRAM_IPVERSION_SET	R	IP Version ID
0x1004	MPAHBRAM_CMD_SET	W	Command Register
0x1008	MPAHBRAM_CTRL_SET	RW	Control Register
0x100C	MPAHBRAM_ECCERRADDR0_SET	RH	ECC Error Address 0
0x1010	MPAHBRAM_ECCERRADDR1_SET	RH	ECC Error Address 1
0x101C	MPAHBRAM_ECCMERRIND_SET	RH	Multiple ECC Error Indication
0x1020	MPAHBRAM_IF_SET	RWH INTFLAG	Interrupt Flags
0x1024	MPAHBRAM_IEN_SET	RW	Interrupt Enable
0x2000	MPAHBRAM_IPVERSION_CLR	R	IP Version ID
0x2004	MPAHBRAM_CMD_CLR	W	Command Register
0x2008	MPAHBRAM_CTRL_CLR	RW	Control Register

0x201C	MPAHBRAM_ECCMERRIND_CLR	RH	Multiple ECC Error Indication
0x2020	MPAHBRAM_IF_CLR	RWH INTFLAG	Interrupt Flags
0x2024	MPAHBRAM_IEN_CLR	RW	Interrupt Enable
0x3000	MPAHBRAM_IPVERSION_TGL	R	IP Version ID
0x3004	MPAHBRAM_CMD_TGL	W	Command Register
0x3008	MPAHBRAM_CTRL_TGL	RW	Control Register
0x300C	MPAHBRAM_ECCERRADDR0_TGL	RH	ECC Error Address 0
0x3010	MPAHBRAM_ECCERRADDR1_TGL	RH	ECC Error Address 1
0x301C	MPAHBRAM_ECCMERRIND_TGL	RH	Multiple ECC Error Indication

Offset	Name	Type	Description
0x3020	MPAHBRAM_IF_TGL	RWH INTFLAG	Interrupt Flags
0x3024	MPAHBRAM_IEN_TGL	RW	Interrupt Enable

### 6.6.8 MPAHBRAM Register Description

#### 6.6.8.1 MPAHBRAM\_IPVERSION - IP Version ID

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x1
<b>Access</b>																																R
<b>Name</b>																																IPVERSION

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
0	IPVERSION	0x1	R	<b>New BitField</b>

#### 6.6.8.2 MPAHBRAM\_CMD - Command Register

Offset	Bit Position																																
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																																0x0	0x0
<b>Access</b>																																W(nB)	W(nB)
<b>Name</b>																																CLEARECCADDR1	CLEARECCADDR0

Bit	Name	Reset	Access	Description
31:2	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
1	CLEARECCADDR1	0x0	W(nB)	<b>Clear ECCERRADDR1</b> Write 1 to clear ECCERRADDR1 and ECCMERRIND.P1.
0	CLEARECCADDR0	0x0	W(nB)	<b>Clear ECCERRADDR0</b> Write 1 to clear ECCERRADDR0 and ECCMERRIND.P0.

### 6.6.8.3 MPAHBRAM\_CTRL - Control Register

Offset	Bit Position																																			
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
<b>Reset</b>																									0x1				0x0			0x0	0x0	0x0		
<b>Access</b>																									RW				RW			RW	RW	RW		
<b>Name</b>																									ADDRFAULTEN				AHBPORTPRIORITY			ECCERRFAULTEN	ECCWEN	ECCEN		

Bit	Name	Reset	Access	Description
31:7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6	ADDRFAULTEN	0x1	RW	<b>Address fault bus fault enable</b> Enable bus fault upon address fault
5:3	AHBPORTPRIORITY	0x0	RW	<b>AHB port arbitration priority</b>
	Value	Mode		Description
	0	NONE		No AHB port have raised priority.
	1	PORT0		AHB port 0 has raised priority.
	2	PORT1		AHB port 1 has raised priority.
2	ECCERRFAULTEN	0x0	RW	<b>ECC Error bus fault enable</b> Enable bus fault upon 2 bit ECC error
1	ECCWEN	0x0	RW	<b>Enable ECC syndrome writes</b>
0	ECCEN	0x0	RW	<b>Enable ECC functionality</b>

## 6.6.8.4 MPAHBRAM\_ECCERRADDR0 - ECC Error Address 0

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																0x0																
Access																R																
Name																ADDR																

Bit	Name	Reset	Access	Description
31:0	ADDR	0x0	R	<b>ECC Error Address</b> Last captured ECC error address on AHB port 0. Cleared by CMD.CLEARECCADDR0

## 6.6.8.5 MPAHBRAM\_ECCERRADDR1 - ECC Error Address 1

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																0x0																
Access																R																
Name																ADDR																

Bit	Name	Reset	Access	Description
31:0	ADDR	0x0	R	<b>ECC Error Address</b> Last captured ECC error address on AHB port 1. Cleared by CMD.CLEARECCADDR1

## 6.6.8.6 MPAHBRAM\_ECCMERRIND - Multiple ECC Error Indication

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																										0x0	0x0					
Access																										R	R					
Name																										P1	P0					

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
1	P1	0x0	R	<b>Multiple ECC errors on AHB port 1</b> Multiple ECC error indication on AHB port 1. Cleared by CMD.CLEARECCADDR1.
0	P0	0x0	R	<b>Multiple ECC errors on AHB port 0</b> Multiple ECC error indication on AHB port 0. Cleared by CMD.CLEARECCADDR0.

### 6.6.8.7 MPAHBRAM\_IF - Interrupt Flags

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0			0x0	0x0
<b>Access</b>																											RW	RW			RW	RW
<b>Name</b>																											AHB1ERR2B	AHB0ERR2B			AHB1ERR1B	AHB0ERR1B

Bit	Name	Reset	Access	Description
31:6	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
5	AHB1ERR2B	0x0	RW	<b>AHB1 2-bit ECC Error Interrupt Flag</b>
4	AHB0ERR2B	0x0	RW	<b>AHB0 2-bit ECC Error Interrupt Flag</b>
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	AHB1ERR1B	0x0	RW	<b>AHB1 1-bit ECC Error Interrupt Flag</b>
0	AHB0ERR1B	0x0	RW	<b>AHB0 1-bit ECC Error Interrupt Flag</b>

6.6.8.8 MPAHBRAM\_IEN - Interrupt Enable

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																											0x0	0x0			0x0	0x0
Access																											RW	RW			RW	RW
Name																											AHB1ERR2B	AHB0ERR2B			AHB1ERR1B	AHB0ERR1B

Bit	Name	Reset	Access	Description
31:6	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
5	AHB1ERR2B	0x0	RW	<b>AHB1 2-bit ECC Error Interrupt Enable</b>
4	AHB0ERR2B	0x0	RW	<b>AHB0 2-bit ECC Error Interrupt Enable</b>
3:2	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
1	AHB1ERR1B	0x0	RW	<b>AHB1 1-bit ECC Error Interrupt Enable</b>
0	AHB0ERR1B	0x0	RW	<b>AHB0 1-bit ECC Error Interrupt Enable</b>

## 6.7 MSC Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	MSC_IPVERSION	R	IP Version ID
0x004	MSC_READCTRL	RW	Read Control Register
0x008	MSC_RDATACTRL	RW	Read Data Control Register
0x00C	MSC_WRITECTRL	RW	Write Control Register
0x010	MSC_WRITECMD	W	Write Command Register
0x014	MSC_ADDRB	RWH	Page Erase/Write Address Buffer
0x018	MSC_WDATA	RWH	Write Data Register
0x01C	MSC_STATUS	RH	Status Register
0x020	MSC_IF	RWH	Interrupt Flag Register
0x024	MSC_IEN	RW	Interrupt Enable Register
0x034	MSC_USERDATASIZE	R	User Data Region Size Register
0x038	MSC_CMD	W	Command Register
0x03C	MSC_LOCK	W	Configuration Lock Register
0x040	MSC_MISLOCKWORD	RW	Mass Erase and User Data Page Lock Word
0x050	MSC_PWRCTRL	RW	Power Control Register
0x120	MSC_PAGELOCK0	RW	Main Space Page 0-31 Lock Word
0x124	MSC_PAGELOCK1	RW	Main Space Page 32-63 Lock Word
0x1000	MSC_IPVERSION_SET	R	IP Version ID
0x1004	MSC_READCTRL_SET	RW	Read Control Register
0x1008	MSC_RDATACTRL_SET	RW	Read Data Control Register
0x100C	MSC_WRITECTRL_SET	RW	Write Control Register
0x1010	MSC_WRITECMD_SET	W	Write Command Register
0x1014	MSC_ADDRB_SET	RWH	Page Erase/Write Address Buffer
0x1018	MSC_WDATA_SET	RWH	Write Data Register
0x101C	MSC_STATUS_SET	RH	Status Register
0x1020	MSC_IF_SET	RWH	Interrupt Flag Register
0x1024	MSC_IEN_SET	RW	Interrupt Enable Register
0x1034	MSC_USERDATASIZE_SET	R	User Data Region Size Register
0x1038	MSC_CMD_SET	W	Command Register
0x103C	MSC_LOCK_SET	W	Configuration Lock Register
0x1040	MSC_MISLOCKWORD_SET	RW	Mass Erase and User Data Page Lock Word
0x1050	MSC_PWRCTRL_SET	RW	Power Control Register
0x1120	MSC_PAGELOCK0_SET	RW	Main Space Page 0-31 Lock Word
0x1124	MSC_PAGELOCK1_SET	RW	Main Space Page 32-63 Lock Word
0x2000	MSC_IPVERSION_CLR	R	IP Version ID

Offset	Name	Type	Description
0x2004	MSC_READCTRL_CLR	RW	Read Control Register
0x2008	MSC_RDATACTRL_CLR	RW	Read Data Control Register
0x200C	MSC_WRITECTRL_CLR	RW	Write Control Register

## 6.8 MSC Register Description

### 6.8.1 MSC\_IPVERSION - IP Version ID

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x2															
<b>Access</b>																	R															
<b>Name</b>																	IPVERSION															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x2	R	<b>IP Version ID</b> IP Version ID

### 6.8.2 MSC\_READCTRL - Read Control Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>											0x2																					
<b>Access</b>											RW																					
<b>Name</b>											MODE																					

Bit	Name	Reset	Access	Description
31:22	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
21:20	MODE	0x2	RW	<b>Read Mode</b>

When changing to a higher frequency, this register must be set to a large number of wait states before the core clock is switched to the higher frequency. When changing to a lower frequency, this register should be set to a lower number of wait states after the frequency transition has been completed. The maximum frequency for each wait state setting is listed in the datasheet.

Value	Mode	Description
0	WS0	Zero wait-states inserted in fetch or read transfers
1	WS1	One wait-state inserted for each fetch or read transfer. See Flash Wait-States table for details
2	WS2	Two wait-states inserted for each fetch or read transfer. See Flash Wait-States table for details
3	WS3	Three wait-states inserted for each fetch or read transfer. See Flash Wait-States table for details

19:0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
------	-----------------	---	--	--

## 6.8.3 MSC\_RDATACTRL - Read Data Control Register

Offset	Bit Position																																						
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0							
<b>Reset</b>																					0x1																	0x0	
<b>Access</b>																					RW																	RW	
<b>Name</b>																					DOUTBUFEN																	AFDIS	

Bit	Name	Reset	Access	Description
31:13	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
12	DOUTBUFEN	0x1	RW	<b>Flash dout pipeline buffer enable</b> Flag to enable or bypass flash data output buffer
11:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	AFDIS	0x0	RW	<b>Automatic Invalidate Disable</b> When this bit is set the cache is not automatically invalidated when a write or page erase is performed.
0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

## 6.8.4 MSC\_WRITECTRL - Write Control Register

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>									0x0																0x0		0x0	0x0				
<b>Access</b>									RW																RW		RW	RW				
<b>Name</b>									RANGECOUNT																LPWRITE		IRQERASEABORT	WREN				

Bit	Name	Reset	Access	Description
31:24	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
23:16	RANGECOUNT	0x0	RW	<b>EraseRange Count</b> Apply only with EraseRange command. Define number of pages to be erased.
15:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
3	LPWRITE	0x0	RW	<b>Low-Power Write</b> When set, write times might double while reducing current consumption
2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	IRQERASEABORT	0x0	RW	<b>Abort Page Erase on Interrupt</b> When this bit is set to 1, any Cortex-M33 interrupt aborts any current page erase operation. Executing that interrupt vector from Flash will halt the CPU.
0	WREN	0x0	RW	<b>Enable Write/Erase Controller</b> When this bit is set, the MSC write and erase functionality is enabled

## 6.8.5 MSC\_WRITECMD - Write Command Register

Offset	Bit Position																																																							
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																								
<b>Reset</b>																				0x0				0x0				0x0	0x0										0x0	0x0							0x0	0x0								
<b>Access</b>																				W																			W																	
<b>Name</b>																				CLEARWDATA																			ERASEMAIN0																	

Bit	Name	Reset	Access	Description
31:13	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
12	CLEARWDATA	0x0	W	<b>Clear WDATA state</b>  Will set WDATABREADY and DMA request. Should only be used when no write is active.
11:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8	ERASEMAIN0	0x0	W	<b>Mass erase region 0</b>  Initiate mass erase of flash memory. If MELOCKBIT in MSC_MISLOCKWORD is set, user firmware cannot initiate mass erase, and only the SE may initiate mass erase.
7:6	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
5	ERASEABORT	0x0	W	<b>Abort erase sequence</b>  Writing to this bit will abort an ongoing erase sequence.
4	ERASERANGE	0x0	W	<b>Erase range of pages</b>  Erase a range of user defined pages started from the MSC_ADDRB register. The WREN bit in the MSC_WRITECTRL register must be set in order to use this command.
3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	WRITEEND	0x0	W	<b>End Write Mode</b>  Write 1 to abort a write command.
1	ERASEPAGE	0x0	W	<b>Erase Page</b>  Erase any user defined page selected by the MSC_ADDRB register. The WREN bit in the MSC_WRITECTRL register must be set in order to use this command.
0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

### 6.8.6 MSC\_ADDRB - Page Erase/Write Address Buffer

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	RW															
<b>Name</b>																	ADDRB															

Bit	Name	Reset	Access	Description
31:0	ADDRB	0x0	RW	<b>Page Erase or Write Address Buffer</b>
This register holds the system address for the erase or write operation. Address should be word aligned address. The MSB bit is not ignored for ADDRb				

### 6.8.7 MSC\_WDATA - Write Data Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	RW															
<b>Name</b>																	DATAW															

Bit	Name	Reset	Access	Description
31:0	DATAW	0x0	RW	<b>Write Data</b>
The data to be written to the address in MSC_ADDRB. This register must be written when the WDATAREADY bit of MSC_STATUS is set. This register does not support write mask.				

### 6.8.8 MSC\_STATUS - Status Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0				0x1					0x0					0x0					0x0	0x0	0x0	0x0	0x1	0x0	0x0	0x0					
<b>Access</b>	R				R					R					R					R	R	R	R	R	R	R	R					
<b>Name</b>	PWRUPCKBDFAILCOUNT				WREADY					PWRON					REGLOCK					RANGEPARTIAL	TIMEOUT	PENDING	ERASEABORTED	WDATAREADY	INVADDR	LOCKED	BUSY					

Bit	Name	Reset	Access	Description									
31:28	PWRUPCKBDFAIL-COUNT	0x0	R	<b>Flash power up checkerboard pattern chec</b>  This field tells how many times checkboard pattern check fail occurred after a reset sequence.									
27	WREADY	0x1	R	<b>Flash Write Ready</b>  When this bit is set, flash has completed the power up sequence and is ready for write/erase commands.									
26:25	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											
24	PWRON	0x0	R	<b>Flash power on status</b>  When this bit is set, flash is powered on. If zero, flash is powered off and reads from flash return indeterminate data.									
23:17	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											
16	REGLOCK	0x0	R	<b>Register Lock Status</b>  Indicates the current status of register lock  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>UNLOCKED</td> <td></td> </tr> <tr> <td>1</td> <td>LOCKED</td> <td></td> </tr> </tbody> </table>	Value	Mode	Description	0	UNLOCKED		1	LOCKED	
Value	Mode	Description											
0	UNLOCKED												
1	LOCKED												
15:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											
7	RANGEPARTIAL	0x0	R	<b>EraseRange with skipped locked pages</b>									
6	TIMEOUT	0x0	R	<b>Write Command Timeout</b>  When this bit is set, it indicates that the last write command has completed due to a write buffer timeout. This bit is cleared automatically when a new write command is initiated.									
5	PENDING	0x0	R	<b>Write Command In Queue</b>  When this bit is set, a flash operation has been requested but not yet started. New commands are ignored when PENDING is set.									
4	ERASEABORTED	0x0	R	<b>Erase Operation Aborted</b>									

Bit	Name	Reset	Access	Description
				When MSC_WRITECTRL_IRQERASEABORT = 1, this bit is set because an interrupt has aborted the erase operation in progress.
3	WDATAREADY	0x1	R	<b>WDATA Write Ready</b> When this bit is set, the content of MSC_WDATA is read by MSC Flash Write Controller and the register may be updated with the next 32-bit word to be written to flash. This bit is cleared when writing to MSC_WDATA.
2	INVADDR	0x0	R	<b>Invalid Write Address or Erase Page</b> When this bit is set, software has attempted to load an invalid (unmapped) address into the MSC_ADDRB register.
1	LOCKED	0x0	R	<b>Access Locked</b> When set, the last erase or write was aborted due to erase/write access constraints.
0	BUSY	0x0	R	<b>Erase/Write Busy</b> When set, an erase or write operation is in progress and new commands are ignored.

### 6.8.9 MSC\_IF - Interrupt Flag Register

Offset	Bit Position																																									
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0										
<b>Reset</b>																							0x0	0x0																0x0	0x0	0x0
<b>Access</b>																							RW	RW																RW	RW	RW
<b>Name</b>																							PWROFF	PWRUPF																WDATAOV	WRITE	ERASE

Bit	Name	Reset	Access	Description
31:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9	PWROFF	0x0	RW	<b>Flash Power Off Sequence Complete Flag</b> Set after MSC_CMD.PWROFF received, flash powered off complete
8	PWRUPF	0x0	RW	<b>Flash Power Up Sequence Complete Flag</b> Set after MSC_CMD.PWRUP received, flash powered up complete and ready for read/write
7:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	WDATAOV	0x0	RW	<b>Host write buffer overflow</b> If set, flash controller write buffer overflow detected
1	WRITE	0x0	RW	<b>Host Write Done Interrupt Read Flag</b> Set when a write is done
0	ERASE	0x0	RW	<b>Host Erase Done Interrupt Read Flag</b> Set when erase is done

## 6.8.10 MSC\_IEN - Interrupt Enable Register

Offset	Bit Position																																								
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0									
<b>Reset</b>																							0x0	0x0															0x0	0x0	0x0
<b>Access</b>																							RW	RW															RW	RW	RW
<b>Name</b>																							PWROFF	PWRUPF															WDATAOV	WRITE	ERASE

Bit	Name	Reset	Access	Description
31:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9	PWROFF interrupt enable	0x0	RW	<b>Flash Power Off Seq done irq enable</b>
8	PWRUPF interrupt enable	0x0	RW	<b>Flash Power Up Seq done irq enable</b>
7:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	WDATAOV interrupt enable	0x0	RW	<b>write data buffer overflow irq enable</b>
1	WRITE interrupt enable	0x0	RW	<b>Write Done Interrupt enable</b>
0	ERASE interrupt enable	0x0	RW	<b>Erase Done Interrupt enable</b>

### 6.8.11 MSC\_USERDATASIZE - User Data Region Size Register

Offset	Bit Position																															
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																												0x4				
<b>Access</b>																												R				
<b>Name</b>																												USERDATASIZE				

Bit	Name	Reset	Access	Description
31:6	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
5:0	USERDATASIZE	0x4	R	<b>User Data Size</b> This field determines user data region size. SIZE = 256B * USERDATASIZE.

### 6.8.12 MSC\_CMD - Command Register

Offset	Bit Position																																																										
0x038	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																											
<b>Reset</b>																												0x0				0x0																											
<b>Access</b>																																W																											W
<b>Name</b>																																PWROFF																											PWRUP

Bit	Name	Reset	Access	Description
31:5	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
4	PWROFF	0x0	W	<b>Flash power off/sleep command</b> Write to this bit to power down the Flash. User code should execute from RAM afterwards. Read from flash after flash being powered down will cause undetermined behavior. To power up, either set CMD.PWRUP bit or try read from flash.
3:1	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
0	PWRUP	0x0	W	<b>Flash Power Up Command</b> Write to this bit to power up the Flash. IRQ PWRUPF will be fired when power up sequence completed.

## 6.8.13 MSC\_LOCK - Configuration Lock Register

Offset	Bit Position																															
0x03C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	W															
<b>Name</b>																	LOCKKEY															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	LOCKKEY	0x0	W	<b>Configuration Lock</b>  Write any other value than the unlock code to lock access to MSC_RDATACTRL, MSC_READCTRL, and MSC_WRITECTRL. Write the unlock code to enable access. When reading the register, bit 0 is set when the lock is enabled.
	Value	Mode	Description	
	0	LOCK		
	7025	UNLOCK		

## 6.8.14 MSC\_MISLOCKWORD - Mass Erase and User Data Page Lock Word

Offset	Bit Position																															
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x1					0x1		
<b>Access</b>																									RW					RW		
<b>Name</b>																									UDLOCKBIT					MELOCKBIT		

Bit	Name	Reset	Access	Description
31:5	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
4	UDLOCKBIT	0x1	RW	<b>User Data Lock</b>  Zero means host can write/erase to the user data area. Host is only allowed to write one. Root and debug can clear this bit.
3:1	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
0	MELOCKBIT	0x1	RW	<b>Mass Erase Lock</b>  Zero means host can mass erase the main space. Host is only allowed to write one. Root and debug can clear this bit.

### 6.8.15 MSC\_PWRCTRL - Power Control Register

Offset	Bit Position																															
0x050	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>									0x10																0x0			0x1	0x0			
<b>Access</b>									RW																RW			RW	RW			
<b>Name</b>									PWROFFDLY																PWROFFENTRYAGAIN			PWROFFONEM1PENTRY	PWROFFONEM1ENTRY			

Bit	Name	Reset	Access	Description
31:24	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
23:16	PWROFFDLY	0x10	RW	<b>Power down delay</b>  Defines delay cycles before flash enters sleep mode. Works together with PWROFFENTRYAGAIN bit. The power off delay is 64 * PWROFFDLY bus clock cycles.
15:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	PWROFFENTRYAGAIN	0x0	RW	<b>POWER down flash again in EM1/EM1p</b>  If enabled, flash will enter sleep mode again when POWEROFFONEM1ENTRY/POWEROFFONEM1PENTRY is set and no flash activities occur for the time determined by PWROFFDLY.
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	PWROFFONEM1PENTRY	0x1	RW	<b>Power down Flash macro when enter EM1P</b>  If enabled, flash will be in sleep mode when entering EM1P (radio-only sleep).
0	PWROFFONEM1ENTRY	0x0	RW	<b>Power down Flash macro when enter EM1</b>  If enabled, flash will be in sleep mode when entering EM1.

### 6.8.16 MSC\_PAGELOCK0 - Main Space Page 0-31 Lock Word

Offset	Bit Position																															
0x120	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	RW																															
<b>Name</b>	LOCKBIT																															

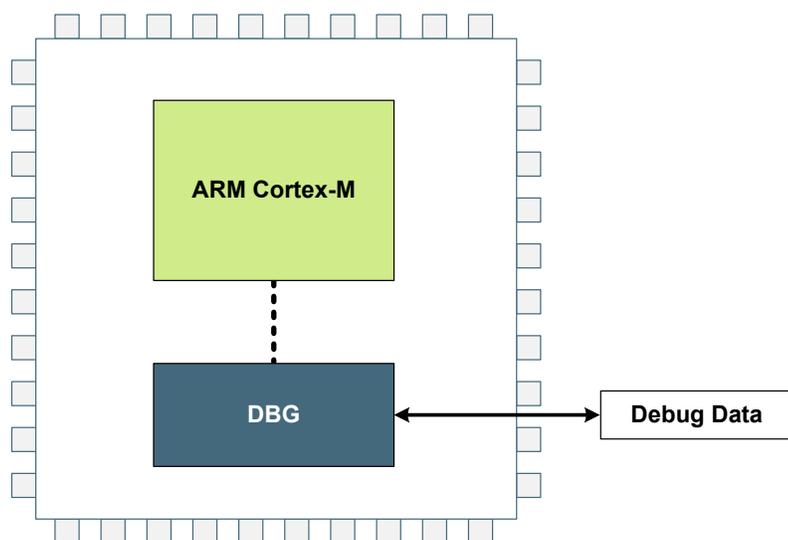

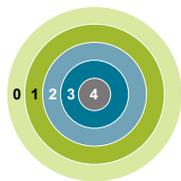

Bit	Name	Reset	Access	Description
31:0	LOCKBIT	0x0	RW	<b>page lock bit</b>
Zero means the corresponding page is allowed to write/erase. change to one will prevent corresponding page from write/erase. bit[0] for main space page 0, and bit[1] for page 1... bit[31] for page 31. Reset to zero. Host is only allowed to write one. Root and Debug are allowed to clear this register				

### 6.8.17 MSC\_PAGELOCK1 - Main Space Page 32-63 Lock Word

Offset	Bit Position																															
0x124	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	RW																															
<b>Name</b>	LOCKBIT																															

Bit	Name	Reset	Access	Description
31:0	LOCKBIT	0x0	RW	<b>page lock bit</b>
Zero means the corresponding page is allowed to write/erase. change to one will prevent corresponding page from write/erase. bit[0] for main space page 32, and bit[1] for page 33... bit[31] for page 63. Reset to zero. Host is only allowed to write one. Root and Debug are allowed to clear this register				

## 7. DBG - Debug Interface

### Quick Facts

#### What?

The Debug Interface is used to program and debug EFR32xG23 devices.

#### Why?

The Debug Interface makes it easy to re-program and update the system in the field, and allows debugging with minimal I/O pin usage.

#### How?

The Cortex®-M33 supports advanced debugging features. EFR32xG23 devices can use a minimum of two port pins for debugging or programming. The internal and external state of the system can be examined with debug extensions supporting instruction or data access break and watch points.

### 7.1 Introduction

The EFR32xG23 devices include hardware debug support through a 2-pin serial-wire debug (SWD) interface or a 4-pin Joint Test Action Group (JTAG) interface, as well as an Embedded Trace Module (ETM) for data/instruction tracing. In addition, there is also a Serial Wire Viewer pin which can be used to output profiling information, data trace and software-generated messages.

For more technical information about the debug interface the reader is referred to:

- ARM Cortex®-M33 Technical Reference Manual
- ARM CoreSight Components Technical Reference Manual
- ARM Debug Interface v5 Architecture Specification
- IEEE Standard for Test Access Port and Boundary-Scan Architecture, IEEE 1149.1-2013

### 7.2 Features

- Debug Access Port Serial Wire JTAG (DAPSWJ)
  - Implements the ADIV5 debug interface
- ARM Trustzone
  - Enables secure debugging
- Breakpoint unit (BPU)
  - Implement up to 8 hardware breakpoints
- Data Watch point and Trace (DWT) unit
  - Implement up to 4 watch points, trigger resources and system profiling
- Instrumentation Trace Macrocell (ITM)
  - Application-driven trace source that supports printf style debugging
- Embedded Trace Macrocell v3.5 (ETM)
  - Real time instruction and data trace information of the processor
- Cross Trigger Interface (CTI)
  - Issues synchronous triggers based on system events
  - Can be used to generate IRQs or route to PRS signalling

## 7.3 Functional Description

There are debug and trace pins available on the device. Operation of these pins is described in the following sections.

### 7.3.1 Debug Pins

The following pins are the debug connections for the device:

- Serial Wire Clock Input and Test Clock Input (SWCLKTCK) (SWCLK) : This pin is enabled after power-up and has a built-in pull-down.
- Serial Wire Data Input/Output and Test Mode Select Input (SWDIOTMS) (SWDIO) : This pin is enabled after power-up and has a built-in pull-up.
- Test Data Output (TDO): This pin is assigned to JTAG functionality after power-up. However, it remains in high-Z state until the first valid JTAG command is received.
- Test Data Input (TDI): This pin is assigned to JTAG functionality after power-up. However, it remains in high-Z state until the first valid JTAG command is received. Once enabled, the pin has a built-in pull-up.
- Serial Wire Viewer (SWV): This pin is disabled after reset.

The debug pins have integrated pull devices that are enabled by default after a reset. Leaving them enabled may increase current consumption if the pins are connected to power or ground. The debug pins have enable bits in the GPIO\_DBGROUPEPEN register; refer to the GPIO chapter for more details. Upon disabling the debug pins, debug contact with the device is lost once the DAPSWJ power request bits are deasserted. By default after a power cycle, the DAPSWJ is in JTAG mode. If during a debugging session the device is switched to SWD mode, a power cycle is needed to return to JTAG mode.

### 7.3.2 Embedded Trace Macrocell (ETM)

ETM makes it possible to non-intrusively trace both instruction and data from the processor in real time. Trace can be controlled through a set of triggering and filtering resources. The resources include 4 address comparators, 2 data value comparators, 2 counters, a context ID comparator and a sequencer. Before enabling the ETM, the CMU\_TRACECLKCTRL register must be configured to select the desired trace clock source. (See the CMU chapter for details.)

The trace can be exported through a set of trace pins, which include:

- Trace Clock (TRACECLK): Functions as a sample clock for the trace. This pin is disabled after reset.
- Trace Data 0-3 (TRACEDATA0, TRACEDATA1, TRACEDATA2, TRACEDATA3): The trace data pins provide the compressed trace stream. These pins are disabled after reset.

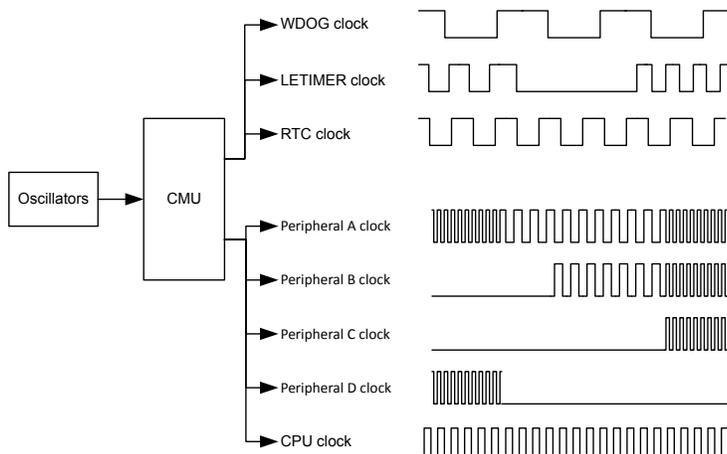

For information on how to configure the ETM, see the ARM Embedded Trace Macrocell Architecture Specification. The Trace Clock and Trace Data pins are enabled through a GPIO register. For more information on how to enable the ETM pins, refer to the GPIO chapter.

### 7.3.3 Debug and EM2/EM3

Debug connectivity in EM2 and EM3 is unavailable by default, to reduce current consumption. Debugging through EM2 and EM3 can be enabled by setting the EM2DBGGEN bit in the EMU\_CTRL register. Setting EM2DBGGEN ensures that power domain associated with the debug circuitry will remain active, but will result in a small amount of additional current in EM2 and EM3.

Leaving the debugger connected when issuing a WFI or WFE to enter EM2 or EM3 will make the system enter a special EM2 mode. This mode differs from regular EM2 and EM3 in that the high frequency clocks are still enabled, and certain core functionality is still powered in order to maintain debug functionality. Because of this, the current consumption in this mode is closer to EM1, and it is, therefore, important to deassert the power requests in the DAPSWJ and disconnect the debugger before undertaking current consumption measurements.

## 8. CMU - Clock Management Unit

### Quick Facts

#### What?

The CMU controls clock switching and distribution. EFR32xG23 supports several different oscillators with minimized power consumption and short start-up time. The CMU has HW support for calibration of RC oscillators.

#### Why?

Oscillators and clocks contribute significantly to the power consumption of the MCU. With the low power oscillators combined with the flexible clock control scheme, it is possible to minimize the energy consumption in any given application.

#### How?

The CMU switches different clock sources for various peripherals and sets the prescaler for the bus clocks. The short oscillator start-up times makes duty-cycling between active mode and the different low energy modes (EM2 DeepSleep, EM3 Stop, and EM4) very efficient. The calibration feature ensures high accuracy RC oscillators. Interrupts are available to avoid CPU polling of flags.

### 8.1 Introduction

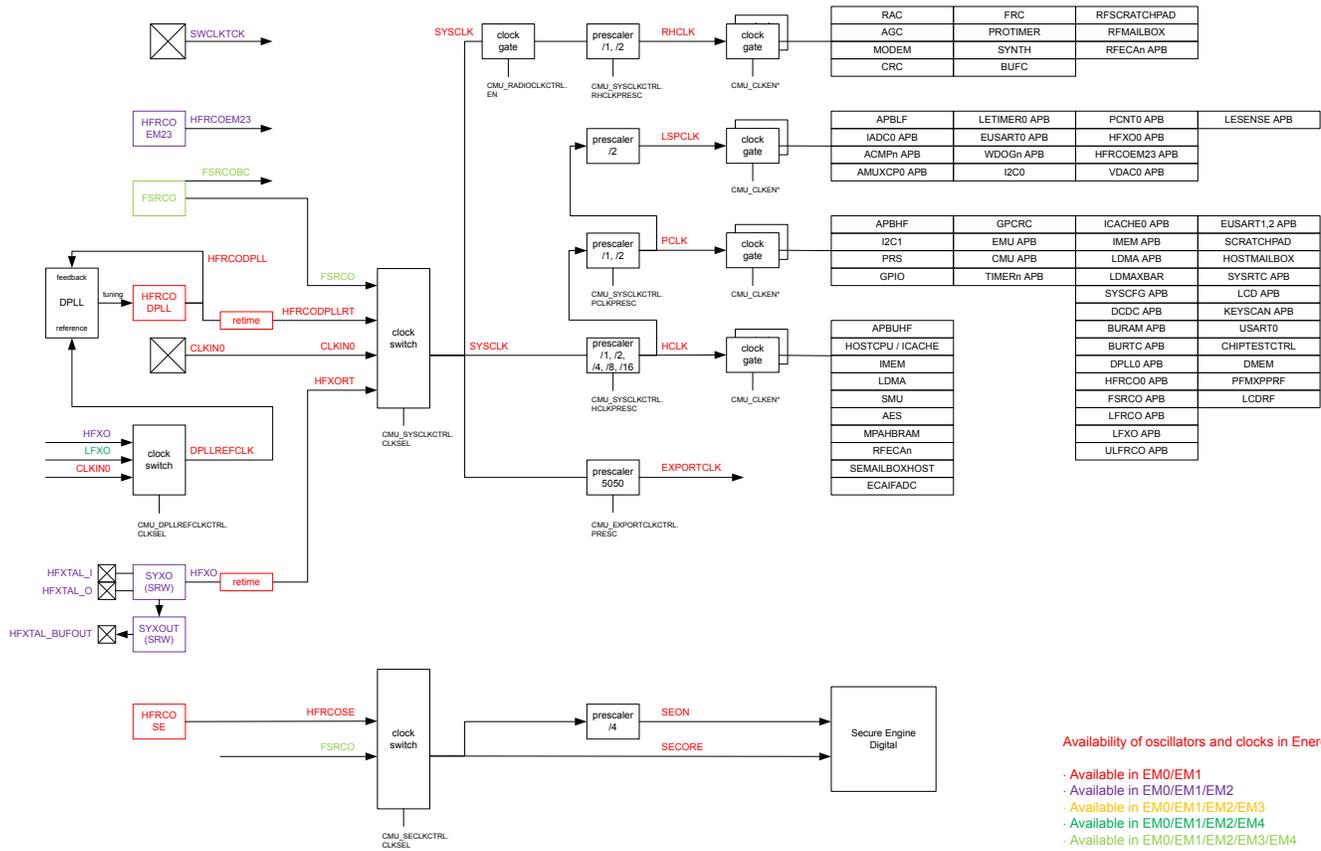

The Clock Management Unit (CMU) is responsible for switching among various oscillator sources and provides clocks to the peripheral modules. Oscillators are automatically turned on and off based on demand from the peripherals to minimize power consumption.

### 8.2 Features

- Multiple clock sources available:
  - 38 MHz - 40 MHz High Frequency Crystal Oscillator (HFXO)
  - 1 MHz - 80 MHz High Frequency RC Oscillator (HFRCODPLL)
  - 1 MHz - 38 MHz Deep Sleep High Frequency RC Oscillator (HFRCOEM23)
  - 20 MHz Fast Startup RC Oscillator (FSRCO)
  - 1 MHz - 38 MHz External Clock from Input Pins (CLKIN0)
  - 32768 Hz Low Frequency Crystal Oscillator (LFXO)
  - 32768 Hz Low Frequency RC Oscillator (LFRCO)
  - 1000 Hz Ultra Low Frequency RC Oscillator (ULFRCO)
- On-demand oscillator request.
- Low power oscillators.
- Fast start-up times.
- Cascaded prescalers for AHB Clocks (HCLK) and APB Clocks (PCLK).
- Clock gating on an individual basis to all peripherals based on module enable.
- Reset on an individual basis for Timer and IADC based on module enable.
- Selectable clocks can be output on external pins and/or PRS.
- Deep Sleep High Frequency RC oscillator (HFRCOEM23) or the Fast-start oscillator (FSRCO), which are asynchronous to the system clock, can be selected for IADC or VDACC0 operation in EM2.
- Hardware support for calibration of RC oscillators.

### 8.3 Functional Description

The CMU is comprised of several programmable clock trees, which connect oscillator resources to peripherals and buses. This section describes clock sources and peripherals available to the largest devices in the EFR32xG23 family. Please refer to the Configuration Summary in the Device Datasheet to see which core and peripheral modules, and therefore clock connections, are present in a specific device. Bus clock selection, including peripherals clocked directly from bus clocks, is shown in [Figure 8.1 Bus Clocks on page 148](#). Clock selection for peripherals with multiple high-frequency clock sources is shown in [Figure 8.2 High Frequency Peripheral Clocks on page 149](#). Clock selection for peripherals with multiple low-frequency clock sources is shown in [Figure 8.3 Low Frequency Peripheral Clocks on page 150](#). Clock selection for peripherals that can select from a high or low frequency clock source is shown in [Figure 8.4 Mixed Frequency Peripheral Clocks on page 151](#).

Availability of oscillators and clocks in Energy Modes:

- Available in EM0/EM1
- Available in EM0/EM1/EM2
- Available in EM0/EM1/EM2/EM3
- Available in EM0/EM1/EM2/EM4
- Available in EM0/EM1/EM2/EM3/EM4

Figure 8.1. Bus Clocks

Availability of oscillators and clocks in Energy Modes:

- Available in EM0/EM1
- Available in EM0/EM1/EM2
- Available in EM0/EM1/EM2/EM3
- Available in EM0/EM1/EM2/EM4
- Available in EM0/EM1/EM2/EM3/EM4

- Available in EM0/EM1/EM2/EM3
- Available in EM0/EM1/EM2/EM4
- Available in EM0/EM1/EM2/EM3/EM4

Figure 8.4. Mixed Frequency Peripheral Clocks

8.3.1 System Clocks

8.3.1.1 SYSCLK - Bus Clock

SYSCLK is the selected System Clock. HCLK is an optionally prescaled version of SYSCLK. PCLK is an optionally prescaled version of HCLK. The SYSCLK, and therefore HCLK and PCLK, can be driven by a high-frequency oscillator or be driven from a pin. The system boots using the FSRCO oscillator, and switches to HFRCODPLL before user firmware execution begins. To change the selected clock source, write to the CLKSEL bitfield in CMU\_SYCLKCTRL. If an invalid option is programmed into CLKSEL, FSRCO will be selected. The SYSCLK is running in EM0 Active and EM1 Sleep and is automatically stopped in EM2 DeepSleep.

The prescaler setting can be changed dynamically and the new setting takes effect immediately. When switching to a higher frequency oscillator source, prescaler setting should be adjusted before clock selection to prevent over clocking. For the same reason, when switching to a lower frequency oscillator source, prescaler setting cannot be adjusted until the clock selection is made.

The HFXO clock is fed directly to the Radio Transceiver. The clock received by the Radio Transceiver is therefore not affected by the selected clock source for SYSCLK nor by any clock prescaler.

### 8.3.1.2 HCLK - AHB Clock

HCLK is a prescaled version of SYSCLK. This clock drives the AHB bus interface. HCLK can be prescaled by setting HCLKPRESC in CMU\_SYCLKCTRL to DIV2 or DIV4. This prescales HCLK to all AHB bus clocks and is typically used to save energy in applications where the system is not required to run at the highest frequency. The setting can be changed dynamically and the new setting takes effect immediately. Some of the modules that are driven by this clock can be clock gated completely when not in use. This is done by clearing the module enable (EN) bit in the module's EN register.

### 8.3.1.3 PCLK - APB Clock

PCLK is a prescaled version of HCLK. This clock drives the APB bus interface. PCLK can be prescaled by setting PCLKPRESC in CMU\_SYCLKCTRL to DIV2. This prescales PCLK to all APB bus clocks and is necessary to prevent PCLK from exceeding the maximum frequency when HCLK is operated at above 40 MHz. The setting can be changed dynamically and the new setting takes effect immediately. Some of the peripherals that are driven by this clock can be clock gated completely when not in use. This is done by clearing the module enable (EN) bit in the module's EN register.

### 8.3.1.4 LSPCLK - Low Speed APB Clock

LSPCLK is a prescaled version of PCLK. This clock drives the Low Speed APB bus interface. LSPCLK is always prescaled by two. This prescales LSPCLK to all Low Speed APB bus clocks. Some of the peripherals that are driven by this clock can be clock gated completely when not in use. This is done by clearing the module enable (EN) bit in the module's EN register.

### 8.3.1.5 RHCLK - AHB Radio Clock

The radio AHB clock (RHCLK) is a prescaled version of SYSCLK. The maximum frequency for RHCLK is 40 MHz. The RHCLKPRESC setting in CMU\_SYCLKCTRL allows for SYSCLK to pass through (DIV1) or apply a divide-by-2 (DIV2) to the clock.

### 8.3.1.6 EM01GRPACLK - Energy Mode 01 Group A Clock

EM01GRPACLK is the selected clock for the Group A Peripherals operating in Energy Modes 0 or 1. These are typically high clock frequency peripheral modules. There are several selectable sources for EM01GRPACLK: HFXO, HFRCODPLL, HFRCOEM23, and FSRCO. In addition, the EM01GRPACLK can be disabled. The selection is configured using the CLKSEL field in CMU\_EM01GRPACLKCTRL.

Each High Frequency Peripheral that is clocked by EM01GRPACLK may have its own prescaler setting and enable bit. The prescaler settings, if available, can be found in the peripheral's control registers. The enable bit can be found in the module's EN register.

### 8.3.1.7 EM01GRPCCLK - Energy Mode 01 Group C Clock

EM01GRPCCLK is the selected clock for the Group C Peripherals operating in Energy Modes 0 or 1. These are typically high clock frequency peripheral modules. There are several selectable sources for EM01GRPCCLK: HFXO, HFRCODPLL, HFRCOEM23, FSRCO, HFRCODPLLRT, and HFXORT. In addition, the EM01GRPCCLK can be disabled. The selection is configured using the CLKSEL field in CMU\_EM01GRPCCLKCTRL.

Each High Frequency Peripheral that is clocked by EM01GRPCCLK may have its own prescaler setting and enable bit. The prescaler settings, if available, can be found in the peripheral's control registers. The enable bit can be found in the module's EN register.

### 8.3.1.8 EM23GRPACLK - Energy Mode 2 and 3 Group A Clock

EM23GRPACLK is the selected clock for the Group A Peripherals operating down to Energy Modes 2 or 3. These are typically low energy consumption peripheral modules. There are three selectable sources for EM23GRPACLK: LFRCO, LFXO and ULFRCO. In addition, the EM23GRPACLK can be disabled. The selection is configured using the CLKSEL field in CMU\_EM23GRPACLKCTRL.

Each Low Energy Peripheral that is clocked by EM23GRPACLK may have its own prescaler setting and enable bit. The prescaler settings, if available, can be found in the peripheral's control registers. The enable bit can be found in the module's EN register.

### 8.3.1.9 EM4GRPACLK - Energy Mode 4 Group A Clock

EM4GRPACLK is the selected clock for the Group A Peripherals operating down to Energy Mode 4. These are typically ultra low energy consumption peripheral modules. There are three selectable sources for EM4GRPACLK: LFRCO, LFXO and ULFRCO. In addition, the EM4GRPACLK can be disabled. The selection is configured using the CLKSEL field in CMU\_EM4GRPACLKCTRL.

**Note:** EM4GRPACLK is in a different power domain than EM23GRPACLK, which makes it available all the way down to EM4.

Each Low Energy Peripheral that is clocked by EM4GRPACLK may have its own prescaler setting and enable bit. The prescaler settings, if available, can be found in the peripheral's control registers. The enable bit can be found in the module's EN register.

### 8.3.1.10 Peripheral Bus Clock Enable

Peripherals each have an individual bus clock enable bit in the CMU\_CLKEN0 or CMU\_CLKEN1 registers. Disabling the bus clock to a peripheral can save energy, even when that peripheral is not active.

### 8.3.1.11 IADCCLK - IADC Clock

IADCCLK is the selected clock for the IADC. The IADCCLK source may be selected from EM01GRPACLK, HFRCOEM23, or FSRCO. In addition, the IADCCLK can be disabled. The selection is configured using the CLKSEL field in CMU\_IADCCLKCTRL.

**Note:** When using a Timer as the synchronous trigger for IADC conversion, EM01GRPACLK must be selected, because Timers run from EM01GRPACLK.

IADC has its own prescaler setting and enable bit. The prescaler settings can be found in the IADC's control registers. The enable bit can be found in the IADC's EN register.

Whichever clock source is selected as the IADC clock via the CLKSEL bitfield in the CMU\_IADCCLKCTRL register, this clock will become active automatically when needed. The IADC can automatically start and stop it.

### 8.3.1.12 VDACnCLK - VDACn Clock

VDACnCLK is the selected clock for VDACn. The VDACnCLK source may be selected from EM01GRPACLK, EM23GRPACLK, HFRCOEM23, or FSRCO. In addition, the VDACnCLK can be disabled. The selection is configured using the CLKSEL field in CMU\_VDACnCLKCTRL.

**Note:** When using a Timer as the synchronous trigger for VDACn conversion, EM01GRPACLK must be selected, because Timers run from EM01GRPACLK.

VDACn has its own prescaler setting and enable bit. The prescaler settings can be found in the VDAC's control registers. The enable bit can be found in the VDAC's EN register.

Whichever clock source is selected as the VDACn clock via the CLKSEL bitfield in the CMU\_VDACnCLKCTRL register, this clock will become active automatically when needed. The VDACn can automatically start and stop it.

### 8.3.1.13 LESENSEHFCLK - LESENSE High Frequency Clock

LESENSEHFCLK is the selected high-frequency clock for the LESENSE peripheral. The selection options are the HFRCOEM23 oscillator or the FSRCO oscillator. The high-frequency clock source is used for faster timing in certain LESENSE configurations. LESENSEHFCLK is selected via the CLKSEL field in CMU\_LESENSEHFCLKCTRL. The low-frequency clock for LESENSE is derived from EM23GRPACLK.

### 8.3.1.14 SYSRTCCLK - SYSRTC Clock

SYSRTCCLK is the selected clock for the SYSRTC peripheral. This clock tree can be clocked from any of the low-frequency oscillators: LFXO, LFRCO, or ULFRCO. SYSRTCCLK is selected via the CLKSEL field in CMU\_SYSRTCCLKCTRL.

### 8.3.1.15 LCDCLK - LCD Clock

LCDCLK is the selected clock for the LCD peripheral. This clock tree can be clocked from any of the low-frequency oscillators: LFXO, LFRCO, or ULFRCO. LCDCLK is selected via the CLKSEL field in CMU\_LCDCLKCTRL.

### 8.3.1.16 PCNT0CLK - PCNT0 Clock

PCNT0CLK is the selected clock for the PCNT peripheral. PCNT can be configured to clock from its S0 input signal, or the EM23GRPACLK, selectable by the CLKSEL field in CMU\_PCNT0CLKCTRL. Note that when configured to clock from the S0 input, the clock can further be selected from the direct S0 input pin, or from a PRS channel. Selection of the S0 input is determined by S0PRSEN in PCNT\_CFG.

### 8.3.1.17 EUSART0CLK - EUSART0 Clock

EUSART0CLK is the selected clock for the EUSART0 peripheral, and can choose between EM01GRPACLK, HFRCOEM23, LFXO, and LFRCO. EUSART0CLK is selected via the CLKSEL field in CMU\_EUSART0CLKCTRL. When operating EUSART0 as a high-speed UART or SPI main interface (EM0/1 only), EM01GRPACLK or HFRCOEM23 must be selected. To operate as a low-energy UART in EM0, EM1, or EM2, LFXO or LFRCO must be selected. To operate as a SPI secondary interface, EM01GRPACLK or HFRCOEM23 should be selected.

### 8.3.1.18 TRACECLK - Debug Trace Clock

The CMU scales the clock used for debug trace via the PRESC field in the CMU\_TRACECLKCTRL register. The debug trace clock is limited to 40 MHz maximum. Therefore, if the SYSCLK is 40 MHz or less, the default DIV1 setting may be used. When SYSCLK is above 40 MHz, use DIV2 to avoid data pump overflow. The selected debug trace clock will be used to run the Cortex®-M33 trace logic. Note that this register should be configured properly before enabling ETM.

### 8.3.1.19 WDOGnCLK - Watchdog Timer Clock

The Watchdog Timer (WDOGn) can be configured to use one of four different clock sources: LFRCO, LFXO, ULFRCO, or HCLKDIV1024. Select option HCLKDIV1024 to track Watchdog timeout with CPU clock speed.

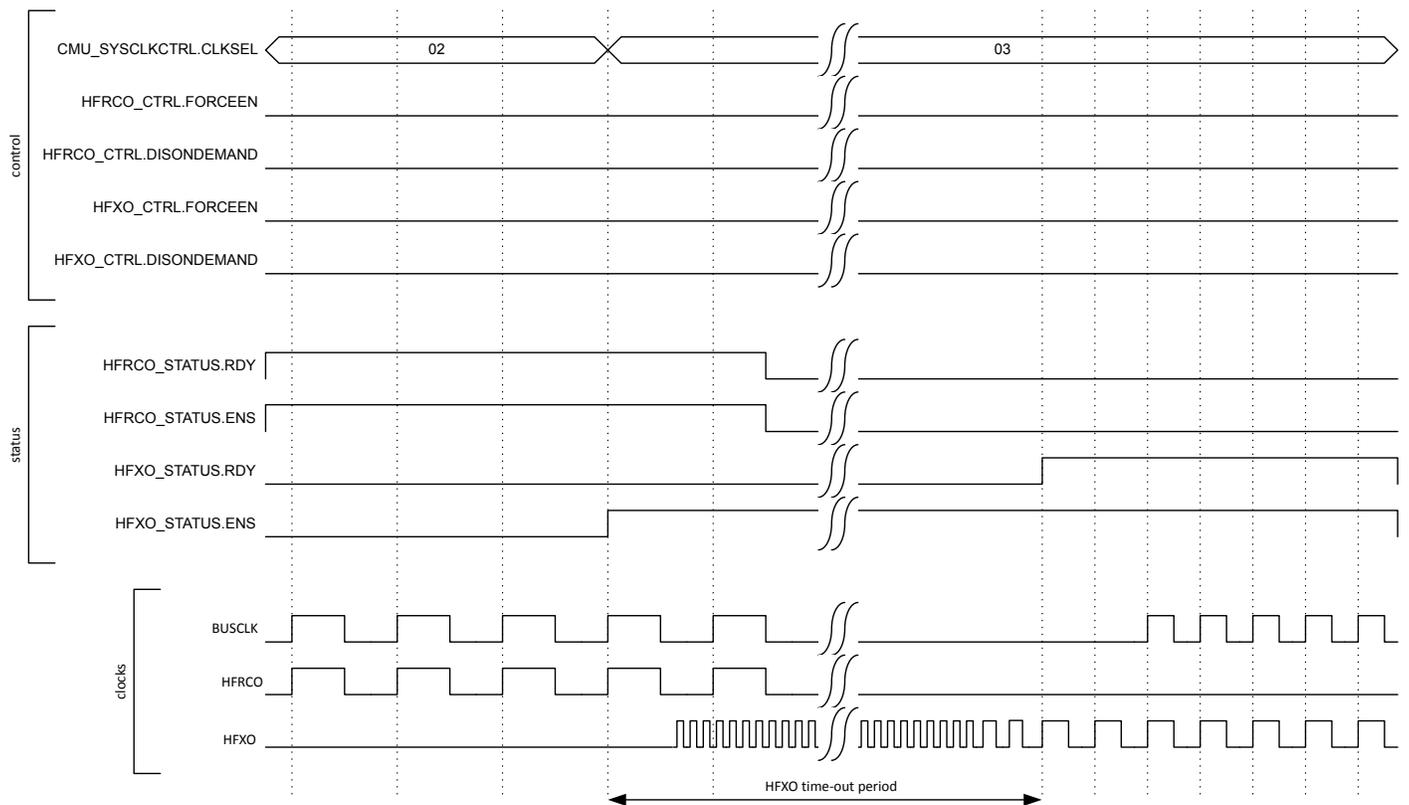

### 8.3.2 Switching Clock Source

The FSRCO oscillator is a fixed frequency (20 MHz), low energy oscillator with extremely short start-up time. Therefore, this oscillator is chosen by hardware as the clock source for SYSCLK when the device starts up (e.g. after reset).

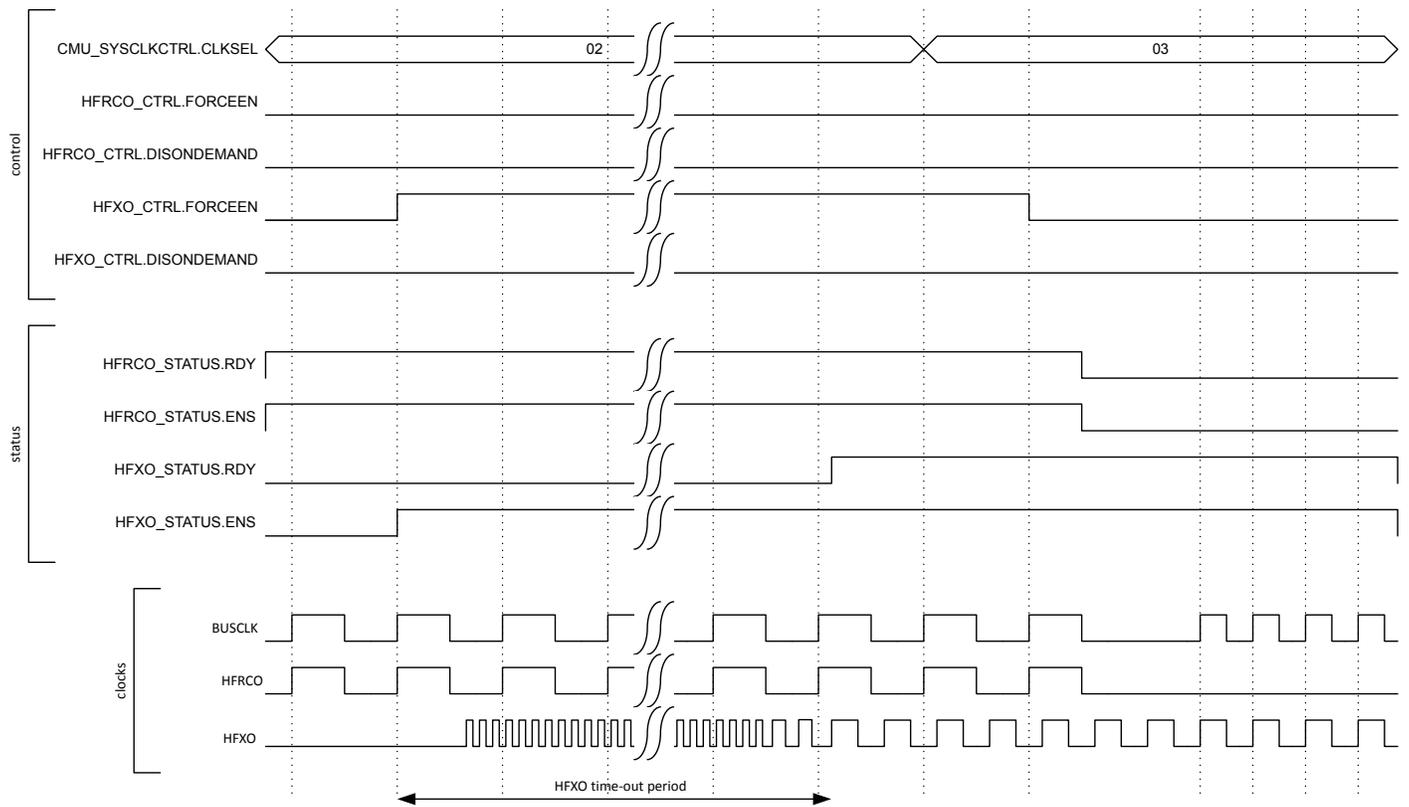

Software can switch between the different clock sources at run-time. For example, when the HFRCODPLL is the clock source, software can switch to HFXO by writing the field CLKSEL in the CMU\_SYCLKCTRL register. See [Figure 8.5 CMU Switching From HFRCO to HFXO Before HFXO is Ready on page 155](#) for a description of the sequence of events for this specific operation.

When switching the SYSCLK to HFXO via the CLKSEL bitfield in CMU\_SYCLKCTRL, HFXO is automatically started. Switching to an oscillator that is not ready yet, the SYSCLK will stop for the duration of the oscillator start-up time. This effectively stalls the Core Modules. It is possible to avoid this by first enabling the target oscillator (e.g. HFXO) and then waiting for that oscillator to become ready before switching the clock source. This way, the system continues to run on the HFRCO until the target oscillator (e.g. HFXO) is ready and provides a reliable clock. This sequence of events is shown in [Figure 8.6 CMU Switching From HFRCO to HFXO After HFXO is Ready on page 156](#).

Generally, all oscillators have a separate flag that is set when the oscillator is ready. This flag can also be configured to generate an interrupt.

**Figure 8.5. CMU Switching From HFRCO to HFXO Before HFXO is Ready**

**Figure 8.6. CMU Switching From HFRCO to HFXO After HFXO is Ready**

Switching clock source for various clock switches is done by setting the CLKSEL bitfields in `CMU_*CLKCTRL`. To ensure no stalls in the peripherals, the clock source should be ready before switching to it.

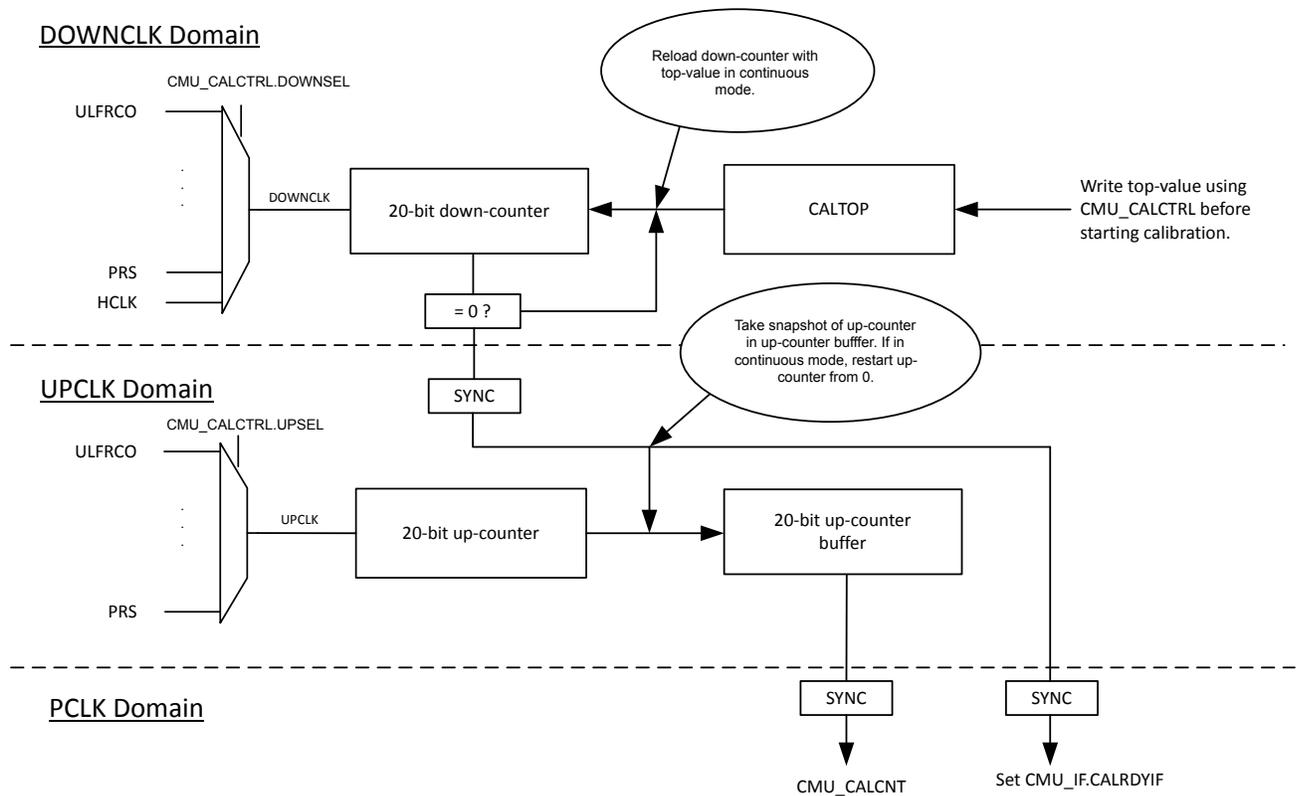

**Note:** To save energy, remember to disable all clock switches and/or module enable bits when not in use.

### 8.3.3 RC Oscillator Calibration

The CMU has built-in hardware support to efficiently calibrate RC oscillators (LFRCO, HFRCODPLL, HFRCOEM23) at run-time or measure the timing of other periodic signals routed via PRS, see [Figure 8.7 Hardware Support for RC Oscillator Calibration on page 157](#) for an illustration of this circuit.

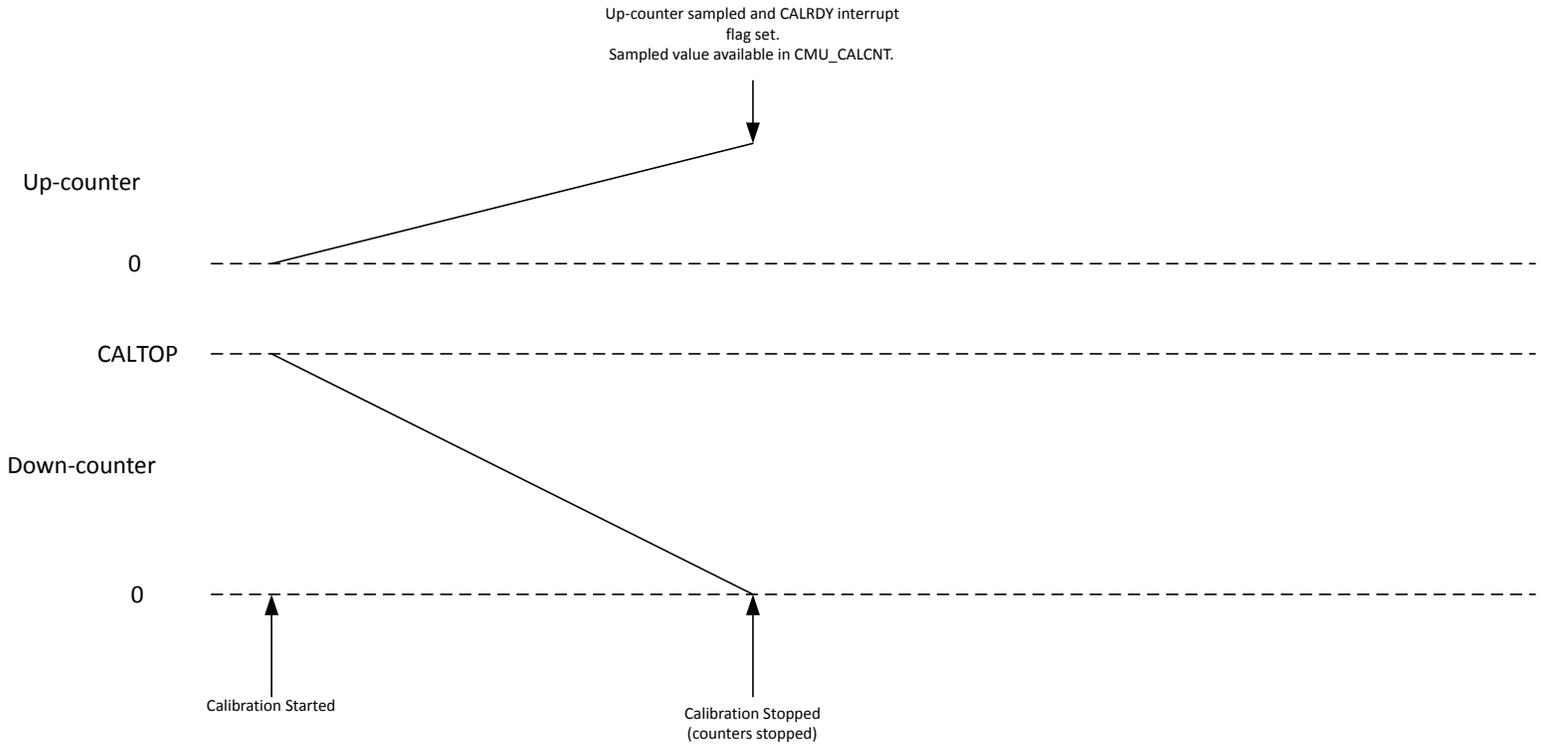

The concept is to select a reference and compare the RC frequency or PRS timing with the reference frequency. When the calibration circuit is started, one down-counter running on a selectable clock (DOWNSEL in CMU\_CALCTRL) and one up-counter running on a selectable clock (UPSEL in CMU\_CALCTRL) are started simultaneously. Reference clocks may also be routed through the PRS channels via the CALUP and CALDN consumer inputs. The top value for the down-counter must be written (CALTOP in CMU\_CALCTRL) before calibration is started. The down-counter counts for CALTOP + 1 cycles. When the down-counter has reached 0, the up-counter is sampled and the CALRDY interrupt flag in the IF register is set. If CONT in CMU\_CALCTRL is cleared, the counters are stopped after finishing the ongoing calibration. If continuous mode is selected by setting CONT in CMU\_CALCTRL, the down-counter reloads the top value and continues counting, while the up-counter restarts from 0.

Software can then read out the sampled up-counter value from CMU\_CALCNT. The up-counter has counted (the sampled value)+ 1 cycles. The ratio between the reference and the oscillator subject to the calibration can easily be found using (the top value)+1 and (the sampled value)+1. Overflows of the up-counter will not occur. If the up-counter reaches its top value before the down-counter reaches 0, the up-counter stays at its top value. Calibration can be started and stopped by writing CALSTART and CALSTOP bitfields in CMU\_CALCMD, respectively. With this hardware support, it is simple to write efficient software calibration algorithms.

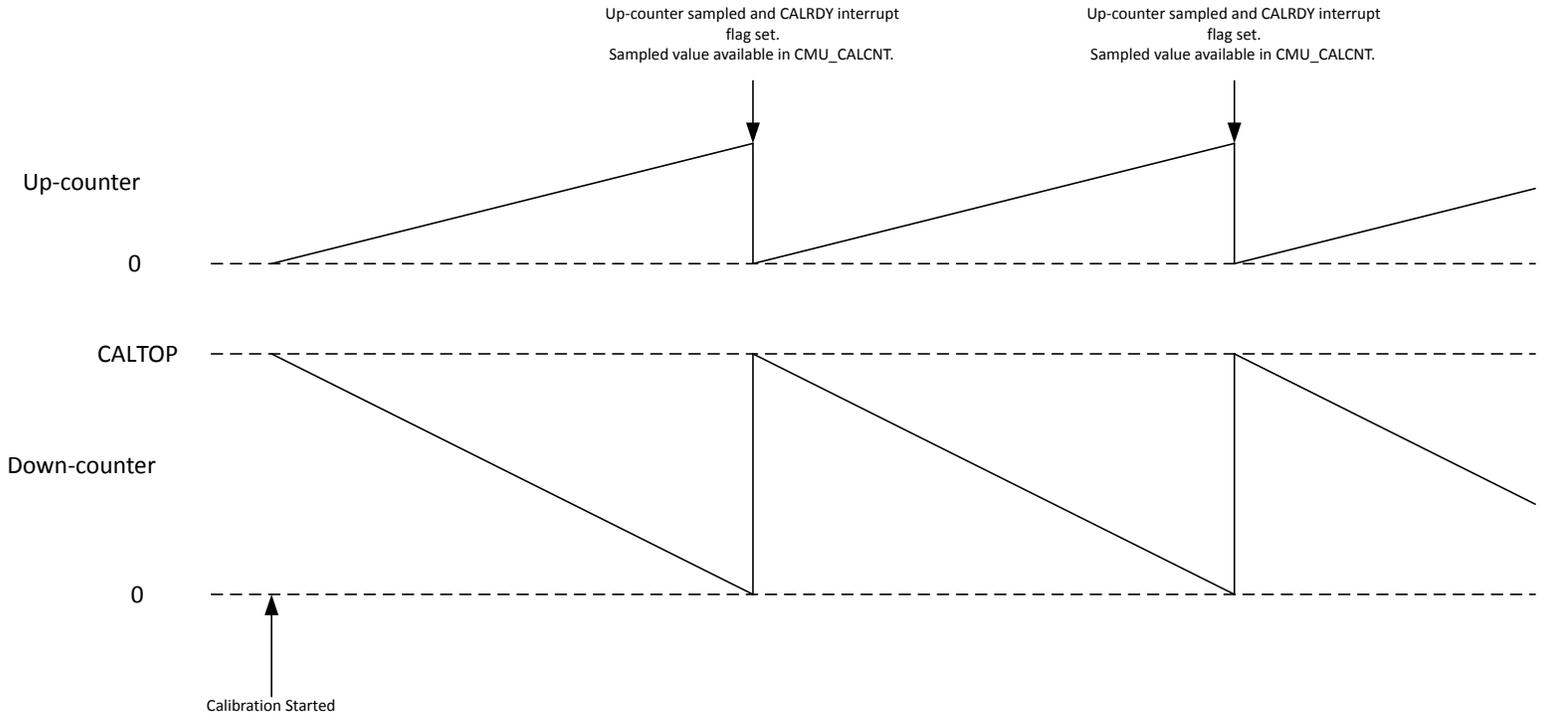

**Figure 8.7. Hardware Support for RC Oscillator Calibration**

The counter operation for single and continuous mode are shown in [Figure 8.8 Single Calibration \(CONT=0\) on page 158](#) and [Figure 8.9 Continuous Calibration \(CONT=1\) on page 159](#) respectively.

**Figure 8.8. Single Calibration (CONT=0)**

**Figure 8.9. Continuous Calibration (CONT=1)**

### 8.3.4 Energy Modes

The availability of oscillators and system clocks depends on the chosen energy mode. By default, the high frequency oscillators and high frequency clocks are available down to EM1 Sleep. From EM2 DeepSleep onwards these oscillators and clocks are normally off, although special cases exist as summarized in [Table 8.1 Oscillator and clock availability in Energy Modes on page 160](#). The CMU figures in [8.3 Functional Description](#) also indicate which oscillators and clocks can be used in what energy modes.

The low frequency oscillators (LFRCO and LFXO) are available in all energy modes except in EM3 Stop when they are off by definition. By default, these oscillators are also off in EM4 Shutoff. The LFXO or LFRCO can be requested in EM4 as needed. The ultra low frequency oscillator (ULFRCO) is on in all energy modes, except for EM4 Shutoff, but it can be requested on in that state as well if needed. The low frequency clocks are in various power domains and therefore their availability not only depends on the chosen clock source, but also on the chosen energy mode as indicated in [Table 8.1 Oscillator and clock availability in Energy Modes on page 160](#).

**Table 8.1. Oscillator and clock availability in Energy Modes**

	EM0 Active / EM1 Sleep	EM2 DeepSleep	EM3 Stop	EM4 Shutoff
HFRCODPLL	On <sup>1</sup>	Off	Off	Off
HFXO	On <sup>1</sup>	On <sup>2</sup>	On <sup>2</sup>	Off
HFRCOEM23	On <sup>1</sup>	On <sup>2</sup>	On <sup>2</sup>	Off
LFRCO, LFXO	On <sup>1</sup>	On <sup>1</sup>	Off	On <sup>3</sup>
ULFRCO	On	On	On	On <sup>3</sup>
SYSCLK, HCLK, PCLK, LSPCLK, RHCLK, EM01GRPACLK, EM01GRPCCLK	On <sup>1</sup>	Off	Off	Off
IADCCLK, LESENSEHFCLK, VDACCCLK	On <sup>1</sup>	On <sup>2</sup>	On <sup>2</sup>	Off
EM23GRPACLK, WDOGnCLK, SYSRTCCLK, VDACC_REFRESH_CLK, LCDCLK, PCNT0CLK	On <sup>1</sup>	On <sup>1</sup>	On <sup>4</sup>	Off
EM4GRPACLK	On <sup>1</sup>	On <sup>1</sup>	On <sup>4</sup>	On <sup>3</sup>

- 1 Under software control.
- 2 Default off, but kept active if requested by modules.
- 3 Default off, but kept active if used by BURTC.
- 4 On only if ULFRCO is used as clock source.

### 8.3.5 Clock Output

The CMU has up to three CLKOUTn signals that can be routed to the PRS or GPIO. The selections for CLKOUTn are controlled using the CLKOUTSELn bitfields in CMU\_EXPORTCLKCTRL (CLKOUTSEL0 controls CLKOUT0, for example).

The following clocks can be selected for CLKOUTn:

- HCLK and EXPORTCLK. The HCLK is the high frequency clock for AHB. The EXPORTCLK is a prescaled version of SYSCLK as controlled by the PRESC bitfield in the CMU\_EXPORTCLKCTRL register.
- The qualified clock from any of the on-chip oscillators. A qualified clock will not have any glitches or skewed duty-cycle during start-up. For the LFXO and HFXO, correct configuration of the TIMEOUT bitfield(s) in LFXO\_CFG and HFXO\_XTALCFG, respectively is required to guarantee a properly qualified clock.

HCLK will only have a 50-50 duty cycle when HCLKPRESC in CMU\_SYSCLKCTRL is DIV1. EXPORTCLK will only be 50-50 duty cycle when the selected division factor is even.

The CLKOUTn signals may be routed to GPIO via the DBUS as CMU.CLKOUTn using controls in the GPIO registers. The required output pins must be enabled in the GPIO\_CMU\_ROUTEEN register and the pin locations can be configured in the GPIO\_CMU\_CLKOUTnROUTE registers.

The CLKOUTn signals can also be used as PRS producers (see [13.3.3 Producers](#) for more detail on PRS producers). CLKOUTn signals used as PRS producers may be simultaneously routed to GPIO, but this is not required to use CLKOUTn as a PRS producer.

### 8.3.6 Clock Input from a Pin

It is possible to configure the CMU to input a clock from the CMU\_CLKI0. This clock can be selected to drive SYSCLK and DPLL reference using CMU\_SYSCLKCTRL.CLKSEL and CMU\_DPLLREFCLKCTRL.CLKSEL respectively. The required input pin locations can be configured in the GPIO\_CMU\_CLKIN0ROUTE register.

### 8.3.7 Interrupts

The interrupts generated by the CMU module are combined into one interrupt vector. If CMU interrupts are enabled, an interrupt will be made if one or more of the interrupt flags in CMU\_IF and their corresponding bits in CMU\_IEN are set.

### 8.3.8 Protection

It is possible to lock the control and command registers to prevent unintended software writes to critical clock settings. This is controlled by the CMU\_LOCK register.

The WDOGCLKCTRL registers are separately locked by CMU\_WDOGLOCK register. This is to prevent EM3 Stop mode from disabling the watch dog clocks inadvertently.

In addition to software locks, hardware locks are implemented to prevent metastability. CMU\_CALCTRL is locked by hardware when calibration is started by CMU\_CALCMD.CALSTART. CMU\_DPLLREFCLKCTRL is locked by hardware when DPLL is enabled via DPLL\_EN.EN. Because these switches are not glitch-less, clock selection must be configured before enabling the operation and cannot be changed during operation.

## 8.4 CMU Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	CMU_IPVERSION	R	IP Version ID
0x008	CMU_STATUS	RH	Status Register
0x010	CMU_LOCK	W	Configuration Lock Register
0x014	CMU_WDOGLOCK	W	WDOG Configuration Lock Register

## 8.5 CMU Register Description

### 8.5.1 CMU\_IPVERSION - IP Version ID

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x2															
<b>Access</b>																	R															
<b>Name</b>																	IPVERSION															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x2	R	<b>IP Version ID</b>

## 8.5.2 CMU\_STATUS - Status Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0	0x0																														0x0
<b>Access</b>	R	R																														R
<b>Name</b>	LOCK	WDOGLOCK																														CALRDY

Bit	Name	Reset	Access	Description
31	LOCK	0x0	R	<b>Configuration Lock Status</b> Indicates the current status of configuration lock
	Value	Mode		Description
	0	UNLOCKED		Configuration lock is unlocked
	1	LOCKED		Configuration lock is locked
30	WDOGLOCK	0x0	R	<b>Configuration Lock Status for WDOG</b> Indicates the current status of WDOG configuration lock
	Value	Mode		Description
	0	UNLOCKED		WDOG configuration lock is unlocked
	1	LOCKED		WDOG configuration lock is locked
29:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	CALRDY	0x0	R	<b>Calibration Ready</b> Calibration is Ready (0 when calibration is ongoing).

### 8.5.3 CMU\_LOCK - Configuration Lock Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x93F7															
<b>Access</b>																	W															
<b>Name</b>																	LOCKKEY															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	LOCKKEY	0x93F7	W	<b>Configuration Lock Key</b> Write any other value than the unlock code to lock registers from editing. Write the unlock code to unlock.
	Value	Mode	Description	
	37879	UNLOCK	Write this value to unlock	

### 8.5.4 CMU\_WDOGLOCK - WDOG Configuration Lock Register

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x5257															
<b>Access</b>																	W															
<b>Name</b>																	LOCKKEY															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	LOCKKEY	0x5257	W	<b>Configuration Lock Key</b> Write any other value than the unlock code to lock registers from editing. Write the unlock code to unlock.
	Value	Mode	Description	
	37879	UNLOCK	Write this value to unlock	

## 8.5.5 CMU\_IF - Interrupt Flag Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0				
<b>Access</b>																											RW	RW				
<b>Name</b>																											CALOF	CALRDY				

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	CALOF	0x0	RW	<b>Calibration Overflow Interrupt Flag</b> Set when calibration overflow has occurred (i.e. if a new calibration completes before CMU_CALSTATUS has been read)
0	CALRDY	0x0	RW	<b>Calibration Ready Interrupt Flag</b> Set when calibration is completed

## 8.5.6 CMU\_IEN - Interrupt Enable Register

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0				
<b>Access</b>																											RW	RW				
<b>Name</b>																											CALOF	CALRDY				

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	CALOF	0x0	RW	<b>Calibration Overflow Interrupt Enable</b> Enable/disable CALOF interrupt
0	CALRDY	0x0	RW	<b>Calibration Ready Interrupt Enable</b> Enable/disable CALRDY interrupt

### 8.5.7 CMU\_CALCMD - Calibration Command Register

Offset	Bit Position																															
0x050	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0	0x0		
<b>Access</b>																													W(nB)	W(nB)		
<b>Name</b>																													CALSTOP	CALSTART		

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	CALSTOP	0x0	W(nB)	<b>Calibration Stop</b> Stops the calibration counters.
0	CALSTART	0x0	W(nB)	<b>Calibration Start</b> Starts the calibration, effectively loading the CMU_CALCTRL.CALCNT into the down-counter and start decrementing.

### 8.5.8 CMU\_CALCTRL - Calibration Control Register

Offset	Bit Position																															
0x054	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0			0x0			0x0													0x0												
<b>Access</b>	RW			RW			RW													RW												
<b>Name</b>	DOWNSEL			UPSEL			CONT													CALTOP												

Bit	Name	Reset	Access	Description
31:28	DOWNSEL	0x0	RW	<b>Calibration Down-counter Select</b> Selects clock source for the calibration down-counter. Changing this while calibration is running results in bus fault..
	Value	Mode		Description
	0	DISABLED		Down-counter is not clocked
	1	HCLK		HCLK is clocking down-counter
	2	PRS		PRS CMU_CALDN consumer is clocking down-counter
	3	HFXO		HFXO is clocking down-counter
	4	LFXO		LFXO is clocking down-counter
	5	HFRCODPLL		HFRCODPLL is clocking down-counter
	6	HFRCOEM23		HFRCOEM23 is clocking down-counter
	9	FSRCO		FSRCO is clocking down-counter
	10	LFRCO		LFRCO is clocking down-counter
	11	ULFRCO		ULFRCO is clocking down-counter
27:24	UPSEL	0x0	RW	<b>Calibration Up-counter Select</b> Selects clock source for the calibration up-counter. Changing this while calibration is running results in bus fault.
	Value	Mode		Description
	0	DISABLED		Up-counter is not clocked
	1	PRS		PRS CMU_CALUP consumer is clocking up-counter
	2	HFXO		HFXO is clocking up-counter
	3	LFXO		LFXO is clocking up-counter
	4	HFRCODPLL		HFRCODPLL is clocking up-counter
	5	HFRCOEM23		HFRCOEM23 is clocking up-counter
	8	FSRCO		FSRCO is clocking up-counter
	9	LFRCO		LFRCO is clocking up-counter
	10	ULFRCO		ULFRCO is clocking up-counter
23	CONT	0x0	RW	<b>Continuous Calibration</b>

Bit	Name	Reset	Access	Description
				Set this bit to enable continuous calibration. Changing this while calibration is running results in bus fault.
22:20	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:0	CALTOP	0x0	RW	<b>Calibration Counter Top Value</b> Write top value before calibration. Changing this while calibration is running results in bus fault.

## 9. Oscillators

### Quick Facts

#### What?

The EFR32xG23 has a wide range of high frequency and low frequency oscillators.

#### Why?

The High Frequency oscillators support EM0/1 operation. The Low-frequency oscillators provide a low frequency clock for the low energy peripherals in EM/2/3/4.

#### How?

The HFXO supports high frequency crystal oscillators. The LFXO supports 32.768 kHz crystal oscillators. The RC oscillators are internal oscillators that require no external components.

### 9.1 Introduction

The EFR32xG23 has several oscillators. This chapter contains a detailed function description and register descriptions for each oscillator. The CMU chapter includes information on how to select clock sources. Each oscillator may require some initial configuration or calibration before being enabled. The CMU supports clock on demand and can enable and disable oscillators. Therefore, it is important to properly configure each oscillator before selecting it as a clock source in the CMU.

### 9.2 HFXO - High Frequency Crystal Oscillator

#### 9.2.1 Introduction

The High Frequency Crystal Oscillator (HFXO) uses an external high frequency crystal and provides a sequencer for starting up the crystal safely and reliably, while minimize energy consumption. An external sine wave clock source can also be used in the absence of a crystal.

## 9.2.2 Features

- Optimized for 39 MHz crystals
- Multiple programming options of start-up parameters to enable optimization of different crystals, supporting a wide range of ESR and ESL
- Support for external sine wave input
- Programmable two-phase start-up to minimize energy consumption
- Built-in current optimization (Automatic oscillation amplitude control)
- Independent on-chip frequency tuning capacitors
- Hardware request for on-demand enable/disable
- Dedicated high-quality clock output
- Register lock

## 9.2.3 Functional Description

### 9.2.3.1 Enabling and Disabling

While the HFXO supports on-demand clocking, it is generally recommended to manually manage the HFXO, at least initially, because it requires software configuration and has a long start-up time. Software can set the FORCEEN to start HFXO and keep it enabled even if it is not selected as a clock source.

However, once started and before EM2 entry, switching the HFXO to on-demand mode may be desirable. This allows the MCU to enter EM2 and then restart the HFXO automatically upon EM2 exit. (During EM1P the HFXO can be conditionally started, depending on the wake-up trigger source.)

The HFXO can be enabled and disabled via both hardware and software mechanisms. Enabling via software is done by setting the FORCEEN bit in the HFXO\_CTRL register. Disabling via software is done by setting the DISONDEMAND bit and clearing FORCEEN bit in the HFXO\_CTRL register. The hardware controlled on-demand mode is enabled by clearing the FORCEEN and DISONDEMAND bits in the HFXO\_CTRL register. Once configured the on-demand mode hardware can autonomously start and stop the HFXO based on various peripheral clock requests in combination with clock switch selections in the CMU. The HFXO is automatically stopped when entering EM2, EM3, or EM4. Hardware can also stop the HFXO via hardware in response to change in peripheral requests and clock switch selections in the CMU.

### 9.2.3.2 Start-up Time

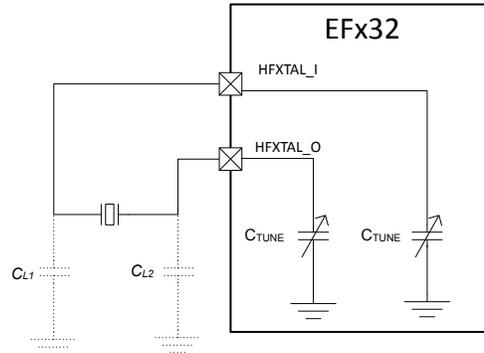

The start-up time differs for different crystals and the HFXO has a configurable time-out to accommodate each crystal type. Software configures the timeout by setting the various TIMEOUT bit fields of the HFXO\_XTALCFG register. The time-out delays the assertion of the RDY signal for HFXO. The programmed timeout should allow enough time for the oscillator to stabilize. The time-out can be optimized for the chosen crystal used in the application.

The start-up behavior of the HFXO also depends on how and how long the HFXO is disabled.

### 9.2.3.3 Configuration

The High Frequency Crystal Oscillator needs to be configured to ensure safe start-up for the given crystal. Refer to the Device Data sheet and application notes for guidelines in selecting correct components and crystals as well as for configuration trade-offs.

The HFXO crystal is connected to the HFXTAL\_I/HFXTAL\_O pins as shown in [Figure 9.1 HFXO Pin Connection on page 193](#).

**Figure 9.1. HFXO Pin Connection**

Upon enabling the HFXO, a hardware state machine sequentially applies the configurable start-up state, intermediate start-up state, and steady state control settings from the HFXO\_XTALCFG and HFXO\_XTALCTRL registers. After reaching the steady operation state of the HFXO, it is recommended to further optimize current consumption using the Core Bias Optimization Algorithm to trade off noise and current consumption.

Refer to [AN0016.2](#) for more information on settings for different crystals. Write the configuration values, which depends on the crystal's CL, RESR and oscillation frequency, into HFXO\_XTALCFG and HFXO\_XTALCTRL registers.

- COREBIASSTARTUP (HFXO\_XTALCFG) - current setting applied at start-up time
- COREBIASSTARTUPI (HFXO\_XTALCFG) - current setting applied at intermediate start-up time
- COREBIASANA (HFXO\_XTALCTRL) - current setting applied at steady state
- CTUNEXISTARTUP (HFXO\_XTALCFG) - tuning cap setting for XI applied at start-up time
- CTUNEXIANA (HFXO\_XTALCTRL) - tuning cap setting for XI applied at steady state
- CTUNEXOSTARTUP (HFXO\_XTALCFG) - tuning cap setting for XO applied at start-up time
- CTUNEXOANA (HFXO\_XTALCTRL) - tuning cap setting for XO applied at steady state
- CTUNEFIXANA (HFXO\_XTALCTRL) - fixed tuning cap setting applied throughout
- TIMEOUTSTEADY (HFXO\_XTALCFG) - duration for the steady state settling time
- TIMEOUTCBLBS (HFXO\_XTALCFG) - duration for the optimization settling after each step

All HFXO configuration needs to be performed prior to enabling the HFXO, whether via software by setting FORCEEN bit field, or allowing hardware request by clearing DISONDEMAND bit field in the HFXO\_CTRL register.

By default, the HFXO is started in crystal mode, but it is possible to connect an active external sine or clipped sine wave clock source to the HFXTAL\_I pin of the HFXO. By configuring the MODE field in HFXO\_CFG to EXTCLK, the HFXO can be bypassed and the source clock can be provided through the HFXTAL\_I pin.

### 9.2.3.4 Status Flags

The ENS flag in the HFXO\_STATUS indicates if the HFXO has been successfully enabled. Once the HFXO oscillation amplitude has exceeded the start-up threshold and intermediate start-up threshold, the steady state settling timeout begins. When the steady state timeout has expired, the HFXO is ready for use as indicated by the RDY flag in the HFXO\_STATUS. Once Core Bias Optimization is enabled, the COREBIASOPTRDY flag in the CMU\_STATUS register indicates when the optimization is ready. It is advised to wait for this flag before using the HFXO, because optimization can cause minor disturbance to the oscillator frequency.

### 9.2.3.5 On-Demand Clocking

Software can request to enable the HFXO by setting the HFXO\_CTRL.FORCEEN bit field. The HFXO can also optionally be configured via the HFXO\_CTRL.DISONDEMAND to shut down when no hardware request is present. This is known as on-demand clocking and allows the oscillator to be controlled without any software intervention. On-demand HFXO enable can be used, for example, upon wake-up of the Radio Controller (RAC). The RAC module always requires the HFXO for its operation. Any hardware request for HFXO, including request from RAC, is indicated in the HWREQ bit field of the HFXO\_STATUS register. This request enables the HFXO, provided that DISONDEMAND bit field is cleared in HFXO\_CTRL register. The HFXO is only disabled by hardware upon EM2, EM3 or EM4 entry.

A typical use scenario of the on-demand feature is as follows. Set up the SYSRTC to periodically generate a compare match. Setup a PRS channel which uses this SYSRTC compare match as its source to cause a wake-up into EM1. Setup the RAC to use the PRS channel as its source for TXEN or RXEN. Now, when the EFR32 is in EM2 and the SYSRTC generates a compare match, a wake-up into EM1 occurs, and the HFXO will automatically start. When HFXO is ready, the RAC performs its work and triggers a transition back into EM2 when finished. The system starts, uses, and stops the HFXO without ever being in EM0.

The HFXO analog circuitry can optionally continue operating with the clock output shut off when the HFXO is disabled. This is configured by setting the KEEPWARM bit in HFXO\_STATUS.

### 9.2.3.6 Interrupts

RDYIF and COREBIASOPTRDYIF are interrupt flags as well as status flags. This allows software flexibility to implement interrupt service routine or polling loop for these events. When steady state timeout has exceeded, sticky RDYIF is set until it is cleared by software. If optimization is enabled, sticky COREBIASOPTRDYIF is set when optimization is completed successfully. However, if optimization fails to complete, sticky COREBIASOPTERRIF is set, and the HFXO control state machine stays in the error state until the oscillator is disabled. Similarly, if HFXO fails to start-up, meaning it has not reached the steady state, sticky DNSERRIF is set. The HFXO control state machine stays in the error state until the oscillator is disabled.

### 9.2.3.7 Protection

It is possible to lock the control registers, configuration registers, and command register to prevent unintended software writes to critical clock settings. This is controlled by the HFXO\_LOCK register. A LOCK bit is available in HFXO\_STATUS register. Furthermore, these registers are locked automatically by hardware to prevent clock domain crossing malfunction. To gain access to these registers while oscillator is in steady operation state, set FORCEEN to 1, then set DISONDEMAND to 1 in the HFXO\_CTRL register. A FSMLOCK bit in HFXO\_STATUS register indicates when it is safe for software to update control registers and configuration registers. When software is finished with updates, put the oscillator back to on-demand mode by clearing DISONDEMAND to 0, followed by clearing FORCEEN to 0 in the HFXO\_CTRL register. While DISONDEMAND is 0, FSMLOCK is always set, even if hardware is not requesting. This is to prevent a race condition between software access and hardware lock.

### 9.2.3.8 Tuning

While the oscillator is running in steady operation state, it may be desirable to change control settings. One example is frequency tuning by modifying the tuning capacitance via CTUNEXIANA and CTUNEXOANA fields in the HFXO\_XTALCTRL register. When tuning, care should be taken to make small changes to the CTUNE registers. Ideally, change the CTUNE registers by one LSB at a time and alternate between the XI and XO registers. Sufficient wait time for settling, on the order of TIMEOUTSTEADY, should pass before new frequency measurement is taken.

**Note:** While the HFXO can support crystals with a tuning range of 38 MHz to 40 MHz, the radio specifically requires a 39 MHz crystal. There may also be specific crystal tolerance requirements for each RF protocol supported by the radio.

### 9.2.3.9 High Frequency Clock Output (HFCLKOUT)

Certain device package options include a dedicated HFCLKOUT pin. This signal is designed to be a very high quality sinusoidal clock output operating at the crystal frequency. It is suitable for driving the crystal input on other Silicon Labs EFR products, and enables multi-radio systems operating from a single crystal. When using the HFCLKOUT feature, there are additional controls and considerations.

#### Enabling and Disabling

The HFCLKOUT feature can be enabled and disabled through software or hardware. To enable the output buffer in software the FORCEENBUFOUT bit in HFXO\_CTRL should be set to 1. To disable, the DISONDEMANDBUFOUT bit should be set to 1 and FORCEENBUFOUT cleared to 0 in HFXO\_CTRL.

Hardware (on-demand) control is possible as well. The on-demand hardware mechanism uses a GPIO input (HFXO0.BUFOUT\_REQ\_IN\_ASYNC, routed to PA or PB pin in the GPIO interface) to allow the other radio device to request the oscillator output. The external device requests HFCLKOUT by setting the input high. If the HFXO is not already running when external hardware requests HFCLKOUT, the HFXO will automatically be enabled and stabilized before the HFCLKOUT buffer turns on. When the external hardware enable request becomes inactive (input logic low), the HFXO block may also be automatically shut down to save energy if no other HFXO requestors are active.

Hardware control is enabled by clearing both the FORCEENBUFOUT and DISONDEMANDBUFOUT bits in the HFXO\_CTRL register.

**Note:** Under hardware control, HFCLKOUT is available in EM0, EM1, EM2 and EM3 and will be automatically shut down in EM4.

#### Tuning

If the HFCLKOUT feature is enabled, CTUNEXIBUFOUTANA should normally be set to CTUNEXIANA. This will guarantee a maximum capacitance change of  $\pm 300$  fF between enabling/disabling HFCLKOUT (expected maximum frequency shift of  $\pm 10$  ppm for a typical crystal). For a lower frequency shift, it is recommended to tune CTUNEXIBUFOUTANA at the target frequency while HFCLKOUT is enabled.

## 9.2.4 HFXO Register Map

## 9.3 HFRCO - High-Frequency RC Oscillator

### 9.3.1 Introduction

The HFRCO is a calibrated internal High Frequency RC oscillator.

### 9.3.2 Features

- 1 MHz - 80 MHz High Frequency RC Oscillator with DPLL working in EM01 (HFRCODPLL)
- 1 MHz - 40 MHz High Frequency RC Oscillator working in EM23 (HFRCOEM23)
- Low start-up time
- Run-time band change or tuning

### 9.3.3 Functional Description

#### 9.3.3.1 Start-up

The HFRCO starts up quickly in a few micro-seconds (refer to device data sheet for start-up time specifications.) After the start-up time, the RDY status bit will go high and the RDY interrupt will be triggered. It can take another two clock cycles for the clock to propagate through the CMU before the clock is seen by peripherals.

### 9.3.3.2 On-Demand Clocking

Software can request to enable the HFRCO by setting the HFRCO\_CTRL.FORCEEN bit field. The HFRCO can also optionally be configured via the HFRCO\_CTRL.DISONDEMAND to shut down when no hardware request is present. This is known as on-demand clocking and allows the oscillator to be controlled without any software intervention. This means that HFRCO receives a request for clock from the CMU whenever the oscillator clock is needed. These requests can come at any time from any power domain (depending on the which peripheral is requesting the clock.)

#### 9.3.3.2.1 EM2/EM3 On-Demand Operation (HFRCOEM23)

The HFRCOEM23 can be used by certain peripherals as an on-demand, high-speed clock source in energy modes down to EM3. To enable operation as an on-demand clock in EM2 and EM3, the EM23ONDEMAND bit in the CTRL register should be set to 1. Setting this bit ensures that the associated PDO power domain will remain active and allow the oscillator to honor the request.

**Note:** This feature is not available on the HFRCODPLL oscillator, which only operates in EM0 and EM1.

### 9.3.3.3 Calibration

Several different frequencies are calibrated during production test on every device. In order to use a factory-calibrated value, software must read the value from the appropriate location in the DEVINFO page and write it to the CAL register.

The TUNING and FINETUNING bit fields in the CAL register can be used to trim HFRCO manually.

Software may write the CAL register at any time. If there is already a frequency updating occurring, the current change would apply when the previous update is done. FREQBSY in STATUS register indicates if the updating is finished.

The minimum and maximum frequencies attainable for each setting of the FREQRANGE field are listed in the device data sheet.

**Table 9.1. HFRCODPLL Calibration Frequencies**

DEVINFO Location	Target Frequency
HFRCODPLLCAL0	4 MHz
HFRCODPLLCAL3	7 MHz
HFRCODPLLCAL6	13 MHz
HFRCODPLLCAL7	16 MHz
HFRCODPLLCAL8	19 MHz (default)
HFRCODPLLCAL10	26 MHz
HFRCODPLLCAL11	32 MHz
HFRCODPLLCAL12	38 MHz
HFRCODPLLCAL13	48 MHz
HFRCODPLLCAL14	56 MHz
HFRCODPLLCAL15	64 MHz
HFRCODPLLCAL16	80 MHz

**Table 9.2. HFRCOEM23 Calibration Frequencies**

DEVINFO Location	Target Frequency
HFRCOEM23CAL0	4 MHz
HFRCOEM23CAL1	5 MHz
HFRCOEM23CAL3	7 MHz
HFRCOEM23CAL4	10 MHz
HFRCOEM23CAL6	13 MHz
HFRCOEM23CAL7	16 MHz
HFRCOEM23CAL8	19 MHz (default)
HFRCOEM23CAL9	20 MHz
HFRCOEM23CAL10	26 MHz
HFRCOEM23CAL11	32 MHz
HFRCOEM23CAL12	40 MHz

### 9.3.3.4 Interrupts

HFRCO has one interrupt: IF.RDY. RDY is triggered when the timeout has finished and the qualified HFRCO clock is ready. The clock is gated until it is ready.

### 9.3.3.5 Status Flags

#### 9.3.3.5.1 FREQBSY

The FREQBSY bit indicates the HFRCO is busy updating its frequency after writing to the CAL register. The FREQBSY bit should be used whenever frequency is changed. E.g. After software writes to the CAL register, FREQBSY would assert immediately. Software should wait for FREQBSY to be zero before attempting to write to the CAL register again.

For band-change, FREQBSY would not de-assert until after the timeout upon being re-enabled.

For normal start-up, FREQBSY would not assert.

When DPLL is on, FREQBSY would not assert as the frequency change is not caused by writing to the CAL register. When disabling DPLL the last tuning value is written back to the CAL register, which will assert FREQBSY.

#### 9.3.3.5.2 ENS

ENS indicates the HFRCO is enabled. This flag is used to check if the HFRCO is enabled by any requester.

**Note:** When a band change occurs, the HFRCO is disabled and re-enabled. This will cause the ENS bit to briefly de-assert.

#### 9.3.3.5.3 RDY

RDY indicates HFRCO is enabled and start-up timeout has exceeded. Used to check if the HFRCO clock is ready after enable.

Changing bands will de-assert RDY as the oscillator must reset and start up again.

#### 9.3.3.5.4 SYNCBUSY

SYNCBUSY indicates ongoing synchronization of CAL register fields. Same as all other modules.

### 9.3.3.6 Forced Oscillator Control

The HFRCO can be forced on and off using the FORCEEN and DISONDEMAND bits in the CTRL register.

Setting FORCEEN will force the oscillator core to run, but peripherals will still need to request the clock to un-gate the clock signal.

### 9.3.3.7 Oscillator Modes

The HFRCO has three modes of operation, an **on-demand** mode (which is the normal software use case), a **force on** and a **force off** mode.

In **on-demand** mode the oscillator will start whenever a peripheral requests it. Which in most cases is whenever the peripheral is enabled.

In **force on** mode the analog core will run independently of whether it is requested or not. This can be useful for measuring analog current without any digital load on the clocks.

In **force off** mode, the analog core will be shut off independently of whether it is requested or not. This can be useful for changing analog test settings without risking glitches on the clock.

The DISONDEMAND bit can also be used to give software full control over the clock for exceptional cases where software control is desired.

**Table 9.3. Oscillator modes**

Bit Field	FORCEEN	DISONDEMAND
On-Demand (normal operation)	0	0
Forced On	1	X
Forced Off	0	1

### 9.3.4 HFRCO Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	HFRCO_IPVERSION	R	IP Version ID

### 9.3.5 HFRCO Register Description

#### 9.3.5.1 HFRCO\_IPVERSION - IP Version ID

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x2																															
<b>Access</b>	R																															
<b>Name</b>	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x2	R	<b>IP Version</b>
The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.				

#### 9.3.5.2 HFRCO\_CTRL - Ctrl Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	RW																															
<b>Name</b>	EM23ONDEMAND DISONDEMAND FORCEEN																															

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	EM23ONDEMAND	0x0	RW	<b>EM23 On-demand</b>
Use this bit to prevent EM23 shutdown of the HFRCOEM23 low power domain (PD0C) upon EM23 entry. Set this bit to 1 if on-demand requests are supposed to be honored while in EM23.				
1	DISONDEMAND	0x0	RW	<b>Disable On-demand</b>
Setting this bit disable HFRCO on-demand feature				
0	FORCEEN	0x0	RW	<b>Force Enable</b>
Setting this bit force HFRCO enabled				

## 9.3.5.3 HFRCO\_CAL - Calibration Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Access</b>																																RW
<b>Name</b>																																RDY

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
0	RDY	0x0	RW	<b>RDY Interrupt Enable</b> Enable/disable the RDY interrupt

## 9.3.5.7 HFRCO\_LOCK - Lock Register

Offset	Bit Position																																
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																																	0x8195
<b>Access</b>																																	W
<b>Name</b>																																	LOCKKEY

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	LOCKKEY	0x8195	W	<b>Lock Key</b> Write any other value than the unlock code to lock registers from editing. Write the unlock code to unlock.
	Value	Mode	Description	
	33173	UNLOCK	Unlock code	

## 9.4 DPLL - Digital Phased Locked Loop

## 9.4.1 Introduction

The Digital Phase-Locked Loop (DPLL) uses a reference clock to generate a desired clock frequency at a specified ratio to the reference clock.

## 9.4.2 Features

- Frequency Lock Mode
- Phase-Lock Mode
- Output frequency =  $F_{REF} * (N+1) / (M+1)$ , where N and M are 12-bit values
- Very fast lock time
- Very fast transient tracking
- Low output jitter
- Lock detection with an interrupt
- Lock fail detection with interrupts

## 9.4.3 Functional Description

### 9.4.3.1 Enabling and Disabling

The DPLL can be enabled and disabled by software via the DPLL\_EN register. Before enabling DPLL, software should:

1. Select reference clock by setting the CLKSEL field in CMU\_DPLLREFCLKCTRL.
2. The CMU should not be running from the HFRCO. If necessary, the CMU should switch to the FSRCO until after the DPLL has locked to avoid over-clocking due to overshoot. If necessary, select FSRCO or HFXO in the CMU\_SYCLKCTRL register CLKSEL field.
3. Configure the DPLL.
4. Make certain that the ENS bit in DPLL\_STATUS is low.

The DPLL is disabled automatically when entering EM2, EM3, or EM4. Note that disabling the DPLL will not automatically turn off the reference clock. The CLKSEF field in CMU\_DPLLREFCLKCTRL must be set to DISABLED before entering EM2 or the selected REFCLK may continue to run in EM2.

### 9.4.3.2 Lock Modes

The DPLL provides two lock modes, referred to as frequency-lock loop mode (FREQLL) and phase-lock loop mode (PHASELL). FREQLL mode keeps the DCO frequency-locked to the reference clock, which means the DCO frequency will be accurate. However, the phase error can accumulate over time and cause a non-zero average frequency error. FREQLL mode also provides better jitter and transient performance. PHASELL mode keeps the DCO phase-locked to the reference clock, which means the phase error does not accumulate over time, which makes the average frequency error zero. FREQLL mode is usually sufficient unless specific phase requirement exists.

### 9.4.3.3 Configurations

The formula for the DPLL output frequency is  $FREF \cdot (N+1) / (M+1)$ . The user should calculate N and M in DPLL\_CFG1 to achieve the target frequency. Note that with a larger value of N, the DCO lock time would increase and DCO jitter would decrease. Both effects are approximately linear. This relationship can be used to select N for a given application to strike a compromise between lock time and output jitter. For example if an ratio of 3 is desired, the DPLL could be configured as {N=599, M=199} for fast lock time but high jitter, or as {N=2999, M=999} for lower jitter but longer lock time.

**Note:** All configuration settings should be done before enabling the DPLL. They should not be changed when DPLL is running. The final tuning values can be read back from TUNING and FINETUNING in HFRCO\_CAL, after DPLL is disabled and DPLENS in DPLL\_STATUS is low.

### 9.4.3.4 Lock Detection

The DPLL has 3 different types of output events: ready, lock fail due to period underflow, and lock fail due to period overflow. Each of the events has its own interrupt flag. DPLLRDY is set when DPLL successfully locks to the reference clock based on the software configuration. DPLLLOCKFAILLOW is set when the DPLL fails to lock because the period lower boundary is hit. DPLLLOCKFAILHIGH is set when the DPLL fails to lock because the period upper boundary is hit. If the interrupt flags are set and the corresponding interrupt enable bits in DPLL\_IEN are set, the DPLL will request an interrupt. Based on different interrupt events, software should take different actions:

- If the DPLLRDY interrupt is received first, it means target clock is ready and it is safe to switch to use DCO's output.
- If the DPLLLOCKFAILLOW interrupt is received first, it indicates the RANGE in HFRCO\_CAL is too small. Software should disable the DPLL and write a larger value to RANGE, then enable the DPLL again to lock.
- If the DPLLLOCKFAILHIGH interrupt is received first, it indicates the RANGE in HFRCO\_CAL is too large. Software should disable DPLL and write a smaller value to RANGE, then enable DPLL again to lock.
- If the DPLLRDY interrupt is received first and then DPLLLOCKFAILLOW or DPLLLOCKFAILHIGH is received later, it means reference clock drifted over 1% and the DPLL has lost its locked status.
  - If AUTORECOVER in DPLL\_CFG is not set, software should disable the DPLL and enable DPLL again to lock.
  - If AUTORECOVER in DPLL\_CFG is set, hardware will re-lock automatically. When the target frequency is near the boundary of a range, the drift may cause underflow or overflow. In this case the fail interrupt will still be received. Software should disable the DPLL and modify RANGE in HFRCO\_CAL in corresponding direction, depending on whether the DPLLLOCKFAILLOW or DPLLLOCKFAILHIGH bit is set. Then enable DPLL again to lock.

### 9.4.4 DPLL Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	DPLL_IPVERSION	R	IP Version

## 9.4.5 DPLL Register Description

### 9.4.5.1 DPLL\_IPVERSION - IP Version

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset	0x1																															
Access	R																															
Name	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x1	R	<b>IP Version ID</b>
The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.				

### 9.4.5.2 DPLL\_EN - Enable

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																															0x0	0x0
Access																															R	RW
Name																															DISABLING	EN

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISABLING	0x0	R	<b>Disablement Busy Status</b>
When EN is cleared, DISABLING status is set immediately, and cleared when disablement finishes. Disablement resets peripheral cores and not APB registers except hardware updated registers such as INTFLAGS and FIFO				
0	EN	0x0	RW	<b>Module Enable</b>
The ENABLE bit enables the module. Software should write to CONFIG type registers before setting the ENABLE bit. Software should write to SYNC type registers only after setting the ENABLE bit.				

## 9.4.5.3 DPLL\_CFG - Config

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0				0x0	0x0	0x0	
<b>Access</b>																									RW				RW	RW	RW	
<b>Name</b>																									DITHEN				AUTORECOVER	EDGESEL	MODE

Bit	Name	Reset	Access	Description
31:28	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
27:16	N	0x0	RW	<b>Factor N</b> The locked DCO frequency is given by: $F_{dco} = F_{ref} * (N + 1)/(M+1)$ . N is required to be larger than 300.
15:12	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
11:0	M	0x0	RW	<b>Factor M</b> The locked DCO frequency is given by: $F_{dco} = F_{ref} * (N + 1)/(M+1)$ . M can be any value.

## 9.4.5.5 DPLL\_IF - Interrupt Flag

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0	0x0			
<b>Access</b>																											RW	RW	RW			
<b>Name</b>																											LOCKFAILHIGH	LOCKFAILLOW	LOCK			

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
2	LOCKFAILHIGH	0x0	RW	<b>Lock Failure High Interrupt Flag</b> Set when DPLL fail to lock because of period overflow.
1	LOCKFAILLOW	0x0	RW	<b>Lock Failure Low Interrupt Flag</b> Set when DPLL fail to lock because of period underflow.
0	LOCK	0x0	RW	<b>Lock Interrupt Flag</b> Set when DPLL achieve the lock.

## 9.4.5.6 DPLL\_IEN - Interrupt Enable

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0	0x0			
<b>Access</b>																											RW	RW	RW			
<b>Name</b>																											LOCKFAILHIGH	LOCKFAILLOW	LOCK			

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	LOCKFAILHIGH LOCKFAILHIGH Interrupt Enable	0x0	RW	<b>LOCKFAILHIGH Interrupt Enable</b>
1	LOCKFAILLOW LOCKFAILLOW Interrupt Enable	0x0	RW	<b>LOCKFAILLOW Interrupt Enable</b>
0	LOCK LOCK interrupt Enable	0x0	RW	<b>LOCK interrupt Enable</b>

## 9.4.5.7 DPLL\_STATUS - Status

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset	0x0																														0x0	0x0
Access	R																														R	R
Name	LOCK																														ENS	RDY

Bit	Name	Reset	Access	Description
31	LOCK	0x0	R	<b>Lock Status</b> Indicates the current status of configuration lock
	Value	Mode		Description
	0	UNLOCKED		DPLL is unlocked
	1	LOCKED		DPLL is locked
30:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	ENS	0x0	R	<b>Enable Status</b> DPLL is enabled.
0	RDY	0x0	R	<b>Ready Status</b> DPLL is enabled and locked.

## 9.4.5.8 DPLL\_LOCK - Lock

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																0x7102																
Access																W																
Name																LOCKKEY																

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15:0	LOCKKEY	0x7102	W	<b>Lock Key</b> Write any other value than the unlock code to lock registers from editing. Write the unlock code to unlock.
	Value	Mode		Description
	28930	UNLOCK		Unlock code

## 9.5 LFXO - Low-Frequency Crystal Oscillator

### 9.5.1 Introduction

The Low Frequency Crystal Oscillator (LFXO) uses an external 32.768 kHz crystal to provide an accurate low-frequency clock. The module is available in all energy modes, except EM3. The main interaction is with the CMU through the clock requesting mechanism.

### 9.5.2 Features

High-level features.

- Crystal calibration
- Functional in all energy modes, except EM3
- Failure detection and EM4WU
- External CMOS mode
- Edge interrupts and EM2WU
- On-demand oscillator enabling

### 9.5.3 Functional Description

#### 9.5.3.1 Modes

The LFXO can be used in three different modes. The mode can be programmed by setting MODE bit field in the LFXO\_CFG register. If MODE is set to XTAL, the LFXO is programmed to operate in crystal mode and a 32.768 kHz crystal oscillator should be connected to LF crystal pads, LFXTAL\_I and LFXTAL\_O (see the device data sheet for details). If MODE is set to BUFEXTCLK, the LFXO is programmed to operate in external sine mode and the sine wave should be supplied to LFXTAL\_I pin. If MODE is set to DIGEXTCLK, LFXO is programmed to operate in external CMOS mode and the external 32.768 kHz clock should be provided on LFXTAL\_I pin. See the register descriptions for more details.

#### 9.5.3.2 Enabling

There are two ways to turn on the LFXO clock. One is to turn it on in FORCEON mode by setting FORCEEN bit to 1 in LFXO\_CTRL register. Another is to keep it ready to be turned on in ONDEMAND mode by setting FORCEEN bit to 0 and DISONDEMAND bit to 0 in LFXO\_CTRL register. This means that the oscillator will be off unless its clock requested. When a peripheral requests the clock, hardware will automatically enable the LFXO without any software intervention. The oscillator will remain on as long as the peripheral requests it. DISONDEMAND setting does not have any impact when FORCEEN set to 1. LFXO is in FORCEOFF mode when FORCEEN set to 0 and DISONDEMAND set to 1. In FORCEOFF mode all requests are blocked and LFXO will not generate the clock. The LFXO clock is available in all energy modes, except EM3.

#### 9.5.3.3 Clock Qualification

Once the LFXO is enabled, the clock should not be used until it has had time to stabilize. Therefore, a number of cycles are required to qualify the clock. Before the clock is qualified, no clock requesters will receive the LFXO clock. The number of cycles used to qualify the clock can be programmed by setting the TIMEOUT bit field in the LFXO\_CFG register. The TIMEOUT default value is set to 32,728 cycles, which is much more than necessary for stabilization. The stabilization time required will depend on the particular crystal, oscillator settings, and frequency accuracy requirements. A value of 4096 clocks is generally recommended for most applications. A low timeout of 2 cycles may be used in DIGEXTCLK mode in order to filter out the first glitch from the pad. The 2 clock cycle timeout should not be used with crystals. There are two status bits and one interrupt associated with enabling the oscillator and qualifying its clock. Once the oscillator gets enabled the ENS bit in LFXO\_STATUS register will be set high. Note that due to the nature of on demand clocking, the oscillator can be enabled anytime, so if software reads ENS low it is not safe to assume that ENS stays low during the next instruction. It is only safe to assume that oscillator is OFF at the time ENS is being read. Similarly, if software reads ENS high it is not safe to assume that ENS stays high during the next instruction. Once the clock is qualified, the RDY status is set high in the LFXO\_STATUS register. The same uncertainties also apply to the RDY bit. However, software can wait for RDY bit to go high to detect that LFXO clock is qualified. Or it can enable the interrupt with RDYIEN in LFXO\_IEN register and receive RDYIF interrupt available in LFXO\_IF register. RDYIF also acts as EM2 wakeup source if RDYIEN set high. If put into FORCEON mode, the LFXO will start the qualification and once qualified it will gate off the clock but immediately start with no qualification upon receiving a request. If in ONDEMAND mode, the LFXO starts the qualification every time it is switched from off to on due to clock requests. The qualification can take up to 32k cycles. Note that only enabling RDY interrupt does not act as a clock request.

### 9.5.3.4 Edge Detection Interrupts

There is a possibility for software to detect rising or falling edges of the LFXO clock. The edge detection is enabled if any of POSEDGEIEN and NEGEDGEIEN is set to 1. The corresponding flags are available in POSEDGEIF and NEGEDGEIF. If none of the interrupts are enabled, the edge detection is disabled and POSEDGEIF and NEGEDGEIF hold their last value until cleared or set by software. Disabling the edge detection is only allowed on NEGEDGEIF. Both flags act as EM2 wakeup sources if the corresponding IEN is set high.

### 9.5.3.5 Clock Failure

In case the oscillator or crystal stops or does not output clock when expected, a failure interrupt can be raised. The failure occurs if fewer than 3 LFXO clock positive edges happen during one 1ms. The failure detection is enabled by setting FAILDETEN to 1 in LFXO\_CTRL register. This bit acts as a clock requester. Once enabled, failure detection status can be checked by reading FAILIF in LFXO\_IF register. If FAILIEN is set high, failure will generate both interrupt and EM2 wakeup. Failure detection is also implemented as EM4 wakeup source. To wakeup from EM4 on LFXO failure detection, set FAILDETEM4WUEN high in LFXO\_CTRL.

### 9.5.3.6 Automatic Gain Control

AGC and HIGHAMPL in LFXO\_CFG are settings applied to the LFXO oscillator. Both settings provide higher crystal oscillation amplitude. This will improve duty cycle in the output clock and give lower sensitivity to noise, but at the cost of higher current consumption. The AGC bit is used to enable the Automatic Gain Control module that adjusts the amplitude of the oscillations. It is enabled by default. When disabled, the LFXO will run at the start-up current and the crystal will oscillate rail-to-rail or limited by the start-up current. The HIGHAMPL bit will have no effect when AGC is disabled. When AGC is enabled setting the HIGHAMPL bit will give about 70% higher crystal oscillation amplitude.

### 9.5.3.7 Force Off

It is not allowed to write to LFXO\_CFG unless LFXO is in FORCEOFF mode. If this guideline is violated, the write access is blocked and a bus fault is generated. Writing to CFG registers has no effect in DIGEXTCLK mode. Note: when putting the oscillators to FORCEOFF mode, wait for ENS status to go low for the oscillator to completely shut off. Once the oscillator is forced off, it is safe to write to the LFXO\_CFG register.

### 9.5.3.8 Register Synchronization

While the CFG registers are static LFXO configuration, LFXO\_CAL register has GAIN and CAPTURE bit fields which can be written to while the oscillator is running. This is used to calibrate the LFXO clock. These registers are allowed to be written only if CALBSY in LFXO\_SYNCBUSY register is low. If this guideline is violated, the write access is blocked and a bus fault is generated. CALBSY is guaranteed to be low in FORCEOFF mode. When exiting FORCEOFF mode, CALBSY will go high and stay high until the initial internal synchronization is done. CALBSY is also guaranteed to be low in DIGEXTCLK mode since writing to CAL register has no effect in DIGEXTCLK mode. CAPTURE is allowed to be incremented or decremented by one LSB when not in FORCEOFF mode. Note that CAPTURE tunes the internal capacitors connected to LFXTAL\_I and LFXTAL\_O pads (see Register map for more details). By programming GAIN bit field it is possible to optimize start-up time and power consumption for a given crystal. Internal capacitances are not provided on all chips (see the device data sheet for more details).

### 9.5.3.9 Register Lock

See the LFXO\_LOCK register on how to lock certain registers. Registers LFXO\_CTRL, LFXO\_CFG, and LFXO\_CAL are lockable. The LOCK bit in LFXO\_STATUS register is available to check whether the registers are locked. If locked, all updates to these registers are blocked and bus faults are issued.

### 9.5.3.10 Reset Behavior

Upon reset, the LFXO is configured for the safe crystal start-up. The TIMEOUT is set to 32k cycles, The MODE is set to XTAL and the reset state is FORCEOFF. In order to minimize the start-up time and power consumption for a given crystal, it is possible to adjust the start-up gain in the oscillator by programming GAIN in LFXO\_CAL. All controls are retained in EM4, except LFXO\_IEN register which is reset after EM4 wakeup.

### 9.5.4 LFXO Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	LFXO_IPVERSION	R	LFXO IP Version
0x004	LFXO_CTRL	RW	LFXO Control Register

4	FAILDETEN	0x0	RW	<b>LFXO Failure Detection Enable</b> Set this bit to enable the oscillator failure detection feature. Note that setting this bit will enable the oscillator core.
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISONDEMAND	0x1	RW	<b>LFXO Disable On-demand requests</b> Set this bit to disable On-demand requests.
0	FORCEEN	0x0	RW	<b>LFXO Force Enable</b> Set this bit to enable the oscillator core. The oscillator core is enabled regardless of On-demand requests.

## 9.5.5.3 LFXO\_CFG - LFXO Configuration Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>											0x7						0x0					0x0	0x1									
<b>Access</b>											RW						RW					RW	RW									
<b>Name</b>											TIMEOUT						MODE					HIGHAMPL	AGC									

Bit	Name	Reset	Access	Description
31:11	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
10:8	TIMEOUT	0x7	RW	<b>LFXO Start-up Delay</b> Configures the start-up delay for LFXO.
	Value	Mode		Description
	0	CYCLES2		Timeout period of 2 cycles
	1	CYCLES256		Timeout period of 256 cycles
	2	CYCLES1K		Timeout period of 1024 cycles
	3	CYCLES2K		Timeout period of 2048 cycles
	4	CYCLES4K		Timeout period of 4096 cycles
	5	CYCLES8K		Timeout period of 8192 cycles
	6	CYCLES16K		Timeout period of 16384 cycles
	7	CYCLES32K		Timeout period of 32768 cycles
7:6	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
5:4	MODE	0x0	RW	<b>LFXO Mode</b> Selects the LFXO mode.
	Value	Mode		Description
	0	XTAL		A 32768Hz crystal should be connected to the LF crystal pads. Voltage must not exceed VDDIO.
	1	BUFEXTCLK		An external sine source with minimum amplitude 100mv (zero-to-peak) and maximum amplitude 500mV (zero-to-peak) should be connected in series with LFXXTAL_I pin. Minimum voltage should be larger than ground and maximum voltage smaller than VDDIO. The sine source does not need to be ac coupled externally as it is ac couples inside LFXO. LFXXTAL_O is free to be used as a general purpose GPIO.
	2	DIGEXTCLK		An external 32KHz CMOS clock should be provided on LFXXTAL_I. LFXXTAL_O is free to be used as a general purpose GPIO.

Bit	Name	Reset	Access	Description
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	HIGHAMPL	0x0	RW	<b>LFXO High Amplitude Enable</b> Set this bit to enable high XTAL oscillation amplitude.
0	AGC	0x1	RW	<b>LFXO AGC Enable</b> Set this bit to enable automatic gain control which limits XTAL oscillation amplitude.

#### 9.5.5.4 LFXO\_STATUS - LFXO Status Register

Offset	Bit Position																																
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>	0x0																0x0																0x0
<b>Access</b>	R																R																R
<b>Name</b>	LOCK																ENS																RDY

Bit	Name	Reset	Access	Description									
31	LOCK	0x0	R	<b>LFXO Locked Status</b> If set, all LFXO lockable registers are locked.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>UNLOCKED</td> <td>LFXO lockable registers are not locked</td> </tr> <tr> <td>1</td> <td>LOCKED</td> <td>LFXO lockable registers are locked</td> </tr> </tbody> </table>	Value	Mode	Description	0	UNLOCKED	LFXO lockable registers are not locked	1	LOCKED	LFXO lockable registers are locked
Value	Mode	Description											
0	UNLOCKED	LFXO lockable registers are not locked											
1	LOCKED	LFXO lockable registers are locked											
30:17	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											
16	ENS	0x0	R	<b>LFXO Enable Status</b> LFXO is enabled.									
15:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											
0	RDY	0x0	R	<b>LFXO Ready Status</b> LFXO is enabled and start-up time has exceeded.									

## 9.5.5.5 LFXO\_CAL - LFXO Calibration Register

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																								0x2			0x0					
<b>Access</b>																								RW			RW					
<b>Name</b>																								GAIN			CAPTUNE					

Bit	Name	Reset	Access	Description
31:10	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
9:8	GAIN	0x2	RW	<b>LFXO Startup Gain</b> The optimal value depends on the chosen crystal.
7	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
6:0	CAPTUNE	0x0	RW	<b>Internal Capacitance Tuning</b> Program internal load capacitance connected between X_N pin and ground and X_P pin and ground. The bus affects tuning capacitances on both pins symmetrically. CAPTUNE value must not exceed 0x4F. When updating CAPTUNE, its value must only be incremented or decremented by 1 which provides a tuning step of 0.25pF. The maximum value is estimated to be 20pF. Please refer to the device Datasheet for more information.

### 9.5.5.9 LFXO\_LOCK - Configuration Lock Register

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x1A20															
<b>Access</b>																	W															
<b>Name</b>																	LOCKKEY															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	LOCKKEY	0x1A20	W	<b>Lock Key</b> Write any other value than UNLOCK to lock CTRL, CFG and CAL registers. Write UNLOCK value to unlock the registers.
	Value	Mode		Description
	6688	UNLOCK		Unlock LFXO lockable registers

## 9.6 LFRCO - Low-Frequency RC Oscillator

### 9.6.1 Introduction

The LFRCO is an integrated low-frequency (32.768 kHz) RC oscillator that may be used as a timing reference in low energy modes when crystal accuracy is not required.

### 9.6.2 Features

- 32.768 kHz oscillator
- High Accuracy
- Available in all energy modes, except EM3
- On-demand
- EM2 wakeup interrupt for oscillator ready
- EM2 wakeup interrupts for rising and falling edges of the clock
- Lockable registers
- Trim bit synchronization

### 9.6.3 Functional Description

#### 9.6.3.1 Start-up

The LFRCO has a fast start-up time (refer to the data sheet electrical specifications for the exact start-up time). When the oscillator has started up and is ready to use, the RDY status bit will go high and the RDY interrupt will be triggered. After start-up, it may take two clock cycles for the clock to propagate through the CMU to the peripherals.

### 9.6.3.2 On-Demand Clocking

Software may forcefully enable the LFRCO by setting the LFRCO\_CTRL.FORCEEN bit field. However, by default, the LFRCO is configured to be enabled only when required by hardware, and to shut down when no hardware request is present (i.e. LFRCO\_CTRL.DISONDEMAND=0 and LFRCO\_CTRL.FORCEEN=0). This is known as on-demand clocking and allows the oscillator to be controlled without any software intervention.

### 9.6.3.3 Calibration

The LFRCO is trimmed in production and the trim values are automatically written to the FREQTRIM field in the LFRCO\_CAL register, before user code execution. Normally, software does not need to modify the to the LFRCO\_CAL register. However, it is possible for software to re-calibrate the LFRCO by modifying the FREQTRIM value. This might be desired, for example if re-calibration is needed at a specific temperature, or there is a desire to use different trim values at different temperatures.

It is possible to recalibrate the LFRCO by modifying the FREQTRIM value in the LFRCO\_CAL register. Software may modify the LFRCO\_CAL register while it is running. However, the LFRCO\_CAL has hardware synchronization, and should only be written after checking that SYNCBUSY\_CALBSY is not set.

### 9.6.3.4 Interrupts

LFRCO has three interrupts, RDYIF, POSEDGEIF and NEGEDGEIF. Each will trigger an EM2 wakeup if the corresponding IEN is set.

RDYIF is triggered after start-up, when the LFRCO startup sequence is complete and the oscillator is ready to use.

POSEDGEIF and NEGEDGEIF are triggered by the rising and falling edge of LFRCO respectively. These flags will only get set if either of the interrupts are enabled (with POSEDGEIEN or NEGEDGEIEN), as the interrupt enable acts as a clock requester and keeps the oscillator running.

### 9.6.4 LFRCO Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	LFRCO_IPVERSION	R	IP Version
0x008	LFRCO_STATUS	RH	Status Register
0x00C	LFRCO_CAL	RW	Calibration Register
0x014	LFRCO_IF	RWH INTFLAG	Interrupt Flag Register
0x018	LFRCO_IEN	RW	Interrupt Enable Register
0x01C	LFRCO_SYNCBUSY	RH	Synchronization Busy Register
0x020	LFRCO_LOCK	W	Configuration Lock Register

0x2018	LFRCO_IEN_CLR	RW	Interrupt Enable Register
0x201C	LFRCO_SYNCBUSY_CLR	RH	Synchronization Busy Register
0x2020	LFRCO_LOCK_CLR	W	Configuration Lock Register
0x3000	LFRCO_IPVERSION_TGL	R	IP Version
0x3008	LFRCO_STATUS_TGL	RH	Status Register
0x300C	LFRCO_CAL_TGL	RW	Calibration Register
0x3014	LFRCO_IF_TGL	RWH INTFLAG	Interrupt Flag Register
0x3018	LFRCO_IEN_TGL	RW	Interrupt Enable Register
0x301C	LFRCO_SYNCBUSY_TGL	RH	Synchronization Busy Register
0x3020	LFRCO_LOCK_TGL	W	Configuration Lock Register

## 9.6.5 LFRCO Register Description

### 9.6.5.1 LFRCO\_IPVERSION - IP Version

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																	0x0															
Access																	R															
Name																	IPVERSION															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x0	R	<b>IP version ID</b>
The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.				

### 9.6.5.2 LFRCO\_STATUS - Status Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset	0x0															0x0															0x0	
Access	R															R															R	
Name	LOCK															ENS															RDY	

Bit	Name	Reset	Access	Description
31	LOCK	0x0	R	<b>Lock Status</b>
This bit is set when LFRCO is locked.				
	Value	Mode		Description
	0	UNLOCKED		Access to configuration registers not locked
	1	LOCKED		Access to configuration registers locked
30:17	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
16	ENS	0x0	R	<b>Enabled Status</b>
This bit is set when LFRCO is enabling the analog core.				
15:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	RDY	0x0	R	<b>Ready Status</b>
This bit is set when qualification is done and LFRCO is ready.				

## 9.6.5.3 LFRCO\_CAL - Calibration Register

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0xA5							
<b>Access</b>																									RW							
<b>Name</b>																									FREQTRIM							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	FREQTRIM	0xA5	RW	<b>Frequency Trim</b> Trims the clock frequency of the LFRCO

## 9.6.5.4 LFRCO\_IF - Interrupt Flag Register

Offset	Bit Position																																		
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
<b>Reset</b>																									0x0			0x0							
<b>Access</b>																									RW			RW			RW				
<b>Name</b>																									NEGEDGE			POSEDGE			RDY				

Bit	Name	Reset	Access	Description
31:3	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
2	NEGEDGE	0x0	RW	<b>Falling Edge Interrupt Flag</b> Triggers on every negative edge of the LFRCO clock.
1	POSEDGE	0x0	RW	<b>Rising Edge Interrupt Flag</b> Triggers on every positive edge of the LFRCO clock.
0	RDY	0x0	RW	<b>Ready Interrupt Flag</b> Triggers when the oscillator becomes ready

## 9.6.5.5 LFRCO\_IEN - Interrupt Enable Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0	0x0			
<b>Access</b>																											RW	RW	RW			
<b>Name</b>																											NEGEDGE	POSEDGE	RDY			

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	NEGEDGE	0x0	RW	<b>Falling Edge Interrupt Enable</b> Enables the negedge interrupt and will cause the oscillator to run. EM2 wakeup source.
1	POSEDGE	0x0	RW	<b>Rising Edge Interrupt Enable</b> Enables the posedge interrupt and will cause the oscillator to run. EM2 wakeup source.
0	RDY	0x0	RW	<b>Ready Interrupt Enable</b> Enables the ready interrupt. EM2 wakeup source.

## 9.6.5.6 LFRCO\_SYNCBUSY - Synchronization Busy Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0					
<b>Access</b>																											R					
<b>Name</b>																											CAL					

Bit	Name	Reset	Access	Description
31:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	CAL	0x0	R	<b>CAL Busy</b> CAL register synchronization busy bit

### 9.6.5.7 LFRCO\_LOCK - Configuration Lock Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x2603															
<b>Access</b>																	W															
<b>Name</b>																	LOCKKEY															

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15:0	LOCKKEY	0x2603	W	<b>Lock Key</b>  Writing the lock key will unlock the lfrco configuration registers (CAL, CTRL and TEST). Writing any other value will lock them.
	Value	Mode		Description
	0	LOCK		Lock Configuration Registers
	9731	UNLOCK		Unlock Configuration Registers

## 9.7 FSRCO - Fast Start RCO

### 9.7.1 Introduction

This is an RC oscillator which can start and stop very fast. It is a fixed frequency oscillator, with no frequency configurability and as such any user of this clock can rely on it being a specific frequency independent of the system state. This is the first oscillator used during power up and hence it minimizes dependency to other blocks.

### 9.7.2 Features

- 20 MHz nominal frequency
- Low energy consumption

### 9.7.3 Functional Description

There are no programmable registers in this module. Software can choose to use this as system clock in the CMU block. the only way to enable or disable the FSRCO is by requesting it as a clock source in the CMU clock select registers.

### 9.7.4 FSRCO Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	<a href="#">FSRCO_IPVERSION</a>	R	IP Version
0x1000	<a href="#">FSRCO_IPVERSION_SET</a>	R	IP Version
0x2000	<a href="#">FSRCO_IPVERSION_CLR</a>	R	IP Version
0x3000	<a href="#">FSRCO_IPVERSION_TGL</a>	R	IP Version

## 9.7.5 FSRCO Register Description

### 9.7.5.1 FSRCO\_IPVERSION - IP Version

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	R															
<b>Name</b>																	IPVERSION															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x0	R	<b>IP Version</b>
The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.				

## 9.8 ULFRCO - Ultra Low Frequency RC Oscillator

### 9.8.1 Introduction

The ULFRCO is an ultra low power 1 kHz oscillator which is available in all energy modes. The ULFRCO is available to many low-frequency peripherals as a lower power alternative to one of the 32 kHz oscillators. This oscillator is also used for internal bias and housekeeping tasks in EM0-EM3.

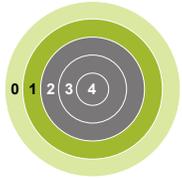

### 9.8.2 Features

- 1 kHz nominal frequency
- Low energy consumption

### 9.8.3 Functional Description

There are no user programmable registers in this module. The oscillator is always on in all energy modes except EM4. In EM4, the oscillator is available on-demand by peripheral requests.

## 10. SMU - Security Management Unit

### Quick Facts

#### What?

The Security Management Unit (SMU) provides configuration and status reporting for ARM TrustZone on the EFR32xG23.

#### Why?

Enables a robust solution at the system level.

#### How?

Hardware context switching and enhanced security provided by ARM TrustZone. Extension of the ARM MPU to control peripheral access.

### 10.1 Introduction

The Security Management Unit is used to configure and extend TrustZone bus level security provided by the Cortex®-M33. In addition it increases the effective MPU regions by providing MPU control over peripheral access.

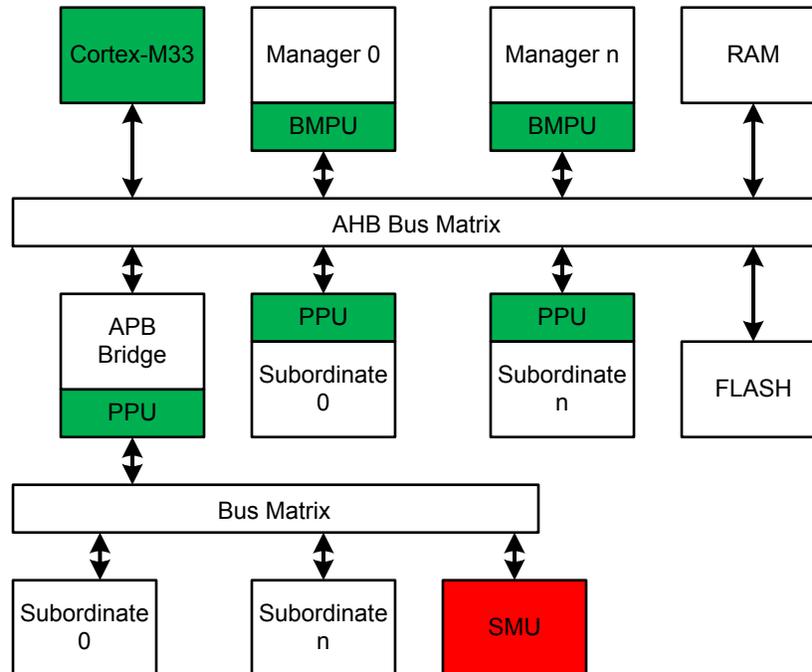

### 10.2 Features

- Per peripheral privileged and secure attributes
- Per manager privileged and secure attributes
- Separate interrupt flags for privileged, secure, or instruction access exceptions.
- Separate interrupt flag for secure manager access exceptions
- Secure and Privileged exception IRQs
- Configurable secure, non-secure, and non-secure-callable memory regions.

## 10.3 Functional Description

### 10.3.1 Bus Level Security

Bus level security is the ability to control the flow of information on the device. The components of bus level security are the Cortex®-M33, the Bus Manager Protect Unit (BMPU), and the Peripheral Protection Unit (PPU) as highlighted in [Figure 10.1 Bus Level Security Implementation on page 253](#). The SMU controls and configures all the components used in bus level security.

**Figure 10.1. Bus Level Security Implementation**

The BMPU is responsible for preventing managers (CPU, DMA, Etc..) from accessing secure addresses without authorization. For example, if a DMA configured as non-secure tries to access memory that is marked secure the BMPU will prevent access and set the corresponding interrupt flag. The BMPU prevents access of secure addresses by non-secure managers. The Cortex®-M33 has BMPU functionality built into the TrustZone implementation.

The PPU is primarily responsible for blocking access to privileged peripherals from unprivileged managers. In addition, it also ensures that secure and non-secure peripherals are only accessible at the appropriate secure or non-secure addresses as described in [10.3.6 Configuring Peripherals](#).

Since FLASH and RAM have no PPU, bus managers of any privilege state may access those resources. The Cortex®-M33 has an MPU which prevents execution of privileged memory when the CPU is in an unprivileged state. For more information on the MPU refer to the ARM Cortex®-M33 documentation.

### 10.3.2 Privileged Access Control

The Cortex®-M33 and all other managers can be in either the privileged or unprivileged state. All bus access to peripherals are tested for privilege level by the PPU and resolved as shown in [Table 10.1 Privileged Access Table on page 254](#).

If an exception is detected on a write, the write will be ignored and the appropriate interrupt flag set. If an exception is detected on a read 0x0 will be returned and the appropriate interrupt flag set.

**Table 10.1. Privileged Access Table**

Manager Attribute	Peripheral Attribute	Result
privileged	privileged	Success
privileged	unprivileged	Success
unprivileged	privileged	Exception
unprivileged	unprivileged	Success

### 10.3.3 Secure Access Control

The Cortex®-M33 and all other managers can be in either the secure or non-secure state. All bus accesses are tested for security status by the BMPUs and PPU and resolve as shown in [Table 10.2 Secure Access Table on page 254](#). Secure access is computed using the secure attribute of the manager and the address region being accessed. If a peripheral is being accessed, the secure attribute of the peripheral is also used. For more information on the relationship between the address regions and peripheral security attributes please see [10.3.6 Configuring Peripherals](#)

If an exception is detected on a write the write will be ignored and the appropriate interrupt flag set. If an exception is detected on a read 0x0 will be returned and the appropriate interrupt flag set.

**Table 10.2. Secure Access Table**

Manager Attribute	Address Attribute	Peripheral Attribute	Result
secure	secure	N/A	Success
secure	secure	secure	Success
secure	secure	non-secure	Exception
secure	non-secure	N/A	Exception
secure	non-secure	secure	Exception
secure	non-secure	non-secure	Success
non-secure	secure	N/A	Exception
non-secure	secure	secure	Exception
non-secure	secure	non-secure	Exception
non-secure	non-secure	N/A	Success
non-secure	non-secure	secure	Exception
non-secure	non-secure	non-secure	Success

### 10.3.4 ARM TrustZone

ARM TrustZone is used to control what addresses are accessible by the CPU at any given time. There are two security states: secure and non-secure. In addition the MPU provides two privilege levels: privileged and unprivileged. This results in 4 possible states: secure-privileged, non-secure-privileged, secure-unprivileged and non-secure-unprivileged.

Non-secure code may not directly call secure code. To call secure code, non-secure code must first call a shim located in specially marked non-secure-callable memory. Unprivileged code may invoke privileged code and change the processor state to privileged by either issuing an SVC instruction or taking an interrupt. The processor is returned to unprivileged state when software manually reconfigures the security state or exits an interrupt.

For more information on secure/non-secure and privileged/unprivileged state transitions see the ARM Cortex®-M33 documentation.

There are two primary use cases for TrustZone and the MPU. The first is simply partitioning a monolithic application in to the 4 states to protect some pieces of the system from bugs or attacks on others. The second is to use a RTOS to isolate several tasks from each other. In this case the RTOS itself normally consumes the privileged states with all other code running in the unprivileged states. Whenever a task switch occurs the RTOS can reconfigure the device so the new task has access to only the components it requires, protecting other tasks from interference.

In both use cases the TrustZone and MPU feature of the Cortex®-M33 both secures and accelerates mode transitions while the SMU provides the ability to configure the security and privilege attributes of peripherals and memory.

The core is in secure-privileged state after a reset.

### 10.3.5 Configuring Managers

The SMU provides the ability to configure the current secure and privileged attribute of all bus managers except for the CPU which is controlled as described in [10.3.4 ARM TrustZone](#).

To configure the privileged attribute of a manager set the appropriate bit in SMU\_BMPUPATDn. To configure the secure attribute of a manager set the appropriate bit in SMU\_BMPUPSATDn.

### 10.3.6 Configuring Peripherals

The SMU provides the ability to configure the current secure and privileged state of all peripherals. To configure the privileged attribute of a peripheral set the appropriate bit in SMU\_PPUPATDn.

Each peripheral is accessible at one of two addresses: A secure address and an non-secure address. Which address is valid depends on the security attribute of the peripheral configured in the SMU. When configured as secure a peripheral may only be accessed at its secure address and when configured as non-secure the peripheral may only be accessed at its non-secure address. This forces code to be aware of the security attribute of the peripheral being accessed, preventing secure code from accessing a non-secure peripheral unintentionally.

The device memory map contains 4 regions of fixed length and fixed security attribute to facilitate the secure access of peripherals and RF peripherals. There is one secure (0x40000000) and one non-secure (0x50000000) region for peripherals and one secure (0xA0000000) and non-secure (0xB0000000) region for the radio subsystem. While each peripheral can be configured independently the radio subsystem is configured as a unit.

To configure the security attribute of a peripheral set the appropriate bit in SMU\_PPUSATDn.

### 10.3.7 Configuring Memory

The SMU provides the ability to configure the security attribute of memory. There are 13 configurable regions in total. There are three regions in FLASH (0 - 2) and three in RAM (4-6) which have pre-determined secure attributes and user selectable sizes. Regions 3 and 11 cover the flash info page and ARM EPPB space respectively and have a fixed size. These regions can be configured as secure or non-secure by setting ESAUR3NS in SMU\_ESAURTYPES0 and ESAUR11NS in SMU\_ESAURTYPES1 respectively.

The size of the FLASH and RAM regions are controlled by the SMU\_ESAUMRBRxy registers as shown in [Table 10.3 Memory Configuration Regions on page 256](#). Region sizes are adjusted in 4 kB increments with the lower 12 bits of SMU\_ESAUMRBRxy ignored. The non-secure-callable regions may be set to size 0 but secure and non-secure regions must be at least 4 kB.

**Table 10.3. Memory Configuration Regions**

Region	Memory	Attributes	Start	End
0	FLASH	secure	0x00000000	SMU_ESAUMRBR01-1
1	FLASH	non-secure-callable	SMU_ESAUMRBR01	SMU_ESAUMRBR12-1
2	FLASH	non-secure	SMU_ESAUMRBR12	0x0FDFFFFFFF
3	FLASH (info page)	secure or non-secure	0x0FE00000	0x0FFFFFFF
4	RAM	secure	0x20000000	SMU_ESAUMRBR45-1
5	RAM	non-secure-callable	SMU_ESAUMRBR45	SMU_ESAUMRBR56-1
6	RAM	non-secure	SMU_ESAUMRBR56	0x2FFFFFFF
7	Peripherals	secure	0x40000000	0x4FFFFFFF
8	Peripherals	non-secure	0x50000000	0x5FFFFFFF
9	SEQRAM/ FRCRAM	secure	0xA0000000	0xAFFFFFFF
10	SEQRAM/ FRCRAM	non-secure	0xB0000000	0xBFFFFFFF
11	EPPB	secure or non-secure	0xE0044000	0xE00DFFF
12	Cortex®-M33 Processor ROM table	exempt	0xE00FE000	0xE00FEFFF

### 10.3.8 Cortex®-M33 Integration

In addition to the SMU based access controls the Cortex®-M33 has additional security features for controlling both secure and privileged access.

The Security Attribution Unit (SAU) provides that ability to setup secure memory regions in addition to those configured by the SMU. To disable the SAU and rely entirely on the SMU for security management clear ENABLE and set ALLNS in the SAU CTRL register. To enable a combination of SMU and SAU control set ENABLE in the SAU CTRL register. If both ENABLE and ALLNS are cleared all Cortex®-M33 will treat all transactions as secure.

When both SAU and SMU are in use, a memory address is considered secure if either the SAU or SMU have it configured as secure. When enabled the SAU applies ONLY to access by the Cortex®-M33 and does not effect any other managers. For more information on the SAU refer to ARM documentation.

**Note:** It is highly recommended that systems avoid using the SAU unless necessary. Since the SAU does not affect any managers outside the Cortex®-M33, extreme care must be taken to ensure the SAU regions can not be trivially bypassed through use of another manager such as the DMA.

In addition to the Cortex®-M33 MPU provides the ability to control which regions of FLASH and RAM are marked as privileged and prevent execution of privileged code by a CPU in unprivileged state. For more information on the configuration and use of the MPU refer to ARM documentation.

### 10.3.9 Exception Handling

When a B MPU detects a non-secure manager attempting to access a secure address, the BMPUSECIF in SMU\_IF is set and the ID of the Manager block is written to SMU\_BMPUFS. If BMPUSECIEN is set and the SMU's Secure IRQ enabled, the CPU will be interrupted.

When a PPU detects an access to a secure peripheral at its non-secure address or an access to a non-secure peripheral at its secure address, PPUSECIF in SMU\_IF is set and the ID of the peripheral being accessed is written to SMU\_PPUFS. If PPUSECIEN is set and the SMU's Secure IRQ enabled, the CPU will be interrupted.

If a PPU detects an attempt to fetch an instruction from a peripheral, PPUINSTIF in SMU\_IF will be set and the ID of the peripheral being accessed is written to SMU\_PPUFS. If PPUINSTIEN is set and the SMU's Privileged IRQ enabled, the CPU will be interrupted.

If a PPU detects an attempt to access a privileged peripheral by an unprivileged manager, PPUPRIVIF in SMU\_IF will be set and the ID of the peripheral being accessed is written to SMU\_PPUFS. If PPUPRIVIEN is set and the SMU's Privileged IRQ enabled, the CPU will be interrupted.

When any IRQ is triggered the Cortex®-M33 is automatically placed in the privileged state. The security state is determined by configuration inside the Cortex®-M33. Refer to ARM's documentation for more details.

If the SMU is configured in an inconsistent way, the SMUPRGERR flag in SMU\_STATUS will be set. One example of an invalid configuration is setting SMU\_ESAUMRBR01 to a value larger than SMU\_ESAUMRBR23. SMUPRGERR should be checked after the SMU is configured.

### 10.3.10 SMU Lock

The SMU registers can be locked to prevent unintended modifications. SMULOCK in SMU\_STATUS indicates if the SMU is currently locked. To unlock the SMU write 0xACCE55 to the SMU\_LOCK register. To lock write any other value to SMU\_LOCK.

In addition to locking the SMU registers the SMU can prevent access to the Cortex®-M33 ASU, MPU, S MPU, V TOR and V TAIRCR registers. To lock access to one or more of these blocks set the corresponding bit in SMU\_M33CTRL.

## 10.4 SMU Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	SMU_IPVERSION	R	IP Version
0x004	SMU_STATUS	RH	Status Register
0x008	SMU_LOCK	W	Lock Register
0x00C	SMU_IF	RWH INTFLAG	Interrupt Flag Register
0x010	SMU_IEN	RW	Interrupt Enable Register
0x020	SMU_M33CTRL	RW	M33 Control Settings
0x040	SMU_PUPATD0	RW	Privileged Access
0x044	SMU_PUPATD1	RW	Privileged Access
0x060	SMU_PPUSATD0	RW	Secure Access
0x064	SMU_PPUSATD1	RW	Secure Access

## 10.5 SMU Register Description

### 10.5.1 SMU\_IPVERSION - IP Version

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																0x2																
<b>Access</b>																R																
<b>Name</b>																IPVERSION																

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x2	R	<b>IP Version</b>

The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.

### 10.5.2 SMU\_STATUS - Status Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0	0x0		
<b>Access</b>																													R	R		
<b>Name</b>																													SMUPRGERR	SMULOCK		

Bit	Name	Reset	Access	Description
31:2	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
1	SMUPRGERR	0x0	R	<b>SMU Programming Error</b> Indicates if SMU Registers were programmed incorrectly.
0	SMULOCK	0x0	R	<b>SMU Lock</b> Indicates if SMU Registers are locked.
	Value	Mode	Description	
	0	UNLOCKED		
	1	LOCKED		

### 10.5.3 SMU\_LOCK - Lock Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0			
<b>Access</b>																													W			
<b>Name</b>																													SMULOCKKEY			

Bit	Name	Reset	Access	Description
31:24	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
23:0	SMULOCKKEY	0x0	W	Write anything but UNLOCK to lock registers.
	Value	Mode	Description	
	11325013	UNLOCK	Unlocks Registers	

## 10.5.4 SMU\_IF - Interrupt Flag Register

Offset	Bit Position																																
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>															0x0	0x0															0x0		0x0
<b>Access</b>															RW	RW															RW		RW
<b>Name</b>															BMPUSEC	PPUSEC															PPUINST		PPUPRIV

Bit	Name	Reset	Access	Description
31:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
17	BMPUSEC	0x0	RW	<b>BMPU Security Interrupt Flag</b> Triggered when a security fault occurs in the Bus Manager Protection Unit
16	PPUSEC	0x0	RW	<b>PPU Security Interrupt Flag</b> Triggered when a security fault occurs in the Peripheral Protection Unit
15:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	PPUINST	0x0	RW	<b>PPU Instruction Interrupt Flag</b> Triggered when a instruction fault occurs in the Peripheral Protection Unit
1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	PPUPRIV	0x0	RW	<b>PPU Privilege Interrupt Flag</b> Triggered when a privilege fault occurs in the Peripheral Protection Unit

## 10.5.5 SMU\_IEN - Interrupt Enable Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>															0x0	0x0													0x0		0x0	
<b>Access</b>															RW	RW													RW		RW	
<b>Name</b>															BMPUSEC	PPUSEC													PPUINST		PPUPRIV	

Bit	Name	Reset	Access	Description
31:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
17	BMPUSEC	0x0	RW	<b>BMPU Security Interrupt Enable</b> Set to enable the BMPUSECIF Interrupt
16	PPUSEC	0x0	RW	<b>PPU Security Interrupt Enable</b> Set to enable the PPUSECIF Interrupt
15:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	PPUINST	0x0	RW	<b>PPU Instruction Interrupt Enable</b> Set to enable the PPUINSTIF Interrupt
1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	PPUPRIV	0x0	RW	<b>PPU Privilege Interrupt Enable</b> Set to enable the PPUPRIVIF Interrupt

### 10.5.6 SMU\_M33CTRL - M33 Control Settings

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0	0x0	0x0	0x0	
<b>Access</b>																											RW	RW	RW	RW	RW	
<b>Name</b>																											LOCKSAU	LOCKNSMPU	LOCKSMPU	LOCKNSVTOR	LOCKSVTAIRCR	

Bit	Name	Reset	Access	Description
31:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	LOCKSAU Set to 1 lock security attribution unit	0x0	RW	<b>New BitField</b>
3	LOCKNSMPU Set to 1 lock non-secure MPU configuration	0x0	RW	<b>New BitField</b>
2	LOCKSMPU Set to 1 lock secure MPU configuration	0x0	RW	<b>New BitField</b>
1	LOCKNSVTOR Set to 1 lock non-secure VTOR	0x0	RW	<b>New BitField</b>
0	LOCKSVTAIRCR Set to 1 lock secure VTAIRCR	0x0	RW	<b>New BitField</b>

### 10.5.7 SMU\_PPUPATD0 - Privileged Access

Offset	Bit Position																																
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Reset	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1	0x1

11:0	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		

## 11. SE - Secure Engine Subsystem

### Quick Facts

#### What?

The Secure Engine Subsystem encapsulates security peripherals providing both improved system security and ease of use.

#### Why?

Isolation of security hardware from the Cortex®-M33 protects the SE system from exploits that target the main CPU. The subsystem also provides autonomous cryptographic operations allowing the main CPU to perform other tasks or enter EM1 to save power.

#### How?

Security peripherals are completely isolated from the main CPU and controlled with a processor internal to the SE subsystem.

### 11.1 Introduction

The Secure Engine (SE) provides several security features and acts as a barrier protecting the security hardware from activity on the Cortex®-M33. It also enables autonomous operation of security features.

Available features include:

- Secure Boot with Root of Trust and Secure Loader (RTSL)
- Hardware Cryptographic Acceleration with DPA countermeasures for AES128/256, SHA-1, SHA-2 (up to 256-bit), ECC (up to 256-bit), ECDSA, ECDH and J-Pake
- True Random Number Generator (TRNG) compliant with NIST SP800-90 and AIS-31
- ARM® TrustZone®
- Secure Debug with lock/unlock

All Secure Engine functions are enabled by software. These functions are fully described in the Secure Engine emlib online documentation located at the following link:

<https://docs.silabs.com/mcu/latest/efr32mg21/group-SE>

### 11.2 Security Features

#### 11.2.1 Security Features Overview

- Acceleration of cryptographic functions
  - AES encryption and decryption with 128, 192, or 256-bit keys
  - Supported block cipher modes of operation for AES include: ECB, CTR, CBC, CFB, CBC-MAC, CMAC, CCM, GCM and GMAC.
  - ECC over GF(P) up to 256-bit
  - Supported ECC NIST recommended curves include P-192 and P-256
  - SHA-1 and SHA-2 up to 256-bit
- True Random Number Generation
  - Entropy Source complies to NIST 800-90B requirements
  - Online Health tests comply to NIST 800-90 and AIS31 requirements
  - Random Data Passes NIST 800-22 and NIST 800-90B test suites
- Secure Boot Loader (First Stage Boot Loader)

### 11.2.2 Secure Boot with Root of Trust and Secure Loader (RTSL)

The Secure Boot with RTSL authenticates a chain of trusted firmware that begins from an immutable memory (ROM).

It prevents malware injection, prevents rollback, ensures that only authentic firmware is executed, and protects Over The Air updates.

For more information about this feature, see [AN1218: Series 2 Secure Boot with RTSL](#).

### 11.2.3 Secure Debug

The SE provides a secure debug unlock function that allows users to grant debug access to locked devices on a device by device basis. To use this function the device must be programmed with a public Command key by the user. To unlock a device, a unique challenge (a device-unique persistent random set of bytes) must be read out and signed by the private key associated with public Command key creating an unlock token. The device can then be unlocked by providing the valid unlock token. The token can be used to unlock the device any number of times. There is also a command to force the device to update its challenge, which revokes the previously-generated token.

More information on Secure Debug can be found in the AN1190: Secure Debug application note.

**Note:** Secure debug locking a device will limit the capability for Silicon Labs to perform failure analysis on the device. Provide secure debug tokens for each device when submitting parts for failure analysis.

### 11.2.4 Cryptographic Accelerator

The Cryptographic Accelerator in Secure Engine is an autonomous hardware accelerator with Differential Power Analysis (DPA) countermeasures to protect keys.

It supports AES encryption and decryption with 128/192/256-bit keys, Elliptic Curve Cryptography(ECC) to support public key operations and hashes.

Supported block cipher modes of operation for AES include:

- ECB (Electronic Code Book)
- CTR (Counter Mode)
- CBC (Cipher Block Chaining)
- CFB (Cipher Feedback)
- GCM (Galois Counter Mode)
- CCM (Counter with CBC-MAC)
- CBC-MAC (Cipher Block Chaining Message Authentication Code)
- GMAC (Galois Message Authentication Code)

The Cryptographic Accelerator accelerates Elliptical Curve Cryptography and supports the NIST (National Institute of Standards and Technology) recommended curves including P-192 and P-256 for ECDH(Elliptic Curve Diffie-Hellman) key derivation and ECDSA (Elliptic Curve Digital Signature Algorithm) sign and verify operations.

Secure Engine also supports ECJ-PAKE (Elliptic Curve variant of Password Authenticated Key Exchange by Juggling).

Supported hashes include SHA-1, SHA2/224, and SHA-2/256.

This implementation provides a fast and energy efficient solution to state of the art cryptographic needs.

**Note:** AES\_ECB, AES\_CBC, AES\_CBCMAC, and SHA-1 are provided for legacy compatibility and are not recommended for cryptographic purposes without thoroughly understanding their potential security weaknesses.

### 11.2.5 True Random Number Generation

The SE provides access to a non-deterministic random number generator based on a full hardware solution. The TRNG output passes the NIST 800-22 and AIS31 test suites. The TRNG module includes several built-in self tests to detect issues with the noise source, ensure entropy, and meet cryptography standards. The Repetition Count Test and Adaptive Proportion Test with window sizes of 64 and 4096 bits described in section 6.5.1.2 of NIST-800-90B are implemented in hardware and run continuously on the data.

<http://csrc.nist.gov/publications/drafts/800-90/draft-sp800-90b.pdf>

The AIS31 Online Test described in section 5.5.3 of AIS 31 is also implemented in hardware, and runs continuously on the data.

[https://www.bsi.bund.de/SharedDocs/Downloads/DE/BSI/Zertifizierung/Interpretationen/AIS\\_31\\_Functionality\\_classes\\_for\\_random\\_number\\_generators\\_e.pdf](https://www.bsi.bund.de/SharedDocs/Downloads/DE/BSI/Zertifizierung/Interpretationen/AIS_31_Functionality_classes_for_random_number_generators_e.pdf)

## 11.3 SE Mailbox

All communication with the Secure Engine Subsystem takes place through the SE Mailbox. Operations are performed by using the mailbox to sending a command and then receive the SE response. The mailbox is a bidirectional 64 word FIFO.

### 11.3.1 Sending Commands

The TX FIFO has two status flags in SE\_TX\_STATUS register. TXFULL is set when the FIFO is full and TXINT is set if there is space in the FIFO for at least 16 words. If TXINTEN in SE\_CONFIGURATION is set an interrupt will be generated when TXINT is set.

Writing to any SE\_DATAn register will result in data being placed in the FIFO. For example, to write 16 words to the FIFO software may write SE\_DATA0 16 times, or may make a single write to each of the 16 SE\_DATAn registers. If the FIFO is written when no space is available, the CPU will be stalled until spaces becomes available and the write can be completed.

To send a command, first check TXINT to ensure that there is space available in the FIFO. Then write SE\_TX\_HEADER with the command length and protection bit. Finally, write the command data into the SE\_DATAn registers. While the command is being written, BYTERM in SE\_TX\_STATUS will contain the number of bytes remaining in the command. To ensure minimal performance impact, software should ensure that space exists in the FIFO before writing to it.

### 11.3.2 Receiving Responses

The RX FIFO has two status flags in SE\_RX\_STATUS register. RXEMPTY is set when the FIFO is empty and RXINT is set if there are at least 4 words in the FIFO or if the final word of the message is present in the FIFO. If RXINTEN in SE\_CONFIGURATION is set, an interrupt will be generated when RXINT is set.

Reading from any SE\_DATAn register will result in data being read from the FIFO. For example, to read 16 words from the FIFO, software may read SE\_DATA0 16 times, or may make a single read from each of the 16 SE\_DATAn registers. If the FIFO is read when it is empty and no message is available, a 0x0 will be read. If the FIFO is read when empty and a message is being processed, the CPU will be stalled until data becomes available.

Software may check for responses by polling RXINT, RXEMPTY, or RXHEADER in SE\_RX\_STATUS. The RXINT interrupt may also be used to notify the CPU when data is available. To receive a response first read the response header from SE\_RX\_HEADER. Software may read the message size from SE\_RX\_HEADER, or use BYTERM in SE\_RX\_STATUS, which contains the number of words remaining in the response.

The command status is available in both SE\_RX\_STATUS and SE\_RX\_HEADER and indicates if the command completed successfully.

### 11.3.3 MAILBOX Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	MAILBOX_MSGPTRx	RW	Message Pointer
0x040	MAILBOX_IF	RW INTFLAG	Interrupt Flag Register
0x044	MAILBOX_IEN	RW	Interrupt Enable Register
0x1000	MAILBOX_MSGPTRx_SET	RW	Message Pointer
0x1040	MAILBOX_IF_SET	RW INTFLAG	Interrupt Flag Register
0x1044	MAILBOX_IEN_SET	RW	Interrupt Enable Register
0x2000	MAILBOX_MSGPTRx_CLR	RW	Message Pointer
0x2040	MAILBOX_IF_CLR	RW INTFLAG	Interrupt Flag Register
0x2044	MAILBOX_IEN_CLR	RW	Interrupt Enable Register
0x3000	MAILBOX_MSGPTRx_TGL	RW	Message Pointer
0x3040	MAILBOX_IF_TGL	RW INTFLAG	Interrupt Flag Register
0x3044	MAILBOX_IEN_TGL	RW	Interrupt Enable Register

### 11.3.4 MAILBOX Register Description

## 12. EMU - Energy Management Unit

### Quick Facts

#### What?

The EMU (Energy Management Unit) handles the different low energy modes in EFR32xG23

#### Why?

The need for performance and peripheral functions varies over time in most applications. By efficiently scaling the available resources in real time to match the demands of the application, the energy consumption can be kept at a minimum.

#### How?

With a broad selection of energy modes, a high number of low-energy peripherals available even in EM2, and short wake-up time, applications can dynamically minimize energy consumption during program execution.

### 12.1 Introduction

The Energy Management Unit (EMU) manages all the low energy modes (EM) in EFR32xG23. Each energy mode manages whether the CPU and the various peripherals are available. The energy modes range from EM0 to EM4. EM0 mode provides the highest amount of features, enabling the CPU, Radio, and peripherals with the highest clock frequency. EM4 Mode provides the lowest power state, allowing the part to return to EM0 on a wake-up condition. The EMU also controls the internal regulators settings and voltage monitoring needed for optimal power configuration and protection.

## 12.2 Features

The primary features of the EMU are listed below:

- Energy Modes control
  - Entry into EM4
  - Configuration of regulators and clocks for each Energy Mode
  - Configuration of various EM4 wake-up conditions
  - Configuration of GPIO retention settings
- Power routing configurations
  - DCDC control and bypass
- Temperature sensor
- Brown Out Detection
- Supply voltage scaling
  - EM0 / EM1 voltage scaling
  - EM2 / EM3 voltage scaling
- Reset Management
  - Power-on Reset (POR)
  - Brown-out Detection (BOD) on the following power domains:
    - Analog Unregulated Power Domain AVDD
    - Digital Unregulated Power Domain DVDD
    - I/O Unregulated Power Domain IOVDDx
    - Regulated Digital Domain DECOUPLE (DEC)
  - RESETn pin reset
  - Watchdog (WDOG) reset
  - Software triggered reset (SYSRESETREQ)
  - Core LOCKUP condition
  - EM4 Detection
  - EM4 wakeup reset from GPIO pin
  - Configurable reset levels
  - A software readable register indicates the cause of the last reset

### 12.3 Functional Description

The EMU is responsible for managing the wide range of energy modes available in EFR32xG23. The block works in harmony with the entire platform to easily transition between energy modes in the most efficient manner possible. The following diagram [Figure 12.1 EMU Overview](#) on [page 288](#), shows the relative connectivity to the various blocks in the system.

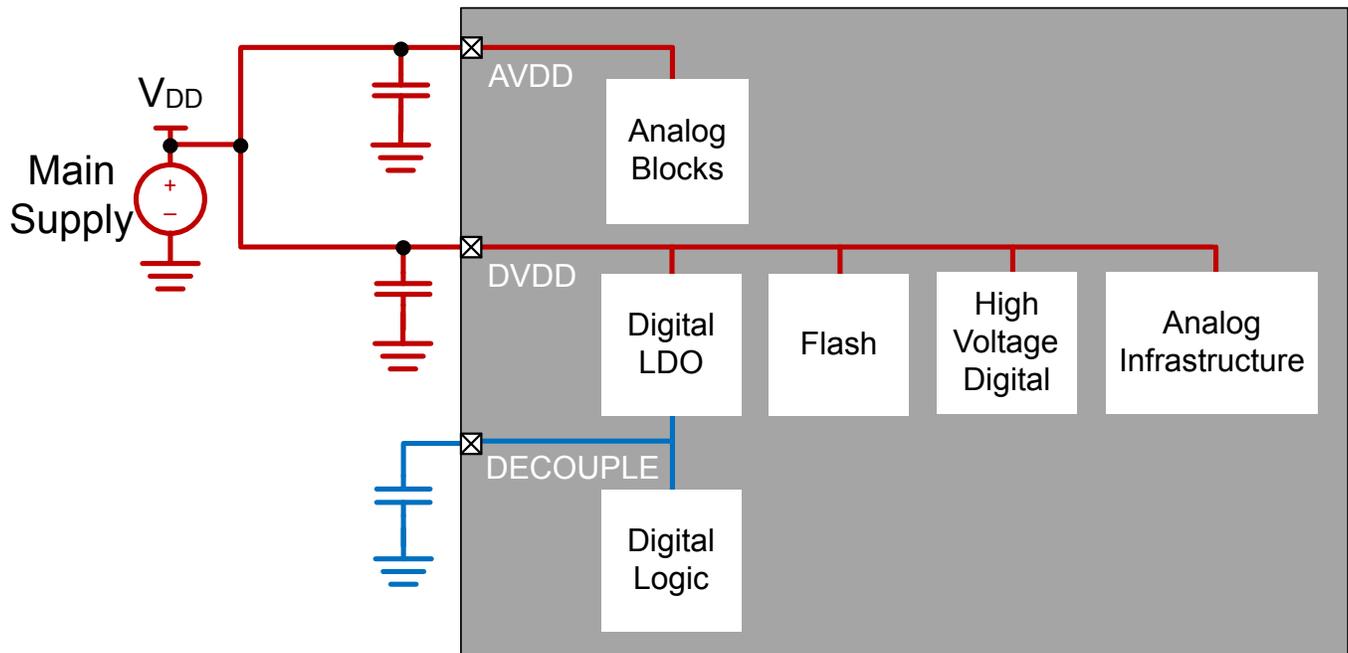

Figure 12.1. EMU Overview

The EMU is available on the peripheral bus. The energy management state machine controls the internal voltage regulators, oscillators, memories, and interrupt system. Events, interrupts, and resets can trigger the energy management state machine to return to the active state. This is further described in the following sections.

### 12.3.1 Energy Modes

EFR32xG23 features five main energy modes, referred to as Energy Mode 0 (EM0) through Energy Mode 4 (EM4). The Cortex®-M33 is only available for program execution in EM0. In EM0 Active/EM1 Sleep any peripheral function can be enabled. EM2 through EM4, also referred to as low energy modes, provide a significantly reduced energy consumption while still allowing a rich set of peripheral functionality. The following [Table 12.1 table on page 289](#) shows the possible transitions between different energy modes.

**Table 12.1. Energy Mode Transitions**

Current Mode	EM Transition Action				
	Enter EM0	Enter EM1	Enter EM2	Enter EM3	Enter EM4
EM0		Sleep (WFI, WFE)	Deep Sleep (WFI, WFE)	Deep Sleep (WFI, WFE)	EM4 Entry
EM1	IRQ		Peripheral wake up done <sup>1</sup>	Peripheral wake up done <sup>1</sup>	
EM2	IRQ	Peripheral wake up req <sup>1</sup>			
EM3	IRQ	Peripheral wake up req <sup>1</sup>			
EM4	Wake Up				

**Note:**  
1. Peripheral wake-up from EM2/3 to EM1 and then automatically back to EM2/3 when done.

Certain peripherals and timers in the radio subsystem have the ability to temporarily turn on additional logic in EM2 or EM3 to receive and transmit data or trigger LDMA transfers without intervention from the M33 core. The system automatically returns to the original energy mode when such operations are complete.

The Core can always request to go to EM1 with the WFI or WFE command during EM0. The core will be prevented from entering EM2 or EM3 if the radio is transferring data or if flash is programming or erasing.

An overview of supported energy modes and available functionality is shown in the following table. For each energy mode, the system will typically default to its lowest power configuration, with non-essential clocks and peripherals disabled. Functionality may be then selectively enabled by software.

Modules with EM2/3/4 capability exist in a Low Power Domain (e.g., PD0x or PDHV). Refer to [12.3.4 Power Domains](#) for more details.

**Table 12.2. Energy Modes**

	EM0 / EM1	EM2	EM3	EM4
Cortex®-M33 Core Active	Yes, in EM0 only	-	-	-

GPIO Pin State Retention	Yes	Yes	Yes	Available <sup>12</sup>

**Note:**

1. Leaving the debugger connected when in EM2 or EM3 will cause the system to enter a higher power EM2 mode in which the high frequency clocks are still enabled and certain core functionality is still powered-up in order to maintain debug-functionality.
2. The LDMA can be used with some low power peripherals (e.g., IADC) in EM2/3. Features required by the LDMA which are not supported in EM2/3 (e.g., HCLK), will be automatically enabled prior to the LDMA transfer and then automatically disabled afterwards.
3. The RAC can be woken via a PRS interrupt to EM1 to transfer data. Once complete, the system will return to EM2.
4. Default off, but kept active if used by the IADC or VDAC.
5. Default off, but kept active if used by the BURTC
6. Must be using ULFRCO
7. ACMP functionality in EM2/3 limited to edge interrupt
8. I2C0 only. Not supported on all GPIO Ports. Functionality limited to receive address recognition
9. EUSART0 only. Not supported on all GPIO Ports. Functionality limited to low-frequency UART or SPI secondary interface
10. Wake on any key press supported in EM2/3. Full key scanning operates in EM0/1.
11. Pin wake-up in EM4 supported only on GPIO\_EM4WUx pins. Consult data sheet for complete list of pins.
12. If enabled in EMU->EM4CTRL.EM4IORETMODE.

The different energy modes are summarized in the following sections.

**12.3.1.1 EM0**

EM0 provides all system features.

- Cortex®-M33 is executing code
- Radio functionality is available
- High and low frequency clock trees are active
- All oscillators are available
- All peripheral functionality is available

**12.3.1.2 EM1**

EM1 disables the core but leaves the remaining system fully available.

- Cortex®-M33 is in sleep mode. Clocks to the core are off
- Radio functionality is available
- High and low frequency clock trees are active
- All oscillators are available
- All peripheral functionality is available

### 12.3.1.3 EM1P

EM1P is a subset of EM1 which allows the radio to operate while the core and high-speed peripherals are shut down to save energy. It is entered when the radio is active and software requests to enter EM2.

- Cortex®-M33 is in sleep mode. Clocks to the core and all high-speed peripherals are off
- Radio and HFXO remain active
- All peripherals and oscillators capable of EM2, EM3 or EM4 operation are available

### 12.3.1.4 EM2

This is the first level into the low power energy modes. Most of the high frequency peripherals are disabled or have reduced functionality. Memory and registers retain their values.

- Cortex®-M33 is in sleep mode. Clocks to the core are off.
- Radio inactive
- High frequency clock tree is inactive
- Low frequency clock tree is active
- The following oscillators are available
  - LFRCO, LFXO, ULFRCO
  - On-demand if used by peripherals: FSRCO, HFRCOEM23
- The following low frequency peripherals are available
  - SYSRTC, BURTC, WDOG, LETIMER, PCNT, LESENSE, I2C0, EUSART0 (UART or SPI secondary only), KEYSKAN, and LCD
- The following analog peripherals are available (with potential limitations on functionality)
  - ACMP, IADC, VDAC
- Wake-up to EM0 through
  - Peripheral interrupt, reset pin, power on reset, asynchronous pin interrupt, I2C0 address recognition
- Wake-up to EM1 through
  - Peripheral data transfer request
  - Part returns to EM2 when transfers are complete
- RAM and register values are preserved
  - RAM blocks may be optionally powered down for lower power
- GPIO pin state is retained
- Debug connectivity is unavailable by default to reduce current consumption. Debug connectivity can be enabled by setting the EM2DBGGEN bit in the EMU\_CTRL register, and will consume about 0.5 uA extra supply current.

### 12.3.1.5 EM3

In this low energy mode, all low frequency oscillators (LFXO, LFRCO) and all low frequency clocks derived from them are stopped, as well as all high frequency clocks. Most peripherals are disabled or have reduced functionality. Memory and registers retain their values.

- Cortex®-M33 is in sleep mode. Clocks to the core are off.
- Radio inactive
- High frequency clock tree is inactive
- All low frequency clock trees derived from the low frequency oscillators (LFXO, LFRCO) are inactive
- The following oscillators are available
  - ULFRCO
  - On-demand if used by peripherals: FSRCO, HFRCOEM23
- The following low frequency peripherals are available if clocked by the ULFRCO
  - SYSRTC, BURTC, and WDOG
  - SYSRTC, BURTC, WDOG, LETIMER, PCNT, LESENSE, I2C0, EUSART0 (SPI secondary only), KEYSKAN, and LCD
- The following analog peripherals are available (with potential limitations on functionality)
  - ACMP, IADC, VDAC
- Wake-up to EM0 through
  - Peripheral interrupt, reset pin, power on reset, asynchronous pin interrupt, I2C0 address recognition
- Wake-up to EM1 through
  - Peripheral data transfer request
  - Part returns to EM3 when transfers are complete
- RAM and register values are preserved
  - RAM blocks may be optionally powered down for lower power
- GPIO pin state is retained
- Debug connectivity is unavailable by default to reduce current consumption. Debug connectivity can be enabled by setting the EM2DBGEN bit in the EMU\_CTRL register, and will consume about 0.5 uA extra supply current.

### 12.3.1.6 EM4

EM4 is the lowest energy mode of the part. There is no retention except for GPIO PAD state and BURAM values. Wake-up from EM4 requires a reset to the system, returning it back to EM0.

- Cortex®-M33 is off
- Radio is off
- High frequency clock tree is off
- Low frequency clock tree may be active
- No RAM or register values are retained, except for the BURAM.
- The following oscillators are on if used by the BURTC:
  - LFRCO, LFXO, ULFRCO
- The following low frequency peripherals are available
  - BURTC
- Wake-up to EM0 through
  - BURTC interrupt, reset pin, power on reset, asynchronous pin interrupt (on GPIO\_EM4WUx pins only)
- GPIO pin state may be retained (depending on EMU->EM4CTRL.EM4IORETMODE configuration)

## 12.3.2 Entering Low Energy Modes

The following sections describe the requirements for entering the various energy modes.

### 12.3.2.1 Entry Into EM1

Energy mode EM1 is entered when the Cortex®-M33 executes the Wait For Interrupt (WFI) or Wait For Event (WFE) instruction while the SLEEPDEEP bit in the Cortex®-M33 System Control Register is cleared. The MCU can re-enter sleep automatically out of an Interrupt Service Routine (ISR) if the SLEEPONEXIT bit in the Cortex®-M33 System Control Register is set. Refer to ARM documentation on entering Sleep modes.

Alternatively, EM1 can be entered from either EM2 or EM3 due to certain peripheral wake-up requests, allowing transfers from the peripheral to system RAM. The system will return back to EM2 or EM3 once the peripheral has completed its transfers and processing.

### 12.3.2.2 Entry Into EM2 or EM3

Energy mode EM2 or EM3 may be entered when **all** of the following conditions are true:

- Radio state machine is in OFF state
- Cortex®-M33 (if present) is in DEEPSLEEP state
- Flash Program/Erase Inactive
- DMA done with all current requests
- A debugger is not currently connected.

**Note:** The device will still enter a sleep state which emulates the behavior of EM2 or EM3 when an active debug connection is present, but it will draw more than the specified sleep current.

Energy mode EM2 is entered from EM0 when the Cortex®-M33 executes the Wait For Interrupt (WFI) or Wait For Event (WFE) instruction while the SLEEPDEEP bit in the Cortex®-M33 System Control Register is set. The MCU can re-enter DeepSleep automatically out of an Interrupt Service Routine (ISR) if the SLEEPONEXIT bit in the Cortex®-M33 System Control Register is set. Refer to ARM documentation on entering Sleep modes.

Alternately, EM2 or EM3 is entered from EM1 upon the completion of a Peripheral Wake-Up Request from capable peripherals if no EM0 wake-up happens in the meantime.

When entering EM2 or EM3, if any peripheral on an auxiliary low power domain (PD0B, PD0C, etc.) is enabled, that auxiliary low power domain will be powered, causing higher current draw. Otherwise, the auxiliary power domain will be powered down. See [12.3.4 Power Domains](#) for more information.

### 12.3.2.3 Entry Into EM4

Energy mode EM4 is entered through register access.

Software must ensure no modules are active, such as the Radio, when entering EM4.

Software may enter EM4 from EM0 by writing the sequence 2,3,2,3,2,3,2,3,2 to EM4CTRL->EM4ENTRY bit field. If the EM4BLOCK bit in WDOGn\_CTRL is set, the CPU will be prevented from entering EM4 by software request.

An active debugger connection will prevent entry into EM4.

### 12.3.3 Exiting a Low Energy Mode

A system in EM2 and EM3 can be woken up to EM0 through regular interrupt requests from active peripherals. Since state and RAM retention is available, the EFR32 Series 2 is fully restored and can continue to operate as before it went into the Low Energy Mode.

Wake-up from EM4 is performed through a reset. Wake-up from a specific module must be enabled in that module's EM4WUEN register.

Enabled interrupts that can cause wake-up from EM2, EM3, and EM4 are shown in the following table. The wake-up triggers always return the device to EM0. Additionally, any reset source will return to EM0.

**Table 12.3. Wake-Up Triggers from Low Energy Modes**

Peripheral	Wake-Up Trigger	EM2	EM3	EM4
LETIMER	Any enabled interrupt	Yes	-	-
LFXO	Ready Interrupt	Yes	-	-
LFRCO	Ready Interrupt	Yes	-	-
WDOG	Any enabled interrupt	Yes	Yes	-
I <sup>2</sup> C0	Receive address recognition	Yes	Yes	-
EUSART0	Any enabled interrupt	Yes	-	-
IADC	SCAN and SINGLE FIFO events, Window comparator events	Yes	Yes	
ACMP	Any enabled edge interrupt	Yes	Yes	-
VDAC	Any enabled interrupt except ABUS conflict and allocation interrupts	Yes	Yes	
SYSRTC	Any enabled interrupt	Yes	Yes	-
BURTC	Timeout	Yes	Yes	Yes <sup>1</sup>
EMU Temperature Sensor	Measured temperature outside the defined limits	Yes	Yes	-
Pin Interrupts	Transition	Yes <sup>2</sup>	Yes <sup>2</sup>	Yes <sup>1 3</sup>
Reset Pin	Assertion	Yes	Yes	Yes
Power	Cycle Off/On	Yes	Yes	Yes

**Note:**

1. Corresponding bit in the module's EM4WUEN must be set.
2. Available on Port A, Port B, and all EM4WU pins.
3. Only available on EM4WU pins.

### 12.3.4 Power Domains

Peripherals may exist on several independent power domains which are powered down to minimize supply current when not in use. Power domains are managed automatically by the EMU.

The lowest-energy power domain is the "high-voltage" power domain (PDHV), which supports extremely low-energy infrastructure and peripherals. Circuits powered from PDHV are always on and available in all energy modes down to EM4.

The next power domain is the low power domain (PD0), which is further divided to power subsets of peripherals. All PD0 power domains are shut down in EM4. Circuits powered from PD0 power domains may be available in EM0, EM1, EM2, and EM3.

Low power domain A (PD0A) is the base power domain for EM2 and EM3 and will always remain on in EM0-EM3. It powers the most commonly-used EM2 and EM3-capable peripherals and infrastructure required to operate in EM2 and EM3. Auxiliary PD0 power domains (PD0B, PD0C, PD0D, PD0E) power additional EM2- and EM3-capable peripherals on demand. If any peripherals on one of the auxiliary power domains is enabled, that power domain will be active in EM2 and EM3. Otherwise, the auxiliary PD0 power domains will be shut down to reduce current.

**Note:** Power domain PD0E is also turned on when peripherals on PD0B, PD0C, or PD0D are used.

The active power domain (PD1) powers the rest of the device circuitry, including the CPU core and EM0 / EM1 peripherals. PD1 is always powered on in EM0 and EM1. PD1 is always shut down in EM2, EM3, and EM4.

[Table 12.4 Peripheral Power Subdomains on page 296](#) shows the peripherals on the PDHV and PD0x domains. Any peripheral not listed is on PD1.

**Table 12.4. Peripheral Power Subdomains**

Always On in EM2/EM3		Selectively On in EM2/3			
PDHV <sup>1</sup>	PD0A	PD0B <sup>2</sup>	PD0C <sup>2</sup>	PD0D <sup>2</sup>	PD0E
LFRCO	SYSRTC	LETIMER0	HFRCOEM23	DEBUG	GPIO
LFXO	FSRCO	IADC0	HFXO	WDOG0	KEYSCAN
BURTC	LCD	PCNT0		WDOG1	PRS
ULFRCO		ACMP0		EUSART0	
		ACMP1		I2C0	
		LESENSE			
		VDAC0			

**Note:**

1. Peripherals on PDHV are also available in EM4.
2. If any of PD0B, PD0C, or PD0D are enabled, PD0E will also be automatically enabled.

### 12.3.5 Voltage Scaling

The EFR32xG23 supports supply voltage scaling for the LDO powering DECOUPLE. Voltage scaling helps to optimize the energy efficiency of the system by operating at lower voltages when possible. Three supply voltage operating points are available:

**Table 12.5. Voltage Scaling Options**

VSCALE Setting	DECOUPLE Voltage	Operating Conditions
VSCALE2	1.1 V	EM0/EM1 Operation up to 80 MHz EM2 and EM3
VSCALE1	1.0 V	EM0/EM1 Operation up to 40 MHz EM2 and EM3
VSCALE0	0.9 V	EM2 and EM3 Only

#### 12.3.5.1 Voltage Scaling in EM0 and EM1

In EM0 and EM1, the voltage scaling value should be set according to the desired operating frequency. The system defaults to VSCALE2 out of reset. To operate above 40 MHz, VSCALE2 should always be used. If the system will operate below 40 MHz, VSCALE1 may be used to save energy.

The voltage scaling value for EM0 and EM1 is changed via software command bits in the EMU\_CMD register. Setting EMU\_CMD\_EM01VSCALE1 will switch to VSCALE1, and setting EMU\_CMD\_EM01VSCALE2 will switch to VSCALE2.

The command initiates a voltage change operation, but some time is needed before the new supply voltage is reached. When changing between VSCALE values in EM0, it takes approximately 150 us to ramp the voltage down and approximately 32 us to ramp the voltage up to the new values (see the data sheet specifications for exact numbers). During this time, SRAM access is prohibited by the hardware and any accesses to SRAM from the CPU or DMA will be blocked until the operation is complete. The EMU\_STATUS\_VSCALEBUSY bit indicates when a voltage scale change is in progress. When the operation is complete the EMU\_IF\_VSCALEDONEIF flag will be set.

**Note:** Because SRAM access is blocked during a voltage scaling operation, it is recommended to configure the desired EM0 / EM1 voltage scaling once during initial boot-up for systems operating at VSCALE1.

The current VSCALE setting can be read at any time from the EMU\_STATUS\_VSCALE field.

#### 12.3.5.2 Voltage Scaling in EM2 and EM3

A separate voltage scaling value is used during EM2 and EM3. This allows the core to run at a higher voltage when in EM0 / EM1 and reduce the voltage in EM2 and EM3 for power savings, or maintain the same voltage for faster wakeup. The voltage scale level for EM2 and EM3 is defined by the EMU\_CTRL\_EMU23VSCALE field. The new voltage scaling level will be applied when the system is in EM2 or EM3, and return to the EM0 / EM1 voltage scaling level automatically when the system exits the low energy mode.

Hardware will only allow the VSCALE level to remain the same or be reduced when entering EM2 and EM3. If EMU\_CTRL\_EMU23VSCALE is set to a higher VSCALE setting than the current EM0 / EM1 VSCALE level, the DECOUPLE voltage will remain the same as the EM0 / EM1 setting.

If the voltage scaling level for EM2 / EM3 is lower than the level set for EM0 / EM1, additional time is needed to wake up from the low powered state (see the device data sheet for specific timing). The lowest current during sleep will be obtained by setting EMU23VSCALE to VSCALE0, and the fastest wake times will be obtained when EMU23VSCALE is equal to or higher than the EM0 / EM1 voltage scaling value.

### 12.3.6 EM0 / EM1 Peripheral Register Retention

When the device enters EM2 or EM3, all peripherals will retain their register configurations by default. Retention for peripherals on the PD1 power domain (i.e. those which do not operate in EM2 and EM3), can optionally be disabled by setting bit 0 of the EMU\_PD1PAR-ETCTRL\_PD1PARETDIS field. Disabling retention reduces the supply current in EM2 and EM3 slightly. However, the peripheral register interfaces will be reset upon exit to EM0.

**Important:** This feature is not currently supported by Silicon Labs software stacks. It is the responsibility of the user software to re-configure any peripherals as necessary when the device wakes to EM0.

### 12.3.7 Power Configurations

In order to provide the lowest power solutions, the EFR32xG23 comes with a DC-DC module to power internal circuits. The EFR32xG23 may be operated with or without the DC-DC. When used, the DC-DC requires an external inductor and capacitor (refer to the data sheet for recommended values).

The EFR32xG23 has multiple power supply rails: a DC-DC regulator input (VREGVDD), IO Supply (IOVDD), Analog (AVDD), RF Analog Supply (RFVDD), RF Power Amplifier Supply (PAVDD), Digital LDO and flash (DVDD), and Low Voltage Digital Supply (DECOUPLE). Additional detail for each configuration and option is given in the following sections.

Due to on-chip circuitry (e.g., diodes), some power supply pins have a dependent relationship with one or more other power supply pins. These internal relationships between the external voltages applied to the various EFR32 supply pins are defined below. Exceeding the below constraints can result in damage to the device and/or increased current draw.

- VREGVDD  $\geq$  DVDD

**Note:** In systems not using the DC-DC converter, VREGVDD must be shorted to DVDD external to the device.

- PAVDD  $\geq$  RFVDD
- DVDD  $\geq$  DECOUPLE
- AVDD, IOVDD: No supply sequencing dependency. Additional leakage may occur if DVDD remains unpowered with power applied to these supplies.

Additionally, there are other system-level considerations when assigning power supplies.

- The usable range for analog signals connected to GPIO (such as IADC inputs) will be limited to the lower of AVDD and IOVDD.
- The RESETn pin has an internal pullup to the DVDD supply. If RESETn is driven by external circuitry above DVDD, additional current may flow into the pin due to this pullup.

### 12.3.7.2 Power Configuration 1: No DC-DC

In Power Configuration 1, the DC-DC converter is unused, and all power is supplied by external sources. The DVDD pin must be shorted to VREGVDD.

Other supplies may be supplied by the same supply as VREGIN and DVDD (as shown in [12.3.7.2 Power Configuration 1: No DC-DC](#)), or they may be powered from a separate source.

VREGSW must be left disconnected in this configuration.

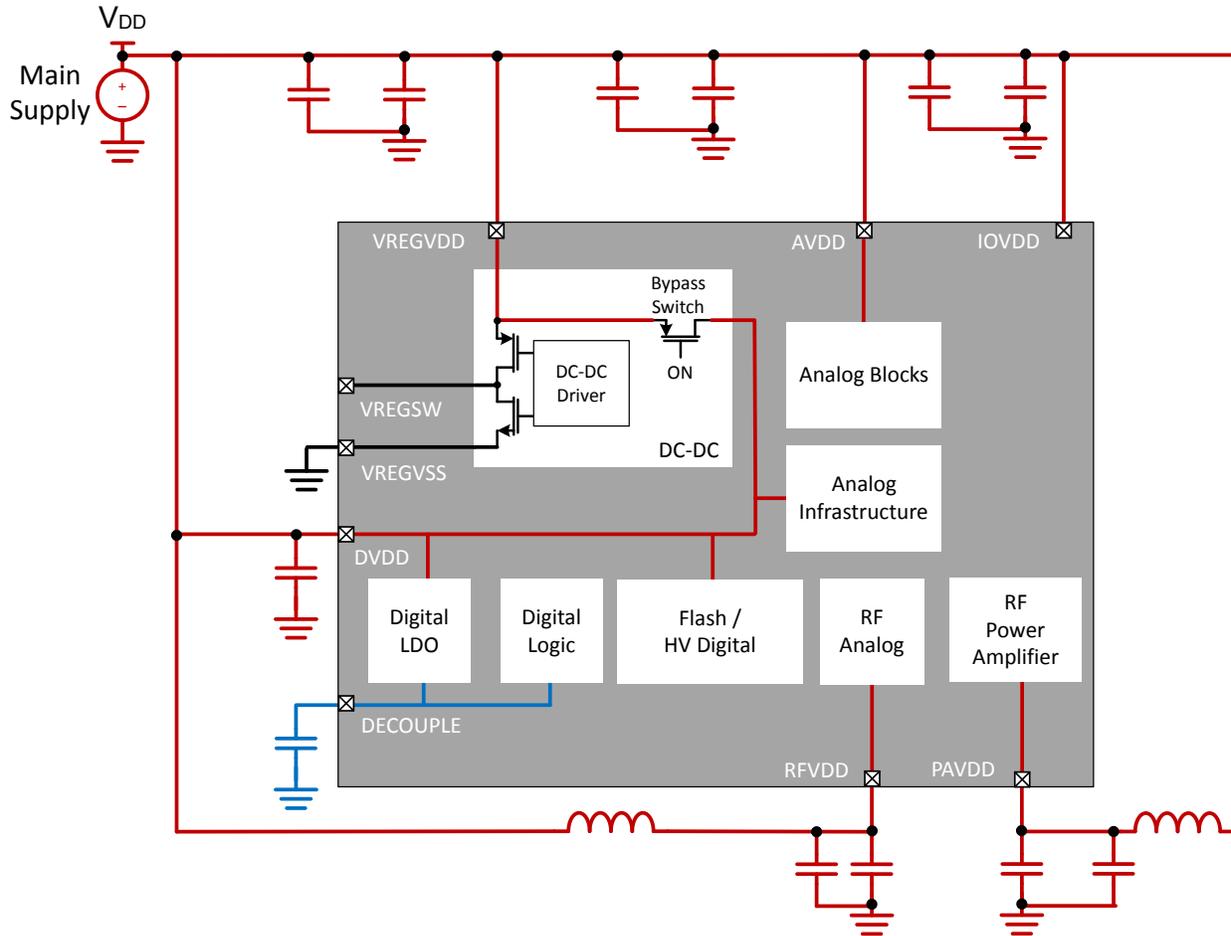

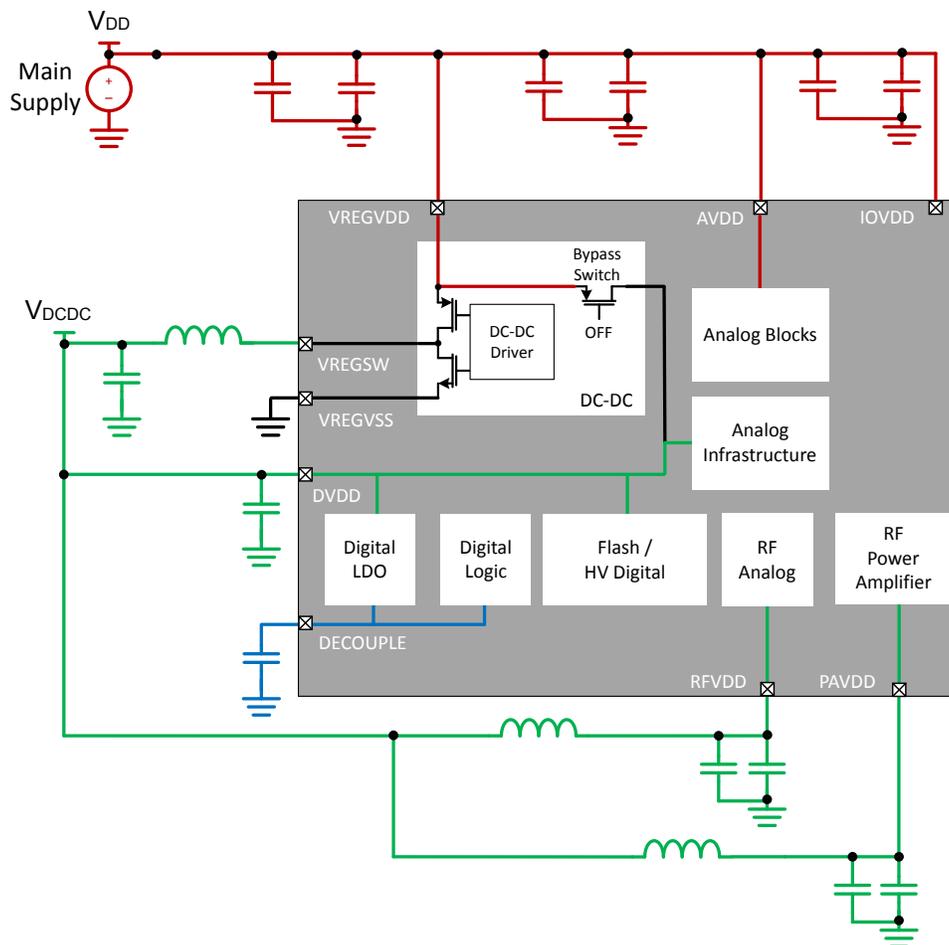

Figure 12.3. DC-DC Off Power Configuration

### 12.3.7.3 Power Configuration 2: DC-DC

For the lowest power applications, the DC-DC converter can be used to power the rest of the supplies on the device. When the DC-DC converter is used to regulate the voltage at DVDD, the maximum supply voltage may be limited by the operating temperature and/or the average lifetime load conditions. Refer to the device datasheet for additional details.

In Power Configuration 2, the DC-DC Output ( $V_{DCDC}$ ) is connected to DVDD and optionally, to all the other supplies on the chip. In the configuration shown in [Figure 12.4 DC-DC Power Configuration on page 301](#), the AVDD and IOVDD supplies are connected to the main supply to support higher voltage external interfaces.

**Figure 12.4. DC-DC Power Configuration**

As the Main Supply voltage approaches the DC-DC output voltage, it eventually reaches a point where becomes inefficient (or impossible) for the DC-DC module to regulate  $V_{DCDC}$ . At this point, firmware can enable bypass mode, which effectively disables the DC-DC and shorts the Main Supply voltage directly to the DC-DC output. If and when sufficient voltage margin on the Main Supply returns, the system can be switched back into DC-DC regulation mode.

### 12.3.7.4 Power Configuration 3: DC-DC With Separate PAVDD

For power-conscious applications that require higher RF transmitter output power (> 14 dBm), PAVDD may be powered from the system supply, while the DC-DC converter can be used to power other supplies on the device. This situation is very similar to [12.3.7.3 Power Configuration 2: DC-DC](#), but PAVDD has been separated out to achieve higher transmitter power.

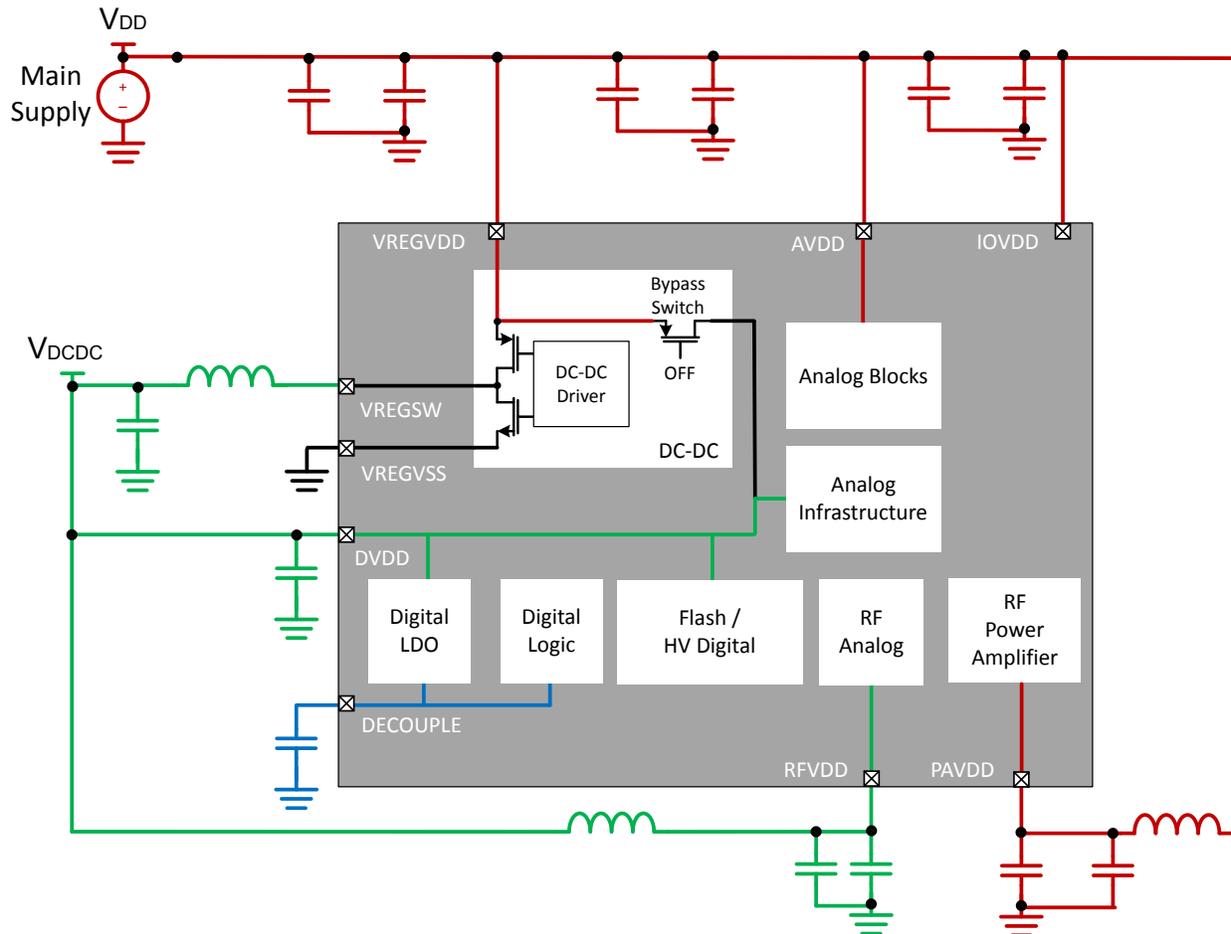

Figure 12.5. DC-DC Power Configuration With Separate PAVDD

### 12.3.8 Buck DC-DC Interface

The EFR32xG23 devices feature a DC-DC buck converter which requires a single external inductor and a single external capacitor. The input supply is the VREGVDD pin, and the DC-DC converter will produce a nominal 1.8 V output at the DVDD pin to power radio and MCU functions. The DC-DC converter is an efficient PFM (Pulse Frequency Modulation) architecture. In addition, the DC-DC converter supports an unregulated bypass mode, in which the input voltage is directly shorted to the DC-DC output. An integrated programmable supply monitor and dedicated interrupt allows software to enable the bypass switch when the VREGVDD supply voltage is below the minimum allowable voltage for the output current load.

The input supply VREGVDD has a maximum range between 1.8 V and 3.8 V, but is limited by application parameters, including transient current load, operating junction temperature, and the lifetime average current load.

Refer to the device datasheet for more details on the input supply voltage range.

### 12.3.8.1 Buck DC-DC Mode Bypass and VREGVDD Comparator

The buck DC-DC converter implements a bypass mode which shorts the VREGVDD input voltage directly to the DC-DC converter output through an internal switch. Bypass mode is enabled automatically during a power-on-reset. Bypass mode can also be enabled and disabled through software, using the DCDC\_CTRL\_MODE field. When set to BYPASS, the bypass switch is enabled and DC-DC regulation will be disabled. Consult the data sheet for the bypass switch impedance specification.

The EFR32xG23 includes a supply comparator circuit to help software determine when the VREGVDD supply is high enough to enable the buck DC-DC, or when to change to bypass mode. The THRESSEL field in the EMU\_VREGVDDCMPCTRL register sets the comparator threshold between 2.0 and 2.3 V, and the VREGINCOMPEN bit is used to enable the supply comparator. When the VREGVDD comparator is used, DCDC\_STATUS\_VREGIN can be read by software to determine whether VREGVDD is above or below the established threshold.

The VREGVDD comparator can also generate interrupt events when the input supply is above or below the specified threshold. The VREGINHIGHIEN and VREGINLOWIEN bits in DCDC\_IEN are used to enable the above / below threshold interrupts, respectively. The VREGVDD comparator will be active and generate interrupts in EM0 and EM1 only.

The VREGVDD Comparator status is always captured and stored in RMURSTCAUSE.VREGIN on any reset event, even if the reset is not caused by VREGVDD being too low. At startup, the firmware should determine if the last reset was caused by a low VREGVDD condition by checking the following:

```
EMU_RSTCAUSE_VREGIN & (EMU_RMURSTCAUSE_DVDDBOB | EMU_RMURSTCAUSE_DVDDLEBOD)
```

If true, the part should remain in bypass mode with the DCDC disabled.

### 12.3.8.2 Buck DC-DC Startup

Out of power-on-reset (POR), the DC-DC converter defaults to bypass mode and the DC-DC block is disabled. Before enabling the DC-DC, software should first configure and enable the VREGVDD comparator. Once the thresholds for the VREGVDD comparator have been configured and the comparator enabled, the DCDC\_STATUS.VREGIN bit should be checked to ensure that the input supply is above the threshold. When the input supply is sufficient, the DC-DC may be configured and enabled. The following steps outline this procedure:

1. Set VREGVDD comparator threshold with EMU\_VREGVDDCMPCTRL.THRESSEL
2. Enable VREGVDD comparator with EMU\_VREGVDDCMPCTRL.VREGINCOMPEN
3. Check DCDC\_STATUS.VREGIN:
  - If low, VREGIN is above the programmed threshold and it is safe to enter DC-DC mode
  - If high, VREGIN is below the programmed threshold and firmware should remain in bypass mode
4. Enable the DC-DC module with DCDC\_EN\_EN = 1
5. Configure the IPKVAL and DRVSPEED settings in DCDC\_EM01CTRL0 and DCDC\_EM23CTRL0.
6. Enable any required interrupts via DCDC\_IEN.
7. Start the DC-DC by setting DCDC\_CTRL.MODE to DCDCREGULATION.

The DC-DC will enter a warmup phase for approximately 100 us, then disable the bypass switch and begin using the DC-DC core to regulate the output voltage. The DCDC\_IF.RUNNINGIF interrupt flag will indicate when the switch from bypass to DC-DC is complete, however this does not indicate that the output is regulated. Until the output capacitor discharges due to normal current draw from the system, the voltage may be higher than 1.8 V. The DCDC\_IF.REGULATIONIF interrupt flag will indicate when the DC-DC has reached regulation and is providing the desired output voltage.

If the VREGINLOWIF interrupt occurs, software should immediately switch back to bypass mode by clearing DCDC\_CTRL.MODE to BYPASS.

### 12.3.8.3 Buck DC-DC Recommended Configuration Settings

Certain DC-DC parameters are adjustable for fine-tuning of performance, but the majority of applications will not need to use any other than the recommended settings. All datasheet parameters are specified using the recommended settings detailed in this section. The configuration settings must be set before DC-DC regulation is started, and must not be changed while the DC-DC is active.

The DCDC\_EM01CTRL0 and DCDC\_EM23CTRL0 registers each have an IPKVAL field to adjust the maximum peak / load current, and a DRVSPEED field to adjust the driver speed. DCDC\_EM01CTRL0 sets the configuration for EM0 and EM1 operation while DCDC\_EM23CTRL0 sets the configuration for EM2 and EM3 operation. The DCDC\_CTRL.IPKTMAXCTRL field adjusts the maximum time for peak current detection, which impacts the voltage ripple at the DC-DC output. The recommended settings are shown in [Table 12.6 DRVSPEED, IPKVAL, and IPKMAXCTRL Recommended Settings for buck DC-DC on page 304](#).

**Table 12.6. DRVSPEED, IPKVAL, and IPKMAXCTRL Recommended Settings for buck DC-DC**

Bit Field	Recommended Setting
DCDC_EM01CTRL0.IPKVAL	9 (LOAD60MA)
DCDC_EM01CTRL0.DRVSPED	1 (DEFAULT_SETTING)
DCDC_EM23CTRL0.IPKVAL	3 (LOAD5MA)
DCDC_EM23CTRL0.DRVSPED	1 (DEFAULT_SETTING)
DCDC_CTRL.IPKTMAXCTRL	16 (1.19 us)

### 12.3.8.4 Buck DC-DC EM4 Entry

The buck DC-DC is available in all energy modes except for EM4. If the system wants to enter EM4, the DC-DC converter must first be turned off and switched over to bypass mode. The system will not enter EM4 if the DC-DC is active. If an attempt is made to go into EM4 with DC-DC active, it will be blocked, and the DCDC\_IF\_EM4ERR flag will be set.

### 12.3.9 EFP01 Communication

The EFP01 Energy Friendly Power Management IC (PMIC) is an extremely flexible, highly efficient, multi-output power management IC, providing complete system power and primary cell battery Coulomb counting for EFR32xG23 devices. The dual-DCDC converter outputs available on certain EFP01 OPNs can, for example, provide power to both the 1.8 V supplies (e.g., DVDD/AVDD/IOVDD) as well as the 1.1/1.0/0.9 V supply (DECOUPLE) for improved efficiency. EFP01 uses an I2C interface for communication and also has a unidirectional, open-drain IRQ# output to indicate status flag changes. Consult EFP01 Datasheet for more detailed information and available OPNs.

The EFR32xG23 has additional built-in hardware support for the EFP01 Energy Friendly PMICs, including:

- Direct Mode Energy Mode transition supporting all energy modes (including EM4) on dedicated pins (PC1 / PC2)
- Hardware IRQ with (dedicated IRQ vector) in all energy modes (included EM4) on dedicated pin (PC5)

EFR32xG23's EFP01 hardware support must be enabled by setting one (or both) of the EFPDRVDECOUPLE or the EFPDRVDVDD bits in the EMU\_CTRL register:

1. EFPDRVDECOUPLE: Set this bit if EFP01's DCDC output will be powering EFR32xG23's DECOUPLE supply. Once set, EFR32xG23's internal LDOs will be disabled, and any voltage changes (due to voltage-scaling and/or energy mode transitions) will be managed by EFP01. Note that because this bit disables in the internal LDO's powering the core, it should be set until after EFP01's DECOUPLE output has been configured and enabled.
2. EFPDRVDVDD: Set this bit if EFP01's DCDC output is powering EFR32xG23's DVDD supply (or DVDD along with other 1.8V supply inputs). This mode assumes that EFR32xG23's internal DCDC is not being used, so the EFR32xG23 VREGVDD and PAVDD pins should be shorted together on the PCB.

EFR32xG23 provides a dedicated hardware IRQ vector for the EFP01's IRQ output. To use the EFR32xG23's hardware support for EFP01's IRQ output:

1. The PC5 pin should be configured as an input with no pull-up/pull-down enabled and connected on the PCB to EFP01's IRQ pin. Note that although this pin exists on Port C, which typically doesn't support EM2/3 operation, when used as a EFP01 IRQ input the PC5 pin can operate in EM2/3. In addition, the PC5 pin can operate in EM4, without the need to be configured as a EM4Wakeup.
2. EFP01 Hardware support must be enabled by setting either the EFPDRVDECOUPLE or the EFPDRVDVDD bits as described above.

Once enabled, the EFP01 interrupt flag in the EMU\_EFPIF register will be set whenever the EFP01 IRQ line goes low. A processor interrupt can be generated to the EMUEFP\_IRQHandler() by setting the EFPIEN bit in the EMU\_EFPIEN register.

EFR32xG23 includes hardware support for EFP01's optional Direct Mode interface to allow fast-energy mode transitions into and out of all energy modes (EM0/1, EM2/3, EM4). Ordinarily, I2C transactions are used to manage EFP01's energy mode state - however, a single I2C transaction can take over 100 us. In Direct Mode, the EFR32xG23 retasks the I2C pins as push-pull outputs with pull-ups disabled to control the EFP01's energy mode state directly, allowing much faster energy mode transitions. State definitions are defined in [Table 12.7 Direct Mode Energy Mode States on page 305](#). Because the Direct Mode feature is non-I2C compliant, it should be enabled only during periods when no communication between EFR32xG23 and EFP01 is required (e.g., an energy mode transition from EM0 to EM2/4), and it is recommended that EFP01 be the only I2C device on the bus. It is also recommended for firmware to wait for the I2C STOP interrupt ensure no I2C transaction is in progress before switching to Direct Mode.

**Table 12.7. Direct Mode Energy Mode States**

Direct Mode State	I2C SCL Level	I2C SDA Level	Allowed State Transitions
EM0	1	1	<ul style="list-style-type: none"> <li>• EM2</li> <li>• I<sup>2</sup>C Start Condition</li> </ul>
EM2	0	1	<ul style="list-style-type: none"> <li>• EM0</li> <li>• EM4</li> </ul>
EM4	0	0	<ul style="list-style-type: none"> <li>• EM2<sup>2</sup></li> </ul>
I <sup>2</sup> C Start Condition	1	0	

- 1 Direct mode transitions between EM0 and EM4 are not allowed. The system must briefly go through the EM2 state on EM4 exit or entrance.
- 2 Direct mode transitions between EM0 and EM4 are not allowed. The system must briefly go through the EM2 state on EM4 exit or entrance.

To enable Direct Mode:

1. The I2C1 module must be used to communicate with EFP01. I2C0 is not supported.
2. The I2C1\_SDA function must be routed to the PC1 pin and connected on the PCB to EFP01's I2C\_SDA pin.
3. The I2C1\_SCL function must be routed to the PC2 pin and connected on the PCB to EFP01's I2C\_SCL pin.
4. Direct Mode must be enabled by setting the EFPDIRECTMODEN bit in the EMU\_CTRL register. The EMU will automatically disable the I2C1 internal pull-ups when in Direct Mode
5. EFP01 Hardware support must be enabled by setting either the EFPDRVDECOUPLE or the EFPDRVDVDD bits as described above.

### 12.3.10 Brown Out Detector (BOD)

Brown out detectors ensure that the minimum supply required for the chip to operate properly and safely is provided to the EFR32xG23. Once triggered, a BOD will generate a system reset.

All BODs detect when the supply falls below a programmed threshold except DECOVMBOD (Over Voltage Monitoring), which detects when the supply goes above a predefined threshold.

All BODs except DVddbOD and DVDDLEBOD can be individually enabled by firmware.

**Table 12.8. EFR32xG23 BODs**

BOD	Control Register	Supported Energy Modes	Function
DVddbOD	n/a	EM0/1	Monitors the DVDD supply in EM0 and EM1. Hardware enables this BOD automatically in EM0/EM1 and disables it in EM2/EM3/EM4
DVDDLEBOD	n/a	EM2/3/4	Low Energy BOD monitors the DVDD supply in EM2/EM3/ EM4. DVDDLEBOD is automatically masked by hardware for ~100us after it is enabled to allow it to settle
DECBOD	EMU_DECBOD	EM0/1/2/3	Monitors the DECOUPLE supply. DECBOD is automatically masked by hardware for ~20us after it is enabled to allow it to settle.
DECOVMBOD	EMU_DECBOD	EM0/1/2/3	Monitors the DECOUPLE supply Over Voltage by detecting DECOUPLE going over a specified threshold. DECOVMBOD is automatically masked by hardware for ~20us after it is enabled to allow it to settle.
AVddbOD	EMU_BOD3SENSE	EM0/1/2/3/4	Monitors the AVDD supply. Automatically masked by hardware for ~100us after it is enabled to allow it to settle.
IOVddbOD	EMU_BOD3SENSE	EM0/1/2/3/4	Monitors the IOVDD supply. Automatically masked by hardware for ~100us after it is enabled to allow it to settle. (Note that some devices may have multiple IOVDD supplies.)

### 12.3.11 Reset Management Unit

EMU RMU (Reset Management Unit) ensures correct reset operation. It is responsible for connecting the different reset sources to the reset lines of the EFR32xG23. After reset, the M33 loads the stack pointer and program entry point from memory and start execution.

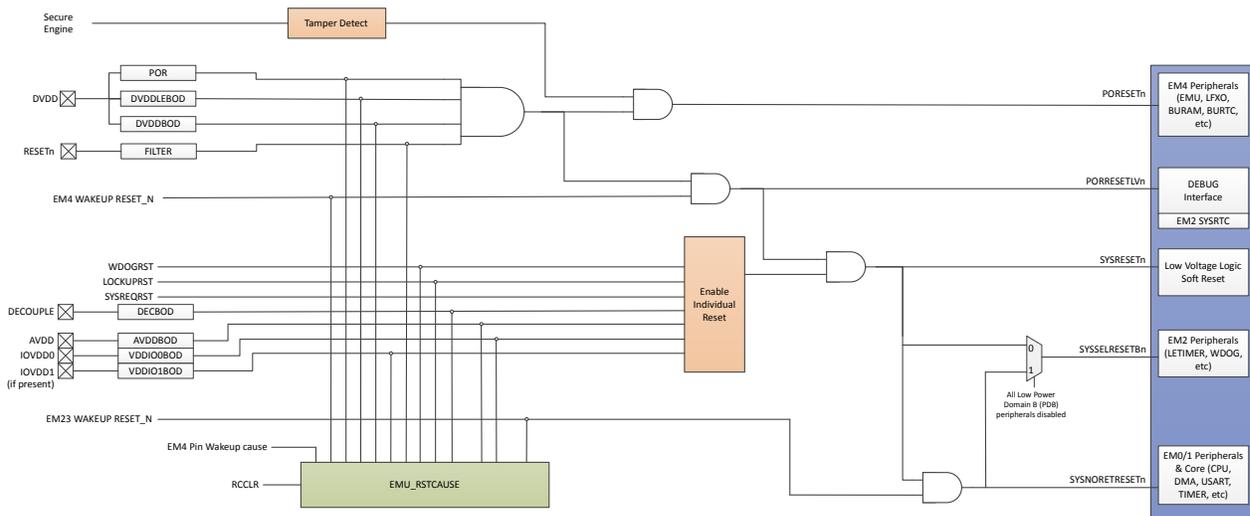

Figure 12.6. Reset Tree

There are two types of reset:

- **HARD resets.** Resets the entire chip. After a hard reset, the EFR32xG23 goes through its power up sequence. For reset timing specifications, please refer to the device datasheet.
- **SOFT resets.** Resets only some of the digital low voltage logic. Resets the MCU subsystems and peripherals but doesn't affect digital HV logic (e.g., Power control, BURTC). For reset timing specifications, please refer to the device datasheet.

**EFR32xG23 Reset sources**

- Power-on Reset (POR)
  - The POR ensures that EFR32xG23 does not start up before the supply voltage DVDD has reached the threshold voltage VPORthr (see Device Datasheet Electrical Characteristics for details). Before the threshold voltage is reached, EFR32xG23 is kept in reset state.
- RESET pin Reset
  - The RESETh pin includes an on-chip pull-up resistor to the DVDD supply, and can therefore be left unconnected if no external reset source is needed. Also connected to the RESETh line is a filter which prevents glitches from resetting the EFR32xG23.
- EM4 wakeup
  - System reset following EM4 exit.
- Watchdog reset
  - The Watchdog circuit is a timer which (when enabled) must be cleared by software regularly. If software does not clear it, a Watchdog reset is activated. This functionality provides recovery from a software stalemate. Refer to the Watchdog section for specifications and description.
- Core lockup condition
  - A MCU lockup is the result of the core being locked up because of an unrecoverable exception following the activation of the processor's built-in system state protection hardware.
- Software triggered reset
  - Software may initiate a reset (e.g. if it finds itself in a non-recoverable state). By asserting the SYSRESETREQ in the Application Interrupt and Reset Control Register, a reset is issued.
- Brown-Out Detection (BOD)
  - EFR32xG23 has multiple built in Brown-out detection (BOD) circuits, which monitor supply voltage level during operation. BOD circuits compare supply voltage to a programmed threshold level and issue a reset request when triggered.
- Secure Engine Tamper detection
  - Secure Engine may issue a system reset request upon tamper detection.

Whether a reset source trigger event lead to a system reset can be controlled via EMU\_RMUCTRL register.

**EMU\_RSTCAUSE register**

User can determine the cause of the last reset by querying the EMU\_RSTCAUSE register. Once read, EMU\_RSTCAUSE should be cleared via EMU\_CMD\_RCCLR.

**Table 12.9. Reset Sources Summary**

RSTCAUSE Bit	Name	Type	Can be Disabled?	Description
0	POR	Hard	No	Power On Reset.
1	PIN	Hard	No	Pin Reset.
2	EM4	Soft	No	EM4 Wakeup
3	WDOG0	Soft	Yes	Watchdog 0
4	WDOG1	Soft	Yes	Watchdog 1
5	LOCKUP	Soft	Yes	M33 Lockup
6	SYSREQ	Soft	Yes	M33 Core System Reset
7	DVddbOD	Hard	No	DVDD BOD
8	DVDDLEBOD	Hard	No	DVDD LEBOD
9	DECBOD	Hard	Yes	DECOUPLE BOD
10	AVddbOD	Soft	Yes	AVDD BOD
11	IOVddbOD	Soft	Yes	IOVDD 0 BOD

### 12.3.12 Temperature Sensor

EMU provides a low energy periodic temperature measurement. A temperature measurement is taken once every 250 ms, with the 9-bit result stored in TEMP bit-field in EMU\_TEMP register. The temperature value is expressed in degrees Kelvin. EMU\_TEMP\_TEMPLSB represents the measured temperature fractional part (in ¼ degree Kelvin).

**Note:** The EMU temperature sensor is always periodically taking single temperature measurements, except in EM4 (shutoff) mode.

To obtain better noise resolution, the temperature sensor also implements a hardware averaging function, and averaged results can be requested using the EMU\_CMD\_TEMPavgREQ command. When TEMPavgREQ is set by software, the temperature sensor will take 16 or 64 samples as quickly as possible. The TEMPavgNUM field in EMU\_CTRL determines how many temperature measurements will be averaged. The averaged result is stored in the 11-bit field EMU\_TEMP\_TEMPavg, which represents the full temperature with resolution of ¼ degree Kelvin.

The EMU provides the following features around temperature changes:

- Interrupt when temperature is updated (EMU\_IF\_TEMP)
- Interrupt when averaged temperature result is updated (EMU\_IF\_TEMPavg)
- Interrupt from LOW level trip (generate interrupt EMU\_IF\_TEMPLOWIF when measured temperature in EMU\_TEMP\_TEMP is below programmed threshold EMU\_TEMPLIMITS\_TEMPLOW)
- Interrupt from HIGH level trip (generate interrupt EMU\_IF\_TEMPHIGHIF when measured temperature in EMU\_TEMP\_TEMP is above programmed threshold EMU\_TEMPLIMITS\_TEMPHI)

High and Low thresholds are specified as 9-bit degree Kelvin values and compared against the single temperature result (EMU\_IF\_TEMP).

Measured temperature can be converted to degrees Celsius by subtracting 273.15 ( $T_{\text{Celsius}} = T_{\text{Kelvin}} - 273.15$ ).

#### 12.3.12.1 Linearization, Offset Correction, and Calibration

The raw value reported by the EMU temperature sensor follows a predictable curve. The output may be linearized and the systematic offset removed to achieve die temperature readings with better than +/- 2.5 degrees C accuracy over the full operating temperature range. Further accuracy can be achieved using in-system calibration.

To linearize the measurement and correct for the systematic offset, a second or third-order polynomial equation representing the nominal curve is used. For example, a third-order correction equation takes the form:

$$T_{\text{corr}} = a \cdot x^3 + b \cdot x^2 + c \cdot x^1 + d$$

Where:

- $T_{\text{corr}}$  is the corrected temperature (in degrees Celsius)
- $x$  is the measured temperature (in degrees Celsius)
- $a$  is the  $x^3$  term
- $b$  is the  $x^2$  term
- $c$  is the  $x^1$  term
- $d$  is the  $x^0$  term

Polynomial coefficients for both third and second-order polynomials are shown in [Table 12.10 Polynomial Coefficients on page 309](#). Note that the polynomial coefficients provided assume the raw output (in Kelvin) has been converted to Celsius prior to linearization.

**Table 12.10. Polynomial Coefficients**

Polynomial Order	$x^3$ Term	$x^2$ Term	$x^1$ Term	$x^0$ Term
Third Order	-1.016E-6	-8.618E-5	1.027	-3.921
Second Order	n/a	-2.468E-4	1.030	-3.772

Additional accuracy may be achieved by performing an in-system calibration at known temperatures and operating conditions after linearization.

### 12.3.13 Register Locks

EMU EMU\_LOCK (for user accessible registers) can be used to control access to the EMU\_RMUCTRL, EMU\_CTRL, and EMU\_DEC-BOD registers. The DCDC\_LOCK register can be used to control access to the DC-DC registers.

## 12.4 EMU Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x010	EMU_DECBOD	RW	DECOUPLE LVBOD Control Register
0x020	EMU_BOD3SENSE	RW	BOD3SENSE Control Register
0x03C	EMU_VREGVDDCMPCTRL	RW	DC-DC VREGVDD Comparator Control Register
0x040	EMU_PD1PARETCTRL	RW	PD1 Partial Retention Control

## 12.5 EMU Register Description

## 12.5.1 EMU\_DECBOB - DECOUPLE LVBOD Control Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																											0x1	0x0			0x1	0x0
Access																											RW	RW			RW	RW
Name																											DECOVBODMASK	DECOVBODEN			DECBODMASK	DECBODEN

Bit	Name	Reset	Access	Description
31:6	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
5	DECOVBODMASK DECOUPLE BOD Over Voltage Monitor Mask	0x1	RW	<b>Over Voltage Monitor Mask</b>
4	DECOVBODEN DECOUPLE BOD Over Voltage Monitor enable. Enables LVBOD below vref high. BOD is masked for 20us after enable	0x0	RW	<b>Over Voltage Monitor enable</b>
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DECBODMASK DECOUPLE BOD Mask	0x1	RW	<b>DECBOD Mask</b>
0	DECBODEN DECOUPLE BOD enable. Enables LVBOD above vref low. BOD is masked for 20us after enable	0x0	RW	<b>DECBOD enable</b>

## 12.5.2 EMU\_BOD3SENSE - BOD3SENSE Control Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0	0x0			
<b>Access</b>																											RW	RW	RW			
<b>Name</b>																											VDDIO1BODEN	VDDIO0BODEN	AVDDBODEN			

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	VDDIO1BODEN	0x0	RW	<b>VDDIO1 BOD enable</b> BOD output is automatically masked for 100us by HW after enable is set
1	VDDIO0BODEN	0x0	RW	<b>VDDIO0 BOD enable</b> BOD output is automatically masked for 100us by HW after enable is set
0	AVDDBODEN	0x0	RW	<b>AVDD BOD enable</b> BOD output is automatically masked for 100us by HW after enable is set

## 12.5.3 EMU\_VREGVDDCMPCTRL - DC-DC VREGVDD Comparator Control Register

Offset	Bit Position																															
0x03C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x3	0x0				
<b>Access</b>																											RW	RW				
<b>Name</b>																											THRESSEL	VREGINCPEN				

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2:1	THRESSEL	0x3	RW	<b>VREGVDD comparator threshold programming</b> VREGVDD comparator threshold programming: 2.0->2.3V, 0.1V/step
0	VREGINCPEN	0x0	RW	<b>VREGVDD comparator enable</b> VREGVDD comparator enable. Output is masked for 5us after enabled. Automatically disabled in EM2.

## 12.5.4 EMU\_PD1PARECTRL - PD1 Partial Retention Control

Offset	Bit Position																															
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	RW															
<b>Name</b>																	PD1PARETDIS															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	PD1PARETDIS	0x0	RW	<b>Disable PD1 Partial Retention</b>  Select PD1 register groups that are NOT retained in EM2/EM3. Each bit controls a register group. MCU core group is always retained. Bit[0]: Disables PD1 retention for MCU Peripherals group. Bit[1]: Disables PD1 retention for RADIO group (only on devices with a radio). Bit [15:2]: Unused. Setting PD1 retention for MCU Peripherals group will also allow PD0B/C/D power domains to be turned OFF in EM23 if all peripherals on those power domains are turned off on EM23 entry
	Value	Mode	Description	
	1	PERIPHNORETAIN	Retain associated registers when in EM2/3	
	2	RADIONORETAIN	Bit[1]. When set, do not retain RADIO associated registers when in EM2/3	

## 12.5.5 EMU\_IPVERSION - IP Version

Offset	Bit Position																															
0x05C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x2															
<b>Access</b>																	R															
<b>Name</b>																	IPVERSION															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x2	R	<b>IP Version</b>  IP Version

### 12.5.6 EMU\_LOCK - EMU Configuration Lock Register

Offset	Bit Position																															
0x060	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0xADE8															
<b>Access</b>																	W															
<b>Name</b>																	LOCKKEY															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	LOCKKEY	0xADE8	W	<b>Lock Key</b> Write any other value than the unlock code to lock
	Value	Mode	Description	
	44520	UNLOCK	Unlock EMU register	

## 12.5.7 EMU\_IF - Interrupt Flags

Offset	Bit Position																																
0x064	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>	0x0	0x0	0x0		0x0		0x0	0x0							0x0	0x0																	
<b>Access</b>	RW	RW	RW		RW		RW	RW							RW	RW																	
<b>Name</b>	TEMPHIGH	TEMPLOW	TEMP		TEMPAVG		VSCALEDONE	EM23WAKEUP							IOVDD0BOD	AVDDBOD																	

Bit	Name	Reset	Access	Description
31	TEMPHIGH	0x0	RW	<b>Temperature high Interrupt flag</b> Measured temperature above threshold
30	TEMPLOW	0x0	RW	<b>Temperature low Interrupt flag</b> Measured temperature below threshold
29	TEMP	0x0	RW	<b>Temperature Interrupt flag</b> Temperature Update
28	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
27	TEMPAVG	0x0	RW	<b>Temperature Average Interrupt flag</b> Averaged Temperature Update
26	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
25	VSCALEDONE	0x0	RW	<b>Vscale done Interrupt flag</b> Voltage scaling completed. EM0 only.
24	EM23WAKEUP	0x0	RW	<b>EM23 Wake up Interrupt flag</b> EM23 wake up
23:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
17	IOVDD0BOD	0x0	RW	<b>VDDIO0 BOD Interrupt flag</b> IOVDD0 BOD triggered
16	AVDDBOD	0x0	RW	<b>AVDD BOD Interrupt flag</b> AVDD BOD triggered
15:0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

## 12.5.8 EMU\_IEN - Interrupt Enables

Offset	Bit Position																																
0x068	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Reset	0x0	0x0	0x0		0x0		0x0	0x0							0x0	0x0																	
Access	RW	RW	RW		RW		RW	RW							RW	RW																	
Name	TEMPHIGH	TEMPLOW	TEMP		TEMPAVG		VSCALEDONE	EM23WAKEUP							IOVDD0BOD	AVDDBOD																	

Bit	Name	Reset	Access	Description
31	TEMPHIGH	0x0	RW	<b>Temperature high Interrupt enable</b> Measured temperature above threshold Interrupt enable
30	TEMPLOW	0x0	RW	<b>Temperature low Interrupt enable</b> Measured temperature below threshold Interrupt enable
29	TEMP	0x0	RW	<b>Temperature Interrupt enable</b> Temperature Update Interrupt enable
28	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
27	TEMPAVG	0x0	RW	<b>Temperature Interrupt enable</b> Averaged Temperature Interrupt enable
26	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
25	VSCALEDONE	0x0	RW	<b>Vscale done Interrupt enable</b> Voltage scaling completed Interrupt enable. EM0 only.
24	EM23WAKEUP	0x0	RW	<b>EM23 Wake up Interrupt enable</b> EM23 wake up Interrupt enable
23:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
17	IOVDD0BOD	0x0	RW	<b>VDDIO0 BOD Interrupt enable</b> IOVDD0 BOD Interrupt enable
16	AVDDBOD	0x0	RW	<b>AVDD BOD Interrupt enable</b> AVDD BOD Interrupt enable
15:0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

## 12.5.9 EMU\_EM4CTRL - EM4 Control

Offset	Bit Position																																																								
0x06C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																									
<b>Reset</b>																								0x0			0x0																														0x0
<b>Access</b>																								RW			RW																														RW
<b>Name</b>																								BOD3SENSEEM4WU			EM4IORETMODE																													EM4ENTRY	

Bit	Name	Reset	Access	Description
31:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8	BOD3SENSEEM4WU	0x0	RW	<b>Set BOD3SENSE as EM4 wakeup</b> Enable BOD3SENSE as EM4 wakeup source
7:6	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
5:4	EM4IORETMODE	0x0	RW	<b>EM4 IO retention mode</b> Determine when IO retention will be applied and removed
	Value	Mode		Description
	0	DISABLE		No Retention: Pads enter reset state when entering EM4
	1	EM4EXIT		Retention through EM4: Pads enter reset state when exiting EM4
	2	SWUNLATCH		Retention through EM4 and Wakeup: software writes UNLATCH register to remove retention
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	EM4ENTRY	0x0	RW	<b>EM4 entry request</b> This field is used to enter the Energy Mode 4 sequence. Writing the sequence 2,3,2,3,2,3,2,3,2 will enter the part into Energy Mode 4

## 12.5.10 EMU\_CMD - EMU Command Register

Offset	Bit Position																																			
0x070	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Name</b>														TAMPERRCCLR	RSTCAUSECLR											EM01VSCALE2	EM01VSCALE1					TEMPAVGREQ			EM4UNLATCH	

Bit	Name	Reset	Access	Description
31:19	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
18	TAMPERRCCLR	0x0	W(nB)	<b>Tamper Reset Cause Clear</b> Set this bit to clear the TAMPERRSTCAUSE register. Root access only
17	RSTCAUSECLR	0x0	W(nB)	<b>Reset Cause Clear</b> Set this bit to clear the RMURSTCAUSE register
16:12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
11	EM01VSCALE2	0x0	W(nB)	<b>Scale voltage to Vscale2</b> EM01 Voltage Scale Command to scale to Voltage Scale Level 2
10	EM01VSCALE1	0x0	W(nB)	<b>Scale voltage to Vscale1</b> EM01 Voltage Scale Command to scale to Voltage Scale Level 1
9:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	TEMPAVGREQ	0x0	W(nB)	<b>Temperature Average Request</b> Request for Averaged Temperature Measurement
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	EM4UNLATCH	0x0	W(nB)	<b>EM4 unlatch</b> GPIO unlatch request after EM4 wakeup. Only valid when EM4IORETMODE== SWUNLATCH
0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

## 12.5.11 EMU\_CTRL - EMU Control Register

Offset	Bit Position																																
0x074	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>	0x0	0x0	0x0														0x0							0x2					0x0				0x0
<b>Access</b>	RW	RW	RW														RW							RW					RW				RW
<b>Name</b>	EFPDRVDVDD	EFPDRVDECOUPLE	EFPDIRECTMODEEN														FLASHPWRUPONDEMAND							EM23VSCALE					TEMPAVGNUM				EM2DBGEN

Bit	Name	Reset	Access	Description												
31	EFPDRVDVDD	0x0	RW	<b>EFP drives DVDD</b> EFP01 Drives DVDD. EFP IRQ is enabled on PC5. VREGVDD and DVDD pins should be shorted together on the PCB.												
30	EFPDRVDECOUPLE	0x0	RW	<b>EFP drives DECOUPLE</b> EFP01 Drives DECOUPLE. Internal LDOs are disabled, EMU voltage scaling is done through EFP01, and EFP IRQ is enabled on PC5.												
29	EFPDIRECTMODEEN	0x0	RW	<b>EFP Direct Mode Enable</b> EFP01 Direct mode enable. EMU drive I2C lines to transition EFP01 between energy modes. Firmware must use I2C1 module with SDA routed to PC1 and SCL routed to SC2.												
28:17	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>														
16	FLASHPWRUPONDEMAND	0x0	RW	<b>Enable flash on demand wakeup</b> When set, during wake up, Flash will be in power down mode until either incoming Flash data fetch or when software issue powerup command to IMEM->MSC_CMD register												
15:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>														
9:8	EM23VSCALE	0x2	RW	<b>EM2/EM3 Vscale</b> Set VSCALE value for EM2/EM3 mode <table border="1" data-bbox="235 1554 1510 1753"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>VSCALE0</td> <td>VSCALE0. 0.9v</td> </tr> <tr> <td>1</td> <td>VSCALE1</td> <td>VSCALE1. 1.0v</td> </tr> <tr> <td>2</td> <td>VSCALE2</td> <td>VSCALE2. 1.1v</td> </tr> </tbody> </table>	Value	Mode	Description	0	VSCALE0	VSCALE0. 0.9v	1	VSCALE1	VSCALE1. 1.0v	2	VSCALE2	VSCALE2. 1.1v
Value	Mode	Description														
0	VSCALE0	VSCALE0. 0.9v														
1	VSCALE1	VSCALE1. 1.0v														
2	VSCALE2	VSCALE2. 1.1v														
7:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>														
3	TEMPAVGNUM	0x0	RW	<b>Averaged Temperature samples num</b> Number of samples taken for Averaged Temperature Measurement												

Bit	Name	Reset	Access	Description
	Value	Mode		Description
	0	N16		16 measurements
	1	N64		64 measurements
2:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	EM2DBGEN	0x0	RW	<b>Enable debugging in EM2</b> Force debug power domain to stay on on EM2 entry. This allows debugger to remain connected in EM2.

### 12.5.12 EMU\_TEMPLIMITS - EMU Temperature Thresholds

Offset	Bit Position																																
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Reset</b>									0x1FF																0x0								
<b>Access</b>									RW																RW								
<b>Name</b>									TEMPHIGH																TEMPLOW								

Bit	Name	Reset	Access	Description
31:25	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
24:16	TEMPHIGH	0x1FF	RW	<b>Temp High limit</b> Temp threshold in degree Kelvin. The TEMPHIGH interrupt flag is set when a periodic temperature measurement is equal to or higher than this value.
15:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8:0	TEMPLOW	0x0	RW	<b>Temp Low limit</b> Temp threshold in degree Kelvin. The TEMPLOW interrupt flag is set when a periodic temperature measurement is equal to or lower than this value.

## 12.5.13 EMU\_STATUS - EMU Status Register

Offset	Bit Position																																					
0x084	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						
<b>Reset</b>																		0x0		0x0		0x0				0x2	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0			
<b>Access</b>																		R		R		R				R				R	R	R	R	R	R	R		
<b>Name</b>																		EM2ENTERED		EM4IORET		RACACTIVE				VSCALE		VSCALEFAILED		VSCALEBUSY		TEMPAVGACTIVE		TEMPACTIVE		FIRSTTEMPDONE		LOCK

Bit	Name	Reset	Access	Description												
31:15	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>														
14	EM2ENTERED	0x0	R	<b>EM2 entered</b> Confirm chip entered EM2 state. EM2 Entry request can be delayed or denied by peripherals.												
13	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>														
12	EM4IORET	0x0	R	<b>EM4 IO retention status</b> The status of IO retention. Will be set upon EM4 entry based on EM4IORETMODE in EMU_EM4CTRL. Cleared by setting EM4UNLATCH in EMU_CMD												
11	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>														
10	RACACTIVE	0x0	R	<b>RAC active</b> This bit indicates the status of the RAC state machine. System can not enter EM2 or lower if set.												
9:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>														
7:6	VSCALE	0x2	R	<b>Vscale status</b> Current Voltage Scale Value <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>VSCALE0</td> <td>Voltage scaling set to 0.9v</td> </tr> <tr> <td>1</td> <td>VSCALE1</td> <td>Voltage scaling set to 1.0v</td> </tr> <tr> <td>2</td> <td>VSCALE2</td> <td>Voltage scaling set to 1.1v</td> </tr> </tbody> </table>	Value	Mode	Description	0	VSCALE0	Voltage scaling set to 0.9v	1	VSCALE1	Voltage scaling set to 1.0v	2	VSCALE2	Voltage scaling set to 1.1v
Value	Mode	Description														
0	VSCALE0	Voltage scaling set to 0.9v														
1	VSCALE1	Voltage scaling set to 1.0v														
2	VSCALE2	Voltage scaling set to 1.1v														
5	VSCALEFAILED	0x0	R	<b>Vscale failed</b> Voltage scaling failed. (Time out)												
4	VSCALEBUSY	0x0	R	<b>Vscale busy</b> Voltage Scaling busy												
3	TEMPAVGACTIVE	0x0	R	<b>Temp Average active</b> Average Temperature Measurement active												
2	TEMPACTIVE	0x0	R	<b>Temp active</b>												

Bit	Name	Reset	Access	Description
				Temperature Measurement active
1	FIRSTTEMPDONE	0x0	R	<b>First Temp done</b> First Temperature measurement completed
0	LOCK	0x0	R	<b>Lock status</b> Indicates the current status of EMU Lock
	Value	Mode		Description
	0	UNLOCKED		All EMU lockable registers are unlocked.
	1	LOCKED		All EMU lockable registers are locked.

#### 12.5.14 EMU\_TEMP - Temperature

Offset	Bit Position																																
0x088	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>												0x0											0x0										
<b>Access</b>												R											R										
<b>Name</b>												TEMPAVG											TEMP										TEMPLSB

Bit	Name	Reset	Access	Description
31:27	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
26:16	TEMPAVG	0x0	R	<b>Averaged Temperature</b> Averaged Temperature Measurement. Temperature in Kelvin. 9 integer bits and 2 decimal bits (0.25 Degree resolution)
15:11	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
10:2	TEMP	0x0	R	<b>Temperature measured</b> Temperature in Kelvin. Value of last periodic temperature measurement. Value is asynchronously updated.
1:0	TEMPLSB	0x0	R	<b>Temperature measured decimal part</b> Temperature decimal part

## 12.5.15 EMU\_RSTCTRL - Reset Management Control Register

Offset	Bit Position																																																						
0x090	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1	EM01CTRL0 EM01CTRL0 Sync Busy Status	0x0	R	<b>EM01CTRL0 Sync Busy Status</b>
0	CTRL CTRL Sync Busy Status	0x0	R	<b>CTRL Sync Busy Status</b>

## 12.7.10 DCDC\_LOCK - Lock Register

Offset	Bit Position																															
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	W															
<b>Name</b>																	LOCKKEY															

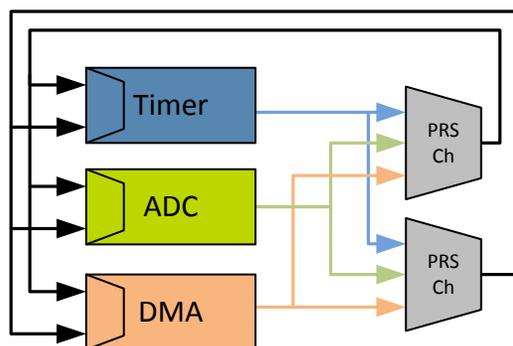

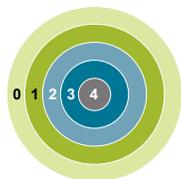

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	LOCKKEY	0x0	W	<b>Configuration Lock Key</b> Write any other value than the unlock code to lock all DCDC registers
	Value	Mode	Description	
	43981	UNLOCKKEY		

## 12.7.11 DCDC\_LOCKSTATUS - Lock Status Register

Offset	Bit Position																															
0x044	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0
<b>Access</b>																																R
<b>Name</b>																																LOCK

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
0	LOCK	0x0	R	<b>Lock Status</b> Lock Status Read-Only Register
	Value	Mode	Description	
	0	UNLOCKED	Unlocked State	
	1	LOCKED	LOCKED STATE	

## 13. PRS - Peripheral Reflex System

### Quick Facts

#### What?

The PRS (Peripheral Reflex System) allows configurable, fast, and autonomous communication between peripherals.

#### Why?

Events and signals from one peripheral can be used as input signals to trigger actions in other peripherals. PRS reduces latency and ensures predictable timing by reducing software overhead and thus current consumption.

#### How?

Without CPU intervention the peripherals can send reflex signals to each other in single- or chained steps. The peripherals can be set up to perform actions based on the incoming reflex signals. This results in improved system performance and reduced energy consumption.

### 13.1 Introduction

The Peripheral Reflex System is a signal routing network allowing direct communication between different peripheral modules without involving the CPU. Peripheral modules which send out reflex signals to the PRS are called producers, and modules accepting reflex signals are called consumers. The PRS routes the reflex signals from producer to consumer peripherals, which perform actions depending on the reflex signals received.

### 13.2 Features

12 configurable asynchronous channels

- Each channel can be connected to any producer
- Consumers can be configured to listen to any asynchronous channel
- Can generate events to the CPU and the DMA
- Software controlled channel output using the SWPULSE and SWLEVEL registers
- Configurable logic to implement combinational functions between channels; multiple channels may be cascaded to produce more complex functions

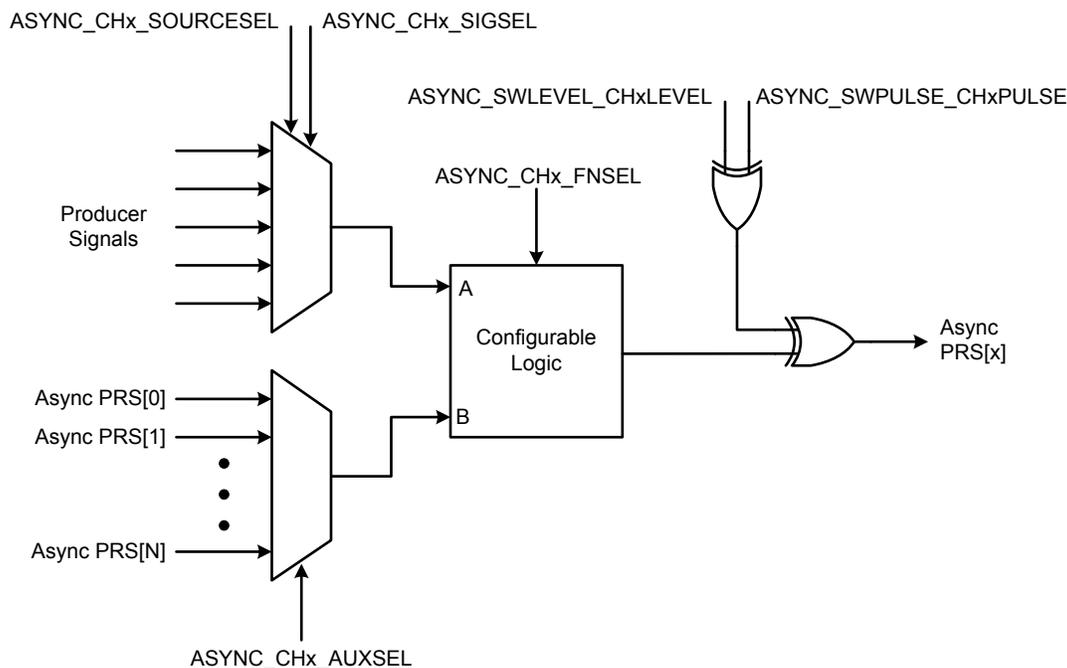

4 configurable synchronous channels

- Special set of channels for high speed signalling between IADC and TIMER blocks

### 13.3 Functional Description

The PRS contains 12 asynchronous and 4 synchronous reflex channels. An overview of an asynchronous PRS reflex channel is shown in [Figure 13.1 PRS Asynchronous Channel Overview on page 345](#). Synchronous channels are similar but do not include the configurable logic block or SWLEVEL / SWPULSE features. Asynchronous channels can be connected to any signal offered by the producers while the synchronous channels are restricted to special signals from the TIMER, IADC, and VDAC modules.

Similarly on the consumer side, all the peripherals can listen to asynchronous channels while only the TIMER, IADC, and VDAC modules can listen to synchronous channels. The consumers of a channel (synchronous or asynchronous) can choose which PRS channel to listen to and perform actions based on the reflex signals routed through that channel. Synchronous channels are only available in EM0 and EM1 while asynchronous channels are available in EM0, EM1, EM2 and EM3.

**Figure 13.1. PRS Asynchronous Channel Overview**

#### 13.3.1 Asynchronous Channel Functions

Different functions can be applied to a reflex signal within the PRS. The asynchronous PRS channels can be manually triggered by writing to PRS\_ASYNC\_SWPULSE or PRS\_ASYNC\_SWLEVEL. SWLEVEL[n] is a programmable level for each asynchronous channel and holds the value it is programmed to. Setting SWPULSE[n] will cause the asynchronous channel to output a high pulse that is one EM01GRPACLK clock cycle wide. The SWLEVEL[n] and SWPULSE[n] signals are then XOR'ed with the output from the configurable logic block to form the output signal and is sent to the channel selection logic for every consumer signal. For example, when SWLEVEL[n] is set, if configurable logic produces a signal of 1, this will cause a channel output of 0.

### 13.3.2 Configurable Logic

The configurable logic feature enables a PRS channel to perform logic operations on the signal coming from the selected producer. Every asynchronous channel has a configurable logic block that can be programmed using the FNSEL field in the asynchronous channel control register. The configurable logic block for each channel has two inputs. Input A is the signal from the selected producer determined by SOURCESEL and SIGSEL of PRS\_ASYNCn\_CTRL. Input B may be selected from the output of any other asynchronous PRS channel using the ASYNC\_CHx\_AUXSEL field. This allows for more complex logic functions to be created using multiple PRS channels.

**Table 13.1. Configurable Logic Look up Table**

A	B	FNSEL
0	0	FNSEL[0]
0	1	FNSEL[1]
1	0	FNSEL[2]
1	1	FNSEL[3]

The configurable logic feature is implemented as a 2 input look up table, with each bit of FNSEL representing the outcome for a specific input combination (see [Table 13.1 Configurable Logic Look up Table on page 346](#)). For example, if input A is 0 and input B is 1, then the PRS output will assume the value of bit 1 of FNSEL (FNSEL[1]).

To calculate the FNSEL field for an "A NAND B" function, the truth table can be filled out as:

**Table 13.2. A NAND B Example**

A	B	FNSEL = (A NAND B)
0	0	FNSEL[0] = 1
0	1	FNSEL[1] = 1
1	0	FNSEL[2] = 1
1	1	FNSEL[3] = 0

In this example, the value of FNSEL has been calculated to be 0111 (binary), or 0x7.

Using the FNSEL field, a total of 16 two-input logic functions can be implemented, as shown in [Table 13.3 List of Logic Functions on page 346](#).

**Table 13.3. List of Logic Functions**

FNSEL value	Implemented Function
0x0	0
0x1	A NOR B
0x2	(NOT A) AND B
0x3	NOT A
0x4	A AND (NOT B)
0x5	(NOT B)
0x6	A XOR B
0x7	A NAND B
0x8	A AND B
0x9	A XNOR B

FNSEL value	Implemented Function
0xA	B
0xB	(NOT A) OR B
0xC	A
0xD	A OR (NOT B)
0xE	A OR B
0xF	1

The default value of FNSEL is 0xC, meaning that the input from the selected producer goes through unchanged. This feature can be used to combine multiple channels to get even more complex functions.

### 13.3.3 Producers

Through SOURCESEL in PRS\_SYNCHx\_CTRL or PRS\_ASYNCx\_CTRL, each PRS channel (synchronous and asynchronous respectively) selects its signal producers. Each producer outputs one or more signals which can be selected by setting the SIGSEL field. Setting the SOURCESEL bits to 0 (Off) leads to a constant 0 output from the input mux regardless of SIGSEL.

The GPIO producer signals depend on settings in the GPIO module. They are selected using the edge interrupt configuration settings described in [24.3.10.1 Standard Interrupt Generation](#). PIN0 uses settings for the EXTI0 interrupt, PIN1 uses settings for EXTI1, and so on.

For example, to route PB00 as a producer for PRS channel 2, EXTI0, EXTI1, EXTI2, or EXTI3 should be configured to connect to PB00, and the corresponding GPIO PINx should be selected as the PRS channel 2 producer. If we choose EXTI1 via PRS producer "GPIO PIN1":

1. GPIO\_EXTIPSELL\_EXTIPSEL1 = PORTB, and GPIO\_EXTIPINSELL\_EXTIPINSEL1 = PIN0 connect PB00 through the EXTI1 signal.
2. PRS\_ASYNC\_CH2\_CTRL\_SOURCESEL = GPIO, and PRS\_ASYNC\_CH2\_CTRL\_SIGSEL = PIN1 connects the PIN1 (EXTI1) signal to asynchronous PRS channel 2 as a producer.

## 13.3.3.1 Producer Details

Table 13.4. Synchronous PRS Producers

Peripheral	SOURCESEL	Signal	SIGSEL
TIMER0	TIMER0 (0x01)	UF	0x0

### 13.3.4 Consumers

Consumer peripherals can be set to listen to a PRS channel and perform an action based on the signal received on that channel. This is done by programming the PRSSEL or SPRSSEL in the consumer registers. SPRSSEL is only present for signals with the ability to listen to synchronous channels. The consumer registers follow the naming convention PRS\_CONSUMER\_<peripheral\_name>\_<signal\_name>. For example, the PRS\_CONSUMER\_TIMER0\_CC0 register is used to select which PRS channel output is sent to the TIMER0 peripheral's CC0 signal. In turn, the target peripheral should be configured to use the associated PRS trigger as desired. This is described in the individual peripheral chapters.

**Note:** When configuring the synchronous PRS consumer registers, the target peripheral should be disabled or configured to not use the affected PRS signal. This will ensure that no false triggers occur at the consumer.

#### 13.3.4.1 Event on PRS

The PRS can be used to send events to the MCU to wake the system. This is very useful in combination with the Wait For Event (WFE) instruction. Any asynchronous PRS channel can be selected for this using PRSSEL in PRS\_CONSUMER\_CORE\_M33RXEV.

Using this feature, one can e.g. set up a timer to trigger an event to the MCU periodically, every time letting the MCU continue from a WFE instruction in its program. This can help in performance-critical sections where timing is known, and the goal is to wait for an event, execute some code, then wait for another event, execute some code, and so on.

#### 13.3.4.2 DMA Request on PRS

Up to two independent DMA requests can be generated by the PRS. The PRS asynchronous channels triggering the DMA requests are selected with the PRSSEL fields in the PRS\_CONSUMER\_LDMAXBAR\_DMAREQx registers. The requests are set whenever the selected asynchronous PRS outputs are high.

### 13.4 PRS Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	PRS_IPVERSION	R	PRS IPVERSION

## 13.5.6 PRS\_ASYNC\_CHx\_CTRL - Async Channel Control Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>					0x0							0xC						0x0							0x0							
<b>Access</b>					RW							RW						RW							RW							
<b>Name</b>					AUXSEL							FNSEL						SOURCESEL							SIGSEL							

Bit	Name	Reset	Access	Description
31:28	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
27:24	AUXSEL	0x0	RW	<b>Aux Select</b> Select Asynchronous PRS channel as input B of LUT function. Async PRS[n] is selected with AUXSEL = n.
23:20	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	FNSEL	0xC	RW	<b>Function Select</b> Look up table function select. Signal A is the selected producer input. Signal B is the output of the previous PRS channel.
	Value	Mode	Description	
	0	LOGICAL_ZERO	Logical 0	
	1	A_NOR_B	A NOR B	
	2	NOT_A_AND_B	(!A) AND B	
	3	NOT_A	!A	
	4	A_AND_NOT_B	A AND (!B)	
	5	NOT_B	!B	
	6	A_XOR_B	A XOR B	
	7	A_NAND_B	A NAND B	
	8	A_AND_B	A AND B	
	9	A_XNOR_B	A XNOR B	
	10	B	B	
	11	NOT_A_OR_B	(!A) OR B	
	12	A	A	
	13	A_OR_NOT_B	A OR (!B)	
	14	A_OR_B	A OR B	
	15	LOGICAL_ONE	Logical 1	
15	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
14:8	SOURCESEL	0x0	RW	<b>Source Select</b>

Bit	Name	Reset	Access	Description
				Select input source for asynchronous PRS channel. See Asynchronous Producers table for details.
7:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2:0	SIGSEL	0x0	RW	<b>Signal Select</b> Select signal input for asynchronous PRS channel. See Asynchronous Producers table for details.
	Value	Mode	Description	
	0	NONE		

### 13.5.7 PRS\_SYNC\_CHx\_CTRL - Sync Channel Control Register

Offset	Bit Position																															
0x048	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0												0x0			
<b>Access</b>																	RW												RW			
<b>Name</b>																	SOURCESEL												SIGSEL			

Bit	Name	Reset	Access	Description
31:15	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
14:8	SOURCESEL	0x0	RW	<b>Source Select</b> Select input source to sync PRS channel.
7:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2:0	SIGSEL	0x0	RW	<b>Signal Select</b> Select signal input to sync PRS channel.
	Value	Mode	Description	
	0	NONE		

## 13.5.8 PRS\_CONSUMER\_CMU\_CALDN - CALDN Consumer Register

Offset	Bit Position																															
0x058	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## 14. GPCRC - General Purpose Cyclic Redundancy Check

### Quick Facts

#### What?

The GPCRC is an error-detecting module commonly used in digital networks and storage systems to detect accidental changes to data.

#### Why?

The GPCRC module can detect errors in data, giving a higher system reliability and robustness.

#### How?

Blocks of data entering GPCRC module can have a short checksum, based on the remainder of a polynomial division of their contents; on retrieval the calculation is repeated, and corrective action can be taken against presumed data corruption if the check values do not match.

### 14.1 Introduction

The GPCRC module implements a Cyclic Redundancy Check (CRC) function. It supports both 32-bit and 16-bit polynomials. The supported 32-bit polynomial is 0x04C11DB7 (IEEE 802.3), while the 16-bit polynomial can be programmed to any value, depending on the needs of the application. Common 16-bit polynomials are 0x1021 (CCITT-16), 0x3D65 (IEC16-MBus), and 0x8005 (zigbee, 802.15.4, and USB).

### 14.2 Features

- Programmable 16-bit polynomial, fixed 32-bit polynomial
- Byte-level bit reversal for the CRC input
- Byte-order reorientation for the CRC input
- Word or half-word bit reversal of the CRC result
- Ability to configure and seed an operation in a single register write
- Single-cycle CRC computation for 32-, 16-, or 8-bit blocks
- DMA operation

### 14.3 Functional Description

An overview of the GPCRC module is shown in [Figure 14.1 GPCRC Overview on page 424](#).

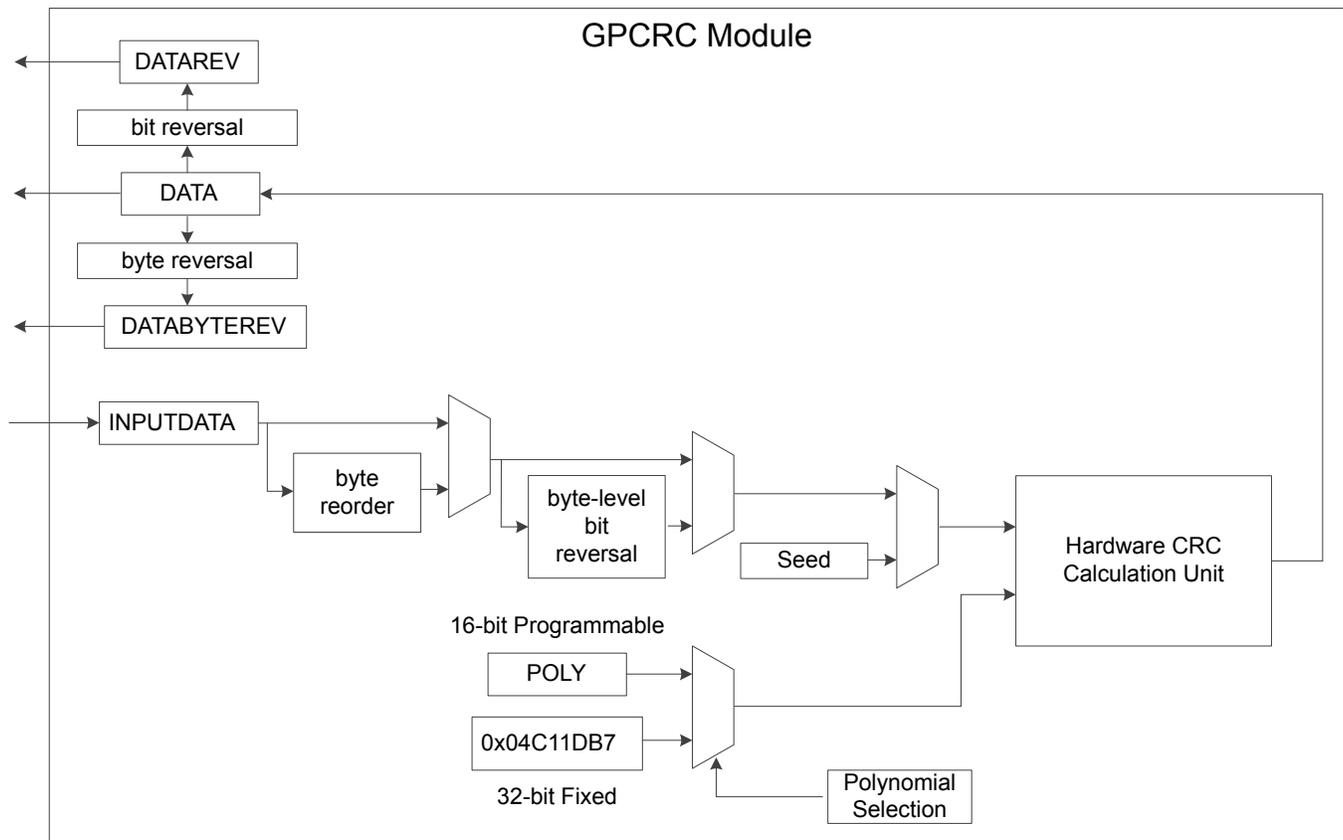

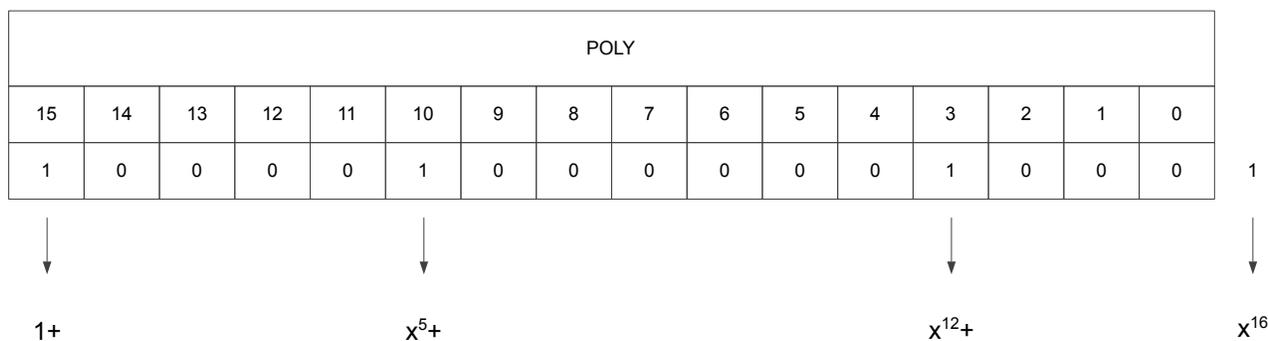

Figure 14.1. GPCRC Overview

### 14.3.1 Polynomial Specification

POLYSEL in GPCRC\_CTRL selects between 32-bit and 16-bit polynomial functions. When a 32-bit polynomial is selected, the fixed IEEE 802.3 polynomial(0x04C11DB7) is used. When a 16-bit polynomial is selected, any valid polynomial can be defined by the user in GPCRC\_POLY.

A valid 16-bit CRC polynomial must have an  $x^{16}$  term and an  $x^0$  term. Theoretically, a 16-bit polynomial has 17 terms total. The convention used is to omit the  $x^{16}$  term. The polynomial should be written in **reversed** (little endian) bit order. The most significant bit corresponds to the lowest order term. Thus, the most significant bit in CRC\_POLY represents the  $x^0$  term, and the least significant bit in CRC\_POLY represents the  $x^{15}$  term. The highest significant bit of CRC\_POLY should always set to 1. The polynomial representation for the CRC-16-CCIT polynomial  $x^{16} + x^{12} + x^5 + 1$ , or 0x8408 in reversed order, is shown in [Figure 14.2 Polynomial Representation on page 425](#).

CRC-16-CCITT Normal: 0x1021 Reversed: 0x8408

**Figure 14.2. Polynomial Representation**

### 14.3.2 Input and Output Specification

The CRC input data can be written to the GPCRC\_INPUTDATA, GPCRC\_INPUTDATAWORD or GPCRC\_INPUTDATABYTE register via the APB bus based on different data size. If BYTEMODE in GPCRC\_CTRL is set, only the least significant byte of the data word will be used for the CRC calculation no matter which input register is written. There are also three output registers for different ordering. Reading from GPCRC\_DATA will get the result based on the polynomial in reversed order, while reading from GPCRC\_DATAREV will get the result based on the polynomial in normal order. The CRC calculation completes in one clock cycle. Reads from the GPCRC\_DATA, GPCRC\_DATAREV or GPCRC\_DATABYTEREV registers and writes to the GPCRC\_CMD register are halted while the calculation is in progress.

### 14.3.3 Initialization

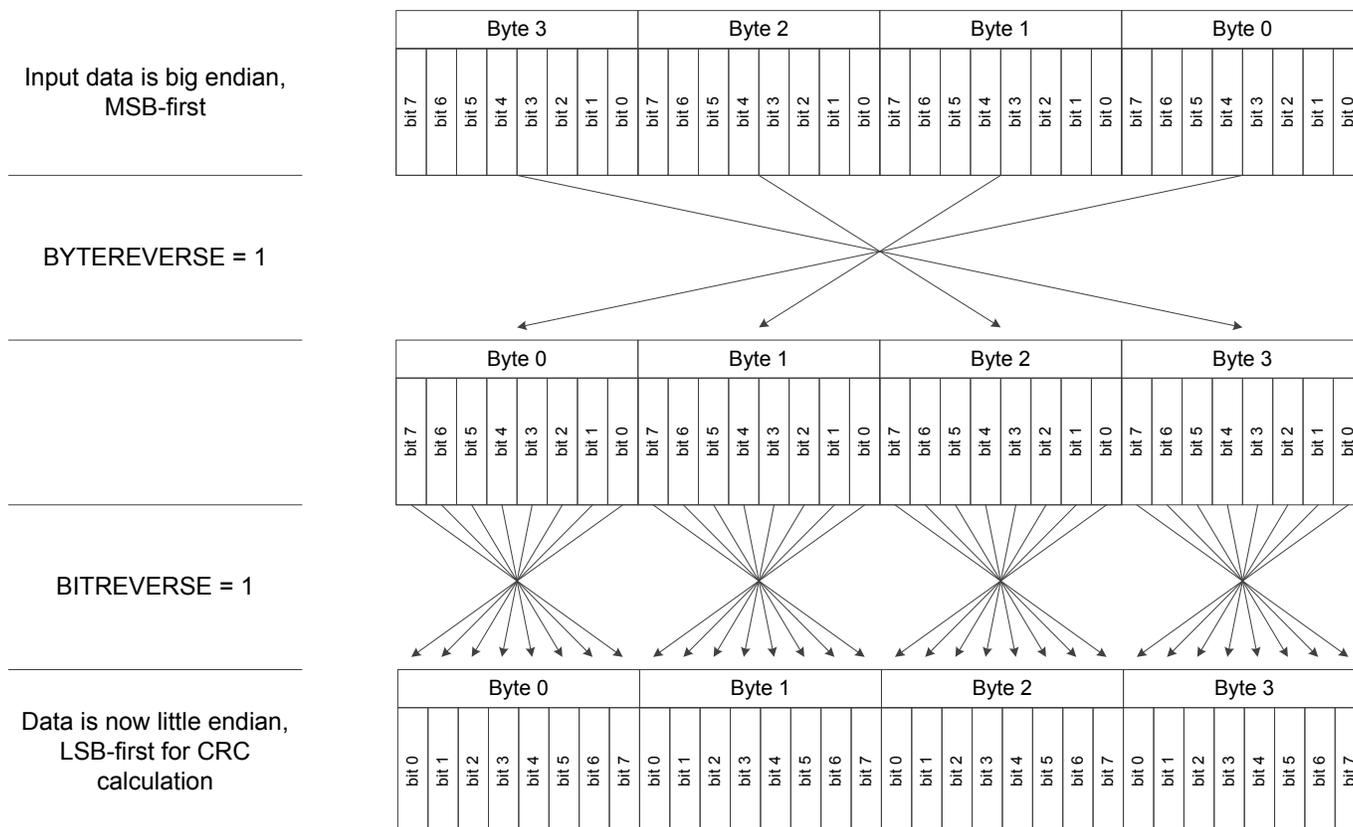

The CRC can be pre-loaded or re-initialized by first writing a 32-bit programmable init value to INIT in GPCRC\_INIT and then setting INIT in GPCRC\_CMD. It can also be re-initialized automatically when read from DATA, DATAREV or DATABYTEREV provided that AUTOINIT in GPCRC\_CTRL is set, the CRC would be re-initialized with the stored init value.

### 14.3.4 DMA Usage

A DMA channel may be used to transfer data into the CRC engine. All bytes and half-word writes must be word-aligned. The recommended DMA usage model is to use the DMA to transfer all available words of data and use software writes to capture any remaining bytes.

### 14.3.5 Byte-Level Bit Reversal and Byte Reordering

The byte-level bit reversal and byte reordering operations occur before the data is used in the CRC calculation. Byte reordering can occur on words or half words. The hardware ignores the BYTEREVERSE field with any byte writes or operations with byte mode enabled (BYTEMODE = 1), but the bit reversal settings (BITREVERSE) are still applied to the byte. 32-bit little endian MSB-first data can be treated like 32-bit little endian LSB-first data, as shown in [Figure 14.3 Data Ordering Example - 32-bit MSB -first to LSB-first on page 426](#). In this example, 32-bit data is written to GPCRC\_INPUTDATA, BYTEREVERSE is set for byte ordering, and BITREVERSE is set for byte-level bit reversal.

**Figure 14.3. Data Ordering Example - 32-bit MSB -first to LSB-first**

When handling 16-bit data, the byte reordering function only swap the two lowest bytes and clear the two highest bytes, as shown in [Figure 14.4 Data Ordering Example - 16-bit MSB -first to LSB-first on page 427](#). In this example, 16-bit data is written to GPCRC\_INPUTDATAWORD, BYTEREVERSE is set for byte ordering, and BITREVERSE is set for byte-level bit reversal.

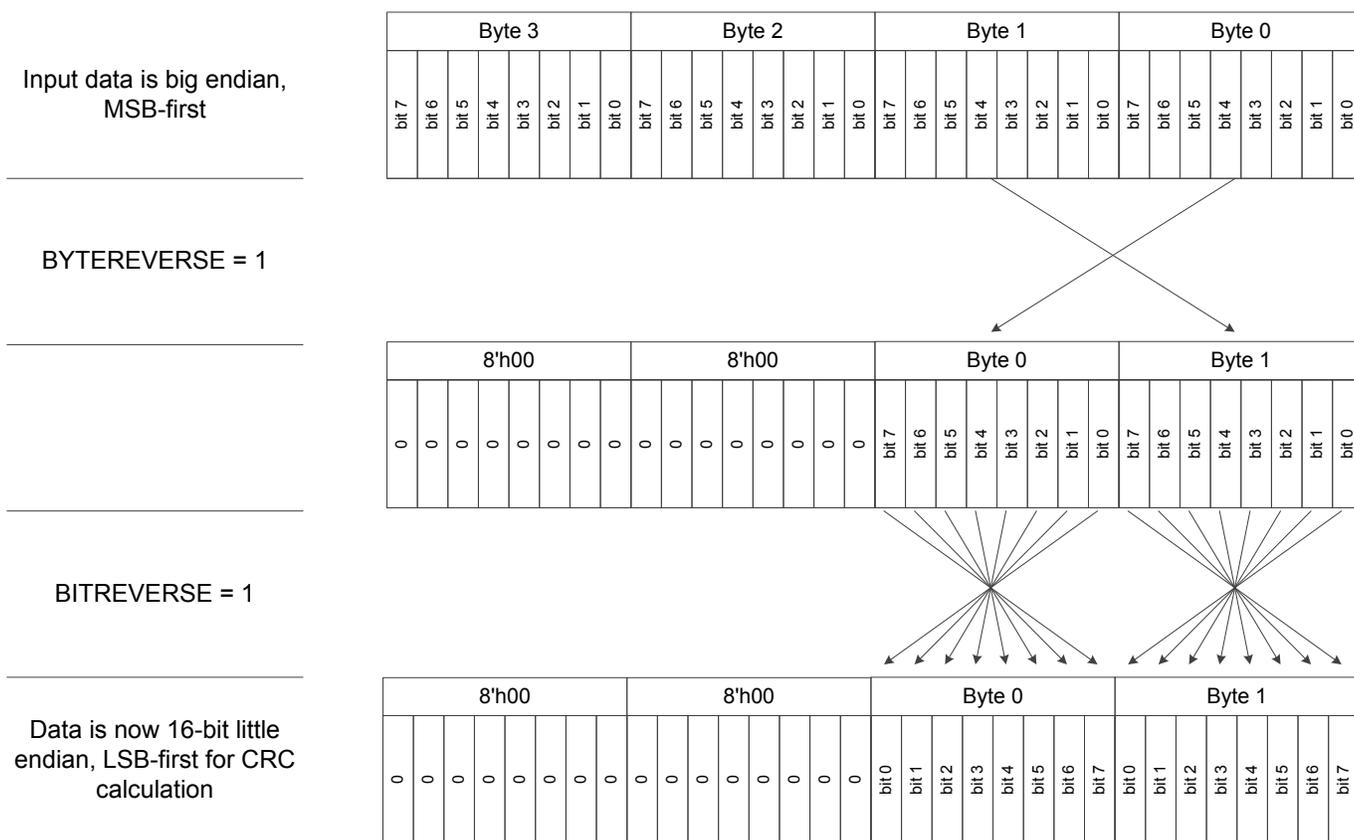

Figure 14.4. Data Ordering Example - 16-bit MSB -first to LSB-first

Assuming a word input byte order of B3 B2 B1 B0, the values used in the CRC calculation for the various settings of the byte-level bit reversal and byte reordering are shown in Table 14.1 Byte-Level Bit Reversal and Byte Reordering Results (B3 B2 B1 B0 Input Order) on page 427.

Table 14.1. Byte-Level Bit Reversal and Byte Reordering Results (B3 B2 B1 B0 Input Order)

Input Width(bits)	BYTEREVERSE Setting	BITREVERSE Setting	Input to CRC Calculation
32	0	0	B3 B2 B1 B0
32	1	1	'B0 'B1 'B2 'B3
32	1	0	B0 B1 B2 B3
32	0	1	'B3 'B2 'B1 'B0
16	0	0	XX XX B1 B0
16	1	1	XX XX 'B0 'B1

## 14.5 GPCRC Register Description

### 14.5.1 GPCRC\_IPVERSION - IP Version ID

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																0x0																
<b>Access</b>																R																
<b>Name</b>																IPVERSION																

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x0	R	<b>IP Version ID</b>

The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.

## 14.5.2 GPCRC\_EN - CRC Enable

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0
<b>Access</b>																																RW
<b>Name</b>																																EN

Bit	Name	Reset	Access	Description
31:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	EN	0x0	RW	<b>CRC Enable</b>  The ENABLE bit enables the module. Software should write to CONFIG type registers before setting the ENABLE bit. Software should write to SYNC type registers only after setting the ENABLE bit.
	Value	Mode		Description
	0	DISABLE		Disable CRC function. Reordering functions are still available. Only BITREVERSE and BYTEREVERSE bits are configurable in this mode.
	1	ENABLE		Writes to INPUTDATA registers will result in CRC operations.

## 14.5.3 GPCRC\_CTRL - Control Register

Offset	Bit Position																																				
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
Reset																	0x0			0x0	0x0	0x0				0x0											
Access																	RW			RW	RW	RW									RW						
Name																	AUTOINIT			BYTEREVERSE	BITREVERSE	BYTEMODE								POLYSEL							

Bit	Name	Reset	Access	Description
31:14	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
13	AUTOINIT	0x0	RW	<b>Auto Init Enable</b> Enables auto init by re-seeding the CRC result based on the value in INIT after reading of DATA, DATAREV or DATABYTEREV.
12:11	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
10	BYTEREVERSE	0x0	RW	<b>Byte Reverse Mode</b> Allows byte level reverse of bytes B3, B2, B1, B0 within the 32-bit data word
	Value	Mode	Description	
	0	NORMAL	No reverse: B3, B2, B1, B0	
	1	REVERSED	Reverse byte order. For 32-bit: B0, B1, B2, B3; For 16-bit: 0, 0, B0, B1	
9	BITREVERSE	0x0	RW	<b>Byte-level Bit Reverse Enable</b> Reverses bits within each byte of the 32-bit data word
	Value	Mode	Description	
	0	NORMAL	No reverse	
	1	REVERSED	Reverse bit order in each byte	
8	BYTEMODE	0x0	RW	<b>Byte Mode Enable</b> Treats all writes as bytes. Only the least significant byte of the data-word will be used for CRC calculation for all writes
7:5	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
4	POLYSEL	0x0	RW	<b>Polynomial Select</b> Selects 16-bit CRC programmable polynomial or 32-bit CRC fixed polynomial
	Value	Mode	Description	
	0	CRC32	CRC-32 (0x04C11DB7) polynomial selected	
	1	CRC16	16-bit CRC programmable polynomial selected	

Bit	Name	Reset	Access	Description
3:0	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		

#### 14.5.4 GPCRC\_CMD - Command Register

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Name</b>																																INIT

Bit	Name	Reset	Access	Description
31:0	INIT	0x0	RW	<b>CRC Initialization Value</b> This value is loaded into CRC_DATA upon issuing the INIT command in CRC_CMD

### 14.5.6 GPCRC\_POLY - CRC Polynomial Value

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	RW															
<b>Name</b>																	POLY															

Bit	Name	Reset	Access	Description
31:16	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
15:0	POLY	0x0	RW	<b>CRC Polynomial Value</b>  This value defines 16-bit POLY, which is used as the polynomial during the 16-bit CRC calculation. The polynomial is defined in reversed representation, meaning that the lowest degree term is in the highest bit position of POLY. Additionally, the highest degree term in the polynomial is implicit. Further examples of the CRC configuration can be found in the documentation.

### 14.5.7 GPCRC\_INPUTDATA - Input 32-Bit Data Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	W															
<b>Name</b>																	INPUTDATA															

Bit	Name	Reset	Access	Description
31:0	INPUTDATA	0x0	W	<b>Input Data for 32-bit</b>  CRC Input 32-bit Data can be written to this register. Each time this register is written, the CRC value is updated.

## 14.5.8 GPCRC\_INPUTDATAWORD - Input 16-Bit Data Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	W															
<b>Name</b>																	INPUTDATAWORD															

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
15:0	INPUTDATAWORD	0x0	W	<b>Input Data for 16-bit</b> CRC Input 16-bit Data can be written to this register. Each time this register is written, the CRC value is updated.

## 14.5.9 GPCRC\_INPUTDATABYTE - Input 8-Bit Data Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	W															
<b>Name</b>																	INPUTDATABYTE															

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
7:0	INPUTDATABYTE	0x0	W	<b>Input Data for 8-bit</b> CRC Input 8-bit Data can be written to this register. Each time this register is written, the CRC value is updated.

## 14.5.10 GPCRC\_DATA - CRC Data Register

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	R(r)																															
<b>Name</b>	DATA																															

Bit	Name	Reset	Access	Description
31:0	DATA	0x0	R(r)	<b>CRC Data Register</b>
CRC Data Register, read only. The CRC data register may still be indirectly written from software, by writing the INIT register and then issue an INITIALIZE command.				

## 14.5.11 GPCRC\_DATAREV - CRC Data Reverse Register

Offset	Bit Position																															
0x028	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	R(r)																															
<b>Name</b>	DATAREV																															

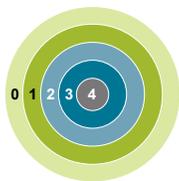

Bit	Name	Reset	Access	Description
31:0	DATAREV	0x0	R(r)	<b>Data Reverse Value</b>
Bit reversed version of CRC Data register. When a 32-bit CRC polynomial is selected, the reversal occurs on the entire 32-bit word. When a 16-bit CRC polynomial is selected, the bits [15:0] are reversed.				

## 14.5.12 GPCRC\_DATABYTEREV - CRC Data Byte Reverse Register

Offset	Bit Position																															
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	R(r)															
<b>Name</b>																	DATABYTEREV															

Bit	Name	Reset	Access	Description
31:0	DATABYTEREV	0x0	R(r)	<b>Data Byte Reverse Value</b> Byte reversed version of CRC Data register. When a 32-bit CRC polynomial is selected, the bytes are swizzled to {B0, B1, B2, B3}. When a 16-bit CRC polynomial is selected, the bytes are swizzled to {0, 0, B0, B1}.

## 15. SYSRTC - System RTC

### Quick Facts

#### What?

The System Real-Time Counter (SYSRTC) is a 32-bit Real Time Clock ensuring timekeeping in low energy modes.

#### Why?

Timekeeping over long time periods while using as little power as possible is required in many low power applications.

#### How?

The SYSRTC operates a central counter off a low-frequency oscillator source. It has configurable compare and capture channels which can be used to trigger wake-up, generate PRS signalling, or capture system events. The SYSRTC allows the system to stay in low energy modes for long periods of time and maintain reliable timekeeping.

### 15.1 Introduction

The SYSRTC (System Real Time Counter), is a 32-bit counter kept running down to energy mode EM3. It can be used as a sleep timer / wakeup source as well as a timekeeping counter during low energy modes. Multiple groups of capture / compare registers are available to different cores in the system, allowing the peripheral and time base to be shared across cores and save energy. Only group 0 registers are directly accessible to the main processor core, but compare / capture signals and interrupts from group 1 are also available to the main processor.

Capture compare channels can be used to trigger interrupts, generate PRS signals, capture PRS events, and to wake the device up from EM1, EM2, or EM3.

**Note: Critical portions of the EFR32/EFM32 software stack related to system timing and power management make use of SYSRTC in such a way that it is effectively unavailable to user software. Please refer to relevant software documentation for additional information.**

### 15.2 Features

- 32-bit counter
- Debug mode
- 32.768 kHz LFXO or LFRCO / 1 kHz ULFRCO
- Low energy wake-up source
- Separate groups of capture / compare registers and signals
  - MCU core and Radio core each control one group
  - 2 compare channels per group
  - 1 capture channel per group
  - Separate interrupt vectors for MCU and Radio events
  - Capture / compare available in PRS

### 15.3 Functional Description

### 15.3.1 Interrupts and Wake Events

Each group has a dedicated, independent interrupt line, and has the ability to wake the system. The Group 0 interrupt line (SYSRTC\_APP) is used and fully controlled by user code running on the main processor. The Group 1 interrupt line (SYSRTC\_SEQ) is also available to the main processor, but Group 1 registers and configuration are not directly available to the user application.

### 15.3.2 Counter

A single counter value (CNT) is used across all groups. The SYSRTC module is enabled by setting its EN bit field. The counter value is asserted to 0x00000000 on reset. The counter can be started/stopped by writing to the START/STOP bit fields in the CMD register. The RUNNING field in the STATUS register indicates that the counter is running when it is set.

Once started, the counter increments by 1 on each cycle (typically 32.768 kHz). The counter value can be programmed directly by writing to the CNT register. Once the programmed value is applied and the counter is running, the counter will increment on every clock starting from the newly programmed value.

When the counter reaches its maximum value of 0xFFFFFFFF, an overflow event is generated, followed by a counter wrap-around to its reset value (from which counting continues) and the OVF interrupt flag (OVFIF) on the next cycle. The overflow event is common for all the groups, i.e. OVFIF flags in all groups get set.

The normal operation of SYSRTC is to configure it, enable it, start it, and then leave it running. This should be done by a single core so that other cores only access the registers for their designated group as needed. If SYSRTC needs to be disabled, it is recommended to stop it first using the STOP command.

### 15.3.3 Compare Events

A compare event for channel "x" of group "n" is generated whenever the counter is RUNNING, the CMPxEN bit is set / enabled in the GRPn\_CTRL register, and the CNT value is equal to the GRPn\_CMPxVALUE register setting. This event is followed by GRPn\_IF.CMPxIF being set on the next counter clock cycle.

Compare events can be routed as PRS producers on the GRPnOUTx signals. There are several options for the match action, selected by CMPxCMOA in GRPn\_CTRL. Note that when using the PULSE option, the PRS output should already be cleared for the pulse to get set and the PULSE option should remain configured until the pulse is cleared (otherwise if the PULSE option is reprogrammed to the SET option, the "pulse" remains set). A possible use case when using the CMPxIF option is to signal early events prior to the following wake-up. After wakeup, the compare flag should be processed and cleared. To avoid a race condition on the PRS output, the compare flag should be cleared away from the next possible compare event.

Note that when setting the compare value to the current counter value, a compare event may not get generated until the counter overflows and reaches the current value again. To generate a compare event quickly, it is recommended to program the compare value to the current counter value + 1. Compare events are group-specific.

### 15.3.4 Capture Events

SYSRTC groups support counter value capture triggered by PRS consumer signals. For group "n" the SYSRTC0 "INn" PRS consumer is used to trigger captures. Capture can be triggered on RISING, FALLING, or BOTH edges, according to the setting programmed in CAP0EDGE of the GRPn\_CTRL register. A capture event for group "n" is generated whenever the counter is RUNNING, the CAP0EN bit is set / enabled in the GRPn\_CTRL register, and the desired event occurs on the PRS output.

A capture event is followed by GRPn\_IF\_CAP0IF being set after up to 3 counter clock cycles. At the same time the flag is set, the GRPn\_CAP0VALUE register captures the current counter value. Note that PRS input edges should not occur more frequently than once every three counter cycles. If the counter is being started/stopped or GRPn\_CTRL.CAP0EN / GRPn\_CTRL.CAP0EDGE is changed close to the PRS input edge, a race condition may occur. Capture events are group-specific.

### 15.3.5 SYSRTC Behavior on SWRST/Disablement/STOP

On SWRST / Disablement, the counter is reset to 0x00000000, PRS outputs are cleared, compare/capture events are disabled, compare/capture flags are reset, and the CAP0VALUE register is reset.

When the counter is stopped using the STOP command in the CMD register, all other settings remain unchanged, except that the RUNNING status will return to 0, which blocks any compare/capture events until the counter is started again.

### 15.3.6 Debug Functionality

By default, the counter value is frozen when the main processor is halted during debugging. The RUNNING status bit is not affected by debug halt, and will continue to indicate that the counter is active. If DEBUGRUN in the CFG register is set, the counter will not halt when the main processor is halted, and SYSRTC will continue to count clocks.

Note that the main processor runs on a much higher frequency than the counter and that the halt condition needs to last long enough (more than 3 counter cycles) for the counter to reach the frozen state.

## 15.4 SYSRTC Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description

## 15.5 SYSRTC Register Description

## 15.5.1 SYSRTC\_IPVERSION - IP VERSION

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x1																															
<b>Access</b>	R																															
<b>Name</b>	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x1	R	<b>IP VERSION</b> Gives access to the IP VERSION of SYSRTC

## 15.5.2 SYSRTC\_EN - Module Enable Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	0x0
<b>Access</b>																															R	RW
<b>Name</b>																															DISABLING	EN

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISABLING	0x0	R	<b>Disablement busy status</b> Set when EN cleared and cleared when the peripheal core reset is finished
0	EN	0x0	RW	<b>SYSRTC Enable</b> Enable the SYSRTC by requesting Clk from CMU

### 15.5.3 SYSRTC\_SWRST - Software Reset Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0				
<b>Access</b>																											R	W				
<b>Name</b>																											RESETTING	SWRST				

Bit	Name	Reset	Access	Description
31:2	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
1	RESETTING	0x0	R	<b>Software reset busy status</b>  When SWRST command is issued, resetting logic sets this status immediately and it is later cleared when the reset process is finished
0	SWRST	0x0	W	<b>Software reset command</b>  A software reset command field resets the module back to the initial condition, similar to the power-on reset condition

### 15.5.4 SYSRTC\_CFG - Configuration Register

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0					
<b>Access</b>																											RW					
<b>Name</b>																											DEBUGRUN					

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
0	DEBUGRUN	0x0	RW	<b>Debug Mode Run Enable</b>  Set this bit to keep the SYSRTC running during a debug halt.
	Value	Mode	Description	
	0	DISABLE	SYSRTC is frozen in debug mode	
	1	ENABLE	SYSRTC is running in debug mode	

### 15.5.5 SYSRTC\_CMD - Command Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	0x0
<b>Access</b>																															W(nB)	W(nB)
<b>Name</b>																															STOP	START

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	STOP Write a 1 to stop the SYSRTC	0x0	W(nB)	<b>Stop SYSRTC</b>
0	START Write a 1 to start the SYSRTC	0x0	W(nB)	<b>Start SYSRTC</b>

### 15.5.6 SYSRTC\_STATUS - Status Register

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	0x0
<b>Access</b>																															R	R
<b>Name</b>																															LOCKSTATUS	RUNNING

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	LOCKSTATUS Indicates the current status of SYSRTC Lock	0x0	R	<b>Lock Status</b>
	Value	Mode		Description
	0	UNLOCKED		SYSRTC registers are unlocked
	1	LOCKED		SYSRTC registers are locked
0	RUNNING Indicates the current status of SYSRTC running	0x0	R	<b>SYSRTC running status</b>

## 15.5.7 SYSRTC\_CNT - Counter Value Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	RW																															
<b>Name</b>	CNT																															

Bit	Name	Reset	Access	Description
31:0	CNT	0x0	RW	<b>Counter Value</b> Gives access to the counter value of the SYSRTC.

## 15.5.8 SYSRTC\_SYNCBUSY - Synchronization Busy Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																												0x0	0x0	0x0		
<b>Access</b>																												R	R	R		
<b>Name</b>																												CNT	STOP	START		

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	CNT	0x0	R	<b>Sync busy for CNT bitfield</b> Last writing of CNT is synchronizing to LF clock
1	STOP	0x0	R	<b>Sync busy for STOP bitfield</b> Last writing of STOP is synchronizing to LF clock
0	START	0x0	R	<b>Sync busy for START bitfield</b> Last writing of START is synchronizing to LF clock

## 15.5.9 SYSRTC\_LOCK - Configuration Lock Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	W															
<b>Name</b>																	LOCKKEY															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	LOCKKEY	0x0	W	<b>Configuration Lock Key</b> Write any other value than the unlock code to lock EN, SWRST, CFG, CMD, CNT registers from editing. Write the unlock code to unlock.
	Value	Mode	Description	
	18294	UNLOCK	Write to unlock SYSRTC lockable registers	

## 15.5.10 SYSRTC\_GRP0\_IF - Group Interrupt Flags

Offset	Bit Position																															
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0	0x0	0x0	0x0
<b>Access</b>																													RW	RW	RW	RW
<b>Name</b>																													CAP0	CMP1	CMP0	OVF

Bit	Name	Reset	Access	Description
31:4	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
3	CAP0	0x0	RW	<b>Capture 0 Interrupt Flag</b> This bit is set when CAP0VALUE is updated
2	CMP1	0x0	RW	<b>Compare 1 Interrupt Flag</b> This bit is set when counter matches COMP1VALUE
1	CMP0	0x0	RW	<b>Compare 0 Interrupt Flag</b> This bit is set when counter matches COMP0VALUE
0	OVF	0x0	RW	<b>Overflow Interrupt Flag</b> This bit is set when counter overflows

## 15.5.11 SYSRTC\_GRP0\_IEN - Group Interrupt Enables

Offset	Bit Position																															
0x044	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0	0x0	0x0		
<b>Access</b>																											RW	RW	RW	RW		
<b>Name</b>																											CAP0	CMP1	CMP0	OVF		

Bit	Name	Reset	Access	Description
31:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
3	CAP0 Enable CAP0 interrupt	0x0	RW	<b>Capture 0 Interrupt Enable</b>
2	CMP1 Enable CMP1 interrupt	0x0	RW	<b>Compare 1 Interrupt Enable</b>
1	CMP0 Enable CMP0 interrupt	0x0	RW	<b>Compare 0 Interrupt Enable</b>
0	OVF Enable OVF interrupt	0x0	RW	<b>Overflow Interrupt Enable</b>

### 15.5.12 SYSRTC\_GRP0\_CTRL - Group Control Register

Offset	Bit Position																															
0x048	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>												0x0		0x0		0x0		0x0		0x0		0x0		0x0		0x0						
<b>Access</b>												RW		RW		RW		RW		RW		RW		RW								
<b>Name</b>												CAP0EDGE		CMP1CMOA		CMP0CMOA		CAP0EN		CMP1EN		CMP0EN										

Bit	Name	Reset	Access	Description
31:11	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
10:9	CAP0EDGE	0x0	RW	<b>Capture 0 Edge Select</b> Select edge detection for Capture 0
	Value	Mode		Description
	0	RISING		Rising edges detected
	1	FALLING		Falling edges detected
	2	BOTH		Both edges detected

## 16. BURTC - Back-Up Real Time Counter

### Quick Facts

#### What?

The BURTC is a 32 bit counter which operates on a low frequency oscillator, and is capable of running in all Energy Modes.

#### Why?

It can provide periodic Wakeup events and PRS signals which can be used to wake up peripherals from any energy mode.

The availability of the BURTC in EM4, where most of the device is powered down, makes it ideal for keeping track of time in EM4.

#### How?

The BURTC provides a very wide range of periods for the interrupts facilitating flexible ultra-low energy operation.

### 16.1 Introduction

The Back-Up Real Time Counter (BURTC) is a 32-bit counter which operates on a low frequency oscillator, and is capable of running in all Energy Modes. It can provide periodic Wakeup events and PRS signals which can be used to wake up peripherals from any energy mode. The BURTC provides a very wide range of periods for the interrupts facilitating flexible ultra-low energy operation. The availability of the BURTC in EM4, where most of the device is powered down, makes it ideal for keeping track of time in EM4. A single compare channel is available which can be used to trigger an interrupt and/or wake the device up from a low energy mode.

### 16.2 Features

A low frequency oscillator is used as clock signal and the BURTC with one compare channel which can trigger wake-up, generate PRS signalling, or capture system events. 32-bit resolution and selectable prescaling allows the system to stay in low energy modes for long periods of time and still maintain reliable timekeeping.

- 32-bit Real Time Counter
- 15-bit pre-counter for flexible frequency scaling of main counter
- EM2/3/4 operation and wakeup
- Reset only by External Pin and Power-On Resets
- Interrupt/wake up event after deterministic intervals
- PRS Outputs
- Debug mode
  - Configurable to either run or stop when processor is stopped (break)

### 16.3 Functional Description

An overview of the BURTC module is shown in [Figure 16.1 BURTC Overview on page 453](#).

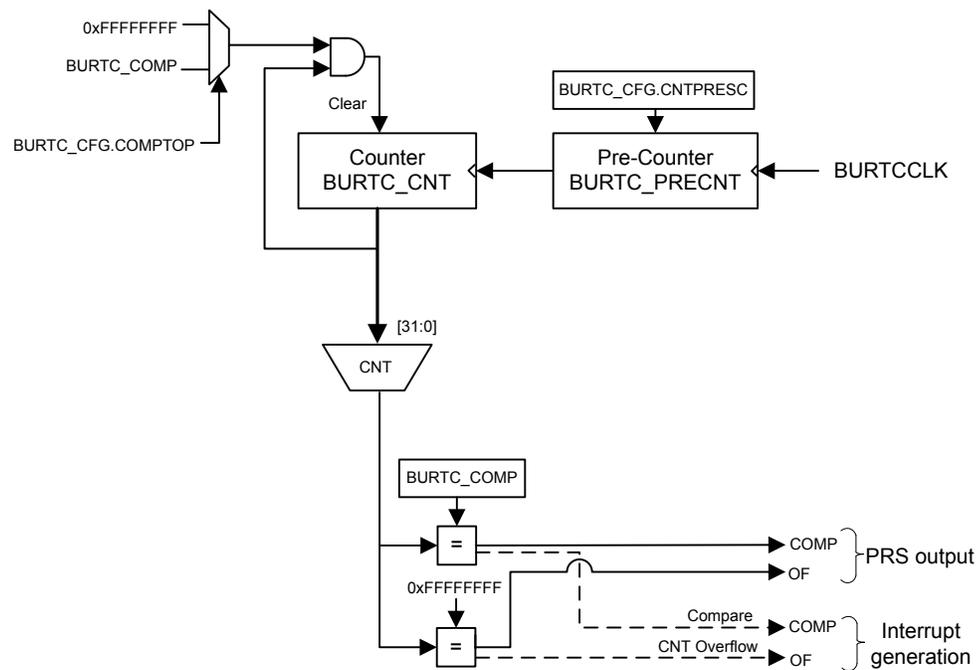

Figure 16.1. BURTC Overview

#### 16.3.1 Clock Selection

The BURTC source clock (BURTCCLK) can be selected to be the LFXO, LFRCO, or ULFRCO by configuring the CMU\_EM4GRPACLKCTRL.CLKSEL bitfield. Note that in EM3, only ULFRCO is a valid source clock.

#### 16.3.2 Configuration

To configure and use the BURTC properly, the following programming sequence must be followed:

1. Configure any desired options in the BURTC\_CFG register. Note that the BURTC\_CFG register can only be written when BURTC\_EN.EN = 0 - a bus fault will occur if writing BURTC\_CFG register while BURTC\_EN.EN = 1.
2. Set BURTC\_EN.EN = 1.
3. Set BURTC\_CMD.START = 1 to start the BURTC counter.

**Note:** All low frequency synchronization registers can only be programmed after EN is set to 1. The BURTC counter will only start to count once START command is issued. For HV Sync registers (e.g., BURTC\_CMD), the first bitfield write will occur without issue. However, on subsequent bitfield writes to HV Sync registers, the firmware needs to poll the corresponding bit in BURTC\_SYNCBUSY before programming the same bitfield once again.

To stop the BURTC, set BURTC\_CMD.STOP = 1

#### 16.3.3 Debug Features and Description

By default, the BURTC is halted when code execution is halted from the debugger. By setting the DEBUGRUN bit in the BURTC\_CFG register, the BURTC will continue to run even when the debugger has halted the system.

### 16.3.4 Counter

The BURTC consists of two counters: the 32-bit main counter, BURTC\_CNT, and a 15-bit pre-counter, BURTC\_PRECNT. The pre-counter is a free running counter clocked by low frequency clock, used to generate a specific frequency for the main counter. The pre-counter will be counting only when the BURTC\_CFG.CNTPRESC value is set greater than 0.

The BURTC peripheral clock is requested by setting the EN bit in BURTC\_EN. Then the BURTC counters can be started by setting the command register START in BURTC\_CMD. When BURTC\_CMD.START has been initiated and BURTC\_CFG.CNTPRESC > 0, the pre-counter (BURTC\_PRECNT) increments upon each positive clock edge of the BURTCCLK, wrapping around to zero when it overflows.

The main counter can be accessed in BURTC\_CNT register, and counts at frequency determined by the CNTPRESC bitfiled in BURTC\_CFG. Setting CNTPRESC to 0 gives the maximum resolution, with the main counter clocked at the same frequency as the BURTCCLK. When CNTPRESC > 0, the main counter increments upon each tick given from the pre-counter, allowing the main counter ticks to be power-of-2 divisions of the BURTCCLK.

The [Table 16.1 BURTC Resolution vs Overflow,  \$F\_{BURTCCLK} = 32768\$  Hz on page 454](#) table below shows the BURTC Resolution vs Overflow Time when using a 32768 Hz oscillator as the source clock of BURTC.

**Table 16.1. BURTC Resolution vs Overflow,  $F_{BURTCCLK} = 32768$  Hz**

BURTC_CFG.CNTPRESC	Main counter period, $T_{CNT}$	Overflow Time
DIV1	30.5 $\mu$ s	36.4 hours
DIV2	61 $\mu$ s	72.8 hours
DIV4	122 $\mu$ s	145.6 hours
DIV8	244 $\mu$ s	12 days
DIV16	488 $\mu$ s	24 days
DIV32	977 $\mu$ s	48 days
DIV64	1.95 ms	97 days
DIV128	3.91 ms	194 days
DIV256	7.81 ms	388 days
DIV512	15.6 ms	776 days
DIV1024	31.25 ms	4.2 years
DIV2048	62.5 ms	8.5 years
DIV4096	0.125 s	17 years
DIV8192	0.25 s	34 years
DIV16384	0.5 s	68 years
DIV32768	1 s	136 years

By default, the counter will keep counting until it reaches the top value, 0xFFFFFFFF, and then it wrap around and continue counting from zero. If COMPTOP in BURTC\_CFG is set, the main counter will wrap to 0 on a Compare value match (i.e., BURTC\_CNT = BURTC\_COMP). If using the Compare value match, make sure to set COMPTOP prior to or at the same time the BURTC is enabled. Setting COMPTOP after enabling the BURTC will result in a bus fault error.

The counters of the BURTC, BURTC\_CNT and BURTC\_PRECNT, can at any time be written by software, as long as the registers are not locked using BURTC\_LOCKKEY. All BURTC control registers with Sync Type HV uses the 2 FF synchronization scheme.

**Note:** Writing to the BURTC\_PRECNT register may alter the frequency of the ticks for the BURTC\_CNT register.

### 16.3.5 Compare Channel

A single compare channel is available in the BURTC. The compare value is set in BURTC\_COMP register. If BURTC\_CFG.COMPTOP is set, the main counter will clear to 0 when it matches the value set in BURTC\_COMP.

### 16.3.6 Interrupts

The BURTC has two interrupts: one for counter overflow and another for the compare match event. Individual interrupts are enabled by BURTC\_IEN register bits, and the respective bits can be used as EM2 wakeup. BURTC\_EM4WUEN enables the wakeup enable from EM4 for those events.

### 16.3.7 Register Lock

To prevent accidental writes to the BURTC registers, the BURTC\_LOCK register can be written to any other value than the unlock value. To unlock the register, write the unlock value to BURTC\_LOCKKEY. Registers affected by this lock are:

- BURTC\_CFG
- BURTC\_EN
- BURTC\_CMD
- BURTC\_PRECNT
- BURTC\_CNT
- BURTC\_COMP
- BURTC\_IEN

## 16.4 BURTC Register Map

<b>Access</b>																													R	R		
<b>Name</b>																													LOCK	RUNNING		

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	LOCK	0x0	R	<b>Configuration Lock Status</b> Indicates the current status of BURTC Lock
	Value	Mode		Description
	0	UNLOCKED		All BURTC lockable registers are unlocked.
	1	LOCKED		All BURTC lockable registers are locked.
0	RUNNING	0x0	R	<b>BURTC running status</b> Indicates the current status of BURTC running

## 16.5.6 BURTC\_IF - Interrupt Flag Register

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0	0x0		
<b>Access</b>																													RW	RW		
<b>Name</b>																													COMP	OF		

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	COMP	0x0	RW	<b>Compare Match Interrupt Flag</b> Set on a compare match between CNT and COMP.
0	OF	0x0	RW	<b>Overflow Interrupt Flag</b> Set on a CNT value overflow.

## 16.5.7 BURTC\_IEN - Interrupt Enable Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0	0x0		
<b>Access</b>																													RW	RW		
<b>Name</b>																													COMP	OF		

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	COMP	0x0	RW	<b>Compare Match Interrupt Flag</b> Set to enable the COMPIF Interrupt
0	OF	0x0	RW	<b>Overflow Interrupt Flag</b> Set to enable the OFIF Interrupt

## 16.5.8 BURTC\_PRECNT - Pre-Counter Value Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>															0x0																	
<b>Access</b>															RW																	
<b>Name</b>															PRECNT																	

Bit	Name	Reset	Access	Description
31:15	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
14:0	PRECNT	0x0	RW	<b>Pre-Counter Value</b> Gives access to the Pre-counter value of the BURTC.

## 16.5.9 BURTC\_CNT - Counter Value Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	
<b>Access</b>																															RW	
<b>Name</b>																															CNT	

Bit	Name	Reset	Access	Description
31:0	CNT	0x0	RW	<b>Counter Value</b> Gives access to the counter value of the BURTC.

## 16.5.10 BURTC\_EM4WUEN - EM4 Wakeup Request Enable Register

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Name</b>																																	COMP

Bit	Name	Reset	Access	Description
31:0	COMP	0x0	RW	<b>Compare Value</b> A compare match event occurs when CNT is equal to this value. This event sets the COMP interrupt flag. It is also available as a PRS signal.

## 17. BURAM - Backup RAM

### Quick Facts

#### What?

The BURAM is a dedicated 128-byte low-power RAM that is retained in EM4.

#### Why?

Most of the system, including the RAM, is powered off at EM4 entry to minimize current draw. The purpose of the BURAM is to retain critical data for use when the system wakes up.

#### How?

Because it is separate from the main system RAM, the BURAM has a dedicated power supply that is not shutdown when the system enters EM4.

### 17.1 Introduction

The Back-Up RAM (BURAM) is a dedicated 128-byte RAM that remains powered when the system enters EM4. Upon exit from EM4, the data retained in the BURAM can be accessed by the application software.

### 17.2 Functional Description

The BURAM consists of 32 x 32-bit registers, which are retained in all energy modes, including EM4. Each word in the BURAM is accessible through the corresponding 32 RETx\_REG register. Note that each RETx\_REG register has an undefined state out of reset.

### 17.3 BURAM Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	<a href="#">BURAM_RETx_REG</a>	RW	Retention Register
0x1000	<a href="#">BURAM_RETx_REG_SET</a>	RW	Retention Register
0x2000	<a href="#">BURAM_RETx_REG_CLR</a>	RW	Retention Register
0x3000	<a href="#">BURAM_RETx_REG_TGL</a>	RW	Retention Register

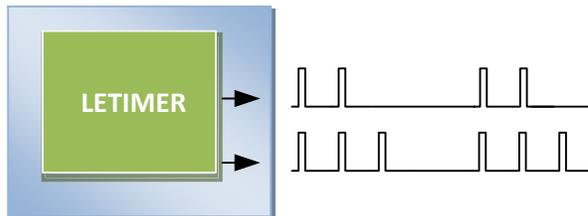

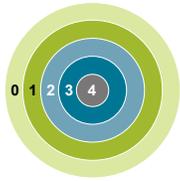

## 17.4 BURAM Register Description

### 17.4.1 BURAM\_RET<sub>x</sub>\_REG - Retention Register

Offset	Bit Position

<p>The RETREG registers are undefined out of reset. Any written RETREG values will be retained through any event other than a brownout or power-on reset.</p>				

## 18. LETIMER - Low Energy Timer

### Quick Facts

#### What?

The LETIMER is a down-counter that can keep track of time and output configurable waveforms. Running on a 32768 Hz clock, the LETIMER is available in EM0 Active, EM1 Sleep, EM2 DeepSleep, and EM3 Stop.

#### Why?

The LETIMER can be used to provide repeatable waveforms to external components while remaining in EM2 DeepSleep. It is well suited for applications such as metering systems or to provide more compare values than available in the SYSRTC.

#### How?

With buffered repeat and top value registers, the LETIMER can provide glitch-free waveforms at frequencies up to 16 kHz. It can be coupled with SYSRTC using PRS, allowing advanced time-keeping and wake-up functions in EM2 DeepSleep and EM3 Stop.

### 18.1 Introduction

The LETIMER is a down-counter that can keep track of time and output configurable waveforms with minimal software intervention. Running on a Low Frequency clock, the LETIMER is available in Energy Mode0, Energy Mode 1 and optionally available in Energy Mode 2 and Energy Mode 3. Because of this, it can be used for timing and output generation when most of the device is powered down, allowing simple tasks to be performed while the power consumption of the system is kept at an absolute minimum. It is well suited for applications such as metering systems or to provide more compare values than available in the SYSRTC. With buffered repeat and top value registers, the LETIMER can provide glitch-free waveforms at frequencies up to 16 kHz. It can be coupled with other peripherals using PRS, allowing advanced time-keeping and wake-up functions.

### 18.2 Features

#### High-level features

- 24-bit Down counter
- 8-bit prescaler
- 2 Compare match registers
- TOP register can be Timer top value
- TOP register can be double buffered using TOPBUFF register
- Double buffered 8-bit Repeat Register
- Timer Start/Stop/Clear trigger can be from PRS or Software
- Configurable 2 Output pins - Toggle/Pulse/PWM
- Interrupt - Compare match/Timer underflow/Repeat done
- Optionally runs during debug
- 2 output pins can optionally be configured to provide different waveforms on timer underflow:
  - Toggle output pin
  - Pulse output with width of One Prescaled clock period
  - PWM
- 2 PRS Output

### 18.3 Functional Description

An overview of the LETIMER module is shown in [Figure 18.1 LETIMER Overview on page 469](#). The LETIMER is a 24-bit down-counter with two compare registers, LETIMERn\_COMP0 and LETIMERn\_COMP1. The LETIMERn\_TOP register can optionally act as a top value for the counter. The repeat counter LETIMERn\_REP0 allows the timer to count a specified number of times before it stops. Both the LETIMERn\_TOP and LETIMERn\_REP0 registers can be double buffered by the LETIMERn\_TOPBUFF and LETIMERn\_REP1 registers to allow continuous operation. The timer can generate a single pin output, or two linked outputs.

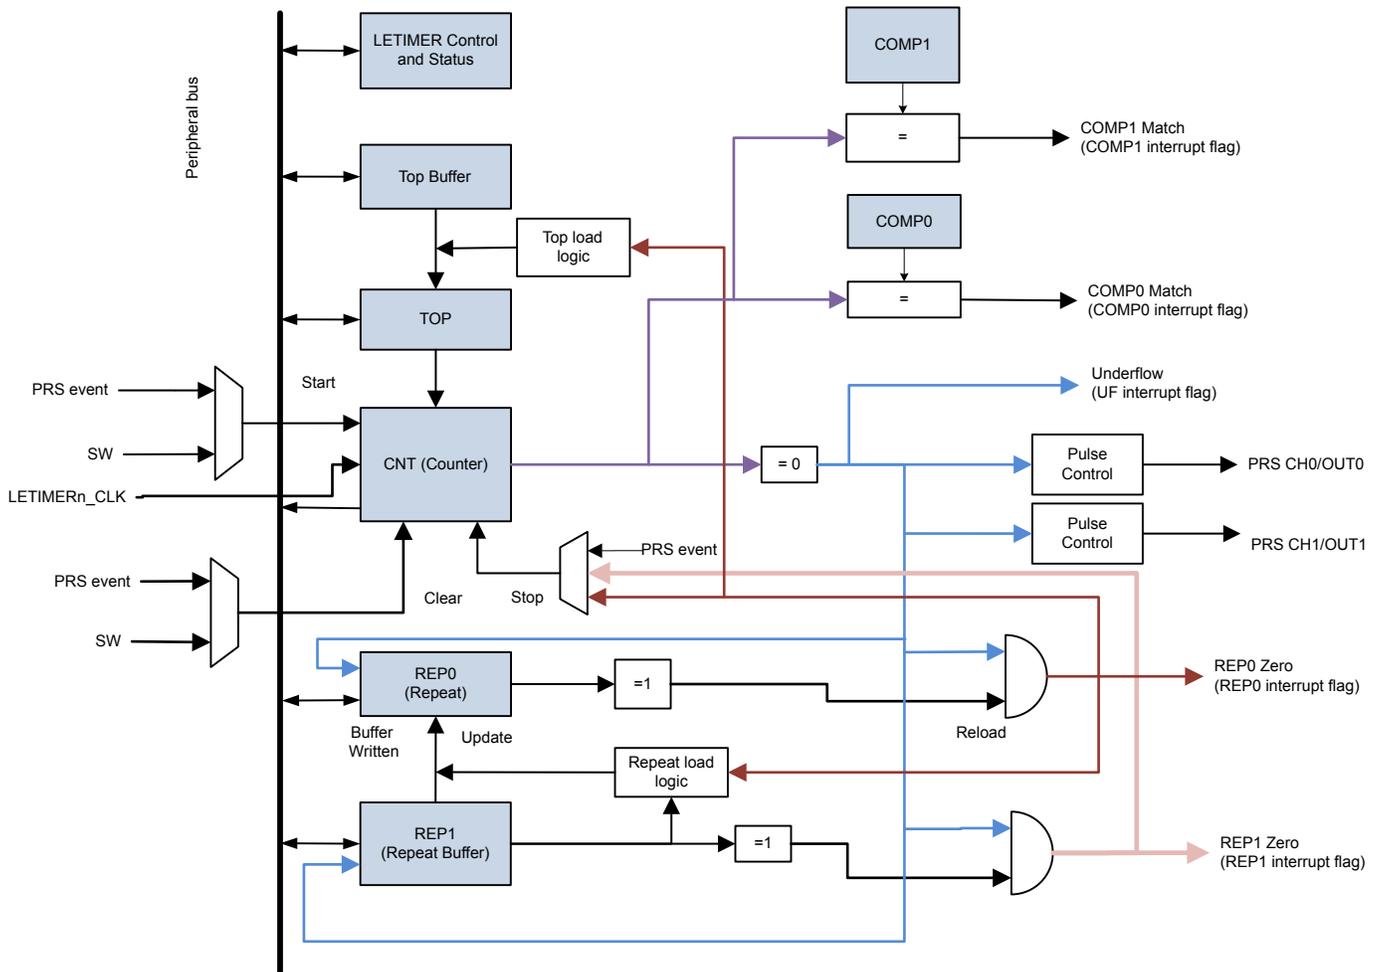

Figure 18.1. LETIMER Overview

### 18.3.1 Internal Overview

#### Timer

The timer value can be read using the LETIMERn\_CNT register. The value can be written, and it can also be cleared by setting the CLEAR command bit in LETIMERn\_CMD. If the CLEAR and START commands are issued at the same time, the timer will be cleared, then start counting at the top value.

#### Compare Registers

- The LETIMER has two compare match registers, LETIMERn\_COMP0 and LETIMERn\_COMP1. Each of these compare registers are capable of generating an interrupt when the counter value LETIMERn\_CNT is equal to their value. When LETIMERn\_CNT is equal to the value of LETIMERn\_COMP0, the interrupt flag COMP0 in LETIMERn\_IF is set, and when LETIMERn\_CNT is equal to the value of LETIMERn\_COMP1, the interrupt flag COMP1 in LETIMERn\_IF is set.

#### • Top Value

If CNTTOPEN in LETIMERn\_CTRL is set, the value of LETIMERn\_TOP acts as the top value of the timer, and LETIMERn\_TOP is loaded into LETIMERn\_CNT on timer underflow. If CNTTOPEN is cleared to 0, the timer wraps around to 0xFFFFFFFF. The underflow interrupt flag UF in LETIMERn\_IF is set when the timer reaches zero.

#### • Repeat Modes

By default, the timer wraps around to the top value or 0xFFFFFFFF on each underflow, and continues counting. The repeat counters can be used to get more control of the operation of the timer, including defining the number of times the counter should wrap around. Four different repeat modes are available, see [Table 18.1 LETIMER Repeat Modes on page 470](#).

**Table 18.1. LETIMER Repeat Modes**

REPMODE	Mode	Description
0b00	Free-running	The timer runs until it is stopped.
0b01	One-shot	The timer runs as long as LETIMERn_REP0 != 0. LETIMERn_REP0 is decremented at each timer underflow.
0b10	Buffered	The timer runs as long as LETIMERn_REP0 != 0. LETIMERn_REP0 is decremented on each timer underflow. If LETIMERn_REP1 has been written with Non zero value, then it is loaded into LETIMERn_REP0 when LETIMERn_REP0 is about to be decremented to 0 and Timer continue counting with new LETIMERn_REP0.
0b11	Double	The timer runs as long as LETIMERn_REP0 != 0 or LETIMERn_REP1 != 0. Both LETIMERn_REP0 and LETIMERn_REP1 are decremented at each timer underflow.

The interrupt flags REP0 and REP1 in LETIMERn\_IF are set whenever LETIMERn\_REP0 or LETIMERn\_REP1 are decremented to 0 respectively. REP0 is also set when the value of LETIMERn\_REP1 is loaded into LETIMERn\_REP0 in buffered mode.

Write operations to LETIMERn\_REP0 have priority over buffer loads from LETIMERn\_REP1.

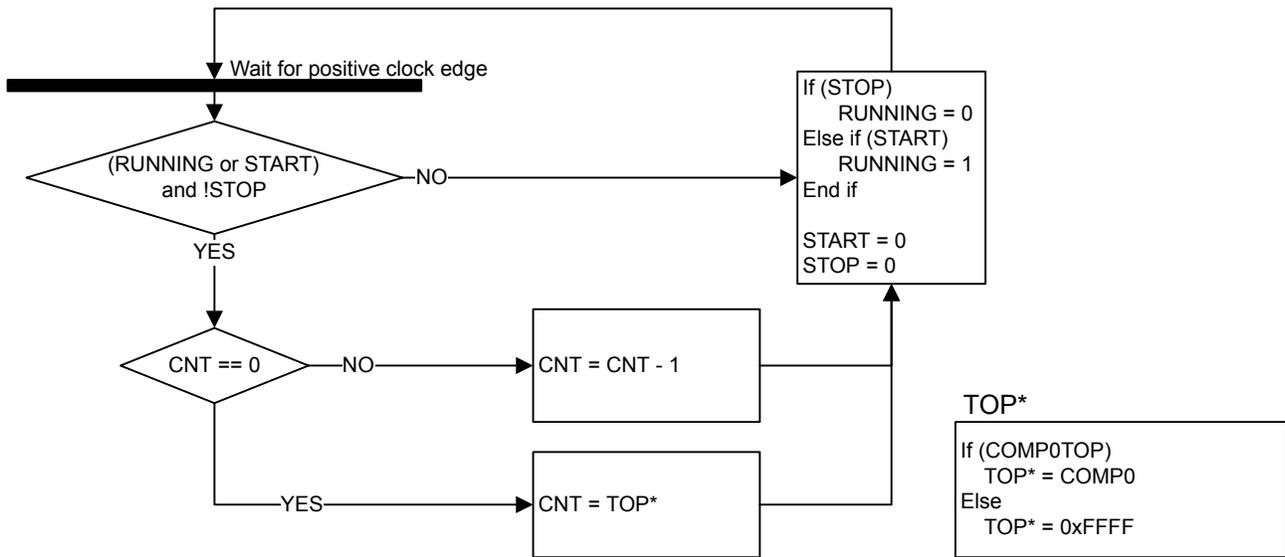

#### • Buffered Top Value

In Buffered Mode, If BUFTOP in LETIMERn\_CTRL is set, the value of LETIMERn\_TOP is buffered by LETIMERn\_TOPBUFF. In this mode, the value of LETIMERn\_TOPBUFF is loaded into LETIMERn\_TOP every time LETIMERn\_REP0 is about to decrement to 0. This can be used to generate continually changing output waveforms.

Write operations to LETIMERn\_TOP have priority over buffer loads from LETIMERn\_\_TOPBUFF.

### 18.3.2 Free Running Mode

In free-running mode, the LETIMER acts as a regular timer and the repeat operation is disabled. When started, the timer runs until it is stopped using the STOP command bit in LETIMERn\_CMD/PRS. A state machine for this mode is shown in [Figure 18.2 LETIMER State Machine for Free-running Mode on page 471](#) .

**Figure 18.2. LETIMER State Machine for Free-running Mode**

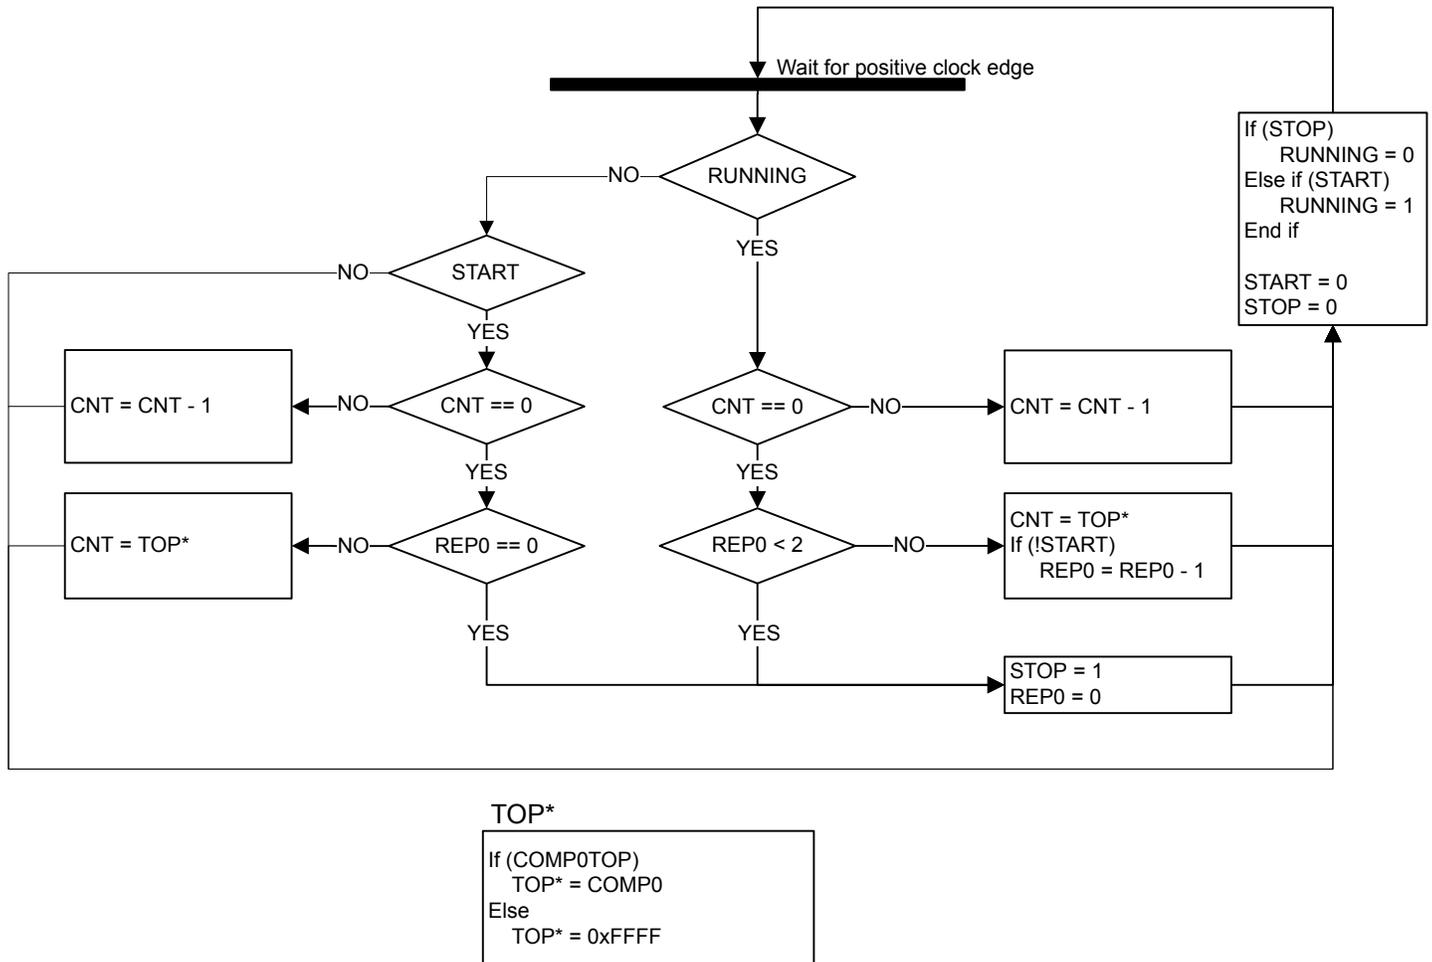

Note that the CLEAR command bit in LETIMERn\_CMD always has priority over Decrement and Load TOP to LETIMERn\_CNT. When the clear command is used, LETIMERn\_CNT is set to 0 and an underflow event will not be generated when LETIMERn\_CNT wraps around to the top value or 0xFFFFF. Since no underflow event is generated, no output action is performed. LETIMERn\_REP0, LETIMERn\_REP1, LETIMERn\_COMP0 and LETIMERn\_COMP1 are also left untouched.

### 18.3.3 One-shot Mode

The one-shot repeat mode is the most basic repeat mode. In this mode, the repeat register LETIMERn\_REP0 is decremented every time the timer underflows, and the timer stops when LETIMERn\_REP0 goes from 1 to 0. In this mode, the timer counts down LETIMERn\_REP0 times, i.e. the timer underflows LETIMERn\_REP0 times.

**Note:** Note that write operations to LETIMERn\_REP0 have priority over the timer decrement event. If LETIMERn\_REP0 is assigned a new value in the same cycle as a timer decrement event occurs, the timer decrement will not occur and the new value is assigned.

LETIMERn\_REP0 can be written while the timer is running to allow the timer to run for longer periods at a time without stopping. Write to LETIMERn\_REP0 should be done after checking SYNC busy status [Figure 18.3 LETIMER One-shot Repeat State Machine on page 472](#).

**Figure 18.3. LETIMER One-shot Repeat State Machine**

### 18.3.4 Buffered Mode

The Buffered repeat mode allows buffered timer operation. When started, the timer runs LETIMERN\_REP0 number of times. If LETIMERN\_REP1 has been written since the last time it was used and if it is nonzero, LETIMERN\_REP1 is then loaded into LETIMERN\_REP0, and counting continues the new number of times. The timer keeps going as long as LETIMERN\_REP1 is updated with a nonzero value before LETIMERN\_REP0 is finished counting down. The timer top value (LETIMERN\_TOP) may also optionally be buffered using Top buff value (LETIMERN\_TOPBUFF) by setting BUFTOP in LETIMERN\_CTRL.

If the timer is started when both LETIMERN\_CNT and LETIMERN\_REP0 are zero but LETIMERN\_REP1 is non-zero, LETIMERN\_REP1 is loaded into LETIMERN\_REP0, and the counter counts the loaded number of times.

Used in conjunction with a buffered top value, both the top and repeat values of the timer may be buffered, and the timer can for instance be set to run 4 times with period 7 (top value 6), 6 times with period 200, then 3 times with period 50.

A state machine for the buffered repeat mode is shown in [Figure 18.4 LETIMER Buffered Repeat State Machine on page 473](#). REP1<sub>USED</sub> shown in the state machine is an internal variable that keeps track of whether the value in LETIMERN\_REP1 has been loaded into LETIMERN\_REP0 or not. The purpose of this is that a value written to LETIMERN\_REP1 should only be counted once. REP1<sub>USED</sub> is cleared whenever LETIMERN\_REP1 is used.

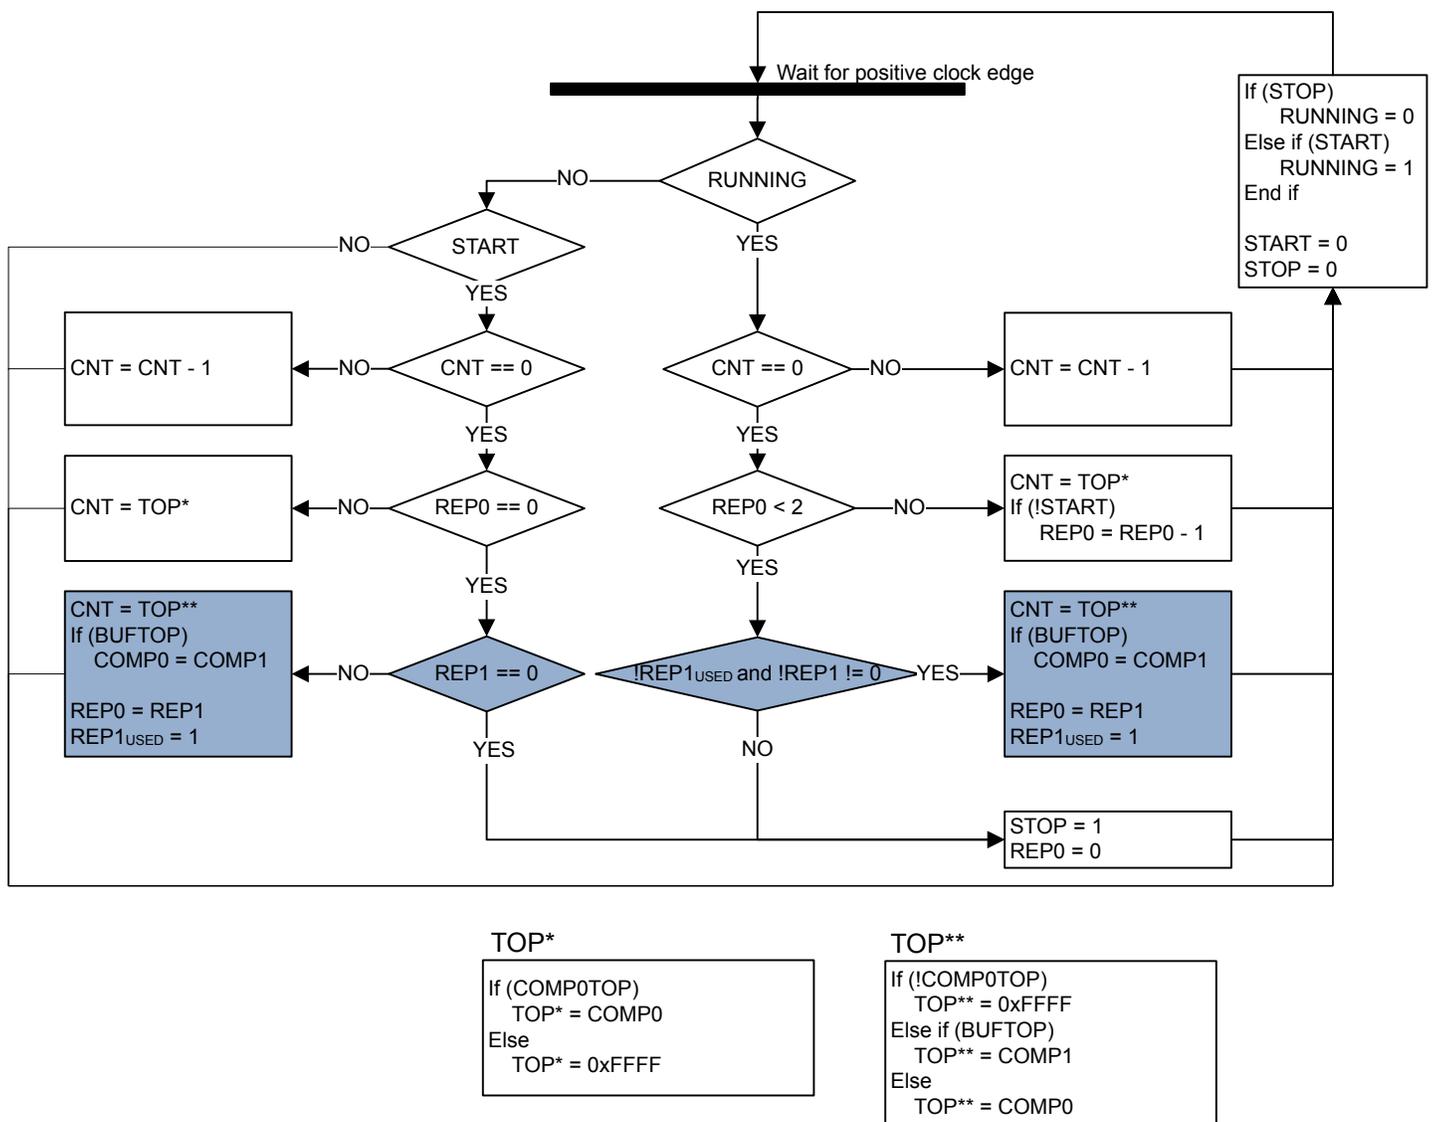

Figure 18.4. LETIMER Buffered Repeat State Machine

### 18.3.5 Double Mode

The Double repeat mode works much like the one-shot repeat mode. The difference is that, where the one-shot mode counts as long as LETIMERN\_REP0 is larger than 0, the double mode counts as long as either LETIMERN\_REP0 or LETIMERN\_REP1 is larger than 0. As an example, say LETIMERN\_REP0 is 3 and LETIMERN\_REP1 is 10 when the timer is started. If no further interaction is done with the timer, LETIMERN\_REP0 will now be decremented 3 times, and LETIMERN\_REP1 will be decremented 10 times. The timer counts a total of 10 times, and LETIMERN\_REP0 is 0 after the first three timer underflows and stays at 0. LETIMERN\_REP0 and LETIMERN\_REP1 can be written at any time. After a write to either of these, the timer is guaranteed to underflow at least the written number of times if the timer is running. Use the Double repeat mode to generate output on both the LETIMER outputs at the same time. The state machine for this repeat mode can be seen in [Figure 18.5 LETIMER Double Repeat State Machine on page 474](#).

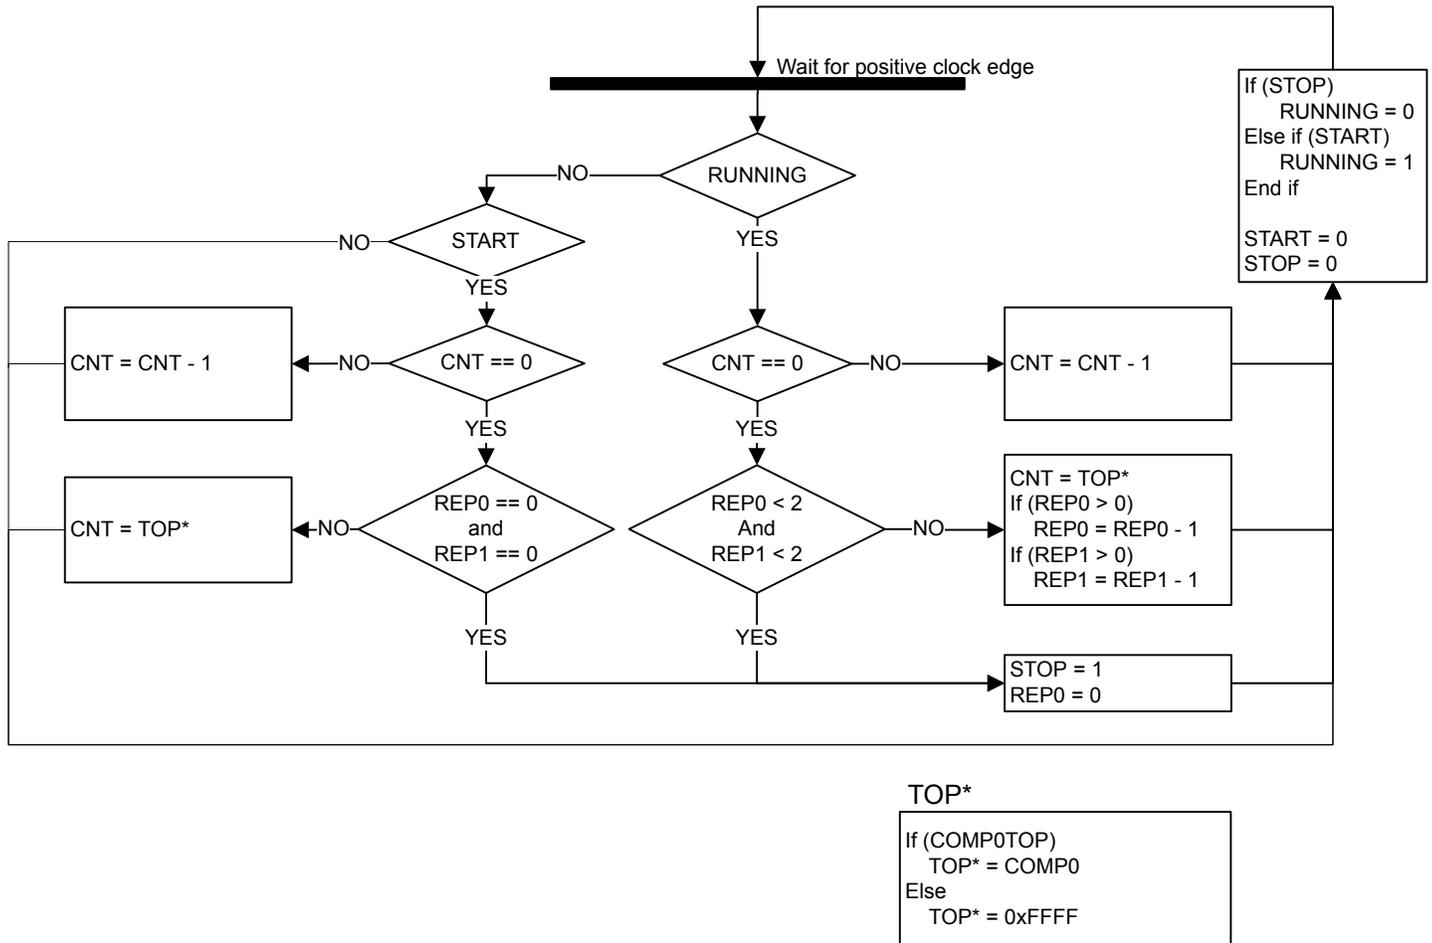

Figure 18.5. LETIMER Double Repeat State Machine

## 18.4 Clock Frequency

The LETIMER clock source is derived from EM23GRPACLK, which is selected in the Clock Management Unit (CMU), and is typically configured to have a frequency of 32 kHz in EM0/1/2 and 1 kHz in EM3. The LETIMER clock prescaler is defined by LETIMERn\_CTRL->CNTPRESC.

The LETIMER Prescaled clock frequency is given by [Figure 18.6 LETIMER Clock Frequency on page 475](#).

EM0/1/2 - Clocked by LFRCO

$$f_{\text{LETIMERn\_CLK}} = 32768/2^{\text{CNTPRESC}}$$

EM3 - Clocked by ULFRCO

$$f_{\text{LETIMERn\_CLK}} = 1024/2^{\text{CNTPRESC}}$$

**Figure 18.6. LETIMER Clock Frequency**

The exponent CNTPRESC is a 4 bit value in the LETIMERn\_CTRL->CNTPRESC register bits.

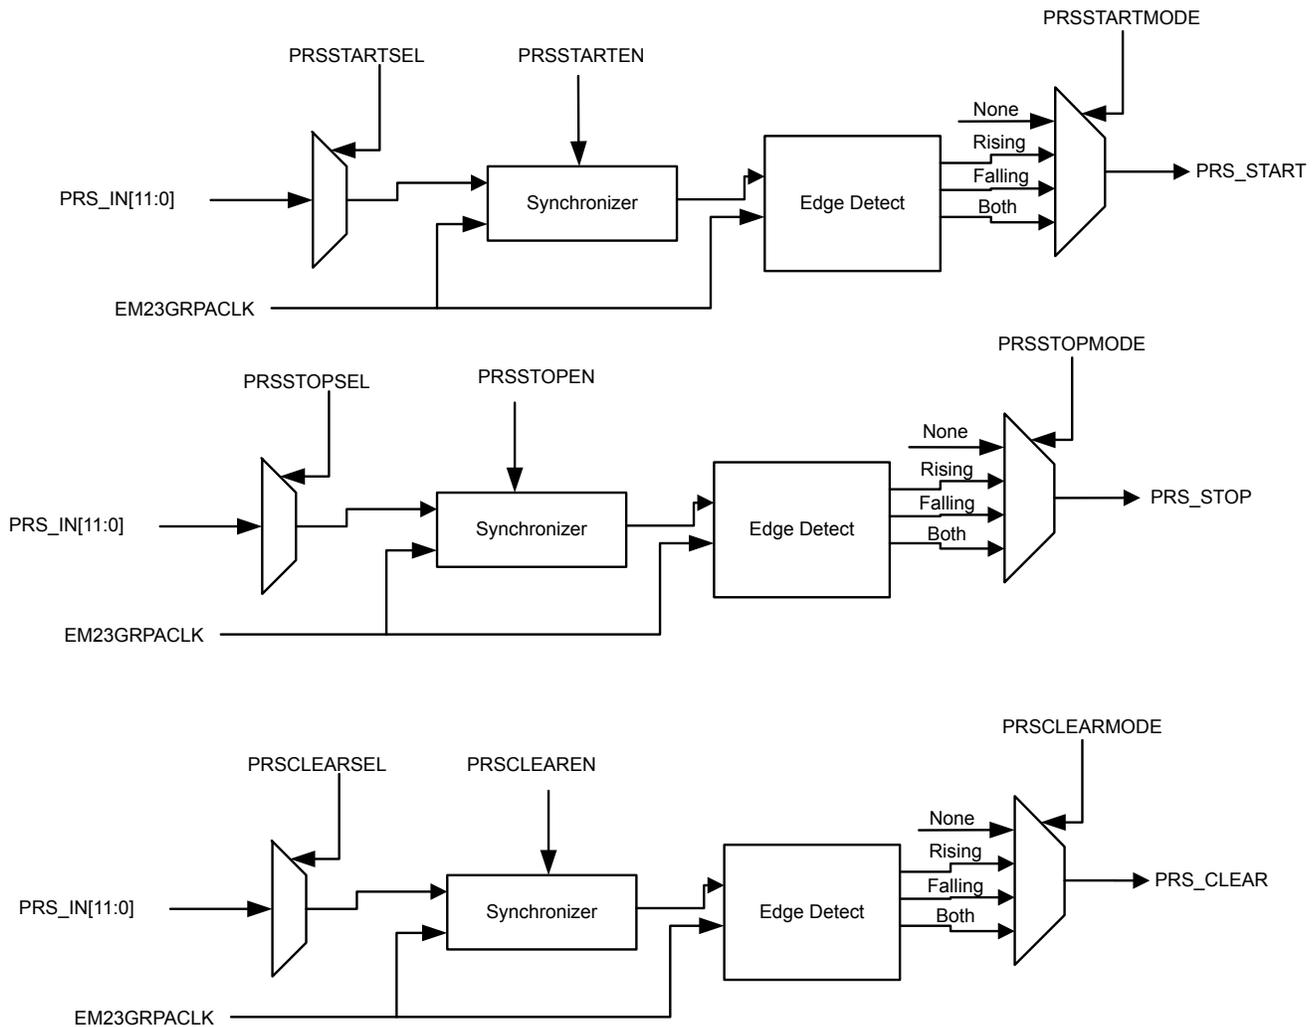

To use this module, the LETIMERn\_CLK must be enabled by writing 1 to LETIMERn\_EN->EN.

## 18.5 PRS Input Triggers

The LETIMER can be configured to start, stop, and/or clear based on PRS inputs. The diagram showing the functions of the PRS input triggers is shown in [Figure 18.7 LETIMER PRS input triggers. on page 476](#).

There are 3 PRS inputs to the LETIMER, allowing the LETIMER to be started, stopped, or cleared based on the PRS inputs. The PRSSTARTMODE, PRSSTOPMODE, and PRSCLEARMODE bitfields in LETIMERn->PRSMODE select which edge or edge(s) will trigger the start, stop, and/or clear action.

The PRS channel inputs can be configured in the PRS\_CONSUMER\_LETIMERn\_CLEAR, PRS\_CONSUMER\_LETIMERn\_START, and PRS\_CONSUMER\_LETIMERn\_STOP registers in the PRS module.

**Figure 18.7. LETIMER PRS input triggers.**

## 18.6 Debug

If DEBUGRUN in LETIMERn\_CTRL is cleared, the LETIMER automatically stops counting when the CPU is halted during a debug session, and resumes operation when the CPU continues. Because of synchronization, the LETIMER is halted two clock cycles after the CPU is halted, and continues running two clock cycles after the CPU continues. RUNNING in LETIMERn\_STATUS is not cleared when the LETIMER stops because of a debug-session.

Set DEBUGRUN in LETIMERn\_CTRL to allow the LETIMER to continue counting even when the CPU is halted in debug mode.

## 18.7 Output Action

For each of the Outputs, an output action can be set.

The output actions can be set by configuring UFOA0 and UFOA1 in LETIMERN\_CTRL. UFOA0 defines the action on output 0, while UFOA1 defines the action on output 1. The possible actions are defined in [Table 18.2 LETIMER Underflow Output Actions on page 477](#).

**Table 18.2. LETIMER Underflow Output Actions**

UFOA0/UFOA1	Mode	Description
0b00	Idle	The output is held at its idle value
0b01	Toggle	The output is toggled on LETIMERN_CNT underflow
0b10	Pulse	The output is held active for one LF clock cycle on LETIMERN_CNT underflow It then returns to its idle value
0b11	PWM	The output is set idle on LETIMERN_CNT underflow and active on compare match with LETIMERN_COMP0/1.

**Note:** For the Pulse output Disabling LETIMER, Clearing Output while pulse output is generated can affect the pulse width.

**Note:** For Double mode, OUT0/1 generation is enabled when LETIMERN\_REP0/1 != 0 respectively.

The polarity of the outputs can be set individually by configuring OPOL0 and OPOL1 in LETIMERN\_CTRL. When these are cleared, their respective outputs have a low idle value and a high active value. When they are set, the idle value is high, and the active value is low. It is recommended to Clear outputs after changing polarity to makesure outputs take their default value.

When using the toggle action, the outputs can be driven to their idle values by setting their respective CTO0/CTO1 command bits in LETIMERN\_CTRL. This can be used to put the output in a well-defined state before beginning to generate toggle output, which may be important in some applications. The command bit can also be used while the timer is running.

## 18.8 PRS Output

The LETIMER outputs can be routed out onto the PRS system. LETn\_O0 can be routed to PRS channel 0, and LETn\_O1 can be routed to PRS channel 1. Enabling the PRS connection can be done by setting SOURCESEL to LETIMERx and SIGSEL to LETIMERxCHn in PRS\_CHx\_CTRL.

## 18.9 Interrupts

The interrupts generated by the LETIMER are combined into one interrupt vector. If the interrupt for the LETIMER is enabled, an interrupt will be made if one or more of the interrupt flags in LETIMERN\_IF and their corresponding bits in LETIMER\_IEN are set.

## 18.10 Using the LETIMER in EM3

The LETIMER can be enabled all the way down to EM3 by using the ULFRCO as clock source. This is done by setting CMU\_EM23GRPACLKCTRL.CLKSEL to ULFRCO before enabling the LETIMER block.

## 18.11 Register Access

This module is a Low Energy Peripheral, and supports immediate synchronization. For description regarding immediate synchronization, refer to [4.2.4.4 Peripheral Access Performance](#).

Since this module is a Low Energy Peripheral, and runs off a clock which is asynchronous to the APB register clock, special considerations must be taken when accessing registers.

## 18.12 Programmer's Model

Important Note : Before writing any LFSYNC register, the module must be enabled ( LETIMER\_EN->EN) and the LETIMER\_SYN-CBUSY register should be polled to ensure the SYNC busy of that particular register field is not high.

Write LETIMER Configuration into LETIMER\_CTRL Register

Enable clock to LETIMER module by setting LETIMER\_EN->EN = 1

If used, write compare values into LETIMER\_COMP0 and LETIMER\_COMP1

If used, write repeat values into LETIMER\_REP0 and LETIMER\_REP1

If used, write LETIMER\_TOP and LETIMER\_TOPBUFF

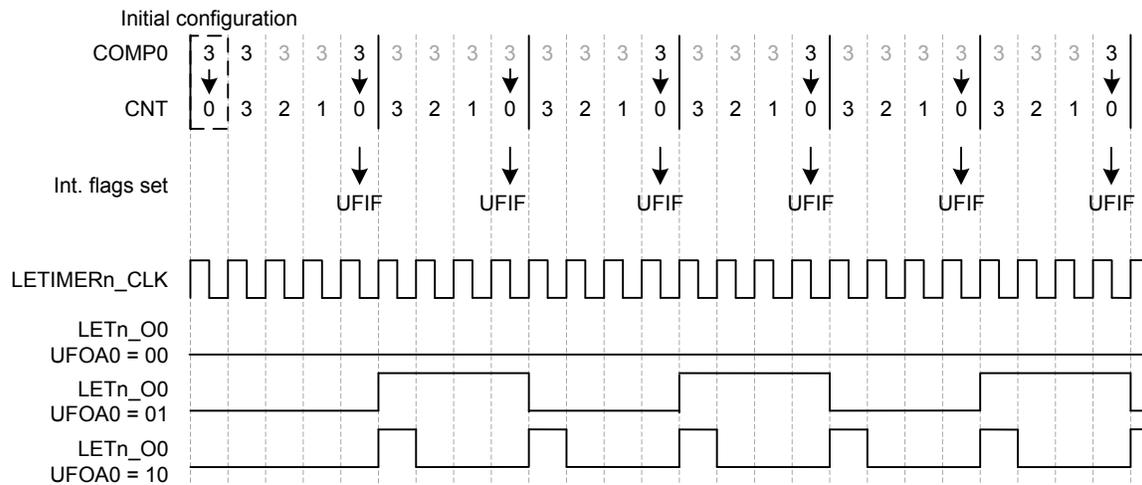

If PRS is used as a trigger, configure LETIMER\_PRSMODE accordingly

Enable Interrupts in LETIMER\_IEN

Write LETIMER\_CMD register to START Timer

### 18.12.1 Free Running Mode

LETIMER operation in Free running Mode with different output modes are shown in [Figure 18.8 LETIMER - Free Running Mode Waveform on page 478](#). In this example, REPMODE in LETIMERn\_CTRL is set to FREE, CNTTOPEN also in LETIMERn\_CTRL has been set and LETIMERn\_TOP has been written to 3. As seen in the figure, LETIMERn\_TOP now decides the length of the signal periods. For the toggle mode, the period of the output signal is  $2(\text{LETIMERn\_TOP} + 1)$ , and for the pulse modes, the periods of the output signals are  $\text{LETIMERn\_TOP} + 1$ . Note that the pulse outputs are delayed by one period relative to the toggle output. The pulses come at the end of their periods.

**Figure 18.8. LETIMER - Free Running Mode Waveform**

### 18.12.2 One Shot Mode

LETIMER operation in ONESHOT Mode with different output modes are shown in [Figure 18.9 LETIMER - One Shot Mode Waveform on page 479](#). In this example, REPMODE in LETIMERn\_CTRL is set to ONESHOT, CNTTOPEN also in LETIMERn\_CTRL has been set and LETIMERn\_TOP has been written to 3 and LETIMERn\_REP0 has been written to 3. The resulting behavior is pretty similar to that shown in Figure 6, but in this case, the timer stops after counting to zero LETIMERn\_REP0 times. By using LETIMERn\_REP0 the user has full control of the number of pulses/toggles generated on the output.

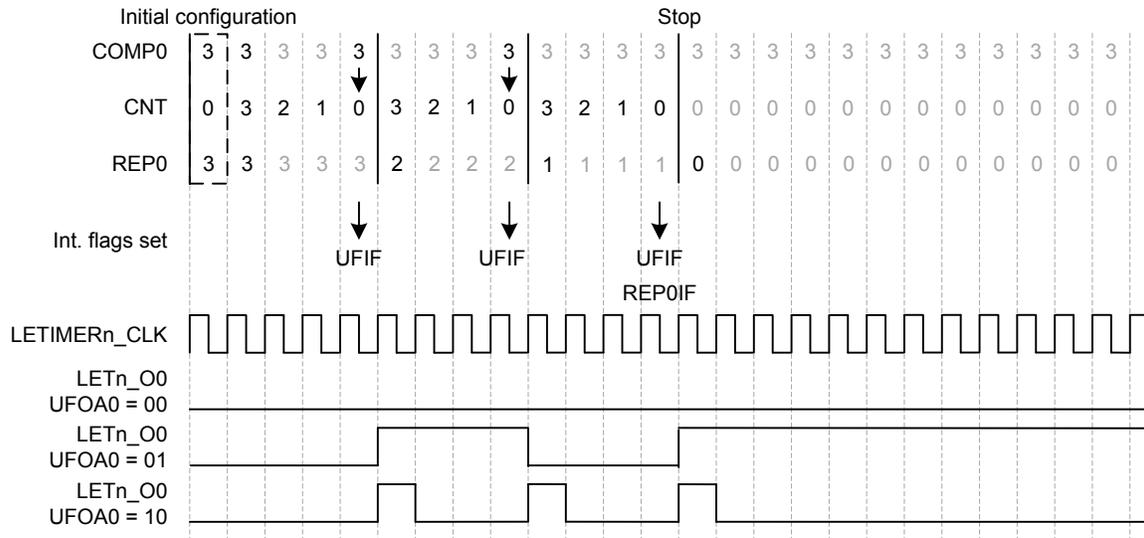

Figure 18.9. LETIMER - One Shot Mode Waveform

### 18.12.3 DOUBLE Mode

LETIMER operation in DOUBLE Mode with both outputs is shown in [Figure 18.10 LETIMER - Double Mode Waveform on page 479](#). UFOA0 and UFOA1 in LETIMERn\_CTRL are configured for pulse output and the outputs are configured for low idle polarity. As seen in the figure, the number written to the repeat registers determine the number of pulses generated on each of the outputs.

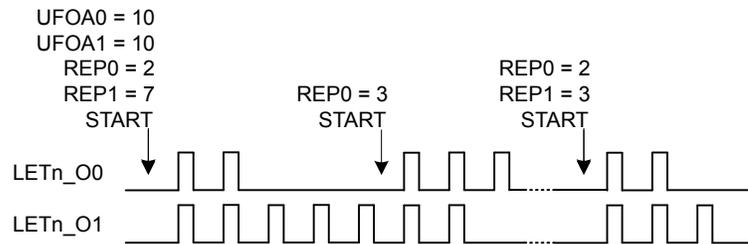

Figure 18.10. LETIMER - Double Mode Waveform

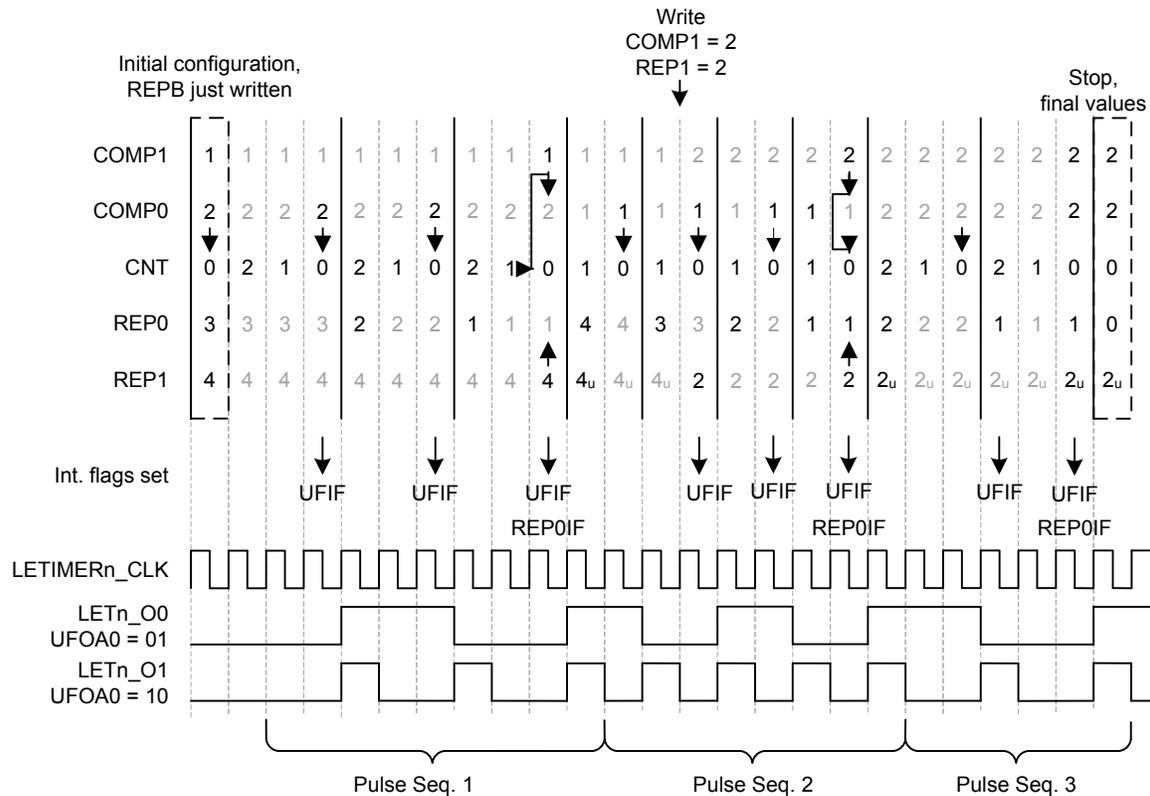

### 18.12.5 Continuous Output Generation

In some scenarios, it might be desired to make LETIMER generate a continuous waveform. Very simple constant waveforms can be generated without the repeat counter as shown in [Figure 18.8 LETIMER - Free Running Mode Waveform on page 478](#), but to generate changing waveforms, using the repeat counter and buffer registers can prove advantageous.

For the example in [Figure 18.12 LETIMER - Continuous Operation on page 481](#), the goal is to produce a pulse train consisting of 3 sequences with the following properties:

- 3 pulses with periods of 3 cycles
- 4 pulses with periods of 2 cycles
- 2 pulses with periods of 3 cycles

**Figure 18.12. LETIMER - Continuous Operation**

The first two sequences are loaded into the LETIMER before the timer is started.

LETIMERn\_TOP is set to 2 (cycles – 1), and LETIMERn\_REP0 is set to 3 for the first sequence, and the second sequence is loaded into the buffer registers, i.e. TOPBUFF is set to 1 and LETIMERn\_REP1 is set to 4.

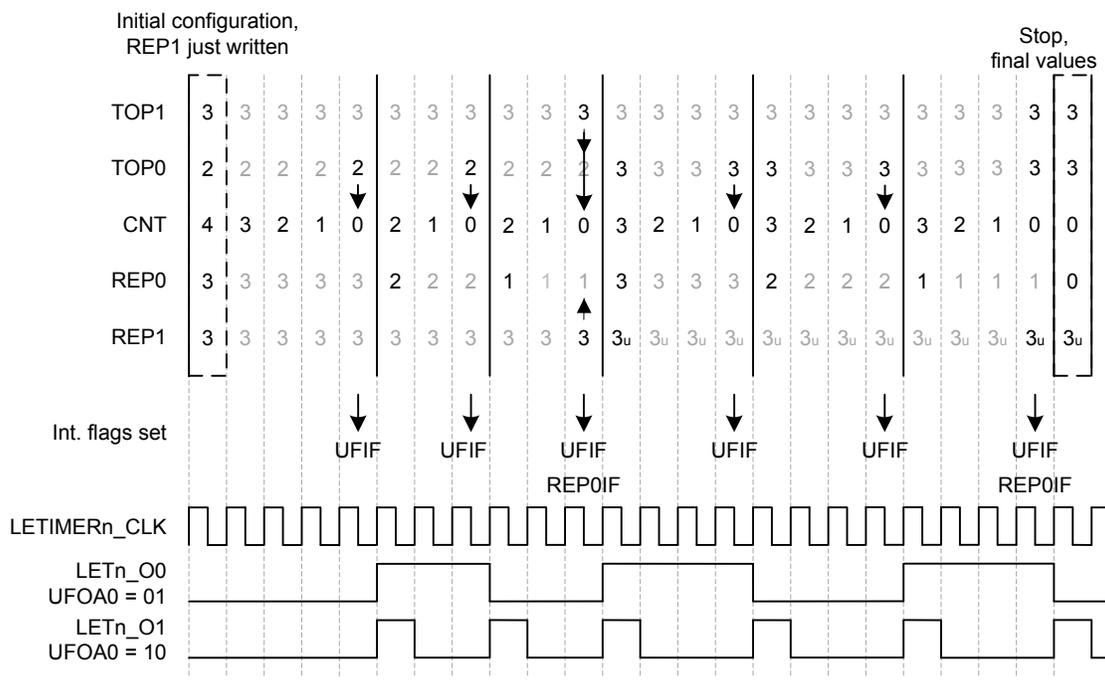

The LETIMER is set to trigger an interrupt when LETIMERn\_REP0 is done by setting REP0 in LETIMERn\_IEN. This interrupt is a good place to update the values of the buffers. Last but not least REPMODE in LETIMERn\_CTRL is set to buffered mode, and the timer is started.

In the interrupt routine the buffers are updated with the values for the third sequence. If this had not been done, the timer would have stopped after the second sequence.

The final result is shown in [Figure 18.12 LETIMER - Continuous Operation on page 481](#). The pulse output is grouped to show which sequence generated which output. Toggle output is also shown in the figure. Note that the toggle output is not aligned with the pulse outputs.

**Note:** Multiple LETIMER cycles are required to write a value to the LETIMER registers. The example in [Figure 18.12 LETIMER - Continuous Operation on page 481](#) assumes that writes are done in advance so they arrive in the LETIMER as described in the figure.

[Figure 18.13 LETIMERn\\_CNT Not Initialized to 0 on page 482](#) shows an example where the LETIMER is started while LETIMERn\_CNT is nonzero. In this case the length of the first repetition is given by the value in LETIMERn\_CNT.

**Figure 18.13. LETIMERn\_CNT Not Initialized to 0**

### 18.12.6 PWM Output

There are several ways of generating PWM output with the LETIMER, but the most straight-forward way is to use the PWM output mode. This mode is enabled by setting UFOA0 or UFOA1 in LETIMERn\_CTRL to 3. In PWM mode, the output is set to idle on timer underflow, and active on LETIMERn\_COMP0/1 match, so if for instance CNTTOPEN = 1 and OPOL0 = 0 in LETIMERn\_CTRL, LETIMERn\_TOP determines the PWM period, and LETIMERn\_COMP0/1 determines the active period.

The PWM period in PWM mode is LETIMERn\_TOP + 1. There is no special handling of the case where LETIMERn\_COMP0/1 > LETIMERn\_TOP, so if LETIMERn\_COMP0/1 > LETIMERn\_TOP, the PWM output is given by the idle output value. This means that for OPOLx = 0 in LETIMERn\_CTRL, the PWM output will always be 0 for at least one clock cycle, and for OPOLx = 1 LETIMERn\_CTRL, the PWM output will always be 1 for at least one clock cycle.

To generate a PWM signal using the full PWM range, invert OPOLx when LETIMERn\_COMP0/1 is set to a value larger than LETIMERn\_TOP.

### 18.13 LETIMER Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	LETIMER_IPVERSION	R	IP Version

## 18.14 LETIMER Register Description

## 18.14.1 LETIMER\_IPVERSION - IP Version

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset	0x1																															
Access	R																															
Name	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x1	R	<b>IP Version</b>
The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.				

## 18.14.2 LETIMER\_EN - Module En

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																															0x0	0x0
Access																															R	RW
Name																															DISABLING	EN

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISABLING	0x0	R	<b>Disablement busy status</b>
When EN is cleared, DISABLING is set immediately, and cleared when disablement finishes. Disablement resets peripheral cores and not APB registers except hardware updated registers such as INTFLAGS, FIFOs etc.				
0	EN	0x0	RW	<b>module en</b>
Enable the LETIMER module. Software should write to CONFIG type registers before setting the ENABLE bit. Software should write to SYNC type registers only after setting the ENABLE bit. When EN is cleared(disablement), it halts module operation immediately, and initialize the core domain such that when the is re-enabled, it starts cleanly.				

### 18.14.3 LETIMER\_SWRST - Software Reset Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0				
<b>Access</b>																											R	W				
<b>Name</b>																											RESETTING	SWRST				

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	RESETTING	0x0	R	<b>Software reset busy status</b>  When SWRST command is issued, resetting logic sets RESETTING status immediately, and later it is cleared when reset process finishes.
0	SWRST	0x0	W	<b>Software reset command</b>  A software reset command field resets the module back to the initial condition, similar to a power on reset condition

### 18.14.4 LETIMER\_CTRL - Control Register

Offset	Bit Position																																	
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
<b>Reset</b>													0x0				0x0				0x0		0x0		0x0		0x0		0x0		0x0			
<b>Access</b>													RW				RW				RW		RW		RW		RW		RW		RW			
<b>Name</b>													CNTPRESC				DEBUGRUN				CNTTOPEN		BUFTOP		OPOL1		OPOL0		UFOA1		UFOA0		REPMODE	

Bit	Name	Reset	Access	Description																														
31:20	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>

Value	Mode	Description																																
0	DISABLE	LETIMER is frozen in debug mode																																
1	ENABLE	LETIMER is running in debug mode																																
11:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>																																
9	CNTTOPEN	0x0	RW	<p><b>Compare Value 0 Is Top Value</b></p> <p>When set, TOP value will be used as Counter Top Value</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>DISABLE</td> <td>The top value of the LETIMER is 65535 (0xFFFF)</td> </tr> </tbody> </table>	Value	Mode	Description	0	DISABLE	The top value of the LETIMER is 65535 (0xFFFF)																								
Value	Mode	Description																																
0	DISABLE	The top value of the LETIMER is 65535 (0xFFFF)																																

Bit	Name	Reset	Access	Description
	1	ENABLE		The top value of the LETIMER is given by COMP0
8	BUFTOP	0x0	RW	<b>Buffered Top</b> Set to load TOPBUFF into TOP when REP0 reaches 0 in BUFFERED mode, allowing a buffered top value.
	Value	Mode		Description
	0	DISABLE		COMP0 is only written by software
	1	ENABLE		COMP0 is set to COMP1 when REP0 reaches 0
7	OPOL1	0x0	RW	<b>Output 1 Polarity</b> Defines the idle value of output 1.
6	OPOL0	0x0	RW	<b>Output 0 Polarity</b> Defines the idle value of output 0.
5:4	UFOA1	0x0	RW	<b>Underflow Output Action 1</b> Defines the action on OUT1 on a LETIMER underflow - IDLE/TOGGLE/PULSE/PWM
	Value	Mode		Description
	0	NONE		LETIMERn_OUT1 is held at its idle value as defined by OPOL1
	1	TOGGLE		LETIMERn_OUT1 is toggled on CNT underflow
	2	PULSE		LETIMERn_OUT1 is held active for one LETIMER0 clock cycle on CNT underflow. The output then returns to its idle value as defined by OPOL1
	3	PWM		LETIMERn_OUT1 is set idle on CNT underflow, and active on compare match with COMP1
3:2	UFOA0	0x0	RW	<b>Underflow Output Action 0</b> Defines the action on OUT0 on a LETIMER underflow - IDLE/TOGGLE/PULSE/PWM
	Value	Mode		Description
	0	NONE		LETIMERn_OUT0 is held at its idle value as defined by OPOL0
	1	TOGGLE		LETIMERn_OUT0 is toggled on CNT underflow
	2	PULSE		LETIMERn_OUT0 is held active for one LETIMER0 clock cycle on CNT underflow. The output then returns to its idle value as defined by OPOL0
	3	PWM		LETIMERn_OUT0 is set idle on CNT underflow, and active on compare match with COMP1
1:0	REPMODE	0x0	RW	<b>Repeat Mode</b> Repeat Mode - FREE/ONESHOT/BUFFERED/DOUBLE
	Value	Mode		Description
	0	FREE		When started, the LETIMER counts down until it is stopped by software
	1	ONESHOT		The counter counts REP0 times. When REP0 reaches zero, the counter stops

Bit	Name	Reset	Access	Description
2		BUFFERED		The counter counts REP0 times. If REP1 has been written, it is loaded into REP0 when REP0 reaches zero, otherwise the counter stops
3		DOUBLE		Both REP0 and REP1 are decremented when the LETIMER wraps around. The LETIMER counts until both REP0 and REP1 are zero

#### 18.14.5 LETIMER\_CMD - Command Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Name	Reset	Access	Description
31:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	CTO1 Set to drive toggle output 1 to its idle value	0x0	W(nB)	<b>Clear Toggle Output 1</b>
3	CTO0 Set to drive toggle output 0 to its idle value	0x0	W(nB)	<b>Clear Toggle Output 0</b>
2	CLEAR Set to clear LETIMER	0x0	W(nB)	<b>Clear LETIMER</b>
1	STOP Set to stop LETIMER	0x0	W(nB)	<b>Stop LETIMER</b>
0	START Set to start LETIMER	0x0	W(nB)	<b>Start LETIMER</b>

## 18.14.6 LETIMER\_STATUS - Status Register

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	0x0
<b>Access</b>																															R	R
<b>Name</b>																															LETIMERLOCKSTATUS	RUNNING

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	LETIMERLOCKSTATUS	0x0	R	<b>LETIMER Lock Status</b> Indicates the current status of LETIMER Lock
	Value	Mode		Description
	0	UNLOCKED		LETIMER registers are unlocked
	1	LOCKED		LETIMER registers are locked
0	RUNNING	0x0	R	<b>LETIMER Running</b> Set when LETIMER is running.

## 18.14.7 LETIMER\_CNT - Counter Value Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	
<b>Access</b>																															RW	
<b>Name</b>																															CNT	

Bit	Name	Reset	Access	Description
31:24	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
23:0	CNT	0x0	RW	<b>Counter Value</b> Use to read the current value of the LETIMER.

## 18.14.8 LETIMER\_COMP0 - Compare Value Register 0

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																								0x0								
<b>Access</b>																								RW								
<b>Name</b>																								COMP0								

Bit	Name	Reset	Access	Description
31:24	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
23:0	COMP0	0x0	RW	<b>Compare Value 0</b> Compare value for LETIMER.

## 18.14.9 LETIMER\_COMP1 - Compare Value Register 1

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																								0x0								
<b>Access</b>																								RW								
<b>Name</b>																								COMP1								

Bit	Name	Reset	Access	Description
31:24	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
23:0	COMP1	0x0	RW	<b>Compare Value 1</b> Compare and optionally buffered top value for LETIMER.

## 18.14.10 LETIMER\_TOP - Counter TOP Value Register

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																								0x0								
<b>Access</b>																								RW								
<b>Name</b>																								TOP								

Bit	Name	Reset	Access	Description
31:24	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
23:0	TOP	0x0	RW	<b>Counter TOP Value</b> TOP will be used as Counter TOP Value if CNTTOPEN is set to 1

## 18.14.11 LETIMER\_TOPBUFF - Buffered Counter TOP Value

Offset	Bit Position																															
0x028	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																								0x0								
<b>Access</b>																								RW								
<b>Name</b>																								TOPBUFF								

Bit	Name	Reset	Access	Description
31:24	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
23:0	TOPBUFF	0x0	RW	<b>Buffered Counter TOP Value</b> TOPBUFF will be used as Counter TOP Value in BUFFERED Mode if CNTTOPEN and BUFFTOP is set set to 1

## 18.14.12 LETIMER\_REP0 - Repeat Counter Register 0

Offset	Bit Position																															
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									RW							
<b>Name</b>																									REP0							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	REP0	0x0	RW	<b>Repeat Counter 0</b> Optional repeat counter.

## 18.14.13 LETIMER\_REP1 - Repeat Counter Register 1

Offset	Bit Position																															
0x030	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									RW							
<b>Name</b>																									REP1							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	REP1	0x0	RW	<b>Repeat Counter 1</b> Optional repeat counter or buffer for REP0.

## 18.14.14 LETIMER\_IF - Interrupt Flag Register

Offset	Bit Position																															
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0	0x0	0x0	0x0	
<b>Access</b>																											RW	RW	RW	RW	RW	
<b>Name</b>																											REP1	REP0	UF	COMP1	COMP0	

Bit	Name	Reset	Access	Description
31:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	REP1	0x0	RW	<b>Repeat Counter 1 Interrupt Flag</b> Set when repeat counter 1 reaches zero.
3	REP0	0x0	RW	<b>Repeat Counter 0 Interrupt Flag</b> Set when repeat counter 0 reaches zero or when the REP1 interrupt flag is loaded into the REP0 interrupt flag.
2	UF	0x0	RW	<b>Underflow Interrupt Flag</b> Set on LETIMER underflow.
1	COMP1	0x0	RW	<b>Compare Match 1 Interrupt Flag</b> Set when LETIMER reaches the value of COMP1.
0	COMP0	0x0	RW	<b>Compare Match 0 Interrupt Flag</b> Set when LETIMER reaches the value of COMP0.

**18.14.16 LETIMER\_LOCK - Configuration Lock Register**

Offset	Bit Position																															
0x03C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	W															
<b>Name</b>																	LETIMERLOCKKEY															

Bit	Name	Reset	Access	Description						
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>								
15:0	LETIMERLOCKKEY	0x0	W	<p><b>Configuration Lock Key</b></p> <p>Write any other value than the unlock code to lock LETIMER_EN, LETIMER_SWRST, LETIMER_CTRL, LETIMER_CMD, LETIMER_CNT, LETIMER_COMP0, LETIMER_COMP1, LETIMER_TOP, LETIMER_TOPBUFF, LETIMER_REP0, LETIMER_REP1 and PRSMODE registers from editing. Write the unlock code to unlock.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>52476</td> <td>UNLOCK</td> <td>Write to unock LETIMER lockable registers</td> </tr> </tbody> </table>	Value	Mode	Description	52476	UNLOCK	Write to unock LETIMER lockable registers
Value	Mode	Description

## 19. TIMER - Timer/Counter

### Quick Facts

#### What?

The TIMER (Timer/Counter) keeps track of timing and counts events, generates output waveforms, and triggers timed actions in other peripherals.

#### Why?

Most applications have activities that need to be timed accurately with as little CPU intervention and energy consumption as possible.

#### How?

The flexible 16/32-bit timer can be configured to provide PWM waveforms with optional dead-time insertion (e.g. motor control) or work as a frequency generator. The timer can also count events and control other peripherals through the PRS, which offloads the CPU and reduces energy consumption.

### 19.1 Introduction

The general purpose timer has 3 or 4 compare/capture channels for input capture and compare/Pulse-Width Modulation (PWM) output.

The TIMER module may be 16 or 32 bits wide. Some timers also include a Dead-Time Insertion module suitable for motor control applications.

Refer to the device data sheet to determine the capabilities (capture/compare channel count, width, and DTI) of each timer instance.

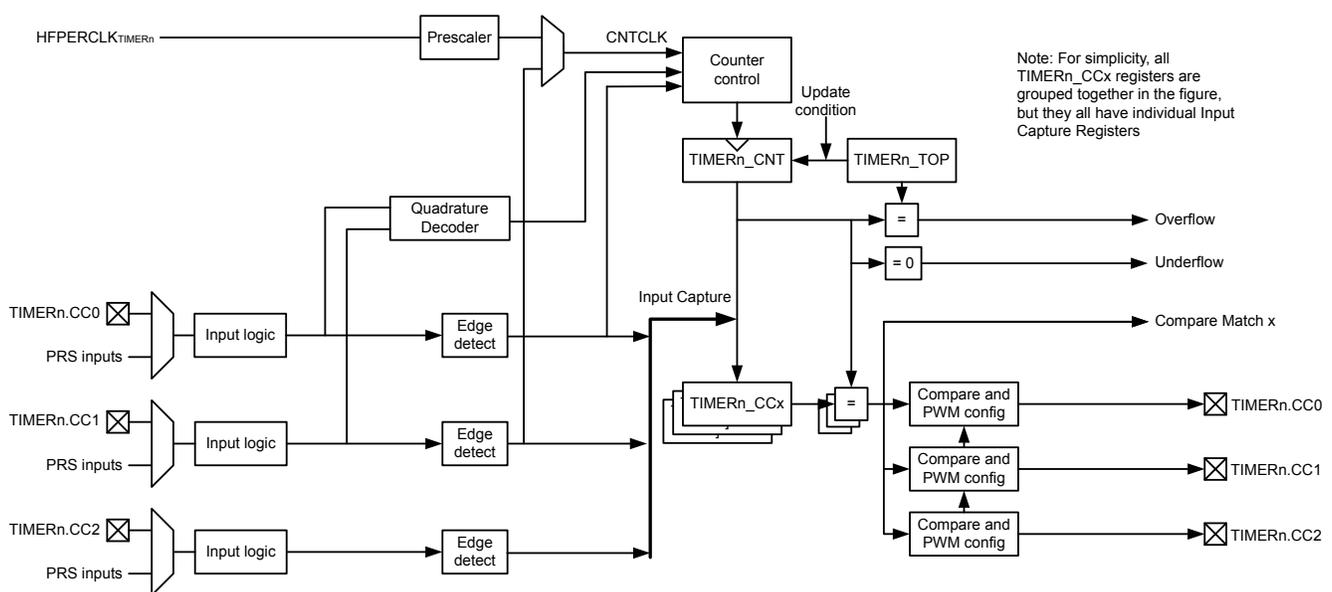

## 19.2 Features

- 16/32-bit auto reload up/down counter
  - Dedicated 16/32-bit reload register which serves as counter maximum
- 3 or 4 Compare/Capture channels
  - Individually configurable as either input capture or output compare/PWM
- Multiple Counter modes
  - Count up
  - Count down
  - Count up/down
  - Quadrature Decoder
  - Direction and count from external pins
- 2x Count Mode
- Counter control from PRS or external pin
  - Start
  - Stop
  - Reload and start
- Inter-Timer connection
  - Allows 32-bit counter mode
  - Start/stop synchronization between several timers
- Input Capture
  - Period measurement
  - Pulse width measurement
  - Two capture registers for each capture channel
    - Capture on either positive or negative edge
    - Capture on both edges
  - Optional digital noise filtering on capture inputs
- Output Compare
  - Compare output toggle/pulse on compare match
  - Immediate update of compare registers
- PWM
  - Up-count PWM
  - Up/down-count PWM
  - Predictable initial PWM output state (configured by SW)
  - Buffered compare register to ensure glitch-free update of compare values
  - Output re-timing to mitigate RF interference
- Clock sources
  - HFPERCLK<sub>TIMERn</sub>
    - 10-bit Prescaler
  - External pin
  - Peripheral Reflex System
- Debug mode
  - Configurable to either run or stop when processor is stopped (halt/breakpoint)
- Interrupts, PRS output and/or DMA request on:
  - Underflow
  - Overflow
  - Compare/Capture event

- Dead-Time Insertion Unit
  - Complementary PWM outputs with programmable dead-time
    - Dead-time is specified independently for rising and falling edge
      - 10-bit prescaler
      - 6-bit time value
  - Outputs have configurable polarity
  - Outputs can be set inactive individually by software.
- Configurable action on fault
  - Set outputs inactive
  - Clear output
  - Tristate output
- Individual fault sources
  - One or two PRS signals
  - Debugger
    - Support for automatic restart
  - Core lockup
  - EM2/EM3 entry
- Configuration lock

### 19.3 Functional Description

An overview of the TIMER module is shown in [Figure 19.1 TIMER Block Overview on page 502](#) and it consists of a 16/32 bit up/down counter with 3 compare/capture channels connected to pins TIMn\_CC0, TIMn\_CC1, and TIMn\_CC2.

**Figure 19.1. TIMER Block Overview**

#### 19.3.1 Register Access

The timer module interface consists of multiple register types. Registers of type "RW CONFIG" should only be written when the module is disabled (TIMERN\_EN\_EN = 0). Registers of type "W SYNC", "R SYNC" or "RW SYNC" should only be read or written when the module is enabled (TIMERN\_EN\_EN = 1). A typical setup sequence for a TIMER module is as follows:

1. With the TIMER disabled (TIMERN\_EN\_EN = 0), program any CONFIG registers required for the application.
2. Enable the TIMER by setting EN in TIMERN\_EN to 1.
3. Program any non-CONFIG registers required for the application.
4. The TIMER is then ready for use.

### 19.3.2 Counter Modes

The timer consists of a counter that can be configured to the following modes, using the MODE field in `TIMERn_CFG`:

- Up-count: Counter counts up until it reaches the value in `TIMERn_TOP`, where it is reset to 0 before counting up again.
- Down-count: The counter starts at the value in `TIMERn_TOP` and counts down. When it reaches 0, it is reloaded with the value in `TIMERn_TOP`.
- Up/Down-count: The counter starts at 0 and counts up. When it reaches the value in `TIMERn_TOP`, it counts down until it reaches 0 and starts counting up again.
- Quadrature Decoder: Two input channels where one determines the count direction, while the other pin triggers a clock event.

In addition to the TIMER modes listed above, the TIMER also supports a 2x count mode. In this mode the counter increments/decrements by 2 on each clock edge. The 2x count mode can be used to double the PWM frequency when the compare/capture channel is put into PWM mode. The 2x count mode is enabled by setting the X2CNT bitfield in the `TIMERn_CTRL` register.

The counter value can be read or written by software any time the module is enabled by accessing the CNT field in `TIMERn_CNT`.

#### 19.3.2.1 Events

The main counter can generate overflow and underflow events during operation.

Overflow (`TIMERn_IF_OF`) is set when the counter value shifts from `TIMERn_TOP` to the next value when counting up. In up-count mode and quadrature decoder mode the next value is 0. In up/down-count mode, the next value is `TIMERn_TOP-1`.

Underflow (`TIMERn_IF_UF`) is set when the counter value shifts from 0 to the next value when counting down. In down-count mode and quadrature decoder mode, the next value is `TIMERn_TOP`. In up/down-count mode the next value is 1.

An update event occurs on overflow in up-count mode and on underflow in down-count or up/down count mode. Additionally, an update event also occurs on overflow and underflow in quadrature decoder. This event is used to time updates of buffered values.

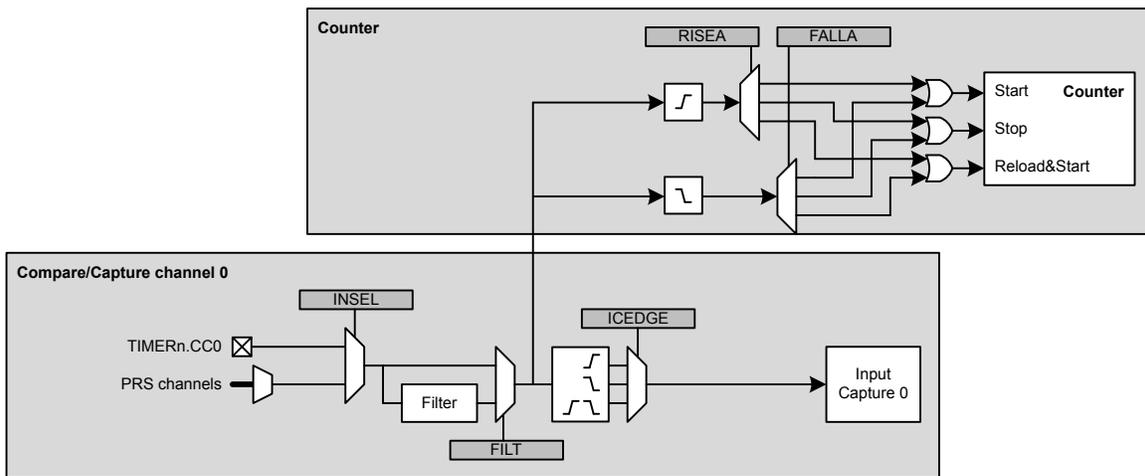

### 19.3.2.2 Operation

Figure 19.2 **TIMER Hardware Timer/Counter Control** on page 504 shows the hardware timer/counter control. Software can start or stop the counter by setting the START or STOP bits in `TIMERn_CMD`. The counter value (CNT in `TIMERn_CNT`) can always be written by software to any 16/32-bit value.

It is also possible to control the counter through either an external pin or PRS input. This is done through the input logic for the compare/capture Channel 0. The timer/counter allows individual actions (start, stop, reload) to be taken for rising and falling input edges. This is configured in the `RISEA` and `FALLA` fields in `TIMERn_CTRL`. The reload value is 0 in up-count and up/down-count mode and TOP in down-count mode.

The `RUNNING` bit in `TIMERn_STATUS` indicates if the timer is running or not. If the `SYNC` bit in `TIMERn_CFG` is set, the timer is started/stopped/reloaded (external pin or PRS) when any of the other timers are started/stopped/reloaded.

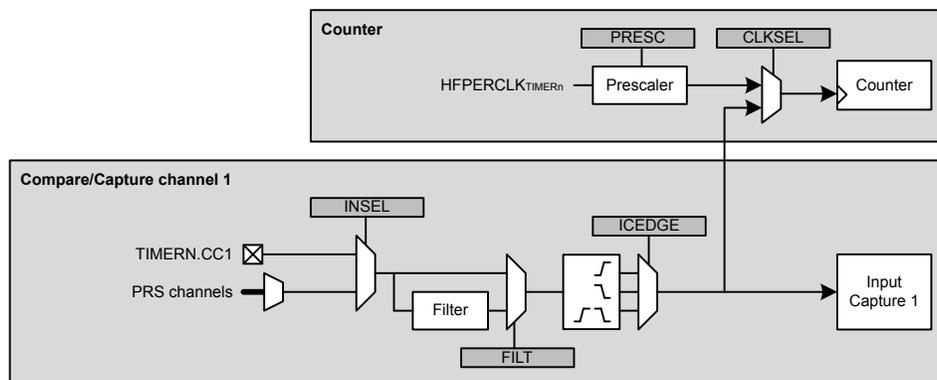

The `DIR` bit in `TIMERn_STATUS` indicates the counting direction of the timer at any given time. The counter value can be read or written by software through the `CNT` field in `TIMERn_CNT`. In Up/Down-Count mode the count direction will be set to up if the `CNT` value is written by software.

**Figure 19.2. TIMER Hardware Timer/Counter Control**

### 19.3.2.3 Clock Source

The counter can be clocked from several sources, which are all synchronized with the incoming peripheral clock for the timer. See Figure 19.3 **TIMER Clock Selection** on page 504.

**Figure 19.3. TIMER Clock Selection**

### 19.3.2.4 Peripheral Clock

The peripheral clock for the timer ( $\text{HFPERCLK}_{\text{TIMER}_n}$ ) clocks the logic for the timer block, even when it is not the selected clock source.

All TIMER instances in this device family use  $\text{EM01GRPACLK}$  selected in  $\text{CMU\_EM01GRPACLKCTRL\_CLKSEL}$  as their peripheral clock source ( $\text{HFPERCLK}_{\text{TIMER}_n}$ ).

The peripheral clock to each timer can be used as a source with a configurable 10-bit prescaler. The  $\text{PRESC}$  bitfield in  $\text{TIMER}_n\_CFG$  sets the prescaler value, and the incoming peripheral clock will be divided by a factor of  $(\text{PRESC}+1)$ . However, if 2x count mode is enabled and the compare/capture channels are configured for PWM mode, the CC output is updated on both clock edges, so prescaling the peripheral clock will produce an incorrect result. The internal prescale counter is stopped and reset when the timer is stopped.

### 19.3.2.5 Compare/Capture Channel 1 Input

The timer can also be clocked by positive and/or negative edges on the compare/capture channel 1 input. This input can either come from the  $\text{TIM}_n\_CC1$  pin or one of the PRS channels. The input signal must not have a higher frequency than  $f_{\text{HFPERCLK\_TIMER}_n}/3$  when running from a pin input or a PRS input with  $\text{FILT}$  enabled in  $\text{TIMER}_n\_CCx\_CFG$ . When running from PRS without  $\text{FILT}$ , the frequency can be as high as  $f_{\text{HFPERCLK\_TIMER}_n}$ . Note that when clocking the timer from the same pulse that triggers a start (through  $\text{RISEA/FALLA}$  in  $\text{TIMER}_n\_CTRL$ ), the starting pulse will not update the counter value.

### 19.3.2.6 Underflow/Overflow From Neighboring Timer

All timers are linked together (see [Figure 19.4 TIMER Connections on page 505](#)), allowing timers to count on overflow/underflow from the lower numbered neighbouring timers to form a larger timer. Note that all timers must be set to count the same direction and less significant timer(s) can only be set to count up or down.

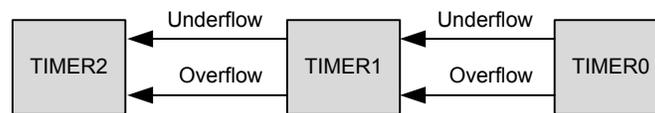

Figure 19.4. TIMER Connections

### 19.3.2.7 One-Shot Mode

By default, the counter counts continuously until it is stopped. If the  $\text{OSMEN}$  bit is set in the  $\text{TIMER}_n\_CFG$  register, however, the counter is disabled by hardware on the first *update event* (see [19.3.2.1 Events](#)). Note that when the counter is running with  $\text{CC1}$  as clock source and  $\text{OSMEN}$  is set, a  $\text{CC1}$  capture event will not take place on the *update event* ( $\text{CC1}$  rising edge) that stops the timer.

### 19.3.2.8 Top Value Buffer

The `TIMERN_TOP` register can be altered either by writing it directly or by writing to the `TIMER_TOPB` (buffer) register. When writing to the buffer register the `TIMERN_TOPB` register will be written to `TIMERN_TOP` on the next *update event*. Buffering ensures that the TOP value is not set below the actual count value. The `TOPBV` flag in `TIMERN_STATUS` indicates whether the `TIMERN_TOPB` register contains data that has not yet been written to the `TIMERN_TOP` register (see [Figure 19.5 TIMER TOP Value Update Functionality](#) on page 506).

**Note:** When writing to `TIMERN_TOP` register directly, the `TIMERN_TOPB` register value will be invalidated and the `TOPBV` flag will be cleared. This prevents `TIMERN_TOP` register from being immediately updated by an existing valid `TIMERN_TOPB` value during the next *update event*.

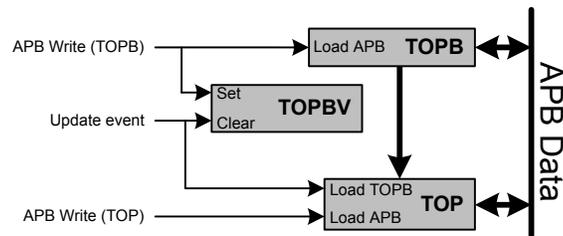

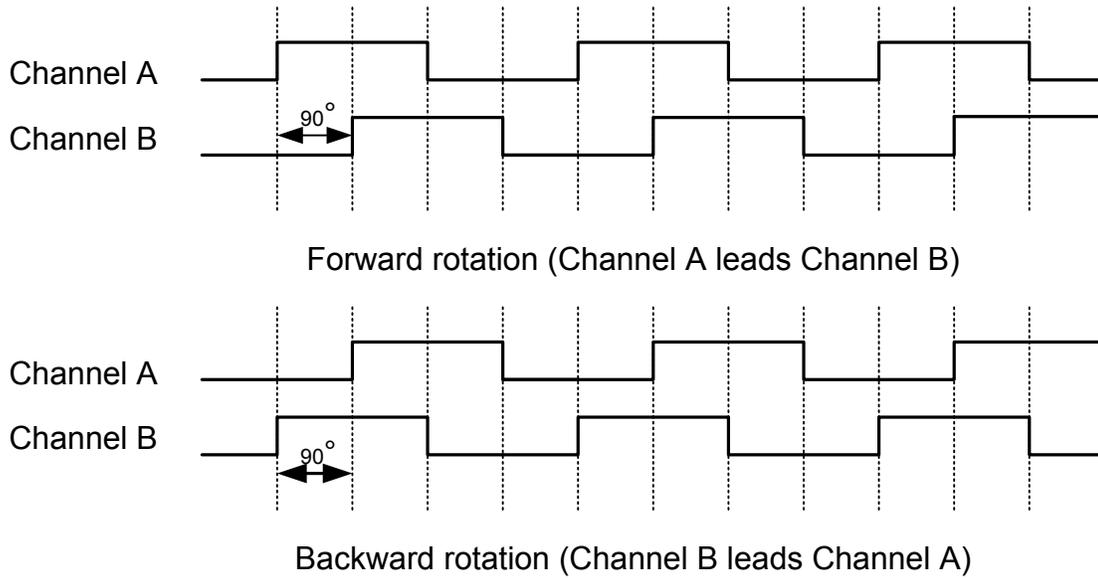

Figure 19.5. TIMER TOP Value Update Functionality

### 19.3.2.9 Quadrature Decoder

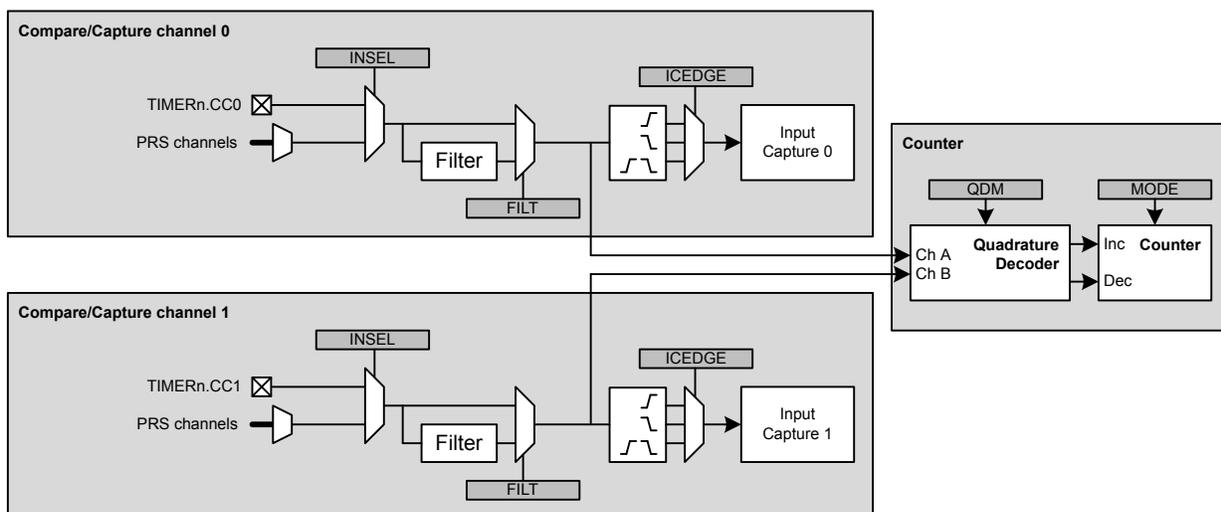

Quadrature decoding mode is used to track motion and determine both rotation direction and position. The quadrature decoder uses two input channels that are 90 degrees out of phase (see [Figure 19.6 TIMER Quadrature Encoded Inputs on page 507](#)).

**Figure 19.6. TIMER Quadrature Encoded Inputs**

In the timer these inputs are tapped from the compare/capture channel 0 (Channel A) and 1 (Channel B) inputs before edge detection. The timer/counter then increments or decrements the counter, based on the phase relation between the two inputs. The DIRCHG flag in TIMERN\_IF is set if the count direction changes in quadrature decoder mode. The quadrature decoder supports two channels, but if a third channel (Z-terminal) is available, this can be connected to an external interrupt and trigger a counter reset from the interrupt service routine. By connecting a periodic signal from another timer as input capture on compare/capture Channel 2, it is also possible to calculate speed and acceleration.

**Note:** In quadrature decoder mode, overflow and underflow triggers an *update event*.

**Figure 19.7. TIMER Quadrature Decoder Configuration**

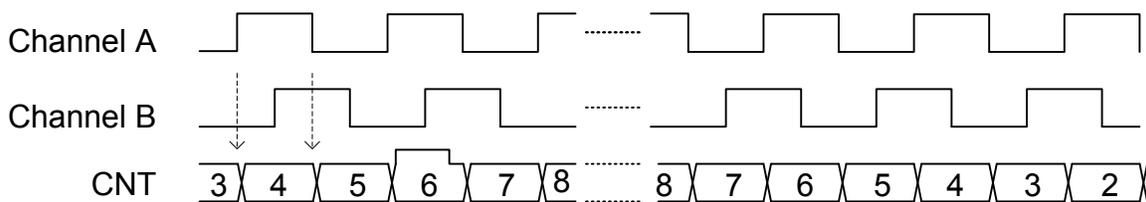

The quadrature decoder can be set in either X2 or X4 mode, which is configured in the QDM bit in TIMERN\_CFG. See [Figure 19.7 TIMER Quadrature Decoder Configuration on page 507](#)

### 19.3.2.10 X2 Decoding Mode

In X2 Decoding mode, the counter increments or decrements on every edge of Channel A, see [Table 19.1 TIMER Counter Response in X2 Decoding Mode on page 508](#) and [Figure 19.8 TIMER X2 Decoding Mode on page 508](#).

**Table 19.1. TIMER Counter Response in X2 Decoding Mode**

Channel B	Channel A	
	Rising	Falling
0	Increment	Decrement
1	Decrement	Increment

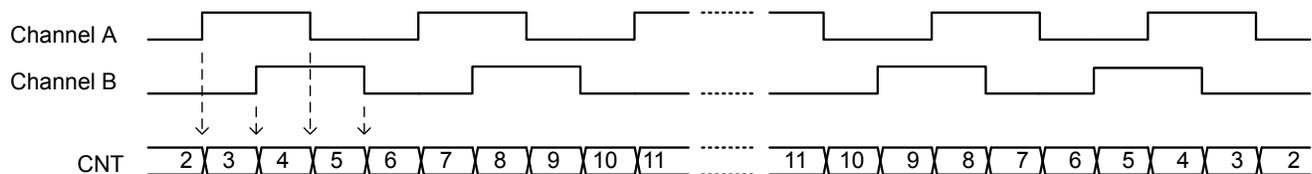

**Figure 19.8. TIMER X2 Decoding Mode**

### 19.3.2.11 X4 Decoding Mode

In X4 Decoding mode, the counter increments or decrements on every edge of Channel A and Channel B, see [Figure 19.9 TIMER X4 Decoding Mode on page 508](#) and [Table 19.2 TIMER Counter Response in X4 Decoding Mode on page 508](#).

**Table 19.2. TIMER Counter Response in X4 Decoding Mode**

Opposite Channel	Channel A		Channel B	
	Rising	Falling	Rising	Falling
Channel A = 0			Decrement	Increment
Channel A = 1			Increment	Decrement
Channel B = 0	Increment	Decrement		
Channel B = 1	Decrement	Increment		

**Figure 19.9. TIMER X4 Decoding Mode**

### 19.3.2.12 Rotational Position

To calculate a position [Figure 19.10 TIMER Rotational Position Equation on page 509](#) can be used.

$$\text{pos}^\circ = (\text{CNT}/X \times N) \times 360^\circ$$

**Figure 19.10. TIMER Rotational Position Equation**

where X = Encoding type and N = Number of pulses per revolution.

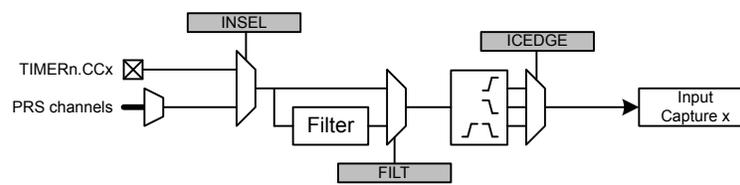

### 19.3.3 Compare/Capture Channels

The timer contains compare/capture channels, which can be independently configured in the following modes:

1. Input Capture
2. Output Compare
3. PWM

#### 19.3.3.1 Input Pin Logic

Each compare/capture channel can be configured as an input source for the Capture Unit or as external clock source for the timer (see [Figure 19.11 TIMER Input Pin Logic on page 509](#)). Compare/capture channels 0 and 1 are the inputs for the quadrature decoder. The input channel can be filtered before it is used, which requires the input to remain stable for up to 5 cycles in a row before the input is propagated to the output.

**Figure 19.11. TIMER Input Pin Logic**

The capture input to the timer may be selected from the dedicated CCx signal for the channel, or a PRS signal. INSEL in `TIMERn_CCx_CFG` determines the input to the channel. When set to PIN, the selected CCx pin will be used. When INSEL is set to PRSSYNC, a synchronous PRS channel is selected as the source. The synchronous PRS channel is determined by the SPRSSEL field in the `PRS_TIMERn_CCx` register. Setting INSEL to PRSASYNCLEVEL or PRSASYNCPULSE selects an asynchronous PRS channel as the source. The asynchronous PRS channel is determined by the PRSSEL field in the `PRS_TIMERn_CCx` register.

The PIN and PRSASYNCLEVEL selections are qualified by a 2-clock input sampler. To recognize and capture the incoming signal, it must be at the new level for at least 2  $\text{HPPERCLK}_{\text{TIMERn}}$  clock cycles. An additional 5  $\text{HPPERCLK}_{\text{TIMERn}}$  cycles of filtering can be applied to the signal by enabling the FILT bit in `TIMERn_CCx_CFG`.

The PRSASYNCPULSE selection can be used to capture higher-speed pulses on an asynchronous PRS input. The input logic for this selection does not qualify the level of the incoming signal. Instead, it will recognize positive or negative edges directly. While the pulse time can be shorter than 1  $\text{HPPERCLK}_{\text{TIMERn}}$ , this mode requires at least 3  $\text{HPPERCLK}_{\text{TIMERn}}$  clocks between adjacent events. The FILT option is not used in this mode.

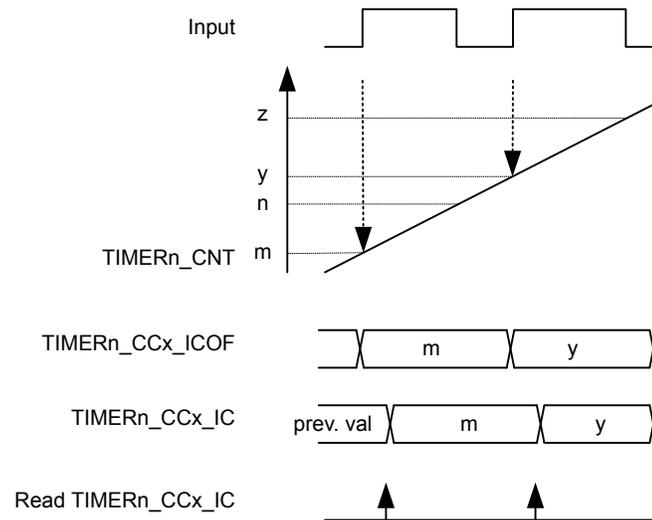

Synchronous PRS signals are inherently synchronized to the module clock, and the 2-clock input sampler is not used. However, it is possible to use FILT to enable the 5  $\text{HPPERCLK}_{\text{TIMERn}}$  filter when using the PRSSYNC option.

#### 19.3.3.2 Compare/Capture Registers

The compare/capture channel registers are prefixed with `TIMERn_CCx_`, where the x stands for the channel number. Since the compare/capture channels serve three functions (input capture, compare, PWM), different registers are used, depending on the mode the channel is set in.

### 19.3.3.3 Input Capture

In input capture, the counter value (TIMERn\_CNT) can be captured in the Input Capture Register (TIMERn\_CCx\_ICF) (see [Figure 19.12 TIMER Input Capture on page 510](#)). The CCPOL bits in TIMERn\_STATUS indicate the polarity of the edge that triggered the capture in TIMERn\_CCx\_ICF.

**Figure 19.12. TIMER Input Capture**

Input captures are buffered into a 2-entry FIFO, allowing 2 subsequent capture events to take place before a read-out is required. Reading TIMERn\_CCx\_ICF from software or DMA pops the oldest unread value from the FIFO. If TIMERn\_CCx\_ICF is read when the FIFO is empty (ICFEMPTY in TIMERn\_STATUS = 1), the FIFO underflow flag for the channel (ICFUF in TIMERn\_IF) will be set. The Input Capture Overflow Register (TIMERn\_CCx\_ICOF) always contains the newest value in the FIFO. If a new capture is triggered while the FIFO is full, the value in TIMERn\_CCx\_ICOF will be over-written with the latest value and the FIFO overflow flag (ICFOF in TIMERn\_IF) for the channel will be set. Reading TIMERn\_CCx\_ICOF does not alter the FIFO contents.

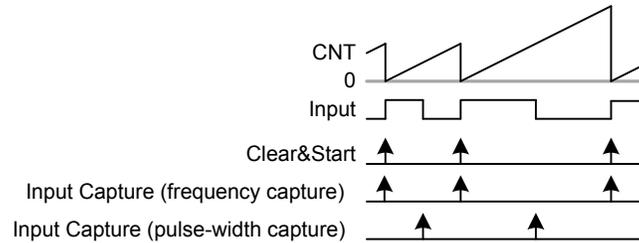

The input capture FIFO also has a programmable watermark level that can be configured to generate interrupts or trigger DMA requests when a certain number of empty spots are left in the FIFO. The ICFWLFULL flag in TIMERn\_IF will be set when the number of empty spots left in the FIFO is less than or equal to the watermark level programmed in TIMERn\_CCx\_CFG\_ICFWL. At a minimum, a TIMER module will have two FIFO entries, but may have more on future devices.

The ICFEMPTY flag in TIMERn\_STATUS indicates when the capture buffer is empty. When this bit reads '0', there is a valid unread capture in the FIFO.

**Note:** In input capture mode, the timer will only trigger interrupts when it is running.

### 19.3.3.4 Period/Pulse-Width Capture

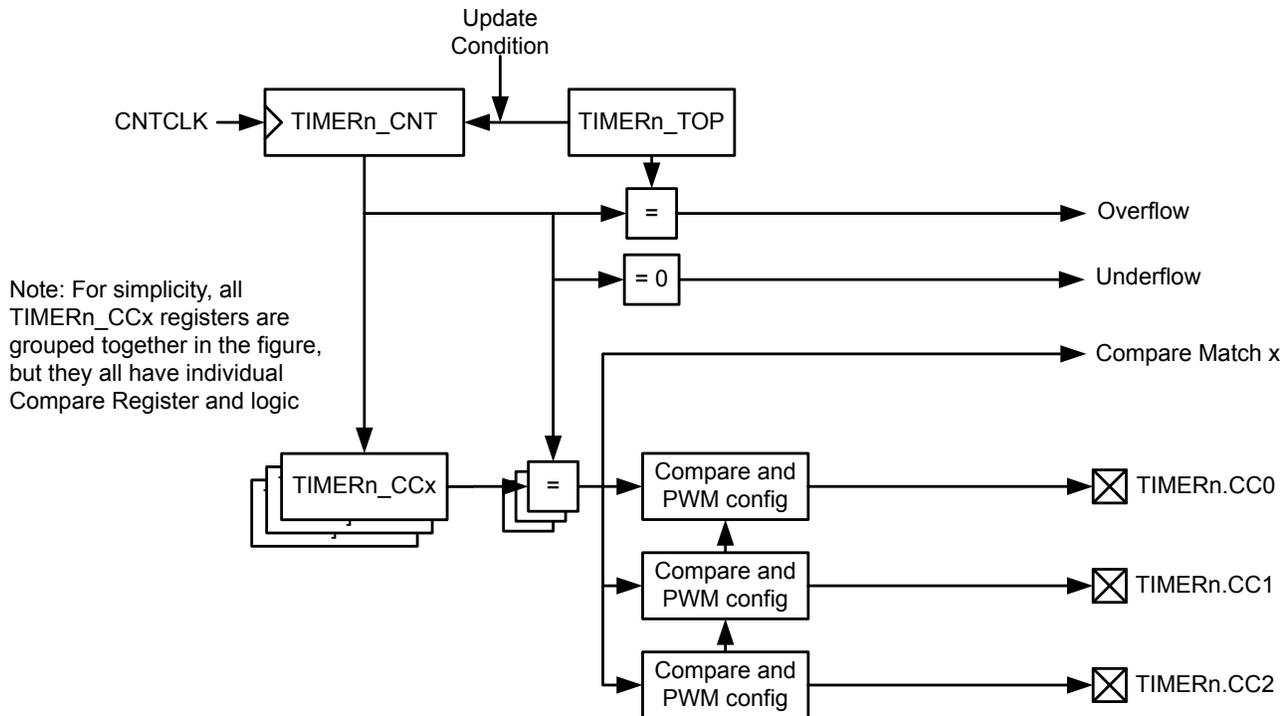

Period and/or pulse-width capture can only be possible with Channel 0 (CC0), because this is the only channel that can start and stop the timer. This can be done by setting the RISEA field in TIMERN\_CTRL to Clear&Start, and selecting the desired input from either external pin or PRS, see [Figure 19.13 TIMER Period and/or Pulse Width Capture on page 511](#). For period capture, the compare/capture channel should then be set to input capture on a rising edge of the same input signal. To capture the width of a high pulse, the compare/capture channel should be set to capture on a falling edge of the input signal. To measure the low pulse-width of a signal, opposite polarities should be chosen.

**Figure 19.13. TIMER Period and/or Pulse Width Capture**

### 19.3.3.5 Compare

Each compare/capture channel contains a comparator which outputs a compare match if the contents of `TIMERn_CCx_OC` matches the counter value, see [Figure 19.14 TIMER Block Diagram Showing Comparison Functionality on page 512](#). In compare mode, each compare channel can be configured to either set, clear or toggle the output on an event (compare match, overflow or underflow). The output from each channel is represented as an alternative function on the port it is connected to, which needs to be enabled for the CC outputs to propagate to the pins.

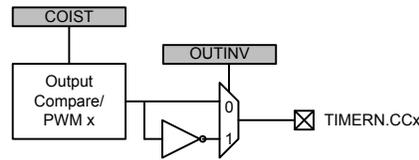

**Figure 19.14. TIMER Block Diagram Showing Comparison Functionality**

The compare output is delayed by one cycle to allow for full 0% to 100% PWM generation. If occurring in the same cycle, match action will have priority over overflow or underflow action.

The input selected (through `PRSEL` in `PRS_CONSUMER_TIMERn_CCx`, `INSEL` and `FILT` in `TIMERn_CCx_CFG`) for the CC channel will also be sampled on compare match and the result is found in the `CCPOL` bits in `TIMERn_STATUS`. It is also possible to configure the `CCPOL` to always track the inputs by setting `ATI` in `TIMERn_CFG`.

**Note:** When using synchronous PRS sources, it is recommended to configure the PRS consumer registers prior to selecting PRS triggering to avoid any false triggers.

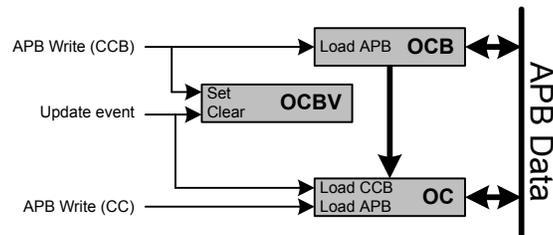

The `COIST` bit in `TIMERn_CCx_CFG` is the initial state of the compare/PWM output. The `COIST` bit can also be used as an initial value to the compare outputs on a reload-start when `RSSCOIST` is set in `TIMERn_CFG`. Also the resulting output can be inverted by setting `OUTINV` in `TIMERn_CCx_CTRL`. It is recommended to turn off the CC channel before configuring the output state to avoid any unwanted pulses on the output. The CC channel can be turned off by setting `MODE` to `OFF` in `TIMERn_CCx_CFG`. The following figure shows the output logic for the TIMER module.

**Figure 19.15. TIMER Output Logic**

### 19.3.3.6 Compare Mode Registers

When running in output compare or PWM mode, the value in `TIMERN_CCx_OC` will be compared against the count value. In Compare mode the output can be configured to toggle, clear or set on compare match, overflow, and underflow through the `CMOA`, `COFOA` and `CUFOA` fields in `TIMERN_CCx_CTRL`. `TIMERN_CCx_OC` can be accessed directly or through the buffer register `TIMERN_CCx_OCB`, see [Figure 19.16 TIMER Output Compare/PWM Buffer Functionality Detail on page 513](#). When writing to the buffer register, the value in `TIMERN_CCx_OCB` will be written to `TIMERN_CCx_OC` on the next *update event*. This functionality ensures glitch free PWM outputs. The `OCBV` flag in `TIMERN_STATUS` indicates whether the `TIMERN_CCx_OCB` register contains data that has not yet been written to the `TIMERN_CCx_OC` register. Note that when writing 0 to `TIMERN_CCx_OCB` in up-down count mode the OC value is updated when the timer counts from 0 to 1. Thus, the compare match for the next period will not happen until the timer reaches 0 again on the way down.

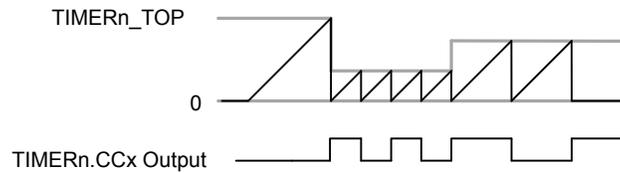

**Figure 19.16. TIMER Output Compare/PWM Buffer Functionality Detail**

### 19.3.3.7 Frequency Generation (FRG)

Frequency generation (see [Figure 19.17 TIMER Up-count Frequency Generation on page 514](#)) can be achieved in compare mode by:

- Setting the counter in up-count mode
- Enabling buffering of the TOP value.
- Setting the CC channels overflow action to toggle

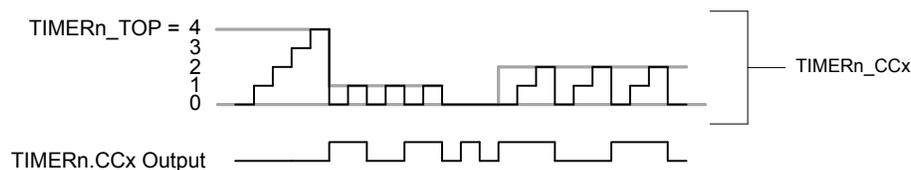

**Figure 19.17. TIMER Up-count Frequency Generation**

The output frequency is given by [Figure 19.18 TIMER Up-count Frequency Generation Equation on page 514](#)

$$f_{FRG} = f_{HFPERCLK\_TIMERn} / [2 \times (PRESC + 1) \times (TOP + 1)]$$

**Figure 19.18. TIMER Up-count Frequency Generation Equation**

The figure below provides cycle accurate timing and event generation information for frequency generation.

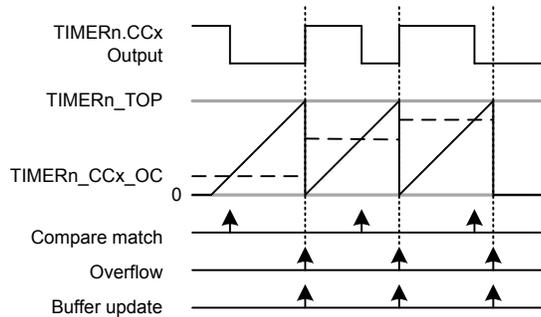

**Figure 19.19. TIMER Up-count Frequency Generation Detail**

### 19.3.3.8 Pulse-Width Modulation (PWM)

In PWM mode, `TIMERn_CCx_OC` is buffered to avoid glitches in the output. The settings in the Compare Output Action configuration bits are ignored in PWM mode and PWM generation is only supported for up-count and up/down-count mode.

### 19.3.3.9 Up-count (Single-slope) PWM

If the counter is set to up-count and the compare/capture channel is put in PWM mode, single slope PWM output will be generated (see [Figure 19.20 TIMER Up-count PWM Generation on page 515](#)). In up-count mode the PWM period is TOP+1 cycles and the PWM output will be high for a number of cycles equal to TIMERn\_CCx\_OC. This means that a constant high output is achieved by setting TIMERn\_CCx\_OC to TOP+1 or higher. The PWM resolution (in bits) is then given by [Figure 19.21 TIMER Up-count PWM Resolution Equation on page 515](#).

**Figure 19.20. TIMER Up-count PWM Generation**

$$R_{PWM_{up}} = \log(TOP+1)/\log(2)$$

**Figure 19.21. TIMER Up-count PWM Resolution Equation**

The PWM frequency is given by [Figure 19.22 TIMER Up-count PWM Frequency Equation on page 515](#):

$$f_{PWM_{up}} = f_{HFPERCLK\_TIMERn} / [(PRESC + 1) \times (TOP + 1)]$$

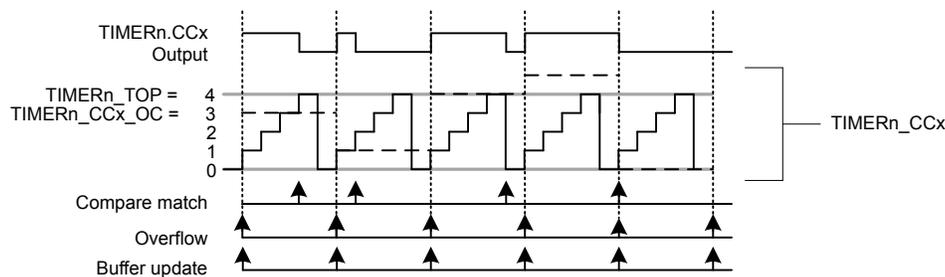

**Figure 19.22. TIMER Up-count PWM Frequency Equation**

The high duty cycle is given by [Figure 19.23 TIMER Up-count Duty Cycle Equation on page 515](#)

$$DS_{up} = OCx/(TOP+1)$$

**Figure 19.23. TIMER Up-count Duty Cycle Equation**

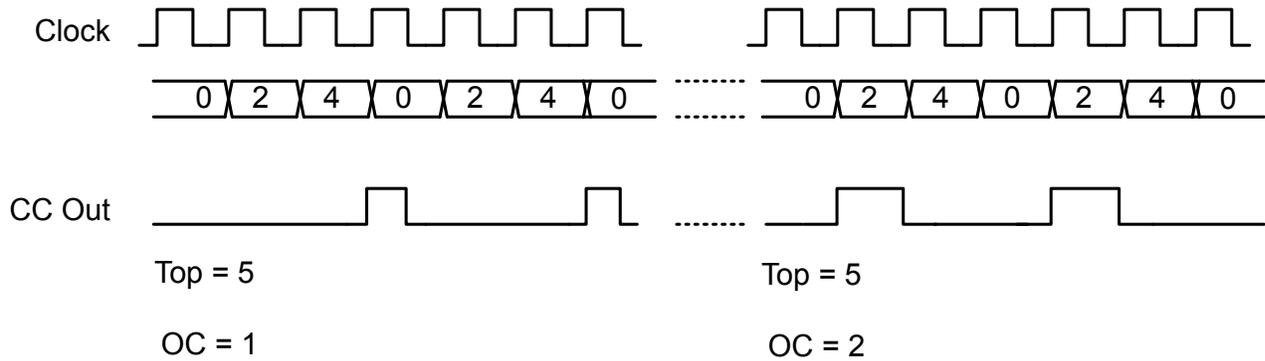

The figure below provides cycle accurate timing and event generation information for up-count mode.

**Figure 19.24. TIMER Up-count PWM Generation Detail**

### 19.3.3.10 2x Count Mode (Up-count)

When the timer is set in 2x mode, the TIMER will count up by two for every (prescaled) clock. This will in effect make any odd Top value be rounded down to the closest even number. Similarly, any odd OC value will generate a match on the closest lower even value as shown in [Figure 19.25 TIMER CC Out in 2x Mode on page 516](#)

**Figure 19.25. TIMER CC Out in 2x Mode**

The PWM resolution is given by [Figure 19.26 TIMER 2x PWM Resolution Equation on page 516](#).

$$R_{PWM_{2xmode}} = \log(TOP/2+1)/\log(2)$$

**Figure 19.26. TIMER 2x PWM Resolution Equation**

The PWM frequency is given by [Figure 19.27 TIMER 2x Mode PWM Frequency Equation \(Up-count\) on page 516](#):

$$f_{PWM_{2xmode}} = f_{HPPERCLK\_TIMERn} / [(PRESC + 1) \times (\text{floor}(TOP/2)+1)]$$

**Figure 19.27. TIMER 2x Mode PWM Frequency Equation (Up-count)**

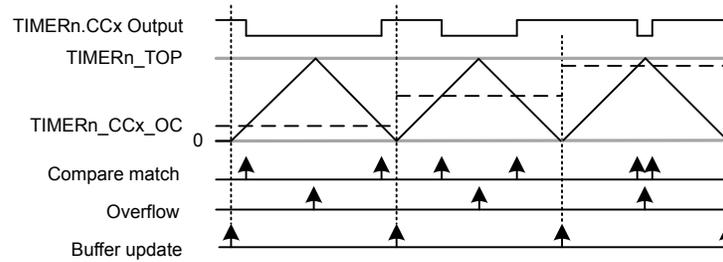

The high duty cycle is given by [Figure 19.28 TIMER 2x Mode Duty Cycle Equation on page 516](#)

$$DS_{2xmode} = OCx / ((\text{floor}(TOP/2)+1)*2)$$

**Figure 19.28. TIMER 2x Mode Duty Cycle Equation**

### 19.3.3.11 Up/Down-count (Dual-slope) PWM

If the counter is set to up-down count and the compare/capture channel is put in PWM mode, dual slope PWM output will be generated by [Figure 19.29 TIMER Up/Down-count PWM Generation on page 517](#). The resolution (in bits) is given by [Figure 19.30 TIMER Up/Down-count PWM Resolution Equation on page 517](#).

**Figure 19.29. TIMER Up/Down-count PWM Generation**

$$R_{PWM_{up/down}} = \log(TOP+1)/\log(2)$$

**Figure 19.30. TIMER Up/Down-count PWM Resolution Equation**

The PWM frequency is given by [Figure 19.31 TIMER Up/Down-count PWM Frequency Equation on page 517](#):

$$f_{PWM_{up/down}} = f_{HFPERCLK\_TIMERn} / (2 \times (PRESC + 1) \times TOP)$$

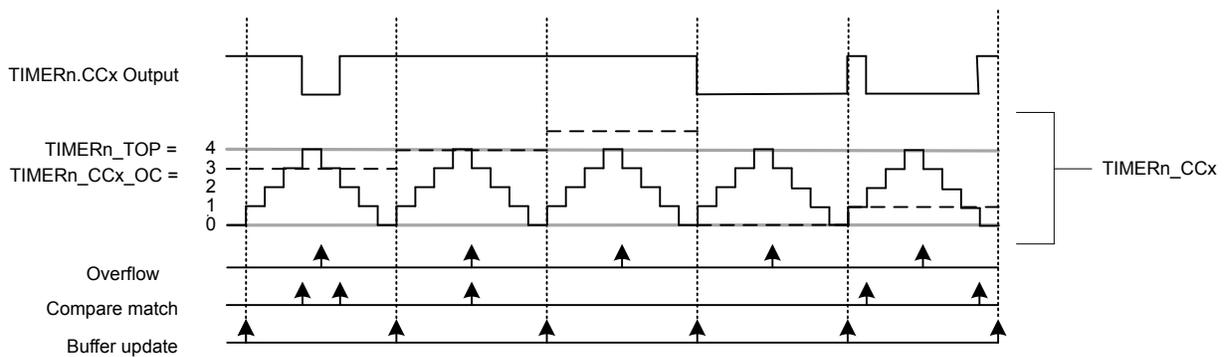

**Figure 19.31. TIMER Up/Down-count PWM Frequency Equation**

The high duty cycle is given by [Figure 19.32 TIMER Up/Down-count Duty Cycle Equation on page 517](#)

$$DS_{up/down} = OCx/TOP$$

**Figure 19.32. TIMER Up/Down-count Duty Cycle Equation**

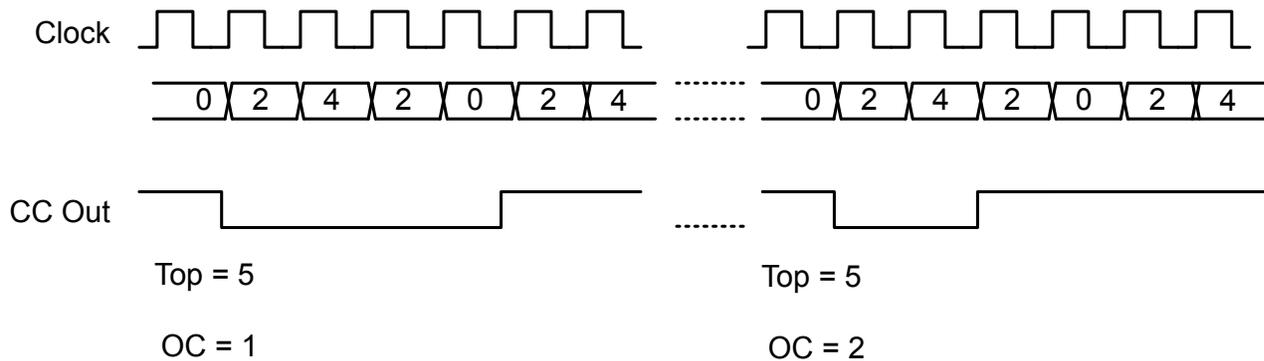

The figure below provides cycle accurate timing and event generation information for up-count mode.

**Figure 19.33. TIMER Up/Down-count PWM Generation**

### 19.3.3.12 2x Count Mode (Up/Down-count)

When the timer is set in 2x mode, the TIMER will count up/down by two. This will in effect make any odd Top value be rounded down to the closest even number. Similarly, any odd OC value will generate a match on the closest lower even value as shown in [Figure 19.34 TIMER CC Out in 2x mode on page 518](#)

**Figure 19.34. TIMER CC Out in 2x mode**

[Figure 19.35 TIMER 2x PWM Resolution Equation on page 518.](#)

$$R_{\text{PWM}_{2\text{xmode}}} = \log(\text{TOP}/2+1)/\log(2)$$

**Figure 19.35. TIMER 2x PWM Resolution Equation**

The PWM frequency is given by [Figure 19.36 TIMER 2x Mode PWM Frequency Equation \(Up/Down-count\) on page 518:](#)

$$f_{\text{PWM}_{2\text{xmode}}} = f_{\text{HFPERCLK\_TIMERn}} / (2 \times (\text{PRESC} + 1) \times (\text{floor}(\text{TOP}/2)))$$

**Figure 19.36. TIMER 2x Mode PWM Frequency Equation (Up/Down-count)**

The high duty cycle is given by two equations based on the OCx values. [Figure 19.37 TIMER 2x Mode Duty Cycle Equation for OCx = 1 or OCx = Even on page 518](#) and [Figure 19.38 TIMER 2x Mode Duty Cycle Equation for all Other OCx = Odd Values on page 518](#)

$$DS_{2\text{xmode}} = (\text{OCx} \times 2) / (\text{floor}(\text{TOP}/2) \times 4)$$

**Figure 19.37. TIMER 2x Mode Duty Cycle Equation for OCx = 1 or OCx = Even**

$$DS_{2\text{xmode}} = (\text{OCx} \times 2 - \text{OCx}) / (\text{floor}(\text{TOP}/2) \times 4)$$

**Figure 19.38. TIMER 2x Mode Duty Cycle Equation for all Other OCx = Odd Values**

### 19.3.3.13 Re-Timing PWM Outputs

PWM outputs are normally synchronous to the TIMER peripheral clock. However for radio applications, it can be desirable to synchronize PWM edges to radio clocks to reduce the interference with RF signalling.

Re-timing is enabled by setting the RETIMEEN bit in TIMERN\_CFG to 1. When RETIMEEN is enabled, PWM X2CNT mode should not be enabled. Doing so may result in unpredictable PWM behavior.

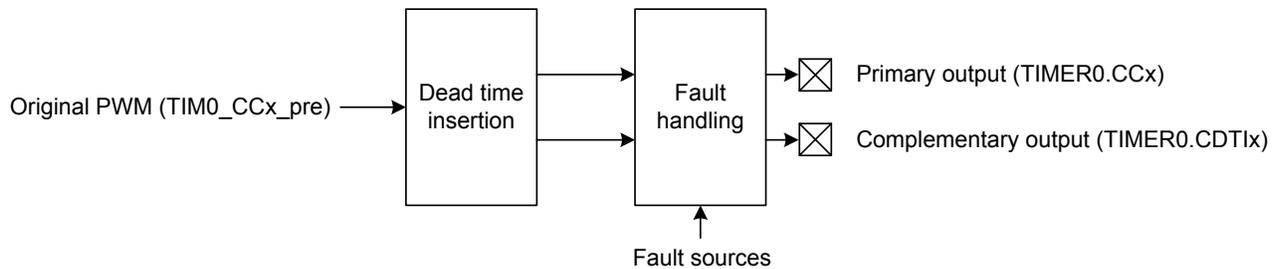

Direct re-timing is supported at peripheral clock frequencies up to 50 MHz. For higher peripheral clock frequencies, set the RETIMESEL bit in TIMERN\_CFG to 1. This allows PWM outputs to be re-timed at frequencies up to 80 MHz, but will introduce up to 1 HFPERCLK<sub>TIMERN</sub> cycle of jitter between the PWM outputs.

#### 19.3.3.14 Timer Configuration Lock

To prevent software errors from making changes to the timer configuration, a configuration lock is available. Writing any value but 0xCE80 to LOCKKEY in TIMERN\_LOCK will lock writes to TIMERN\_CTRL, TIMERN\_CFG, TIMERN\_CMD, TIMERN\_TOP, TIMERN\_TOPB, TIMERN\_CNT, TIMERN\_CCx\_CTRL, TIMERN\_CCx\_CFG, TIMERN\_CCx\_OC, and TIMERN\_CCx\_OCB. To unlock the registers, write 0xCE80 to LOCKKEY in TIMERN\_LOCK. The value of TIMERLOCKSTATUS in TIMERN\_STATUS is 1 when the lock is active, and 0 when the registers are unlocked.

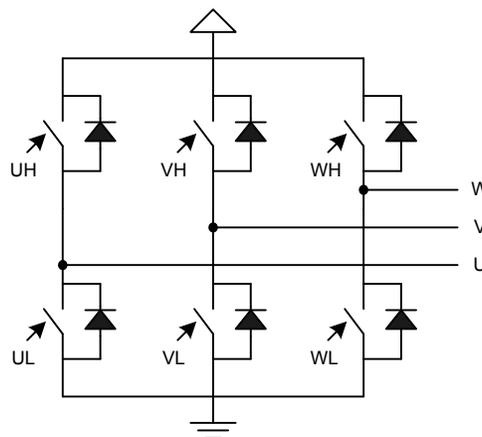

### 19.3.4 Dead-Time Insertion Unit

Some timer modules include a Dead-Time Insertion unit suitable for motor control applications. Refer to the device data sheet to check which timer instances have this feature. The example settings in this section are for TIMER0, but identical settings can be used for other timers with DTI as well. The Dead-Time Insertion Unit aims to make control of brushless DC (BLDC) motors safer and more efficient by introducing complementary PWM outputs with dead-time insertion and fault handling, see [Figure 19.39 TIMER Dead-Time Insertion Unit Overview on page 520](#).

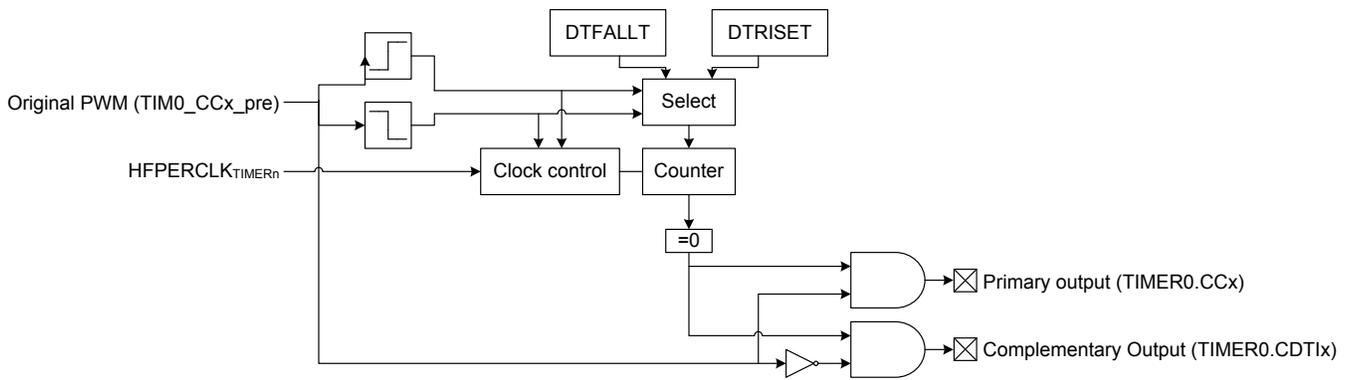

**Figure 19.39. TIMER Dead-Time Insertion Unit Overview**

When used for motor control, the PWM outputs TIM0\_CC0, TIM0\_CC1 and TIM0\_CC2 are often connected to the high-side transistors of a triple half-bridge setup (UH, VH and WH), and the complementary outputs connected to the respective low-side transistors (UL, VL, WL shown in [Figure 19.40 TIMER Triple Half-Bridge on page 520](#)). Transistors used in such a bridge often do not open/close instantaneously, and using the exact complementary inputs for the high and low side of a half-bridge may result in situations where both gates are open. This can give unnecessary current-draw and short circuit the power supply. The DTI unit provides dead-time insertion to deal with this problem.

**Figure 19.40. TIMER Triple Half-Bridge**

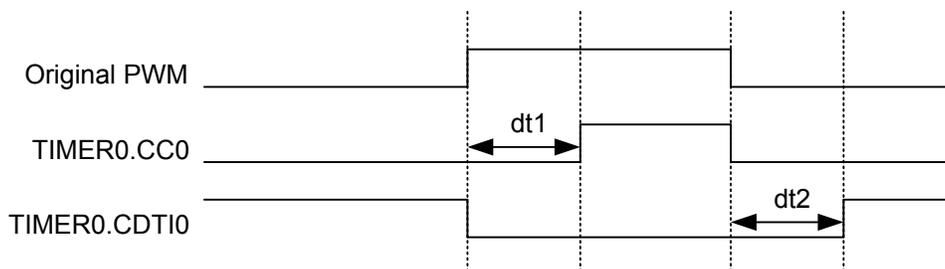

For each of the 3 compare-match outputs of TIMER0, an additional complementary output is provided by the DTI unit. These outputs, named TIM0\_CDTI0, TIM0\_CDTI1 and TIM0\_CDTI2 are provided to make control of e.g. 3-channel BLDC or permanent magnet AC (PMAc) motors possible using only a single timer, see [Figure 19.41 TIMER Overview of Dead-Time Insertion Block for a Single PWM Channel on page 521](#).

**Figure 19.41. TIMER Overview of Dead-Time Insertion Block for a Single PWM Channel**

The DTI unit is enabled by setting DTEN in `TIMER0_DTCFG`. In addition to providing the complementary outputs, the DTI unit then also overrides the compare match outputs from the timer.

The DTI unit gives the rising edges of the PWM outputs and the rising edges of the complementary PWM outputs a configurable time delay. By doing this, the DTI unit introduces a dead-time where both the primary and complementary outputs in a pair are inactive as seen in [Figure 19.42 TIMER Polarity of Both Signals are Set as Active-High on page 521](#).

**Figure 19.42. TIMER Polarity of Both Signals are Set as Active-High**

Dead-time is specified individually for the rising and falling edge of the original PWM. These values are shared across all the three PWM channels of the DTI unit. A single prescaler value is provided for the DTI unit, meaning that both the rising and falling edge dead-times share prescaler value. The prescaler divides the  $H\text{FPERCLK}_{\text{TIMER0}}$  by a configurable factor between 1 and 1024, which is set in the `DTPRESC` field in `TIMER0_DTTIMECFG`. The rising and falling edge dead-times are configured in `DTRISSET` and `DTFALLT` in `TIMER0_DTTIMECFG` to any number between 1-64  $H\text{FPERCLK}_{\text{TIMER0}}$  cycles.

The `DTAR` and `DTFATS` bits in `TIMER0_DTCFG` control the DTI output behavior when the timer stops. By default the DTI block stops when the timer is stopped. Setting the `DTAR` bit will cause the DTI output on channel 0 to continue when the timer is stopped. `DTAR` effects only channel 0. See [19.3.4.2 PRS Channel as a Source](#) for an example of when this can be used. While in this mode the undivided  $H\text{FPERCLK}_{\text{TIMER0}}$  (`DTPRESC=0`) is always used regardless of the programmed `DTPRESC` value in `TIMER0_DTTIMECFG`. This means that rise and fall dead times are calculated assuming `DTPRESC = 0`.

When the timer stops, DTI outputs are frozen by default, preserving their last state. To allow the outputs to go to a safe state, program the `DTFA` field of the `TIMER0_DTCFG` register to the safe values and set the `DTFATS` bitfield in the `TIMER0_DTCFG` register. Note that when `DTAR` is also set, `DTAR` has priority over `DTFATS` for DTI channel 0 output.

The following table shows the DTI output when the timer is halted.

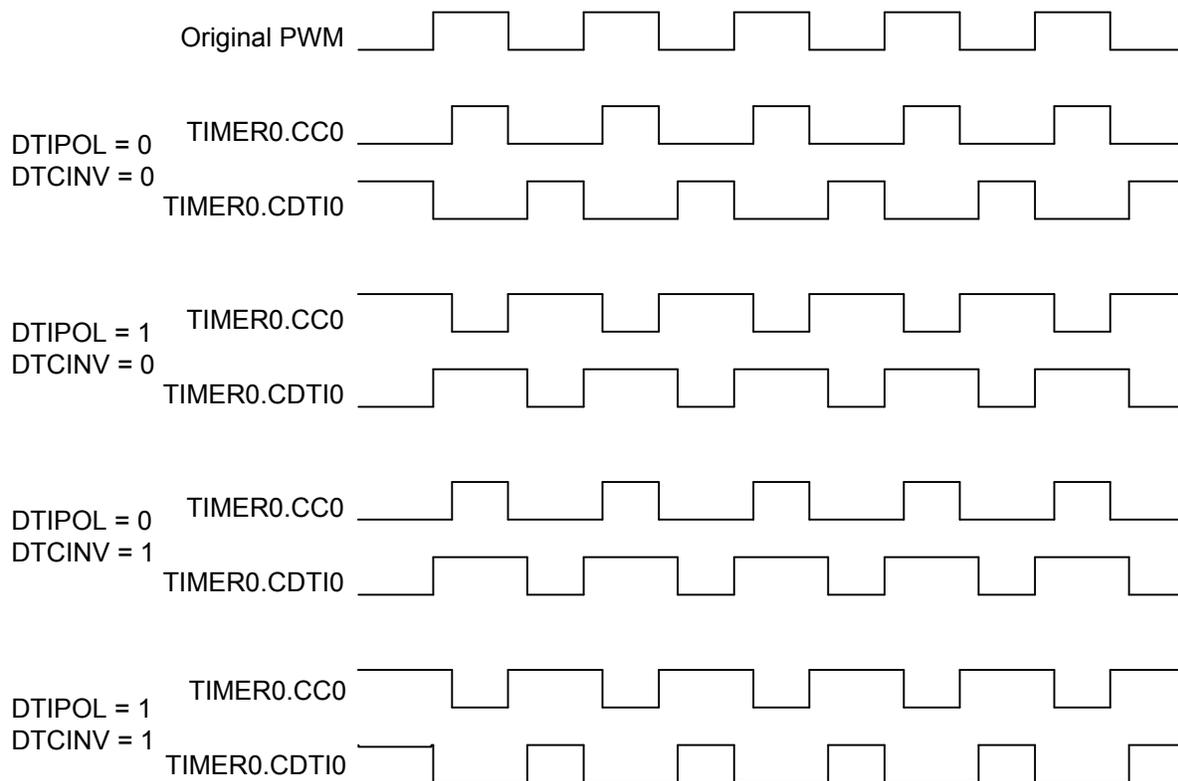

**Table 19.3. DTI Output When Timer Halted**

DTAR	DTFATS	State
0	0	frozen
0	1	safe
1	0	running
1	1	running

**19.3.4.1 Output Polarity**

The value of the primary and complementary outputs in a pair will never be set active at the same time by the DTI unit. The polarity of the outputs can be changed if this is required by the application. The active values of the primary and complementary outputs are set by the DTIPOL and DTCINV bits in the `TIMER0_DTCTRL` register. The DTIPOL bit of this register specifies the base polarity. If DTIPOL = 0, then the outputs are active-high, and if DTIPOL = 1 they are active-low. The relative phase of the primary and complementary outputs is not changed by DTIPOL, as the polarity of both outputs is changed, see [Figure 19.43 TIMER Output Polarities on page 522](#).

In some applications, it may be required that the primary outputs are active-high, while the complementary outputs are active-low. This can be accomplished by manipulating the DTCINV bit of the `TIMER0_DTCTRL` register, which inverts the polarity of the complementary outputs relative to the primary outputs. As an example, DTIPOL = 0 and DTCINV = 0 results in outputs with opposite phase and active-high states. Similarly, DTIPOL = 1 and DTCINV = 1 results in outputs with equal phase and the primary output will be active-high while the complementary will be active-low.

**Figure 19.43. TIMER Output Polarities**

Output generation on the individual DTI outputs can be disabled by configuring `TIMER0_DTOGEN`. When output generation on an output is disabled that output will go to and stay in its inactive state.

### 19.3.4.2 PRS Channel as a Source

A PRS channel can be used as input to the DTI module instead of the PWM output from the timer for DTI channel 0. Setting DTPRSEN in `TIMER0_DTCFG` will override the source of the first DTI channel, driving `TIM0_CC0` and `TIM0_CDTI0`, with the value on the PRS channel. The rest of the DTI channels will continue to be driven by the PWM output from the timer. The input PRS channel is chosen within the PRS module with `PRSEL` in the `PRS_CONSUMER_TIMERn_DTI` register. Note that the timer must be running even when PRS is used as the DTI source. However, if it is required to keep the DTI channel 0 running even when the timer is stopped, set `DTAR` in `TIMER0_DTCFG`. When this bit is set, it uses `DTPRESC=0` regardless of the value programmed in `DTPRESC` in `TIMER0_DTTIMECFG`.

**Note:** When using synchronous PRS sources, it is recommended to configure the PRS consumer registers prior to selecting PRS triggering to avoid any false triggers.

The DTI prescaler, set by `DTPRESC` in `TIMER0_DTTIMECFG` determines the accuracy with which the DTI can insert dead-time into a PRS signal. The maximum dead-time error equals `DTIPRESC+1` clock cycles. With `DTIPRESC = 0`, the inserted dead-times are therefore accurate, but they may be inaccurate for larger prescaler settings.

### 19.3.4.3 Fault Handling

The fault handling system of the DTI unit allows the outputs of the DTI unit to be put in a well-defined state in case of a fault. This hardware fault handling system enables a fast reaction to faults, reducing the possibility of damage to the system.

The fault sources which trigger a fault in the DTI module are determined by the bitfields of `TIMER0_DTFCFG` register. Any combination of the available error sources can be selected:

- PRS source 1, determined by `PRSEL` in `PRS_CONSUMER_TIMERn_DTIFS1`
- PRS source 2, determined by `PRSEL` in `PRS_CONSUMER_TIMERn_DTIFS2`
- Debugger
- Core Lockup
- EM2 or EM3 Entry

One or two PRS channels can be used as an error source. When PRS source 1 is selected as an error source, `PRSEL` in `PRS_CONSUMER_TIMERn_DTIFS1` determines which PRS channel is used for this source. `PRSEL` in `PRS_CONSUMER_TIMERn_DTIFS2` determines which PRS channel is selected as PRS source 2. Note that for Core Lockup, the `LOCKUPRDIS` in `RMU_CTRL` must be set. Otherwise this will generate a full reset of the chip.

**Note:** When using synchronous PRS sources, it is recommended to configure the PRS consumer registers prior to selecting PRS triggering to avoid any false triggers.

### 19.3.4.4 Action on Fault

When a fault occurs, the bit representing the fault source is set in `TIMER0_DTFault` register, and the outputs from the DTI unit are set to a well-defined state. The following options are available, and can be enabled by configuring `DTFA` in `TIMER0_DTFCFG`:

- Set outputs to inactive level
- Clear outputs
- Tristate outputs

With the first option enabled, the output state in case of a fault depends on the polarity settings for the individual outputs. An output set to be active high will be set low if a fault is detected, while an output set to be active low will be driven high.

When a fault occurs, the fault source(s) can be read out from `TIMER0_DTFault` register.

Additionally a fault action can also be triggered when the timer stops if `DTFATS` in `TIMER0_DTCFG` is set. This allows the DTI output to go to safe state specified by `DTFA` in `TIMER0_DTFCFG` when the timer stops. When `DTAR` and `DTFATS` in `TIMER0_DTCFG` are both set, DTI channel 0 keeps running even when the timer stops. This is useful when DTI channel 0 has an input coming from PRS.

### 19.3.4.5 Exiting Fault State

When a fault is triggered by the PRS system, software intervention is required to re-enable the outputs of the DTI unit. This is done by manually clearing bits in the `TIMER0_DTFault` register. If the fault source as determined by checking `TIMER0_DTFault` is the debugger alone, the outputs can be automatically restarted when the debugger exits. To enable automatic restart set `DTDAS` in `TIMER0_DTCFG`. When an automatic restart occurs the `DTDBGF` bit in `TIMER0_DTFault` will be automatically cleared by hardware. If any other bits in the `TIMER0_DTFault` register are set when the hardware clears `DTDBGF` the DTI module will not exit the fault state.

### 19.3.4.6 DTI Configuration Lock

To prevent software errors from making changes to the DTI configuration, a configuration lock is available. Writing any value but 0xCE80 to LOCKKEY in TIMER0\_DTLOCK locks writes to registers TIMER0\_DTCFG, TIMER0\_DTF CFG, TIMER0\_DTCTRL, and TIMER0\_DTTIMECFG. To unlock the registers, write 0xCE80 to LOCKKEY in TIMER0\_DTLOCK. The value of DTILOCKSTATUS in TIMERN\_STATUS is 1 when the lock is active, and 0 when the registers are unlocked.

### 19.3.5 Debug Mode

When the CPU is halted in debug mode, the timer can be configured to either continue to run or to be frozen. This is configured in DEBUGRUN in TIMERN\_CFG.

### 19.3.6 Interrupts, DMA and PRS Output

The timer can generate several type of output events:

- Counter Underflow
- Counter Overflow
- Quadrature Decoder Direction Change
- Compare match or input capture (one per compare/capture channel)

Each of the events has its own interrupt flag. Also, there are interrupt flags for each compare/capture channel which are set on FIFO overflow or underflow in capture mode. FIFO overflow happens when a new capture over-writes an old unread capture in TIMERN\_CCx\_ICF. FIFO underflow happens when software reads TIMERN\_CCx\_ICF while the FIFO is empty.

If the interrupt flags are set and the corresponding interrupt enable bits in TIMERN\_IEN are set high, the timer will send out an interrupt request. Each of the events may optionally trigger signals to PRS channels. The PRSCONF field in TIMERN\_CCx\_CFG determines how PRS events are generated. When PRSCONF is set to PULSE, and event will lead to a one HFPERCLK<sub>TIMERN</sub> cycle high pulse on individual PRS outputs. Setting PRSCONF to LEVEL will make the PRS output follow the compare match output. Interrupts are cleared by setting the corresponding bit in the TIMERN\_IFC register.

Each of the events will also set a DMA request when they occur. The different DMA requests are cleared when certain acknowledge conditions are met, see [Table 19.4 TIMER DMA Events on page 524](#). Events which clear the DMA requests do not clear interrupt flags. Software must still manually clear the interrupt flag if interrupts are in use.

If DMACLACTION is set in TIMERN\_CFG, the DMA request is cleared when the triggered DMA channel is active, without having to access any timer registers. This is useful in cases where a timer event is used to trigger a DMA transfer in output compare or PWM mode that does not target the OC or OCB registers. DMACLACTION is not applicable in input capture mode.

**Table 19.4. TIMER DMA Events**

Event	Acknowledge/Clear
Underflow/Overflow	Read or write to TIMERN_CNT or TIMERN_TOPB
CC0 Input Capture - ICFWLFULL0 flag set	ICFEMPTY0 flag set (read FIFO via TIMERN_CC0_ICF)
CC1 Input Capture - ICFWLFULL1 flag set	ICFEMPTY1 flag set (read FIFO via TIMERN_CC1_ICF)
CC2 Input Capture - ICFWLFULL2 flag set	ICFEMPTY2 flag set (read FIFO via TIMERN_CC2_ICF)
CC3 Input Capture - ICFWLFULL3 flag set	ICFEMPTY3 flag set (read FIFO via TIMERN_CC3_ICF)
CC0 Output Compare / PWM - Match event	Write TIMERN_CC0_OC or TIMERN_CC0_OCB
CC1 Output Compare / PWM - Match event	Write TIMERN_CC1_OC or TIMERN_CC1_OCB
CC2 Output Compare / PWM - Match event	Write TIMERN_CC2_OC or TIMERN_CC2_OCB
CC3 Output Compare / PWM - Match event	Write TIMERN_CC3_OC or TIMERN_CC3_OCB

### 19.3.7 GPIO Input/Output

The TIMn\_CCx inputs/outputs and TIMn\_CDTIx outputs are accessible as alternate functions through GPIO. Each pin connection can be enabled/disabled separately using the GPIO module control registers. See the device data sheet for the available locations for each signal.

## 19.4 TIMER Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	TIMER_IPVERSION	R	IP Version ID
0x004	TIMER_CFG	RW CONFIG	Configuration Register
0x008	TIMER_CTRL	RW SYNC	Control Register

## 19.5 TIMER Register Description

### 19.5.1 TIMER\_IPVERSION - IP Version ID

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x1																															
<b>Access</b>	R																															
<b>Name</b>	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x1	R	<b>IP Version ID</b>  The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.

## 19.5.2 TIMER\_CFG - Configuration Register

Offset	Bit Position																																																	
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																		
<b>Reset</b>																	0x0	0x0				0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0																	
<b>Access</b>																	RW	RW				RW	RW				RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW										
<b>Name</b>																	PRESC																			RETISESEL	DISSYNCOU	RETIMEEN		CLKSEL	DMACTRACT	DEBGRUN	QDM	OSMEN	SYNC					MODE

Bit	Name	Reset	Access	Description
31:28	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>

27:18	PRESC	0x0	RW	<b>Prescaler Setting</b>  These bits select the prescaling factor for the counter clock. The selected timer clock will be divided by PRESC+1 before clocking the counter. The following modes are provided for easier software porting from Series 0 or Series 1 devices. However, the prescaler is not limited to these options.
-------	-------	-----	----	---

Value	Mode	Description
0	DIV1	No prescaling
1	DIV2	Prescale by 2
3	DIV4	Prescale by 4
7	DIV8	Prescale by 8
15	DIV16	Prescale by 16
31	DIV32	Prescale by 32
63	DIV64	Prescale by 64
127	DIV128	Prescale by 128
255	DIV256	Prescale by 256
511	DIV512	Prescale by 512
1023	DIV1024	Prescale by 1024

17	RSSCOIST	0x0	RW	<b>Reload-Start Sets COIST</b>  When enabled, compare output is set to COIST value on a Reload-Start event.
----	----------	-----	----	---

16	ATI	0x0	RW	<b>Always Track Inputs</b>  Enabling ATI makes CCPOL always track the polarity of the inputs.
----	-----	-----	----	---

15:13	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
-------	-----------------	--	--	---

12	RETISESEL	0x0	RW	<b>PWM output retime select</b>  When RETIMEEN is set, the PWM output stage will be re-timed to synchronize edges with radio clocks and reduce RF interference. This will introduce up to 1 cycle of clock jitter between PWM outputs.
----	-----------	-----	----	--

11	DISSYNCOU	0x0	RW	<b>Disable Timer Start/Stop/Reload output</b>  When this bit is set, the Timer does not start/stop/reload other timers with SYNC bit set.
----	-----------	-----	----	---

Bit	Name	Reset	Access	Description
	Value	Mode		Description
	0	EN		Timer can start/stop/reload other timers with SYNC bit set
	1	DIS		Timer cannot start/stop/reload other timers with SYNC bit set
10	RETIMEN	0x0	RW	<b>PWM output retimed enable</b> Enable retiming of PWM output.
	Value	Mode		Description
	0	DISABLE		PWM outputs are not re-timed.
	1	ENABLE		PWM outputs are re-timed.
9:8	CLKSEL	0x0	RW	<b>Clock Source Select</b> These bits select the clock source for the timer.
	Value	Mode		Description
	0	PRESCM01GRPACLK		Prescaled EM01GRPACLK
	1	CC1		Compare/Capture Channel 1 Input
	2	TIMEROUF		Timer is clocked by underflow(down-count) or overflow(up-count) in the lower numbered neighbor Timer
7	DMACLRACT	0x0	RW	<b>DMA Request Clear on Active</b> When this bit is set, the DMA requests are cleared when the corresponding DMA channel is active. This enables the timer DMA requests to be cleared without accessing the timer.
6	DEBUGRUN	0x0	RW	<b>Debug Mode Run Enable</b> Set this bit to enable timer to run in debug mode.
	Value	Mode		Description
	0	HALT		Timer is halted in debug mode
	1	RUN		Timer is running in debug mode
5	QDM	0x0	RW	<b>Quadrature Decoder Mode Selection</b> This bit sets the mode for the quadrature decoder.
	Value	Mode		Description
	0	X2		X2 mode selected
	1	X4		X4 mode selected
4	OSMEN	0x0	RW	<b>One-shot Mode Enable</b> Enable/disable one shot mode.
3	SYNC	0x0	RW	<b>Timer Start/Stop/Reload Synchronization</b> When this bit is set, the Timer is started/stopped/reloaded by start/stop/reload commands in the other timers.
	Value	Mode		Description
	0	DISABLE		Timer operation is unaffected by other timers.

Bit	Name	Reset	Access	Description
	1	ENABLE		Timer may be started, stopped and re-loaded from other timer instances.
2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	MODE	0x0	RW	<b>Timer Mode</b>
These bits set the counting mode for the Timer. Note, when Quadrature Decoder Mode is selected (MODE = 'b11), the CLKSEL is don't care. The Timer is clocked by the Decoder Mode clock output.				
	Value	Mode	Description	
	0	UP	Up-count mode	
	1	DOWN	Down-count mode	
	2	UPDOWN	Up/down-count mode	
	3	QDEC	Quadrature decoder mode	

## 19.5.3 TIMER\_CTRL - Control Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Name	Reset	Access	Description
31:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	X2CNT	0x0	RW	<b>2x Count Mode</b> Enable 2x count mode
3:2	FALLA	0x0	RW	<b>Timer Falling Input Edge Action</b> These bits select the action taken in the counter when a falling edge occurs on the input.
	Value	Mode		Description
	0	NONE		No action
	1	START		Start counter without reload
	2	STOP		Stop counter without reload
	3	RELOADSTART		Reload and start counter
1:0	RISEA	0x0	RW	<b>Timer Rising Input Edge Action</b> These bits select the action taken in the counter when a rising edge occurs on the input.
	Value	Mode		Description
	0	NONE		No action
	1	START		Start counter without reload
	2	STOP		Stop counter without reload
	3	RELOADSTART		Reload and start counter

## 19.5.4 TIMER\_CMD - Command Register

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0	0x0		
<b>Access</b>																													W(nB)	W(nB)		
<b>Name</b>																													STOP	START		

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	STOP Write a 1 to this bit to stop timer	0x0	W(nB)	<b>Stop Timer</b>
0	START Write a 1 to this bit to start timer	0x0	W(nB)	<b>Start Timer</b>

## 19.5.5 TIMER\_STATUS - Status Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Access						R	R	R						R	R	R						R	R	R		R	R	R		R	R	R
Name						CCPOL2	CCPOL1	CCPOL0						ICFEMPTY2	ICFEMPTY1	ICFEMPTY0						OCBV2	OCBV1	OCBV0		SYNCBUSY	DTILOCKSTATUS	TIMERLOCKSTATUS		TOPBV	DIR	RUNNING

Bit	Name	Reset	Access	Description									
31:27	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>											
26	CCPOL2	0x0	R	<b>Compare/Capture Polarity</b>  In Input Capture mode, this bit indicates the polarity of the edge that triggered capture in TIMERNn_CCx_CCv. In Compare/PWM mode, this bit indicates the polarity of the selected input to CC channel x. These bits are cleared when CCMODE is written to 0b00 (Off).  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>LOWRISE</td> <td>CCx polarity low level/rising edge</td> </tr> <tr> <td>1</td> <td>HIGHFALL</td> <td>CCx polarity high level/falling edge</td> </tr> </tbody> </table>	Value	Mode	Description	0	LOWRISE	CCx polarity low level/rising edge	1	HIGHFALL	CCx polarity high level/falling edge
Value	Mode	Description											
0	LOWRISE	CCx polarity low level/rising edge											
1	HIGHFALL	CCx polarity high level/falling edge											
25	CCPOL1	0x0	R	<b>Compare/Capture Polarity</b>  In Input Capture mode, this bit indicates the polarity of the edge that triggered capture in TIMERNn_CCx_CCv. In Compare/PWM mode, this bit indicates the polarity of the selected input to CC channel x. These bits are cleared when CCMODE is written to 0b00 (Off).  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>LOWRISE</td> <td>CCx polarity low level/rising edge</td> </tr> <tr> <td>1</td> <td>HIGHFALL</td> <td>CCx polarity high level/falling edge</td> </tr> </tbody> </table>	Value	Mode	Description	0	LOWRISE	CCx polarity low level/rising edge	1	HIGHFALL	CCx polarity high level/falling edge
Value	Mode	Description											
0	LOWRISE	CCx polarity low level/rising edge											
1	HIGHFALL	CCx polarity high level/falling edge											
24	CCPOL0	0x0	R	<b>Compare/Capture Polarity</b>  In Input Capture mode, this bit indicates the polarity of the edge that triggered capture in TIMERNn_CCx_CCv. In Compare/PWM mode, this bit indicates the polarity of the selected input to CC channel x. These bits are cleared when CCMODE is written to 0b00 (Off).  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>LOWRISE</td> <td>CCx polarity low level/rising edge</td> </tr> <tr> <td>1</td> <td>HIGHFALL</td> <td>CCx polarity high level/falling edge</td> </tr> </tbody> </table>	Value	Mode	Description	0	LOWRISE	CCx polarity low level/rising edge	1	HIGHFALL	CCx polarity high level/falling edge
Value	Mode	Description											
0	LOWRISE	CCx polarity low level/rising edge											
1	HIGHFALL	CCx polarity high level/falling edge											
23:19	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>											
18	ICFEMPTY2	0x0	R	<b>Input capture fifo empty</b>  Set when input capture FIFO is empty									

Bit	Name	Reset	Access	Description
17	ICFEMPTY1	0x0	R	<b>Input capture fifo empty</b> Set when input capture FIFO is empty
16	ICFEMPTY0	0x0	R	<b>Input capture fifo empty</b> Set when input capture FIFO is empty
15:11	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
10	OCBV2	0x0	R	<b>Output Compare Buffer Valid</b> This field indicates that the TIMERN_CCx_CCVB registers contain data which have not been written to TIMERN_CCx_CCV. These bits are only used in OUTPUTCOMPARE or PWM mode and are cleared when CCMODE is written to 0b00 (Off).
9	OCBV1	0x0	R	<b>Output Compare Buffer Valid</b> This field indicates that the TIMERN_CCx_CCVB registers contain data which have not been written to TIMERN_CCx_CCV. These bits are only used in OUTPUTCOMPARE or PWM mode and are cleared when CCMODE is written to 0b00 (Off).
8	OCBV0	0x0	R	<b>Output Compare Buffer Valid</b> This field indicates that the TIMERN_CCx_CCVB registers contain data which have not been written to TIMERN_CCx_CCV. These bits are only used in OUTPUTCOMPARE or PWM mode and are cleared when CCMODE is written to 0b00 (Off).
7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6	SYNCBUSY	0x0	R	<b>Sync Busy</b> Indicates synchronization ongoing
5	DTILOCKSTATUS	0x0	R	<b>DTI lock status</b> Indicates current status of DTI lock
	Value	Mode	Description	
	0	UNLOCKED	DTI registers are unlocked	
	1	LOCKED	DTI registers are locked	
4	TIMERLOCKSTATUS	0x0	R	<b>Timer lock status</b> Indicates current status of Timer lock
	Value	Mode	Description	
	0	UNLOCKED	TIMER registers are unlocked	
	1	LOCKED	TIMER registers are locked	
3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	TOPBV	0x0	R	<b>TOP Buffer Valid</b> This indicates that TIMERN_TOPB contains valid data that has not been written to TIMERN_TOP. This bit is also cleared when TIMERN_TOP is written.
1	DIR	0x0	R	<b>Direction</b> Indicates count direction.
	Value	Mode	Description	

Bit	Name	Reset	Access	Description
	0	UP		Counting up
	1	DOWN		Counting down
0	RUNNING	0x0	R	<b>Running</b> Indicates if timer is running or not.

## 19.5.6 TIMER\_IF - Interrupt Flag Register

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>						0x0	0x0	0x0		0x0	0x0	0x0		0x0	0x0	0x0										0x0	0x0	0x0		0x0	0x0	0x0
<b>Access</b>						RW	RW	RW		RW	RW	RW		RW	RW	RW										RW	RW	RW		RW	RW	RW
<b>Name</b>						ICFUF2	ICFUF1	ICFUF0		ICFOF2	ICFOF1	ICFOF0		ICFWLFULL2	ICFWLFULL1	ICFWLFULL0										CC2	CC1	CC0		DIRCHG	UF	OF

Bit	Name	Reset	Access	Description
31:27	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
26	ICFUF2	0x0	RW	<b>Input capture FIFO underflow</b> Indicates that software tried to read an empty FIFO on channel 2.
25	ICFUF1	0x0	RW	<b>Input capture FIFO underflow</b> Indicates that software tried to read an empty FIFO on channel 1.
24	ICFUF0	0x0	RW	<b>Input capture FIFO underflow</b> Indicates that software tried to read an empty FIFO on channel 0.
23	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
22	ICFOF2	0x0	RW	<b>Input Capture FIFO overflow</b> Indicates that input capture FIFO for channel 2 has overflowed, and a prior captured value was lost. The latest captured value can be read from the ICOF register.
21	ICFOF1	0x0	RW	<b>Input Capture FIFO overflow</b> Indicates that input capture FIFO for channel 1 has overflowed, and a prior captured value was lost. The latest captured value can be read from the ICOF register.
20	ICFOF0	0x0	RW	<b>Input Capture FIFO overflow</b> Indicates that input capture FIFO for channel 0 has overflowed, and a prior captured value was lost. The latest captured value can be read from the ICOF register.
19	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
18	ICFWLFULL2	0x0	RW	<b>Input Capture Watermark Level Full</b> This bit indicates that the Input capture FIFO watermark for channel 2 has been exceeded.
17	ICFWLFULL1	0x0	RW	<b>Input Capture Watermark Level Full</b> This bit indicates that the Input capture FIFO watermark for channel 1 has been exceeded.
16	ICFWLFULL0	0x0	RW	<b>Input Capture Watermark Level Full</b> This bit indicates that the Input capture FIFO watermark for channel 0 has been exceeded.
15:7	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
6	CC2	0x0	RW	<b>Capture Compare Channel 2 Interrupt Flag</b>

Bit	Name	Reset	Access	Description
				In INPUT CAPTURE mode this bit indicates that a new Capture event has taken place. In OUTPUTCOMPARE or PWM mode this bit indicates that a match event has taken place
5	CC1	0x0	RW	<b>Capture Compare Channel 1 Interrupt Flag</b> In INPUT CAPTURE mode this bit indicates that a new Capture event has taken place. In OUTPUTCOMPARE or PWM mode this bit indicates that a match event has taken place
4	CC0	0x0	RW	<b>Capture Compare Channel 0 Interrupt Flag</b> In INPUT CAPTURE mode this bit indicates that a new Capture event has taken place. In OUTPUTCOMPARE or PWM mode this bit indicates that a match event has taken place
3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	DIRCHG	0x0	RW	<b>Direction Change Detect Interrupt Flag</b> This bit is set when count direction changes. Set only in Quadrature Decoder mode
1	UF	0x0	RW	<b>Underflow Interrupt Flag</b> This bit indicates that there has been an underflow.
0	OF	0x0	RW	<b>Overflow Interrupt Flag</b> This bit indicates that there has been an overflow.

## 19.5.7 TIMER\_IEN - Interrupt Enable Register

Offset	Bit Position																																				
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Name	Reset	Access	Description
31:27	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
26	ICFUF2	0x0	RW	<b>ICFUF2 Interrupt Enable</b> Enable/Disable the ICFUF2 interrupt
25	ICFUF1	0x0	RW	<b>ICFUF1 Interrupt Enable</b> Enable/Disable the ICFUF1 interrupt
24	ICFUF0	0x0	RW	<b>ICFUF0 Interrupt Enable</b> Enable/Disable the ICFUF0 interrupt
23	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
22	ICFOF2	0x0	RW	<b>ICFOF2 Interrupt Enable</b> Enable/Disable the ICFOF2 interrupt
21	ICFOF1	0x0	RW	<b>ICFOF1 Interrupt Enable</b> Enable/Disable the ICFOF1 interrupt
20	ICFOF0	0x0	RW	<b>ICFOF0 Interrupt Enable</b> Enable/Disable the ICFOF0 interrupt
19	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
18	ICFWLFULL2	0x0	RW	<b>ICFWLFULL2 Interrupt Enable</b> Enable/Disable the ICFWLFULL2 interrupt
17	ICFWLFULL1	0x0	RW	<b>ICFWLFULL1 Interrupt Enable</b> Enable/Disable the ICFWLFULL1 interrupt
16	ICFWLFULL0	0x0	RW	<b>ICFWLFULL0 Interrupt Enable</b> Enable/Disable the ICFWLFULL0 interrupt
15:7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6	CC2	0x0	RW	<b>CC2 Interrupt Enable</b> Enable/Disable the CC2 interrupt
5	CC1	0x0	RW	<b>CC1 Interrupt Enable</b>

Bit	Name	Reset	Access	Description
				Enable/Disable the CC1 interrupt
4	CC0	0x0	RW	<b>CC0 Interrupt Enable</b> Enable/Disable the CC0 interrupt
3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in 1.2 Conventions</i>		
2	DIRCHG	0x0	RW	<b>Direction Change Detect Interrupt Enable</b> Enable/Disable the DIRCHG interrupt
1	UF	0x0	RW	<b>Underflow Interrupt Enable</b> Enable/Disable the UF interrupt
0	OF	0x0	RW	<b>Overflow Interrupt Enable</b> Enable/Disable the OF interrupt

### 19.5.8 TIMER\_TOP - Counter Top Value Register

Offset	Bit Position																																
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																	0xFFFF																
<b>Access</b>																	RW																
<b>Name</b>																	TOP																

Bit	Name	Reset	Access	Description
31:0	TOP	0xFFFF	RW	<b>Counter Top Value</b> These bits hold the TOP value for the counter

### 19.5.9 TIMER\_TOPB - Counter Top Value Buffer Register

Offset	Bit Position																																
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																	0x0																
<b>Access</b>																	RW																
<b>Name</b>																	TOPB																

Bit	Name	Reset	Access	Description
31:0	TOPB	0x0	RW	<b>Counter Top Buffer Register</b> These bits hold the TOP buffer value.

## 19.5.10 TIMER\_CNT - Counter Value Register

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	RW															
<b>Name</b>																	CNT															

Bit	Name	Reset	Access	Description
31:0	CNT	0x0	RW	<b>Counter Value</b>
These bits hold the counter value.				

## 19.5.11 TIMER\_LOCK - TIMER Configuration Lock Register

Offset	Bit Position																															
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	W															
<b>Name</b>																	LOCKKEY															

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15:0	LOCKKEY	0x0	W	<b>Timer Lock Key</b>
Write any other value than the unlock code to lock TIMERn_CTRL, TIMERn_CFG, TIMERn_CMD, TIMERn_TOP, TIMERn_CNT, TIMERn_CCx_CTRL, TIMERn_CCx_CFG, and TIMERn_CCx_OC from editing. Write the unlock code to unlock these registers.				
Value		Mode		Description
52864		UNLOCK		Write to unlock TIMER registers

## 19.5.12 TIMER\_EN - Module En

Offset	Bit Position																															
0x030	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0				
<b>Access</b>																											R	RW				
<b>Name</b>																											DISABLING	EN				

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISABLING	0x0	R	<b>Disablement busy status</b>  When EN is cleared, DISABLING status is set immediately, and cleared when disablement finishes. Disablement resets peripheral cores and not APB registers except hardware updated registers such as INTFLAGS and FIFO
0	EN	0x0	RW	<b>Timer Module Enable</b>  The ENABLE bit enables the module. Software should write to CONFIG type registers before setting the ENABLE bit. Software should write to SYNC type registers only after setting the ENABLE bit.

## 19.5.13 TIMER\_CCx\_CFG - CC Channel Configuration Register

Offset	Bit Position																															
0x060	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>												0x0	0x0	0x0	0x0												0x0				0x0	
<b>Access</b>												RW	RW	RW	RW												RW				RW	
<b>Name</b>												ICFWL	FILT	PRSCONF	INSEL												COIST				MODE	

Bit	Name	Reset	Access	Description
31:22	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
21	ICFWL	0x0	RW	<b>Input Capture FIFO watermark level</b> Sets the watermark level for generation of the ICFWLFULL interrupt and DMA requests. ICFWLFULL will be set and DMA requests may be generated if the number of free FIFO entries is less than or equal to ICFWL.
20	FILT	0x0	RW	<b>Digital Filter</b> Enable digital filter.
	Value	Mode		Description
	0	DISABLE		Digital Filter Disabled
	1	ENABLE		Digital Filter Enabled
19	PRSCONF	0x0	RW	<b>PRS Configuration</b> Select PRS pulse or level for PRS output.
	Value	Mode		Description
	0	PULSE		Each CC event will generate a one EM01GRPACLK cycle high pulse
	1	LEVEL		The PRS channel will follow CC out
18:17	INSEL	0x0	RW	<b>Input Selection</b> Select Compare/Capture channel input.
	Value	Mode		Description
	0	PIN		TIMERnCCx pin is selected
	1	PRSSYNC		Synchronous PRS selected
	2	PRSASYNCLEVEL		Asynchronous Level PRS selected
	3	PRSASYNCPULSE		Asynchronous Pulse PRS selected
16:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	COIST	0x0	RW	<b>Compare Output Initial State</b>

Bit	Name	Reset	Access	Description
				This bit is only used in Output Compare and PWM mode. When this bit is set in Compare or PWM mode, the output is set high when the counter is disabled. When counting resumes, this value will represent the initial value for the output. If the bit is cleared, the output will be cleared when the counter is disabled.
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	MODE	0x0	RW	<b>CC Channel Mode</b>
	These bits select the mode for Compare/Capture channel.			
	Value	Mode	Description	
	0	OFF	Compare/Capture channel turned off	
	1	INPUTCAPTURE	Input Capture	
	2	OUTPUTCOMPARE	Output Compare	
	3	PWM	Pulse-Width Modulation

#### 19.5.15 TIMER\_CCx\_OC - OC Channel Value Register

Offset	Bit Position																															
0x068	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	RW															
<b>Name</b>																	OC															

Bit	Name	Reset	Access	Description
31:0	OC	0x0	RW	<b>Output Compare Value</b> This fields holds the output compare value

## 19.5.16 TIMER\_CCx\_OCB - OC Channel Value Buffer Register

Offset	Bit Position																															
0x070	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	RW															
<b>Name</b>																	OCB															

Bit	Name	Reset	Access	Description
31:0	OCB	0x0	RW	<b>Output Compare Value Buffer</b>
This field holds the Output Compare buffer value which will be written to TIMERN_CCx_OC on an update event if TIMERN_CCx_OCB contains valid data				

## 19.5.17 TIMER\_CCx\_ICF - IC Channel Value Register

Offset	Bit Position																															
0x074	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	R(r)															
<b>Name</b>																	ICF															

Bit	Name	Reset	Access	Description
31:0	ICF	0x0	R(r)	<b>Input Capture FIFO</b>
This FIFO holds captured values in input capture mode. Reading this register will pop the oldest unread value from the FIFO.				

## 19.5.18 TIMER\_CCx\_ICOF - IC Channel Value Overflow Register

Offset	Bit Position																															
0x078	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	R															
<b>Name</b>																	ICOF															

Bit	Name	Reset	Access	Description
31:0	ICOF	0x0	R	<b>Input Capture FIFO Overflow</b>
This register always contains the most recent input capture value. If the input capture FIFO is full and a new capture occurs, this register will be updated and the previous capture value is over-written.				

## 19.5.19 TIMER\_DTCFG - DTI Configuration Register

Offset	Bit Position																															
0x0E0	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset												0x0	0x0	0x0												0x0	0x0

	52864	UNLOCK		Write to unlock TIMER DTI registers

## 20. USART - Universal Synchronous Asynchronous Receiver/Transmitter

### Quick Facts

#### What?

The USART handles high-speed UART, SPI-bus, SmartCards, and IrDA communication.

#### Why?

Serial communication is frequently used in embedded systems and the USART allows efficient communication with a wide range of external devices.

#### How?

The USART has a wide selection of operating modes, frame formats and baud rates. The multi-processor mode allows the USART to remain idle when not addressed. Triple buffering and DMA support makes high data-rates possible with minimal CPU intervention and it is possible to transmit and receive large frames while the MCU remains in EM1 Sleep.

### 20.1 Introduction

The Universal Synchronous Asynchronous serial Receiver and Transmitter (USART) is a very flexible serial I/O module. It supports full duplex asynchronous UART communication as well as RS-485, SPI, MicroWire and 3-wire. It can also interface with ISO7816 SmartCards, and IrDA devices.

## 20.2 Features

- Asynchronous and synchronous (SPI) communication
- Full duplex and half duplex
- Separate TX/RX enable
- Separate receive / transmit multiple entry buffers, with additional separate shift registers
- Programmable baud rate, generated as a fractional division from the peripheral clock ( $PCLK_{USARTn}$ )
- Max bit-rate
  - Main SPI mode, peripheral clock rate/2
  - Secondary SPI mode, peripheral clock rate/6
  - UART mode, peripheral clock rate/16, 8, 6, or 4
- Asynchronous mode supports
  - Majority vote baud-reception
  - False start-bit detection
  - Break generation/detection
  - Multi-processor mode
- Synchronous mode supports
  - All 4 SPI clock polarity/phase configurations
  - Main and Secondary interface modes
- Data can be transmitted LSB first or MSB first
- Configurable number of data bits, 4-16 (plus the parity bit, if enabled)
  - HW parity bit generation and check
- Configurable number of stop bits in asynchronous mode: 0.5, 1, 1.5, 2
- HW collision detection
- Multi-processor mode
- IrDA modulator
- SmartCard (ISO7816) mode
- I2S mode
- Separate interrupt vectors for receive and transmit interrupts
- Loopback mode
  - Half duplex communication
  - Communication debugging
- PRS RX input
- 8 bit Timer
- Hardware Flow Control
- Automatic Baud Rate Detection

### 20.3 Functional Description

An overview of the USART module is shown in [Figure 20.1 USART Overview on page 558](#).

This section describes all possible USART features. Please refer to the Device Datasheet to see what features a specific USART instance supports.

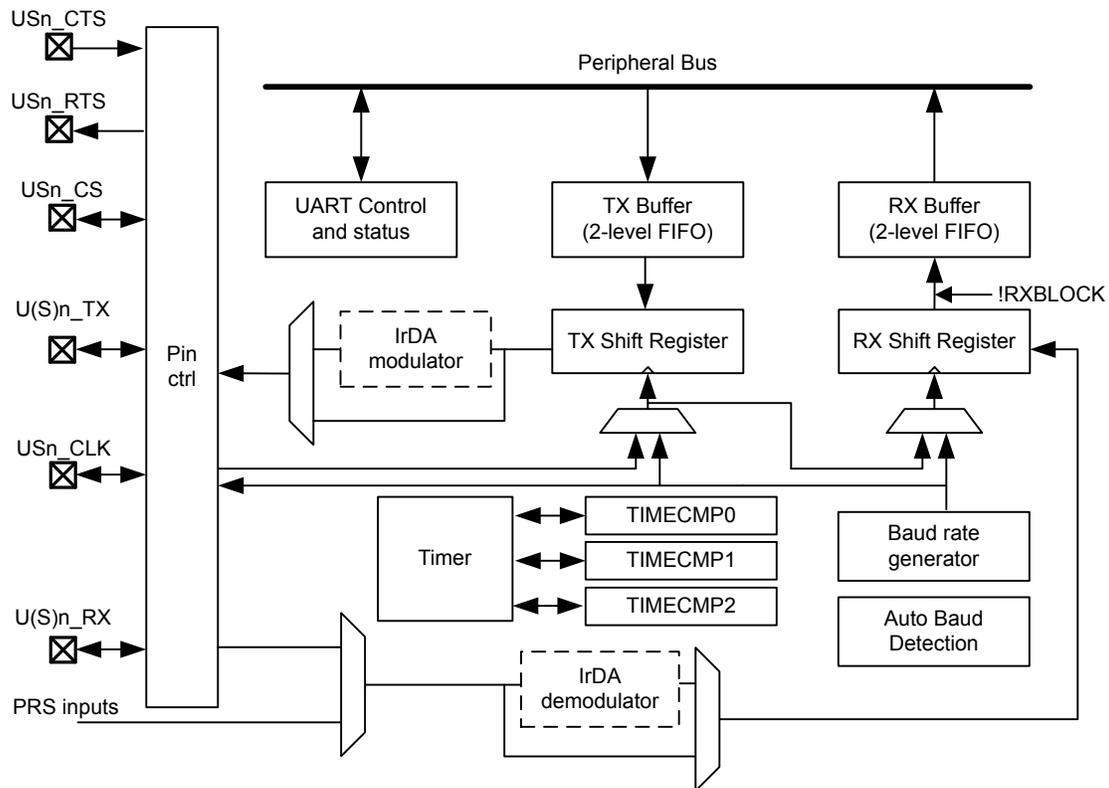

Figure 20.1. USART Overview

### 20.3.1 Modes of Operation

The USART operates in either asynchronous or synchronous mode.

In synchronous mode, a separate clock signal is transmitted with the data. This clock signal is generated by the main interface on the bus, and both the main and secondary devices sample and transmit data according to this clock. Both main and secondary interface modes are supported by the USART. The synchronous communication mode is compatible with the Serial Peripheral Interface Bus (SPI) standard.

In asynchronous mode, no separate clock signal is transmitted with the data on the bus. The USART receiver thus has to determine where to sample the data on the bus from the actual data. To make this possible, additional synchronization bits are added to the data when operating in asynchronous mode, resulting in a slight overhead.

Asynchronous or synchronous mode can be selected by configuring SYNC in USARTn\_CTRL. The options are listed with supported protocols in [Table 20.1 USART Asynchronous vs. Synchronous Mode on page 559](#). Full duplex and half duplex communication is supported in both asynchronous and synchronous mode.

**Table 20.1. USART Asynchronous vs. Synchronous Mode**

SYNC	Communication Mode	Supported Protocols
0	Asynchronous	RS-232, RS-485 (w/external driver), IrDA, ISO 7816
1	Synchronous	SPI, MicroWire, 3-wire

[Table 20.2 USART Pin Usage on page 559](#) explains the functionality of the different USART pins when the USART operates in different modes. Pin functionality enclosed in square brackets is optional, and depends on additional configuration parameters. LOOPBK and MASTER are discussed in [20.3.2.14 Local Loopback](#) and [20.3.3.3 Synchronous Main Interface Mode](#) respectively.

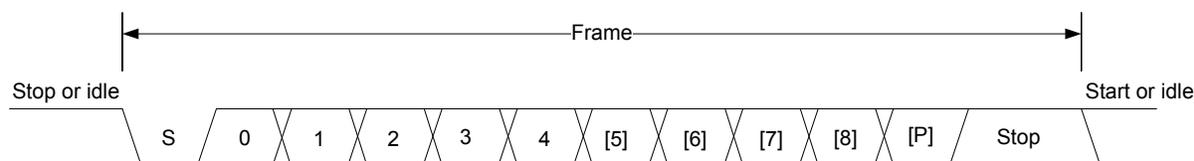

**Table 20.2. USART Pin Usage**

SYNC	LOOPBK	MASTER	Pin functionality			
			U(S)n_TX (MOSI)	U(S)n_RX (MISO)	USn_CLK	USn_CS
0	0	x	Data out	Data in	-	[Driver enable]
0	1	x	Data out/in	-	-	[Driver enable]
1	0	0	Data in	Data out	Clock in	Secondary select
1	0	1	Data out	Data in	Clock out	[Auto secondary select]
1	1	0	Data out/in	-	Clock in	Secondary select
1	1	1	Data out/in	-	Clock out	[Auto secondary select]

### 20.3.2 Asynchronous Operation

### 20.3.2.1 Frame Format

The frame format used in asynchronous mode consists of a set of data bits in addition to bits for synchronization and optionally a parity bit for error checking. A frame starts with one start-bit (S), where the line is driven low for one bit-period. This signals the start of a frame, and is used for synchronization. Following the start bit are 4 to 16 data bits and an optional parity bit. Finally, a number of stop-bits, where the line is driven high, end the frame. An example frame is shown in [Figure 20.2 USART Asynchronous Frame Format on page 560](#).

**Figure 20.2. USART Asynchronous Frame Format**

The number of data bits in a frame is set by DATABITS in USARTn\_FRAME, see [Table 20.3 USART Data Bits on page 560](#), and the number of stop-bits is set by STOPBITS in USARTn\_FRAME, see [Table 20.4 USART Stop Bits on page 560](#). Whether or not a parity bit should be included, and whether it should be even or odd is defined by PARITY, also in USARTn\_FRAME. For communication to be possible, all parties of an asynchronous transfer must agree on the frame format being used.

**Table 20.3. USART Data Bits**

DATA BITS [3:0]	Number of Data bits
0001	4
0010	5
0011	6
0100	7
0101	8 (Default)
0110	9
0111	10

1001	12
1010	13
1011	14
1100	15
1101	16

**Table 20.4. USART Stop Bits**

STOP BITS [1:0]	Number of Stop bits
00	0.5
01	1 (Default)
10	1.5
11	2

The order in which the data bits are transmitted and received is defined by MSBF in USARTn\_CTRL. When MSBF is cleared, data in a frame is sent and received with the least significant bit first. When it is set, the most significant bit comes first.

The frame format used by the transmitter can be inverted by setting TXINV in USARTn\_CTRL, and the format expected by the receiver can be inverted by setting RXINV in USARTn\_CTRL. These bits affect the entire frame, not only the data bits. An inverted frame has a low idle state, a high start-bit, inverted data and parity bits, and low stop-bits.

### 20.3.2.2 Parity Bit Calculation and Handling

When parity bits are enabled, hardware automatically calculates and inserts any parity bits into outgoing frames, and verifies the received parity bits in incoming frames. This is true for both asynchronous and synchronous modes, even though it is mostly used in asynchronous communication. The possible parity modes are defined in [Table 20.5 USART Parity Bits on page 561](#). When even parity is chosen, a parity bit is inserted to make the number of high bits (data + parity) even. If odd parity is chosen, the parity bit makes the total number of high bits odd.

**Table 20.5. USART Parity Bits**

PARITY BITS [1:0]	Description
00	No parity bit (Default)
01	Reserved
10	Even parity
11	Odd parity

### 20.3.2.3 Clock Generation

The USART clock defines the transmission and reception data rate. When operating in asynchronous mode, the baud rate (bit-rate) is given by [Figure 20.3 USART Baud Rate on page 562](#).

$$br = f_{PCLK}/(\text{oversample} \times (1 + \text{USARTn\_CLKDIV}/256))$$

**Figure 20.3. USART Baud Rate**

where  $f_{PCLK}$  is the peripheral clock ( $PCLK_{\text{USARTn}}$ ) frequency and oversample is the oversampling rate as defined by OVS in  $\text{USARTn\_CTRL}$ , see [Table 20.6 USART Oversampling on page 562](#).

**Table 20.6. USART Oversampling**

OVS [1:0]	oversample
00	16
01	8
10	6
11	4

The USART has a fractional clock divider to allow the USART clock to be controlled more accurately than what is possible with a standard integral divider.

The clock divider used in the USART is a 20-bit value, with a 15-bit integral part and an 5-bit fractional part. The fractional part is configured in the lower 5 bits of DIV in  $\text{USART\_CLKDIV}$ . The lowest achievable baud rate at 32 MHz is about 61 bauds/sec.

Fractional clock division is implemented by distributing the selected fraction over four baud periods. The fractional part of the divider tells how many of these periods should be extended by one peripheral clock cycle.

Given a desired baud rate  $br_{\text{desired}}$ , the clock divider  $\text{USARTn\_CLKDIV}$  can be calculated by using [Figure 20.4 USART Desired Baud Rate on page 562](#):

$$\text{USARTn\_CLKDIV} = 256 \times (f_{PCLK}/(\text{oversample} \times br_{\text{desired}}) - 1)$$

**Figure 20.4. USART Desired Baud Rate**

[Table 20.7 USART Baud Rates @ 4MHz Peripheral Clock with 20 bit CLKDIV on page 562](#) shows a set of desired baud rates and how accurately the USART is able to generate these baud rates when running at a 4 MHz peripheral clock, using 16x or 8x oversampling.

**Table 20.7. USART Baud Rates @ 4MHz Peripheral Clock with 20 bit CLKDIV**

Desired baud rate [baud/s]	USARTn_OVS =00			USARTn_OVS =01		
	USARTn_CLKDIV/256 (to 32nd position)	Actual baud rate [baud/s]	Error %	USARTn_CLKDIV/256 (to 32nd position)	Actual baud rate [baud/s]	Error %

#### 20.3.2.4 Auto Baud Detection

Setting AUTOBAUDEN in USARTn\_CLKDIV uses the first frame received to automatically set the baud rate provided that it contains 0x55 (IrDA uses 0x00). AUTOBAUDEN can be used in a simple LIN configuration to auto detect the SYNC byte. The receiver will measure the number of local clock cycles between the beginning of the START bit and the beginning of the 8th data bit. The DIV field in USARTn\_CLKDIV will be overwritten with the new value. The OVS in USARTn\_CTRL and the +1 count of the Baud Rate equation are already factored into the result that gets written into the DIV field. To restart autobaud detection, clear AUTOBAUDEN and set it high again. Since the auto baud detection is done over 8 baud times, only the upper 3 bits of the fractional part of the clock divider are populated.

#### 20.3.2.5 Data Transmission

Asynchronous data transmission is initiated by writing data to the transmit buffer using one of the methods described in [20.3.2.6 Transmit Buffer Operation](#). When the transmission shift register is empty and ready for new data, a frame from the transmit buffer is loaded into the shift register, and if the transmitter is enabled, transmission begins. When the frame has been transmitted, a new frame is loaded into the shift register if available, and transmission continues. If the transmit buffer is empty, the transmitter goes to an idle state, waiting for a new frame to become available.

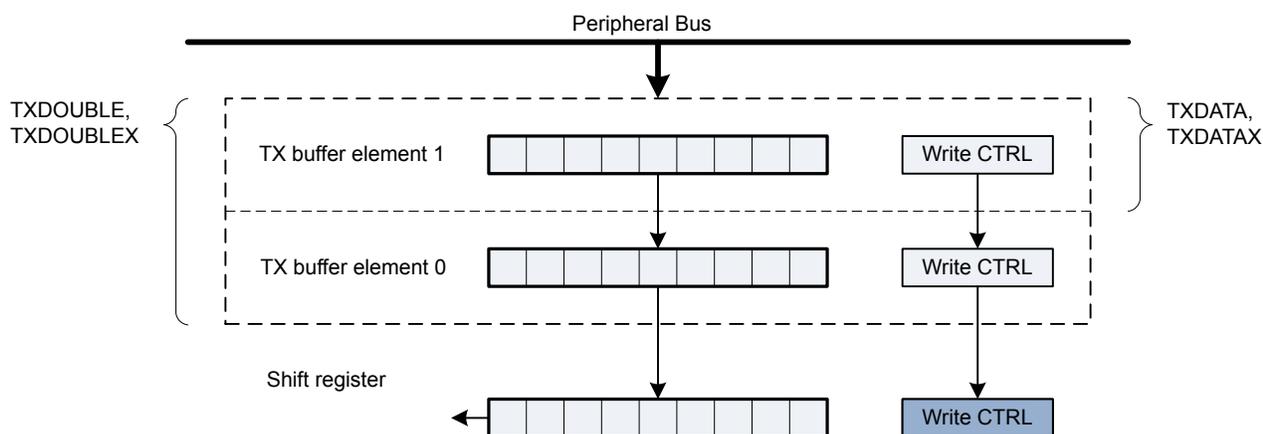

Transmission is enabled through the command register USARTn\_CMD by setting TXEN, and disabled by setting TXDIS in the same command register. When the transmitter is disabled using TXDIS, any ongoing transmission is aborted, and any frame currently being transmitted is discarded. When disabled, the TX output goes to an idle state, which by default is a high value. Whether or not the transmitter is enabled at a given time can be read from TXENS in USARTn\_STATUS.

When the USART transmitter is enabled and there is no data in the transmit shift register or transmit buffer, the TXC flag in USARTn\_STATUS and the TXC interrupt flag in USARTn\_IF are set, signaling that the transmission is complete. The TXC status flag is cleared when a new frame becomes available for transmission, but the TXC interrupt flag must be cleared by software.

### 20.3.2.6 Transmit Buffer Operation

The transmit-buffer is a multiple entry FIFO buffer. A frame can be loaded into the buffer by writing to USARTn\_TXDATA, USARTn\_TXDATAx, USARTn\_TXDOUBLE or USARTn\_TXDOUBLEx. Using USARTn\_TXDATA allows 8 bits to be written to the buffer, while using USARTn\_TXDOUBLE will write 2 frames of 8 bits to the buffer. If 9-bit frames are used, the 9th bit of the frames will in these cases be set to the value of BIT8DV in USARTn\_CTRL.

To set the 9th bit directly and/or use transmission control, USARTn\_TXDATAx and USARTn\_TXDOUBLEx must be used. USARTn\_TXDATAx allows 9 data bits to be written, as well as a set of control bits regarding the transmission of the written frame. Every frame in the buffer is stored with 9 data bits and additional transmission control bits. USARTn\_TXDOUBLEx allows two frames, complete with control bits to be written at once. When data is written to the transmit buffer using USARTn\_TXDATAx and USARTn\_TXDOUBLEx, the 9th bit(s) written to these registers override the value in BIT8DV in USARTn\_CTRL, and alone define the 9th bits that are transmitted if 9-bit frames are used. [Figure 20.5 USART Transmit Buffer Operation on page 564](#) shows the basics of the transmit buffer when DATABITS in USARTn\_FRAME is configured to less than 10 bits.

**Figure 20.5. USART Transmit Buffer Operation**

When writing more frames to the transmit buffer than there is free space for, the TXOF interrupt flag in USARTn\_IF will be set, indicating the overflow. The data already in the transmit buffer is preserved in this case, and no data is written.

In addition to the interrupt flag TXC in USARTn\_IF and status flag TXC in USARTn\_STATUS which are set when the transmission is complete, TXBL in USARTn\_STATUS and the TXBL interrupt flag in USARTn\_IF are used to indicate the level of the transmit buffer. TXBIL in USARTn\_CTRL controls the level at which these bits are set. If TXBIL is cleared, they are set whenever the transmit buffer becomes empty, and if TXBIL is set, they are set whenever the transmit buffer goes from full to half-full or empty. Both the TXBL status flag and the TXBL interrupt flag are cleared automatically when their condition becomes false.

The transmit buffer, including the transmit shift register can be cleared by setting CLEARTX in USARTn\_CMD. This will prevent the USART from transmitting the data in the buffer and shift register, and will make them available for new data. Any frame currently being transmitted will not be aborted. Transmission of this frame will be completed.

### 20.3.2.7 Frame Transmission Control

The transmission control bits, which can be written using USARTn\_TXDATAx and USARTn\_TXDOUBLEx, affect the transmission of the written frame. The following options are available:

- **Generate break:** By setting TXBREAK, the output will be held low during the stop-bit period to generate a framing error. A receiver that supports break detection detects this state, allowing it to be used e.g. for framing of larger data packets. The line is driven high before the next frame is transmitted so the next start condition can be identified correctly by the recipient. Continuous breaks lasting longer than a USART frame are thus not supported by the USART. GPIO can be used for this.
- **Disable transmitter after transmission:** If TXDISAT is set, the transmitter is disabled after the frame has been fully transmitted.
- **Enable receiver after transmission:** If RXENAT is set, the receiver is enabled after the frame has been fully transmitted. It is enabled in time to detect a start-bit directly after the last stop-bit has been transmitted.
- **Unblock receiver after transmission:** If UBRXAT is set, the receiver is unblocked and RXBLOCK is cleared after the frame has been fully transmitted.
- **Tristate transmitter after transmission:** If TXTRIAT is set, TXTRI is set after the frame has been fully transmitted, tristating the transmitter output. Tristating of the output can also be performed automatically by setting AUTOTRI. If AUTOTRI is set TXTRI is always read as 0.

**Note:** When in SmartCard mode with repeat enabled, none of the actions, except generate break, will be performed until the frame is transmitted without failure. Generation of a break in SmartCard mode with repeat enabled will cause the USART to detect a NACK on every frame.

### 20.3.2.8 Data Reception

Data reception is enabled by setting RXEN in USARTn\_CMD. When the receiver is enabled, it actively samples the input looking for a transition from high to low indicating the start baud of a new frame. When a start baud is found, reception of the new frame begins if the receive shift register is empty and ready for new data. When the frame has been received, it is pushed into the receive buffer, making the shift register ready for another frame of data, and the receiver starts looking for another start baud. If the receive buffer is full, the received frame remains in the shift register until more space in the receive buffer is available. If an incoming frame is detected while both the receive buffer and the receive shift register are full, the data in the shift register is overwritten, and the RXOF interrupt flag in USARTn\_IF is set to indicate the buffer overflow.

The receiver can be disabled by setting the command bit RXDIS in USARTn\_CMD. Any frame currently being received when the receiver is disabled is discarded. Whether or not the receiver is enabled at a given time can be read out from RXENS in USARTn\_STATUS.

### 20.3.2.9 Receive Buffer Operation

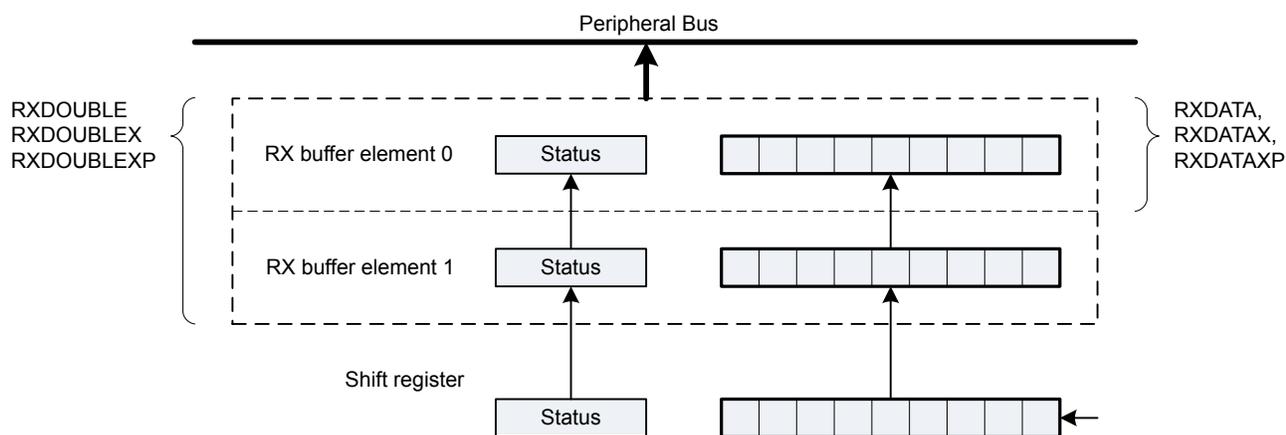

When data becomes available in the receive buffer, the RXDATAV flag in USARTn\_STATUS, and the RXDATAV interrupt flag in USARTn\_IF are set, and when the buffer becomes full, RXFULL in USARTn\_STATUS and the RXFULL interrupt flag in USARTn\_IF are set. The status flags RXDATAV and RXFULL are automatically cleared by hardware when their condition is no longer true. This also goes for the RXDATAV interrupt flag, but the RXFULL interrupt flag must be cleared by software. When the RXFULL flag is set, notifying that the buffer is full, space is still available in the receive shift register for one more frame.

Data can be read from the receive buffer in a number of ways. USARTn\_RXDATA gives access to the 8 least significant bits of the received frame, and USARTn\_RXDOUBLE makes it possible to read the 8 least significant bits of two frames at once, pulling two frames from the buffer. To get access to the 9th, most significant bit, USARTn\_RXDATA\_X must be used. This register also contains status information regarding the frame. USARTn\_RXDOUBLE\_X can be used to get two frames complete with the 9th bits and status bits.

When a frame is read from the receive buffer using USARTn\_RXDATA or USARTn\_RXDATA\_X, the frame is pulled out of the buffer, making room for a new frame. USARTn\_RXDOUBLE and USARTn\_RXDOUBLE\_X pull two frames out of the buffer. If an attempt is done to read more frames from the buffer than what is available, the RXUF interrupt flag in USARTn\_IF is set to signal the underflow, and the data read from the buffer is undefined.

Frames can be read from the receive buffer without removing the data by using USARTn\_RXDATA\_X\_P and USARTn\_RXDOUBLE\_X\_P. USARTn\_RXDATA\_X\_P gives access the first frame in the buffer with status bits, while USARTn\_RXDOUBLE\_X\_P gives access to both frames with status bits. The data read from these registers when the receive buffer is empty is undefined. If the receive buffer contains one valid frame, the first frame in USARTn\_RXDOUBLE\_X\_P will be valid. No underflow interrupt is generated by a read using these registers, i.e. RXUF in USARTn\_IF is never set as a result of reading from USARTn\_RXDATA\_X\_P or USARTn\_RXDOUBLE\_X\_P.

The basic operation of the receive buffer when DATABITS in USARTn\_FRAME is configured to less than 10 bits is shown in [Figure 20.6 USART Receive Buffer Operation on page 566](#).

**Figure 20.6. USART Receive Buffer Operation**

The receive buffer, including the receive shift register can be cleared by setting CLEARRX in USARTn\_CMD. Any frame currently being received will not be discarded.

### 20.3.2.10 Blocking Incoming Data

When using hardware frame recognition, as detailed in [20.3.2.20 Multi-Processor Mode](#) and [20.3.2.21 Collision Detection](#), it is necessary to be able to let the receiver sample incoming frames without passing the frames to software by loading them into the receive buffer. This is accomplished by blocking incoming data.

Incoming data is blocked as long as RXBLOCK in USARTn\_STATUS is set. When blocked, frames received by the receiver will not be loaded into the receive buffer, and software is not notified by the RXDATAV flag in USARTn\_STATUS or the RXDATAV interrupt flag in USARTn\_IF at their arrival. For data to be loaded into the receive buffer, RXBLOCK must be cleared in the instant a frame is fully received by the receiver. RXBLOCK is set by setting RXBLOCKEN in USARTn\_CMD and disabled by setting RXBLOCKDIS also in USARTn\_CMD. There is one exception where data is loaded into the receive buffer even when RXBLOCK is set. This is when an address frame is received when operating in multi-processor mode. See [20.3.2.20 Multi-Processor Mode](#) for more information.

Frames received containing framing or parity errors will not result in the FERR and PERR interrupt flags in USARTn\_IF being set while RXBLOCK in USARTn\_STATUS is set. Hardware recognition is not applied to these erroneous frames, and they are silently discarded.

**Note:** If a frame is received while RXBLOCK in USARTn\_STATUS is cleared, but stays in the receive shift register because the receive buffer is full, the received frame will be loaded into the receive buffer when space becomes available even if RXBLOCK is set at that time. The overflow interrupt flag RXOF in USARTn\_IF will be set if a frame in the receive shift register, waiting to be loaded into the receive buffer is overwritten by an incoming frame even though RXBLOCK in USARTn\_STATUS is set.

### 20.3.2.11 Clock Recovery and Filtering

The receiver samples the incoming signal at a rate 16, 8, 6 or 4 times higher than the given baud rate, depending on the oversampling mode given by OVS in USARTn\_CTRL. Lower oversampling rates make higher baud rates possible, but give less room for errors.

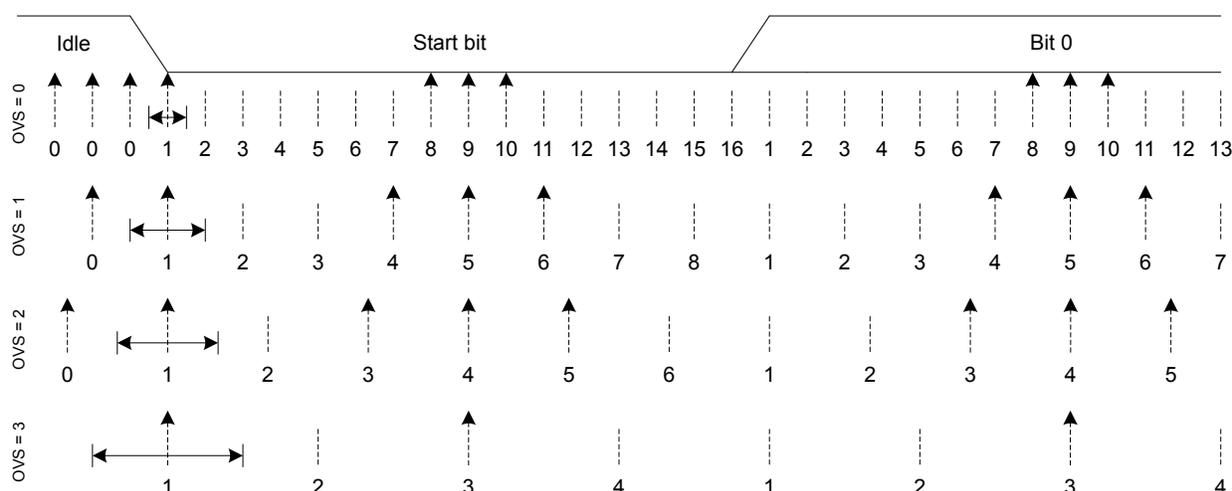

When a high-to-low transition is registered on the input while the receiver is idle, this is recognized as a start-bit, and the baud rate generator is synchronized with the incoming frame.

For oversampling modes 16, 8 and 6, every bit in the incoming frame is sampled three times to gain a level of noise immunity. These samples are aimed at the middle of the bit-periods, as visualized in [Figure 20.7 USART Sampling of Start and Data Bits on page 568](#). With OVS=0 in USARTn\_CTRL, the start and data bits are thus sampled at locations 8, 9 and 10 in the figure, locations 4, 5 and 6 for OVS=1 and locations 3, 4, and 5 for OVS=2. The value of a sampled bit is determined by majority vote. If two or more of the three bit-samples are high, the resulting bit value is high. If the majority is low, the resulting bit value is low.

Majority vote is used for all oversampling modes except 4x oversampling. In this mode, a single sample is taken at position 3 as shown in [Figure 20.7 USART Sampling of Start and Data Bits on page 568](#).

Majority vote can be disabled by setting MVDIS in USARTn\_CTRL.

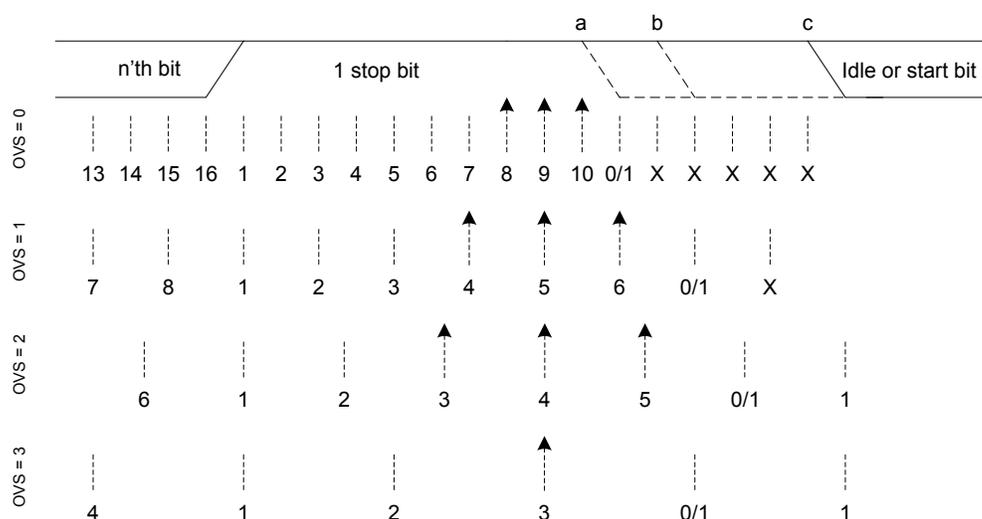

If the value of the start bit is found to be high, the reception of the frame is aborted, filtering out false start bits possibly generated by noise on the input.

**Figure 20.7. USART Sampling of Start and Data Bits**

If the baud rate of the transmitter and receiver differ, the location each bit is sampled will be shifted towards the previous or next bit in the frame. This is acceptable for small errors in the baud rate, but for larger errors, it will result in transmission errors.

When the number of stop bits is 1 or more, stop bits are sampled like the start and data bits as seen in [Figure 20.8 USART Sampling of Stop Bits when Number of Stop Bits are 1 or More on page 569](#). When a stop bit has been detected by sampling at positions 8, 9 and 10 for normal mode, or 4, 5 and 6 for smart mode, the USART is ready for a new start bit. As seen in [Figure 20.8 USART Sampling of Stop Bits when Number of Stop Bits are 1 or More on page 569](#), a stop-bit of length 1 normally ends at c, but the next frame will be received correctly as long as the start-bit comes after position a for OVS=0 and OVS=3, and b for OVS=1 and OVS=2.

**Figure 20.8. USART Sampling of Stop Bits when Number of Stop Bits are 1 or More**

When working with stop bit lengths of half a baud period, the above sampling scheme no longer suffices. In this case, the stop-bit is not sampled, and no framing error is generated in the receiver if the stop-bit is not generated. The line must still be driven high before the next start bit however for the USART to successfully identify the start bit.

#### 20.3.2.12 Parity Error

When parity bits are enabled, a parity check is automatically performed on incoming frames. When a parity error is detected in an incoming frame, the data parity error bit PERR in the frame is set, as well as the interrupt flag PERR in USARTn\_IF. Frames with parity errors are loaded into the receive buffer like regular frames.

PERR can be accessed by reading the frame from the receive buffer using the USARTn\_RXDATAx, USARTn\_RXDATAxP, USARTn\_RXDOUBLEX or USARTn\_RXDOUBLEXP registers.

If ERRSTX in USARTn\_CTRL is set, the transmitter is disabled on received parity and framing errors. If ERRSRX in USARTn\_CTRL is set, the receiver is disabled on parity and framing errors.

#### 20.3.2.13 Framing Error and Break Detection

A framing error is the result of an asynchronous frame where the stop bit was sampled to a value of 0. This can be the result of noise and baud rate errors, but can also be the result of a break generated by the transmitter on purpose.

When a framing error is detected in an incoming frame, the framing error bit FERR in the frame is set. The interrupt flag FERR in USARTn\_IF is also set. Frames with framing errors are loaded into the receive buffer like regular frames.

FERR can be accessed by reading the frame from the receive buffer using the USARTn\_RXDATAx, USARTn\_RXDATAxP, USARTn\_RXDOUBLEX or USARTn\_RXDOUBLEXP registers.

If ERRSTX in USARTn\_CTRL is set, the transmitter is disabled on parity and framing errors. If ERRSRX in USARTn\_CTRL is set, the receiver is disabled on parity and framing errors.

### 20.3.2.14 Local Loopback

The USART receiver samples U(S)n\_RX by default, and the transmitter drives U(S)n\_TX by default. This is not the only option however. When LOOPBK in USARTn\_CTRL is set, the receiver is connected to the U(S)n\_TX pin as shown in [Figure 20.9 USART Local Loopback on page 570](#). This is useful for debugging, as the USART can receive the data it transmits, but it is also used to allow the USART to read and write to the same pin, which is required for some half duplex communication modes. In this mode, the U(S)n\_TX pin must be enabled as an output in the GPIO.

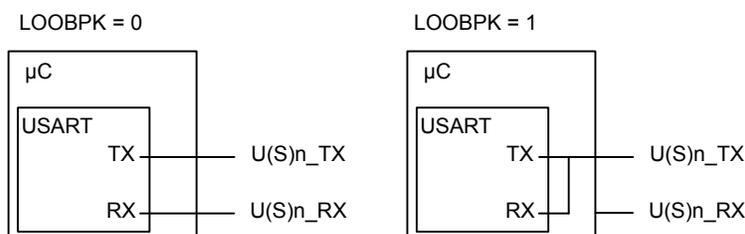

Figure 20.9. USART Local Loopback

### 20.3.2.15 Asynchronous Half Duplex Communication

When doing full duplex communication, two data links are provided, making it possible for data to be sent and received at the same time. In half duplex mode, data is only sent in one direction at a time. There are several possible half duplex setups, as described in the following sections.

### 20.3.2.16 Single Data-link

In this setup, the USART both receives and transmits data on the same pin. This is enabled by setting LOOPBK in USARTn\_CTRL, which connects the receiver to the transmitter output. Because they are both connected to the same line, it is important that the USART transmitter does not drive the line when receiving data, as this would corrupt the data on the line.

When communicating over a single data-link, the transmitter must thus be tristated whenever not transmitting data. This is done by setting the command bit TXTRIEN in USARTn\_CMD, which tristates the transmitter. Before transmitting data, the command bit TXTRIDIS, also in USARTn\_CMD, must be set to enable transmitter output again. Whether or not the output is tristated at a given time can be read from TXTRI in USARTn\_STATUS. If TXTRI is set when transmitting data, the data is shifted out of the shift register, but is not put out on U(S)n\_TX.

When operating a half duplex data bus, it is common to have a main bus controller, which first transmits a request to one of the secondary devices on the bus, then receives a reply. In this case, the frame transmission control bits, which can be set by writing to USARTn\_TXDATAx, can be used to make the USART automatically disable transmission, tristate the transmitter and enable reception when the request has been transmitted, making it ready to receive a response from the secondary device.

The timer, [20.3.10 Timer](#), can also be used to add delay between the RX and TX frames so that the interrupt service routine has time to process data that was just received before transmitting more data. Also hardware flow control is another method to insert time for processing the frame. RTS and CTS can be used to halt either the link partner's transmitter or the local transmitter. See the section on hardware flow control, [20.3.4 Hardware Flow Control](#), for more details.

Tristating the transmitter can also be performed automatically by the USART by using AUTOTRI in USARTn\_CTRL. When AUTOTRI is set, the USART automatically tristates U(S)n\_TX whenever the transmitter is idle, and enables transmitter output when the transmitter goes active. If AUTOTRI is set TXTRI is always read as 0.

**Note:** Another way to tristate the transmitter is to enable wired-and or wired-or mode in GPIO. For wired-and mode, outputting a 1 will be the same as tristating the output, and for wired-or mode, outputting a 0 will be the same as tristating the output. This can only be done on buses with a pull-up or pull-down resistor respectively.

### 20.3.2.17 Single Data-link with External Driver

Some communication schemes, such as RS-485 rely on an external driver. Here, the driver has an extra input which enables it, and instead of tristating the transmitter when receiving data, the external driver must be disabled.

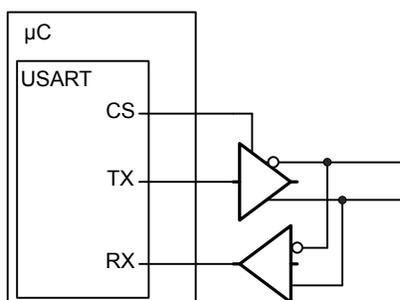

This can be done manually by assigning a GPIO to turn the driver on or off, or it can be handled automatically by the USART. If AUTOCS in USARTn\_CTRL is set, the USn\_CS output is automatically activated a configurable number of baud periods before the transmitter starts transmitting data, and deactivated a configurable number of baud periods after the last bit has been transmitted and there is no more data in the transmit buffer to transmit. The number of baud periods are controlled by CSSETUP and CSHOLD in USARTn\_TIMING. This feature can be used to turn the external driver on when transmitting data, and turn it off when the data has been transmitted.

The timer, [20.3.10 Timer](#), can also be used to configure CSSETUP and CSHOLD values between 1 to 256 baud-times by using TCMPVAL0, TCMPVAL1, or TCMPVAL2 for the TX sequencer.

USn\_CS is immediately deasserted when the transmitter becomes disabled.

**Note:** When using CSSETUP in asynchronous mode with AUTOCS (USARTn\_CTRL.SYNC = 0, USARTn\_CTRL.AUTOCS = 1), TXDELAY in USARTn\_TIMING should be set to 1.

[Figure 20.10 USART Half Duplex Communication with External Driver on page 571](#) shows an example configuration where USn\_CS is used to automatically enable and disable an external driver.

**Figure 20.10. USART Half Duplex Communication with External Driver**

The USn\_CS output is active low by default, but its polarity can be changed with CSINV in USARTn\_CTRL. AUTOCS works regardless of which mode the USART is in, so this functionality can also be used for automatic chip select when in synchronous mode (e.g. SPI).

### 20.3.2.18 Two Data-links

Some limited devices only support half duplex communication even though two data links are available. In this case software is responsible for making sure data is not transmitted when incoming data is expected.

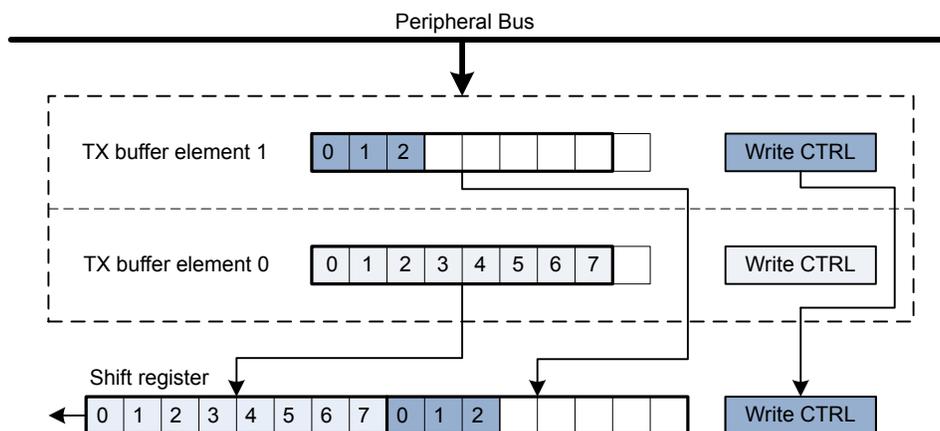

TXARXnEN in USARTn\_TRIGCTRL may be used to automatically start transmission after the end of the RX frame plus any TXSTDELAY and CSSETUP delay in USARTn\_TIMING. For enabling the receiver either use RXENAT in USARTn\_TXDATAx or RXATXnEN in USARTn\_TRIGCTRL.

### 20.3.2.19 Large Frames

As each frame in the transmit and receive buffers holds a maximum of 9 bits, both the elements in the buffers are combined when working with USART-frames of 10 or more data bits.

To transmit such a frame, at least two elements must be available in the transmit buffer. If only one element is available, the USART will wait for the second element before transmitting the combined frame. Both the elements making up the frame are consumed when transmitting such a frame.

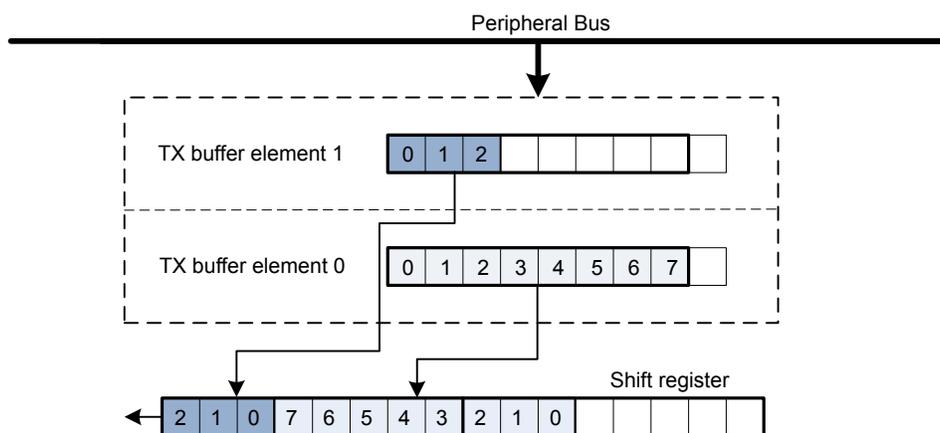

When using large frames, the 9th bits in the buffers are unused. For an 11 bit frame, the 8 least significant bits are thus taken from the first element in the buffer, and the 3 remaining bits are taken from the second element as shown in [Figure 20.11 USART Transmission of Large Frames on page 572](#). The first element in the transmit buffer, i.e. element 0 in [Figure 20.11 USART Transmission of Large Frames on page 572](#) is the first element written to the FIFO, or the least significant byte when writing two bytes at a time using USARTn\_TXDOUBLE.

**Figure 20.11. USART Transmission of Large Frames**

As shown in [Figure 20.11 USART Transmission of Large Frames on page 572](#), frame transmission control bits are taken from the second element in FIFO.

The two buffer elements can be written at the same time using the USARTn\_TXDOUBLE or USARTn\_TXDOUBLEX register. The TXDATAx0 bitfield then refers to buffer element 0, and TXDATAx1 refers to buffer element 1.

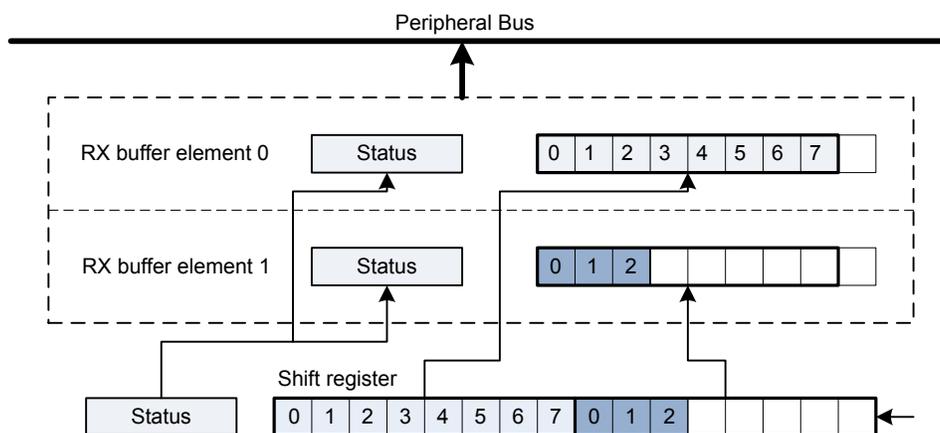

**Figure 20.12. USART Transmission of Large Frames, MSBF**

[Figure 20.12 USART Transmission of Large Frames, MSBF on page 572](#) illustrates the order of the transmitted bits when an 11 bit frame is transmitted with MSBF set. If MSBF is set and the frame is smaller than 10 bits, only the contents of transmit buffer 0 will be transmitted.

When receiving a large frame, BYTESWAP in USARTn\_CTRL determines the order the way the large frame is split into the two buffer elements. If BYTESWAP is cleared, the least significant 8 bits of the received frame are loaded into the first element of the receive buffer, and the remaining bits are loaded into the second element, as shown in [Figure 20.13 USART Reception of Large Frames on page 573](#). The first byte read from the buffer thus contains the 8 least significant bits. Set BYTESWAP to reverse the order.

The status bits are loaded into both elements of the receive buffer. The frame is not moved from the receive shift register before there are two free spaces in the receive buffer.

**Figure 20.13. USART Reception of Large Frames**

The two buffer elements can be read at the same time using the USARTn\_RXDOUBLE or USARTn\_RXDOUBLEX register. RXDATA0 then refers to buffer element 0 and RXDATA1 refers to buffer element 1.

Large frames can be used in both asynchronous and synchronous modes.

### 20.3.2.20 Multi-Processor Mode

To simplify communication between multiple processors, the USART supports a special multi-processor mode. In this mode the 9th data bit in each frame is used to indicate whether the content of the remaining 8 bits is data or an address.

When multi-processor mode is enabled, an incoming 9-bit frame with the 9th bit equal to the value of MPAB in USARTn\_CTRL is identified as an address frame. When an address frame is detected, the MPAF interrupt flag in USARTn\_IF is set, and the address frame is loaded into the receive register. This happens regardless of the value of RXBLOCK in USARTn\_STATUS.

Multi-processor mode is enabled by setting MPM in USARTn\_CTRL, and the value of the 9th bit in address frames can be set in MPAB. Note that the receiver must be enabled for address frames to be detected. The receiver can be blocked however, preventing data from being loaded into the receive buffer while looking for address frames.

When a device has received an address frame and wants to receive the following data, it must make sure the receiver is unblocked before the next frame has been completely received in order to prevent data loss.

BIT8DV in USARTn\_CTRL can be used to specify the value of the 9th bit without writing to the transmit buffer with USARTn\_TXDATA or USARTn\_TXDOUBLEX, giving higher efficiency in multi-processor mode, as the 9th bit is only set when writing address frames, and 8-bit writes to the USART can be used when writing the data frames.

### 20.3.2.21 Collision Detection

The USART supports a basic form of collision detection. When the receiver is connected to the output of the transmitter, either by using the LOOPBK bit in USARTn\_CTRL or through an external connection, this feature can be used to detect whether data transmitted on the bus by the USART did get corrupted by a simultaneous transmission by another device on the bus.

For collision detection to be enabled, CCEN in USARTn\_CTRL must be set, and the receiver enabled. The data sampled by the receiver is then continuously compared with the data output by the transmitter. If they differ, the CCF interrupt flag in USARTn\_IF is set. The collision check includes all bits of the transmitted frames. The CCF interrupt flag is set once for each bit sampled by the receiver that differs from the bit output by the transmitter. When the transmitter output is disabled, i.e. the transmitter is tristated, collisions are not registered.

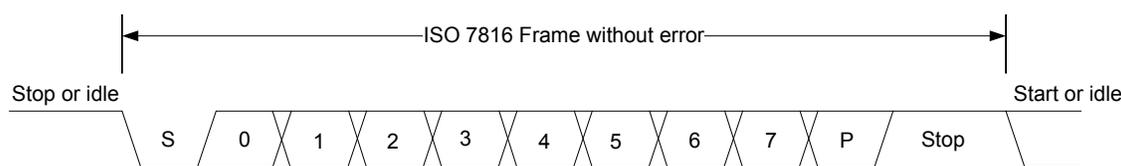

### 20.3.2.22 SmartCard Mode

In SmartCard mode, the USART supports the ISO 7816 I/O line T0 mode. With exception of the stop-bits (guard time), the 7816 data frame is equal to the regular asynchronous frame. In this mode, the receiver pulls the line low for one baud, half a baud into the guard time to indicate a parity error. This NAK can for instance be used by the transmitter to re-transmit the frame. SmartCard mode is a half duplex asynchronous mode, so the transmitter must be tristated whenever not transmitting data.

To enable SmartCard mode, set SCMODE in USARTn\_CTRL, set the number of databits in a frame to 8, and configure the number of stopbits to 1.5 by writing to STOPBITS in USARTn\_FRAME.

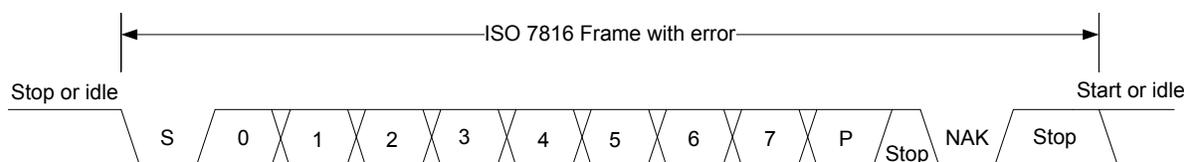

The SmartCard mode relies on half duplex communication on a single line, so for it to work, both the receiver and transmitter must work on the same line. This can be achieved by setting LOOPBK in USARTn\_CTRL or through an external connection. The TX output should be configured as open-drain in the GPIO module.

When no parity error is identified by the receiver, the data frame is as shown in [Figure 20.14 USART ISO 7816 Data Frame Without Error on page 574](#). The frame consists of 8 data bits, a parity bit, and 2 stop bits. The transmitter does not drive the output line during the guard time.

**Figure 20.14. USART ISO 7816 Data Frame Without Error**

If a parity error is detected by the receiver, it pulls the line I/O line low after half a stop bit, see [Figure 20.15 USART ISO 7816 Data Frame With Error on page 574](#). It holds the line low for one bit-period before it releases the line. In this case, the guard time is extended by one bit period before a new transmission can start, resulting in a total of 3 stop bits.

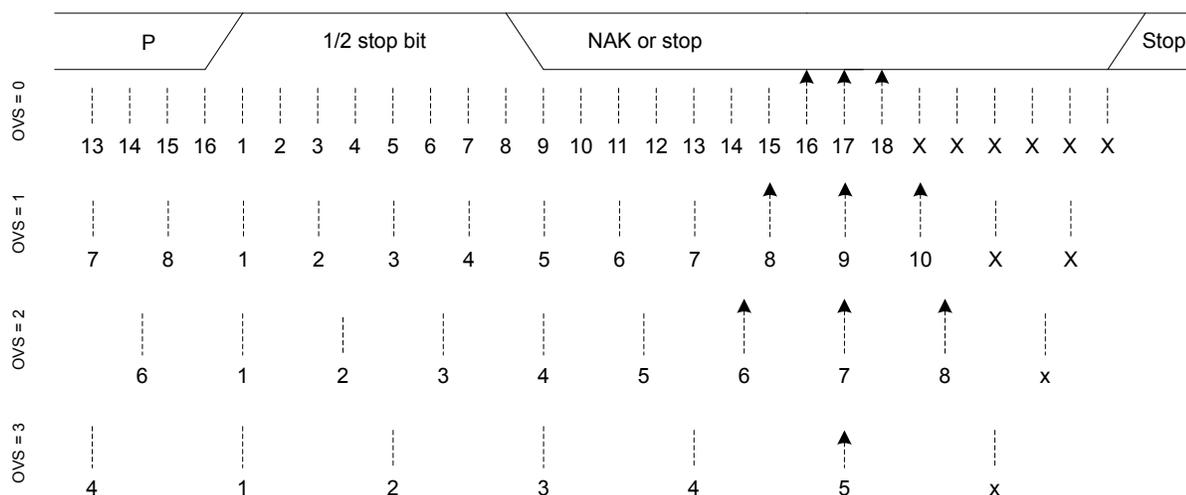

**Figure 20.15. USART ISO 7816 Data Frame With Error**

On a parity error, the NAK is generated by hardware. The NAK generated by the receiver is sampled as the stop-bit of the frame. Because of this, parity errors when in SmartCard mode are reported with both a parity error and a framing error.

When transmitting a T0 frame, the USART receiver on the transmitting side samples position 16, 17 and 18 in the stop-bit to detect the error signal when in 16x oversampling mode as shown in [Figure 20.16 USART SmartCard Stop Bit Sampling on page 575](#). Sampling at this location places the stop-bit sample in the middle of the bit-period used for the error signal (NAK).

If a NAK is transmitted by the receiver, it will thus appear as a framing error at the transmitter, and the FERR interrupt flag in USARTn\_IF will be set. If SCRETRANS USARTn\_CTRL is set, the transmitter will automatically retransmit a NACK'ed frame. The transmitter will retransmit the frame until it is ACK'ed by the receiver. This only works when the number of databits in a frame is configured to 8.

Set SKIPPERRF in USARTn\_CTRL to make the receiver discard frames with parity errors. The PERR interrupt flag in USARTn\_IF is set when a frame is discarded because of a parity error.

**Figure 20.16. USART SmartCard Stop Bit Sampling**

For communication with a SmartCard, a clock signal needs to be generated for the card. This clock output can be generated using one of the timers. See the ISO 7816 specification for more info on this clock signal.

SmartCard T1 mode is also supported. The T1 frame format used is the same as the asynchronous frame format with parity bit enabled and one stop bit. The USART must then be configured to operate in asynchronous half duplex mode.

### 20.3.3 Synchronous Operation

Most of the features in asynchronous mode are available in synchronous mode. Multi-processor mode can be enabled for 9-bit frames, loopback is available and collision detection can be performed.

#### 20.3.3.1 Frame Format

The frames used in synchronous mode need no start and stop bits since a single clock is available to all parts participating in the communication. Parity bits cannot be used in synchronous mode.

The USART supports frame lengths of 4 to 16 bits per frame. Larger frames can be simulated by transmitting multiple smaller frames, i.e. a 22 bit frame can be sent using two 11-bit frames, and a 21 bit frame can be generated by transmitting three 7-bit frames. The number of bits in a frame is set using DATABITS in USARTn\_FRAME.

The frames in synchronous mode are by default transmitted with the least significant bit first like in asynchronous mode. The bit-order can be reversed by setting MSBF in USARTn\_CTRL.

The frame format used by the transmitter can be inverted by setting TXINV in USARTn\_CTRL, and the format expected by the receiver can be inverted by setting RXINV, also in USARTn\_CTRL.

### 20.3.3.2 Clock Generation

The bit-rate in synchronous mode is given by [Figure 20.17 USART Synchronous Mode Bit Rate on page 576](#). As in the case of asynchronous operation, the clock division factor have a 15-bit integral part and a 5-bit fractional part.

$$br = f_{PCLK}/(2 \times (1 + USARTn\_CLKDIV/256))$$

**Figure 20.17. USART Synchronous Mode Bit Rate**

Given a desired baud rate  $br_{desired}$ , the clock divider  $USARTn\_CLKDIV$  can be calculated using [Figure 20.18 USART Synchronous Mode Clock Division Factor on page 576](#)

$$USARTn\_CLKDIV = 256 \times (f_{PCLK}/(2 \times br_{desired}) - 1)$$

**Figure 20.18. USART Synchronous Mode Clock Division Factor**

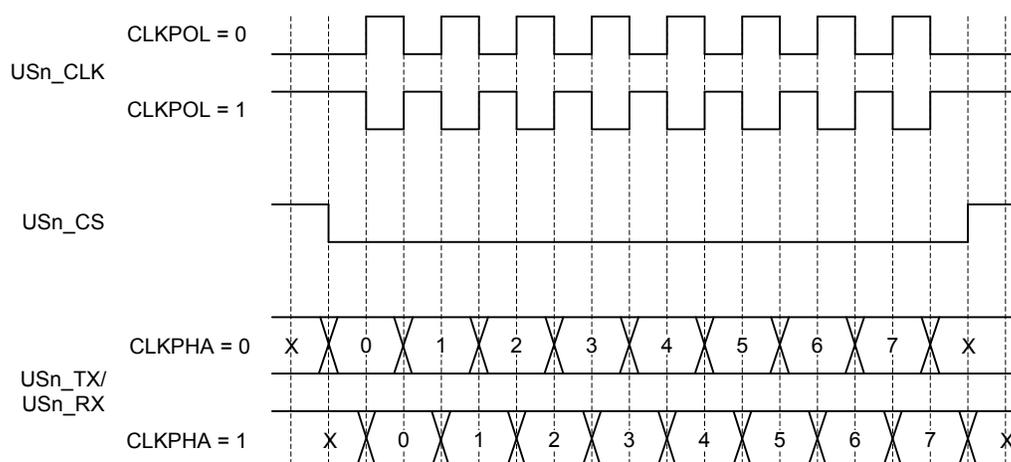

When the USART operates as a synchronous main interface, the highest possible bit rate is half the peripheral clock rate. When operating as a secondary interface however, the highest bit rate is one sixth of the peripheral clock:

- Main interface mode:  $br_{max} = f_{PCLK}/2$
- Secondary interface mode:  $br_{max} = f_{PCLK}/6$

On every clock edge data on the data lines, MOSI and MISO, is either set up or sampled. When  $CLKPHA$  in  $USARTn\_CTRL$  is cleared, data is sampled on the leading clock edge and set-up is done on the trailing edge. If  $CLKPHA$  is set however, data is set-up on the leading clock edge, and sampled on the trailing edge. In addition to this, the polarity of the clock signal can be changed by setting  $CLKPOL$  in  $USARTn\_CTRL$ , which also defines the idle state of the clock. This results in four different modes which are summarized in [Table 20.8 USART SPI Modes on page 576](#). [Figure 20.19 USART SPI Timing on page 576](#) shows the resulting timing of data set-up and sampling relative to the bus clock.

**Table 20.8. USART SPI Modes**

SPI mode	CLKPOL	CLKPHA	Leading edge	Trailing edge
0	0	0	Rising, sample	Falling, set-up
1	0	1	Rising, set-up	Falling, sample
2	1	0	Falling, sample	Rising, set-up
3	1	1	Falling, set-up	Rising, sample

**Figure 20.19. USART SPI Timing**

If  $CPHA=1$ , the TX underflow flag,  $TXUF$ , will be set on the first setup clock edge of a frame in secondary mode if TX data is not available. If  $CPHA=0$ ,  $TXUF$  is set if data is not available in the transmit buffer three  $PCLK$  cycles prior to the first sample clock edge. The  $RXDATAV$  flag is updated on the last sample clock edge of a transfer, while the RX overflow interrupt flag,  $RXOF$ , is set on the first

sample clock edge if the receive buffer overflows. When a transfer has been performed, interrupt flags TXBL and TXC are updated on the first setup clock edge of the succeeding frame, or when CS is deasserted.

### 20.3.3.3 Synchronous Main Interface Mode

When configured as a main interface, the USART is in full control of the data flow on the synchronous bus. When operating in full duplex mode, the secondary devices cannot transmit data to the main device without the main device transmitting to the secondary. The main device outputs the bus clock on USn\_CLK.

Communication starts whenever there is data in the transmit buffer and the transmitter is enabled. The USART clock then starts, and the main device shifts bits out from the transmit shift register using the internal clock.

When there are no more frames in the transmit buffer and the transmit shift register is empty, the clock stops, and communication ends. When the receiver is enabled, it samples data using the internal clock when the transmitter transmits data. Operation of the RX and TX buffers is as in asynchronous mode.

### 20.3.3.4 Operation of USn\_CS Pin

When operating as a synchronous main interface, the USn\_CS pin can have one of two functions, or it can be disabled.

If USn\_CS is configured as an output, it can be used to automatically generate a chip select for a secondary device by setting AUTOCS in USARTn\_CTRL. If AUTOCS is set, USn\_CS is activated before a transmission begins, and deactivated after the last bit has been transmitted and there is no more data in the transmit buffer.

The time between when CS is asserted and the first bit is transmitted can be controlled using the USART Timer and with CSSETUP in USARTn\_TIMING. Any of the three comparators can be used to set this delay. If new data is ready for transmission before CS is deasserted, the data is sent without deasserting CS in between. CSHOLD in USARTn\_TIMING keeps CS asserted after the end of frame for the number of baud-times specified.

By default, USn\_CS is active low, but its polarity can be inverted by setting CSINV in USARTn\_CTRL.

When USn\_CS is configured as an input, it can be used by another synchronous main device that wants control of the bus to make the USART release it. When USn\_CS is driven low, or high if CSINV is set, the interrupt flag SSM in USARTn\_IF is set, and if CSMA in USARTn\_CTRL is set, the USART goes to secondary mode.

### 20.3.3.5 AUTOTX

The main device on a synchronous bus is required to transmit data to a secondary device in order to receive data from that device. In some cases, only a few words are transmitted and a lot of data is then received from the secondary device. In that case, one solution is to keep feeding the TX with data to transmit, but that consumes system bandwidth. Instead AUTOTX can be used.

When AUTOTX in USARTn\_CTRL is set, the USART transmits data as long as there is available space in the RX shift register for the chosen frame size. This happens even though there is no data in the TX buffer. The TX underflow interrupt flag TXUF in USARTn\_IF is set on the first word that is transmitted which does not contain valid data.

During AUTOTX the USART will always send the previous sent bit, thus reducing the number of transitions on the TX output. So if the last bit sent was a 0, 0's will be sent during AUTOTX and if the last bit sent was a 1, 1's will be sent during AUTOTX.

### 20.3.3.6 Synchronous Secondary Interface Mode

When the USART is in synchronous secondary interface mode, data transmission is not controlled by the USART, but by an external synchronous main device. The USART is therefore not able to initiate a transmission, and has no control over the number of bytes written to the external main device.

The output and input to the USART are also swapped when in secondary mode, making the receiver take its input from USn\_TX (MOSI) and the transmitter drive USn\_RX (MISO).

To transmit data when in secondary mode, the device must load data into the transmit buffer and enable the transmitter. The data will remain in the USART until the main device starts a transmission by pulling the USn\_CS input low and transmitting data. For every frame transmitted from main to secondary device, a frame is transferred from secondary to main as well. After a transmission, MISO remains in the same state as the last bit transmitted. This also applies if the main transmits to the secondary and the secondary TX buffer is empty.

If the transmitter is enabled in secondary synchronous mode and the main device starts transmission of a frame, the underflow interrupt flag TXUF in USARTn\_IF will be set if no data is available for transmission.

If the secondary device needs to control its own chip select signal, this can be achieved by clearing CSPEN in the GPIO\_USARTn\_ROUTEEN register. The internal chip select signal can then be controlled through CSINV in the CTRL register. The chip select signal will be CSINV inverted, i.e. if CSINV is cleared, the chip select is active and vice versa.

### 20.3.3.7 Synchronous Half Duplex Communication

Half duplex communication in synchronous mode is very similar to half duplex communication in asynchronous mode as detailed in [20.3.2.15 Asynchronous Half Duplex Communication](#). The main difference is that in this mode, the main interface must generate the bus clock even when it is not transmitting data, i.e. it must provide the secondary device with a clock to receive data. To generate the bus clock, the main device should transmit data with the transmitter tristated, i.e. TXTRI in USARTn\_STATUS set, when receiving data. If 2 bytes are expected from the secondary device, then transmit 2 bytes with the transmitter tristated, and the secondary uses the generated bus clock to transmit data to the main. TXTRI can be set by setting the TXTRIEN command bit in USARTn\_CMD.

**Note:** When operating as SPI secondary interface in half duplex mode, TX has to be tristated (not disabled) during data reception if the device is to transmit data in the current transfer.

### 20.3.3.8 I2S

I2S is a synchronous format for transmission of audio data. The frame format is 32-bit, but since data is always transmitted with MSB first, an I2S device operating with 16-bit audio may choose to only process the 16 msb of the frame, and only transmit data in the 16 msb of the frame.

In addition to the bit clock used for regular synchronous transfers, I2S mode uses a separate word clock. When operating in mono mode, with only one channel of data, the word clock pulses once at the start of each new word. In stereo mode, the word clock toggles at the start of new words, and also gives away whether the transmitted word is for the left or right audio channel; A word transmitted while the word clock is low is for the left channel, and a word transmitted while the word clock is high is for the right.

When operating in I2S mode, the CS pin is used as the word clock. In main mode, this is automatically driven by the USART, and in secondary mode, the word clock is expected from an external main device.

### 20.3.3.9 Word Format

The general I2S word format is 32 bits wide, but the USART also supports 16-bit and 8-bit words. In addition to this, it can be specified how many bits of the word should actually be used by the USART. These parameters are given by FORMAT in USARTn\_I2SCTRL.

As an example, configuring FORMAT to using a 32-bit word with 16-bit data will make each word on the I2S bus 32-bits wide, but when receiving data through the USART, only the 16 most significant bits of each word can be read out of the USART. Similarly, only the 16 most significant bits have to be written to the USART when transmitting. The rest of the bits will be transmitted as zeroes.

### 20.3.3.10 Major Modes

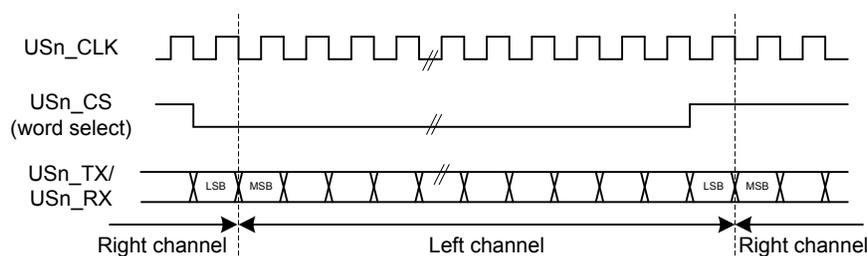

The USART supports a set of different I2S formats as shown in [Table 20.9 USART I2S Modes on page 579](#), but it is not limited to these modes. MONO, JUSTIFY and DELAY in USARTn\_I2SCTRL can be mixed and matched to create an appropriate format. MONO enables mono mode, i.e. one data stream instead of two which is the default. JUSTIFY aligns data within a word on the I2S bus, either left or right which can be seen in figures [Figure 20.22 USART Left-Justified I2S Waveform on page 580](#) and [Figure 20.23 USART Right-Justified I2S Waveform on page 580](#). Finally, DELAY specifies whether a new I2S word should be started directly on the edge of the word-select signal, or one bit-period after the edge.

**Table 20.9. USART I2S Modes**

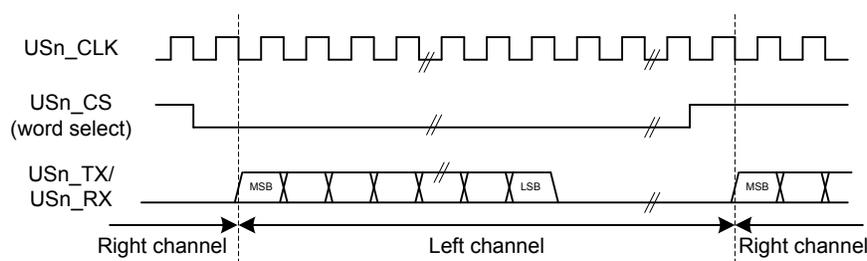

Mode	MONO	JUSTIFY	DELAY	CLKPOL
Regular I2S	0	0	1	0
Left-Justified	0	0	0	1
Right-Justified	0	1	0	1
Mono	1	0	0	0

The regular I2S waveform is shown in [Figure 20.20 USART Standard I2S Waveform on page 579](#) and [Figure 20.21 USART Standard I2S Waveform \(Reduced Accuracy\) on page 579](#). The first figure shows a waveform transmitted with full accuracy. The wordlength can be configured to 32-bit, 16-bit or 8-bit using FORMAT in USARTn\_I2SCTRL. In the second figure, I2S data is transmitted with reduced accuracy, i.e. the data transmitted has less bits than what is possible in the bus format.

Note that the msb of a word transmitted in regular I2S mode is delayed by one cycle with respect to word select

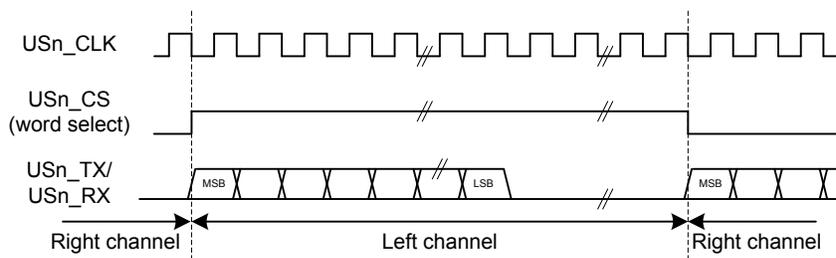

**Figure 20.20. USART Standard I2S Waveform**

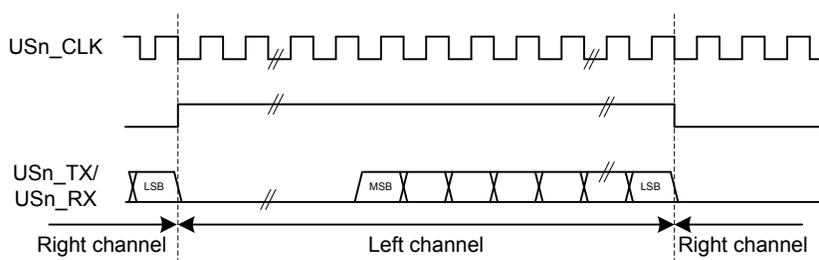

**Figure 20.21. USART Standard I2S Waveform (Reduced Accuracy)**

A left-justified stream is shown in [Figure 20.22 USART Left-Justified I2S Waveform on page 580](#). Note that the MSB comes directly after the edge on the word-select signal in contradiction to the regular I2S waveform where it comes one bit-period after.

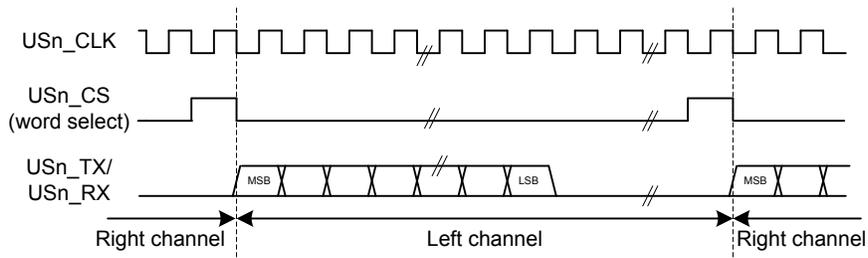

**Figure 20.22. USART Left-Justified I2S Waveform**

A right-justified stream is shown in [Figure 20.23 USART Right-Justified I2S Waveform on page 580](#). The left and right justified streams are equal when the data-size is equal to the word-width.

**Figure 20.23. USART Right-Justified I2S Waveform**

In mono-mode, the word-select signal pulses at the beginning of each word instead of toggling for each word. Mono I2S waveform is shown in [Figure 20.24 USART Mono I2S Waveform on page 580](#).

**Figure 20.24. USART Mono I2S Waveform**

### 20.3.3.11 Using I2S Mode

When using the USART in I2S mode, `DATABITS` in `USARTn_FRAME` must be set to 8 or 16 data-bits. 8 databits can be used in all modes, and 16 can be used in the modes where the number of bytes in the I2S word is even. In addition to this, `MSBF` in `USARTn_CTRL` should be set, and `CLKPOL` and `CLKPHA` in `USARTn_CTRL` should be cleared.

The USART does not have separate TX and RX buffers for left and right data, so when using I2S in stereo mode, the application must keep track of whether the buffers contain left or right data. This can be done by observing `TXBLRIGHT`, `RXDATAVRIGHT` and `RXFULLRIGHT` in `USARTn_STATUS`. `TXBLRIGHT` tells whether TX is expecting data for the left or right channel. It will be set with `TXBL` if right data is expected. The receiver will set `RXDATAVRIGHT` if there is at least one right element in the buffer, and `RXFULLRIGHT` if the buffer is full of right elements.

When using I2S with DMA, separate DMA requests can be used for left and right data by setting `DMASPLIT` in `USARTn_I2SCTRL`.

In both main and secondary mode the USART always starts transmitting on the LEFT channel after being enabled. In main mode, the transmission will stop if TX becomes empty. In that case, `TXC` is set. Continuing the transmission in this case will make the data-stream continue where it left off. To make the USART start on the LEFT channel after going empty, disable and re-enable TX.

### 20.3.4 Hardware Flow Control

Hardware flow control can be used to hold off the link partner's transmission until RX buffer space is available. The RTS and CTS signals are enabled and configured using the `GPIO_USARTn_ROUTEEN`, `GPIO_USARTn_RTSROUTE` and `GPIO_USARTn_CTSROUTE` registers. RTS is an out going signal which indicates that RX buffer space is available to receive a frame. The link partner is being requested to send its data when RTS is asserted. CTS is an incoming signal to stop the next TX data from going out. When CTS is negated, the frame currently being transmitted is completed before stopping. CTS indicates that the link partner has RX buffer space available, and the local transmitter is clear to send. Also use `CTSEN` in `USARTn_CTLX` to enable the CTS input into the TX sequencer. For debug use set `DBGHALT` in `USARTn_CTRLX` which will force the RTS to request one frame from the link partner when the CPU core single steps.

### 20.3.5 Debug Halt

When `DBGHALT` in `USARTn_CTRLX` is clear, RTS is only dependent on the RX buffer having space available to receive data. Incoming data is always received until both the RX buffer is full and the RX shift register is full regardless of the state of `DBGHALT` or chip halt. Additional incoming data is discarded. When `DBGHALT` is set, RTS deasserts on RX buffer full or when chip halt is high. However, a low pulse detected on chip halt will keep RTS asserted when no frame is being received. At the start of frame reception, RTS will deassert if chip halt is high and `DBGHALT` is set. This behavior allows single stepping to pulse the chip halt low for a cycle, and receive the next frame. The link partner must stop transmitting when RTS is deasserted, or the RX buffer could overflow. All data in the transmit buffer is sent out even when chip halt is asserted; therefore, the DMA will need to be set to stop sending the USART TX data during chip halt.

### 20.3.6 PRS-triggered Transmissions

If a transmission must be started on an event with very little delay, the PRS system can be used to trigger the transmission. The PRS channel to use as a trigger can be selected using `PRSEL` in `PRS_USARTn_TRIGGER`. When a positive edge is detected on this signal, the receiver is enabled if `RXTEN` in `USARTn_TRIGCTRL` is set, and the transmitter is enabled if `TXTEN` in `USARTn_TRIGCTRL` is set. Only one signal input is supported by the USART.

The `AUTOTX` feature can also be enabled via PRS. If an external SPI device sets a pin high when there is data to be read from the device, this signal can be routed to the USART through the PRS system and be used to make the USART clock data out of the external device. If `AUTOTXTEN` in `USARTn_TRIGCTRL` is set, the USART will transmit data whenever the PRS signal selected by `PRS_USARTn_TRIGGER` is high given that there is enough room in the RX buffer for the chosen frame size. Note that if there is no data in the TX buffer when using `AUTOTX`, the TX underflow interrupt will be set.

`AUTOTXTEN` can also be combined with `TXTEN` to make the USART transmit a command to the external device prior to clocking out data. To do this, disable TX using the `TXDIS` command, load the TX buffer with the command and enable `AUTOTXTEN` and `TXTEN`. When the selected PRS input goes high, the USART will now transmit the loaded command, and then continue clocking out while both the PRS input is high and there is room in the RX buffer

### 20.3.7 PRS RX Input

The USART can be configured to receive data directly from a PRS channel by setting `RXPRSEN` in `USARTn_CTRLX`. The PRS channel used is selected using `PRSEL` in `PRS_USARTn_RX`.

### 20.3.8 PRS CLK Input

The USART can be configured to receive clock directly from a PRS channel by setting CLKPRSEN in USARTn\_CTRLX. The PRS channel used is selected using PRSSEL in PRS\_USARTn\_CLK. This is useful in synchronous secondary mode and can together with RX PRS input be used to input data from PRS.

### 20.3.9 DMA Support

The USART has full DMA support. The DMA controller can write to the transmit buffer using the registers USARTn\_TXDATA, USARTn\_TXDATAx, USARTn\_TXDOUBLE and USARTn\_TXDOUBLEX, and it can read from the receive buffer using the registers USARTn\_RXDATA, USARTn\_RXDATAx, USARTn\_RXDOUBLE and USARTn\_RXDOUBLEX. This enables single byte transfers, 9 bit data + control/status bits, double byte and double byte + control/status transfers both to and from the USART.

A request for the DMA controller to read from the USART receive buffer can come from the following source:

- Data available in the receive buffer
- Data available in the receive buffer and data is for the RIGHT I2S channel. Only used in I2S mode.

A write request can come from one of the following sources:

- Transmit buffer and shift register empty. No data to send.
- Transmit buffer has room for more data. This does not check the TXBIL for half full. For DMA use, it is either full or empty.
- Transmit buffer has room for RIGHT I2S data. Only used in I2S mode

Even though there are two sources for write requests to the DMA, only one should be used at a time, since the requests from both sources are cleared even though only one of the requests are used.

In some cases, it may be sensible to temporarily stop DMA access to the USART when an error such as a framing error has occurred. This is enabled by setting ERRSDMA in USARTn\_CTRL.

**Note:** For Synchronous mode full duplex operation, if both receive buffer and transmit buffer are served by DMA, to make sure receive buffer is not overflowed the settings below should be followed.

- The DMA channel that serves receive buffer should have higher priority than the DMA channel that serves transmit buffer.
- TXBL should be used as write request for transmit buffer DMA channel.
- IGNORESREQ should be set for both DMA channel.

### 20.3.10 Timer

In addition to the TX sequence timer, there is a versatile 8 bit timer that can generate up to three event pulses. These pulses can be used to create timing for a variety of uses such as RX timeout, break detection, response timeout, and RX enable delay. Transmission delay, CS setup, inter-character spacing, and CS hold use the TX sequence counter. The TX sequencer counter can use the three 8 bit compare values or preset values for delays. There is one general counter with three comparators. Each comparator has a start source, a stop source, a restart enable, and a timer compare value. The start source enables the comparator, resets the counter, and starts the counter. If the counter is already running, the start source will reset the counter and restart it.

Any comparator could start the counter using the same start source but have different timing events programmed into TCMPVALn in USARTn\_TIMECMPn. The TCMP0, TCMP1, or TCMP2 events can be preempted by using the comparator stop source to disable the comparator before the counter reaches TCMPVAL0, TCMPVAL1, or TCMPVAL2. If one comparator gets disabled while the other comparator is still enabled, the counter continues counting. By default the counter will count up to 256 and stop unless a RESTARTEN is set in one of the USARTn\_TIMECMPn registers. By using RESTARTEN and an interval programmed into TCMPVAL, an interval timer can be set up. The TSTART field needs to be changed to DISABLE to stop the interval timer. The timer stops running once all of the comparators are disabled. If a comparator's start and stop sources both trigger the same cycle, the TCMPn event triggers, the comparator stays enabled, and the counter begins counting from zero.

The TXDELAY, CSSETUP, ICS, and CSHOLD in USARTn\_TIMING are used to program start of transmission delay, chip select setup delay, inter-character space, and chip select hold delay. Either a preset value of 0, 1, 2, 3, or 7 can be used for any of these delays; or the value in TCMPVALn may be used to set the delay. Using the preset values leaves the TCMPVALn free for other uses. The same TCMPVALn may be used for multiple events that require the same timing. The transmit sequencer's counter can run in parallel with the timer's counter. The counters and controls are shown in [Figure 20.25 USART Timer Block Diagram on page 584](#).

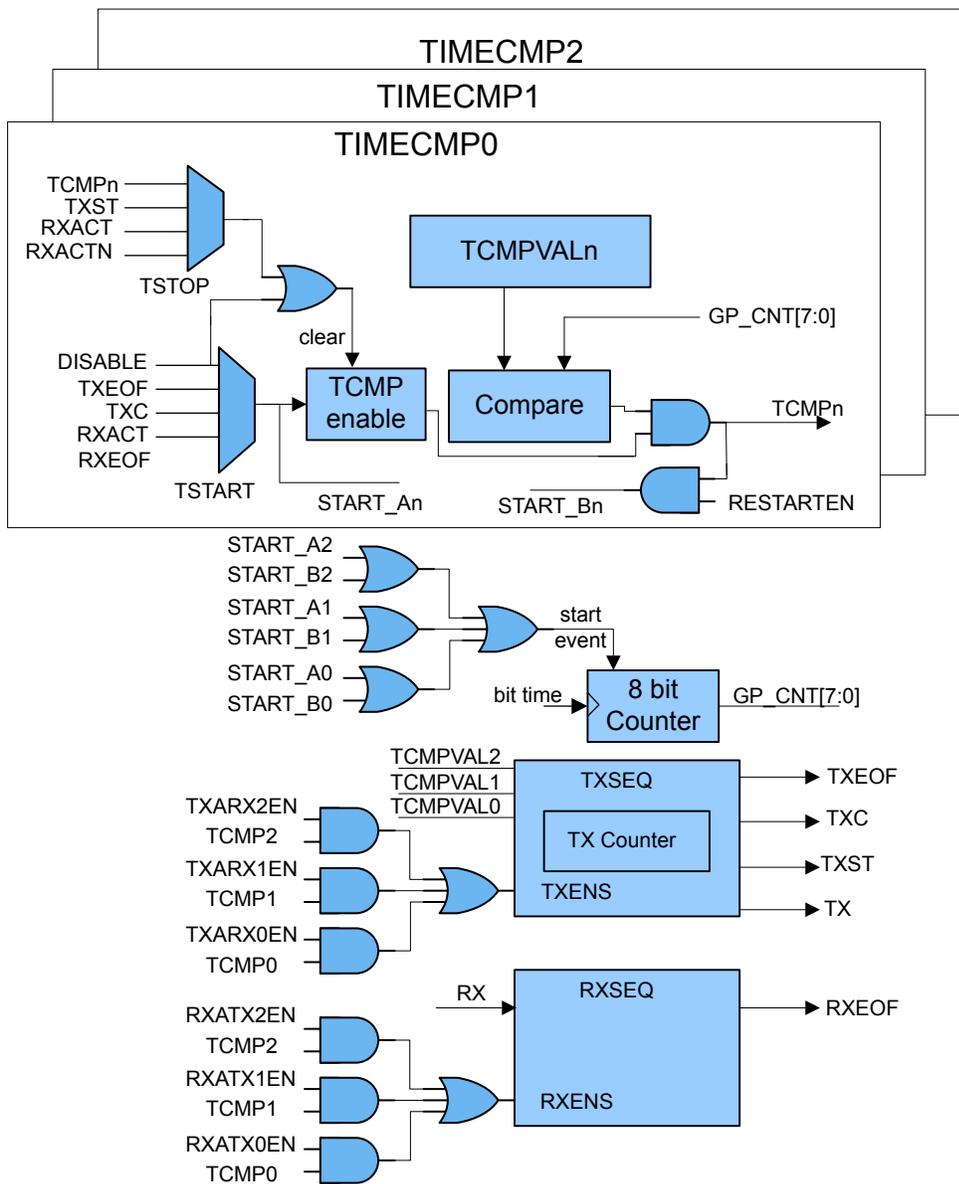

Figure 20.25. USART Timer Block Diagram

The following sections will go into more details on programming the various usage cases.

Table 20.10. USART Application Settings for USARTn\_TIMING and USARTn\_TIMECMPn

Application	TSTARTn	TSTOPn	TCMPVALn	Other
Response Timeout	TSTART0 = TXEOF	TSTOP0 = RXACT	TCMPVAL0 = 0x08	TCMP0 in USARTn_IEN
Receiver Timeout	TSTART1 = RXEOF	TSTOP1 = RXACT	TCMPVAL1 = 0x08	TCMP1 in USARTn_IEN
Large Receiver Timeout	TSTART1 = RXEOF, TCMP1	TSTOP1 = RXACT	TCMPVAL1 = 0xFF	TCMP1 in USARTn_IEN; TIME-RRESTARTED in USARTn_STATUS; RESTART1EN in USARTn_TIMECMP1

Application	TSTARTn	TSTOPn	TCMPVALn	Other
Break Detect	TSTART1 = RXACT	TSTOP1 = RXACTN	TCMPVAL1 = 0x0C	TCMP1 in USARTn_IEN
TX delayed start of transmission and CS setup	TSTART0 = DISABLE, TSTART1 = DISABLE	TSTOP0 = TCMP0, TSTOP1 = TCMP1	TCMPVAL0 = 0x04, TCMPVAL1 = 0x02	TXDELAY = TCMP0, CSSETUP = TCMP1 in USARTn_TIMING; AUTOCS in USARTn_CTRL
TX inter-character spacing	TSTART2 = DISABLE	TSTOP2 = TCMP2	TCMPVAL2 = 0x03	ICS = TCMP2 in USARTn_TIMING; AUTOCS in USARTn_CTRL
TX Chip Select End Delay	TSTART1 = DISABLE	TSTOP1 = TCMP1	TCMPVAL1 = 0x04	CSHOLD = TCMP1 in USARTn_TIMING; AUTOCS in USARTn_CTRL
Response Delay	TSTART1 = RXEOF	TSTOP1 = TCMP1	TCMPVAL1 = 0x08	TXARX1EN in USARTn_TRIGCTRL
Combined TX and RX Example	TSTART1 = RXEOF, TSTART0 = TXEOF	TSTOP1 = TCMP1, TSTOP0 = TCMP0	TCMPVAL1 = 0x1C, TCMPVAL0 = 0x10	TXARX1EN, RXATX0EN in USARTn_TRIGCTRL; CSSETUP = 0x7, CSHOLD = 0x3 in USARTn_TIMING
Combined Delayed TX and Receiver Timeout Example	TSTART0 = TCMPVAL0, TSTART1 = RXEOF	TSTOP0 = RXACTN, TSTOP1 = RXACT	TCMPVAL0 = 0x20, TCMPVAL1 = 0x0C	TXARX0EN in USARTn_TRIGCTRL; TCMP0 in USARTn_IEN

Table 20.10 USART Application Settings for USARTn\_TIMING and USARTn\_TIMECMPn on page 584 shows some examples of how the USART timer can be programmed for various applications. The following sections will describe more details for each applications shown in the table.

### 20.3.10.1 Response Timeout

Response Timeout is when a UART transmitter sends a frame and expects another device to respond within a certain number of baud-times. Refer to Table 20.10 USART Application Settings for USARTn\_TIMING and USARTn\_TIMECMPn on page 584 for specific register settings. Comparator 0 will be looking for TX end of frame to use as the timer start source. For this example, a receiver start of frame RXACT has not been detected for 8 baud-times, and the TCMP0 interrupt in USARTn\_IF is set. If an RX start bit is detected before the 8 baud-times, comparator 0 is disabled before the TCMP0 event can trigger.

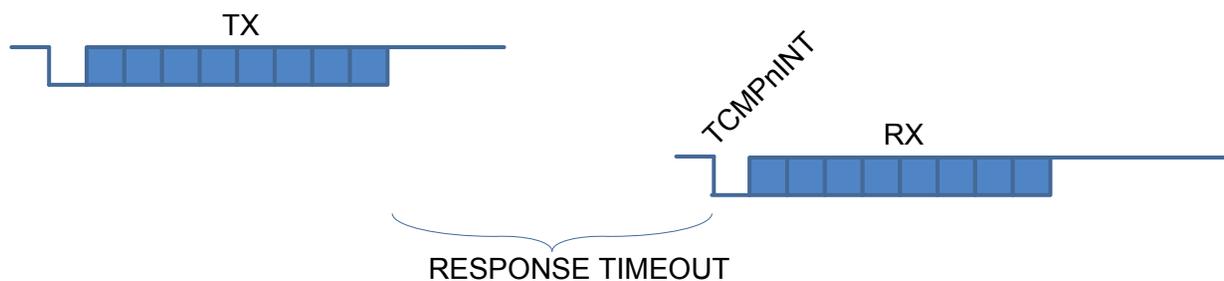

Figure 20.26. USART Response Timeout

### 20.3.10.2 RX Timeout

A receiver timeout function can be implemented by using the RX end of frame to start comparator 1 and look for the RX start bit RXACT to disable the comparator. See [Table 20.10 USART Application Settings for USARTn\\_TIMING and USARTn\\_TIMECMPn on page 584](#) for details on setting up this example. As long as the next RX start bit occurs before the counter reaches the comparator 1 value TCMPVAL1, the interrupt will not get set. In this example the RX Timeout was set to 8 baud-times. To get an RX timeout larger than 256 baud-times, RESTART1EN in USARTn\_TIMER can be used to restart the counter when it reaches TCMPVAL1. By setting TCMPVAL1 in USARTn\_TIMING to 0xFF, an interrupt will be generated after 256 baud-times. An interrupt service routine can then increment a memory location until the desired timeout is reached. Once the RX start bit is detected, comparator 1 will be disabled. If TIMERRESTARTED in USARTn\_STATUS is clear, the TCMP1 interrupt is the first interrupt after RXEOF.

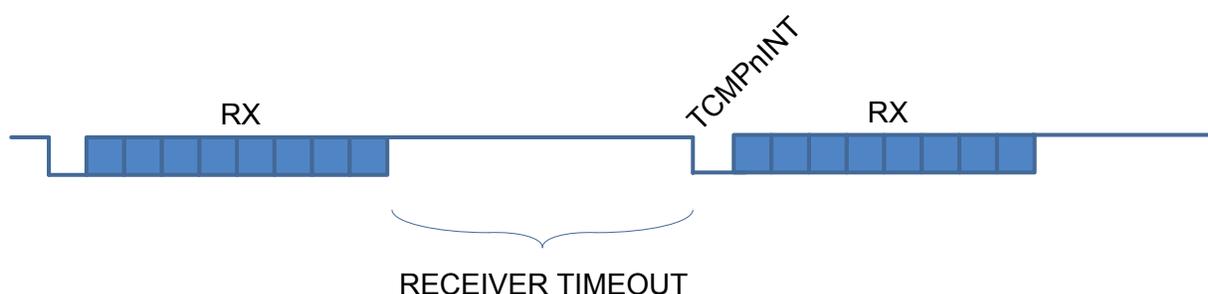

Figure 20.27. USART RX Timeout

### 20.3.10.3 Break Detect

LIN bus and half-duplex UARTs can take advantage of the timer configured for break detection where RX is held low for a number of baud-times to indicate a break condition. [Table 20.10 USART Application Settings for USARTn\\_TIMING and USARTn\\_TIMECMPn on page 584](#) shows the settings for this mode. Each time RX is active (default of low) such as for a start bit, the timer begins counting. If the counter reaches 12 baud-times before RX goes to inactive RXACTN (default of high), an interrupt is asserted.

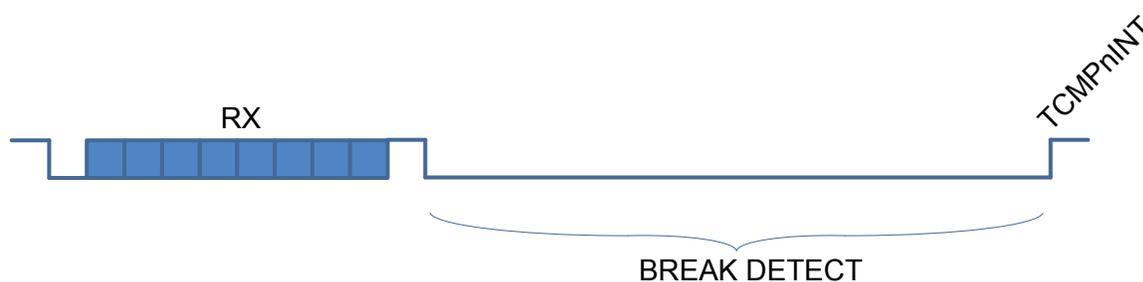

Figure 20.28. USART Break Detection

### 20.3.10.4 TX Start Delay

Some applications may require a delay before the start of transmission. This example in [Figure 20.29 USART TXSEQ Timing on page 587](#) shows the TXSEQ timer used to delay the start of transmission by 4 baud times before the start of CS, and by 2 baud times with CS asserted. See [Table 20.10 USART Application Settings for USARTn\\_TIMING and USARTn\\_TIMECMPn on page 584](#) for details on how to configure this mode. The TX sequencer could be enabled on PRS and start the TXSEQ counter running for 4 baud times as programmed in TCMPVAL0. Then CS is asserted for 2 baud times before the transmitter begins sending TX data. TXDELAY in USARTn\_TIMING is the initial delay before any CS assertion, and CSSETUP is the delay during CS assertion. There are several small preset timing values such as 1, 2, 3, or 7 that can be used for some of the TX sequencer timing which leaves TCMPVAL0, TCMPVAL1, and TCMPVAL2 free for other uses.

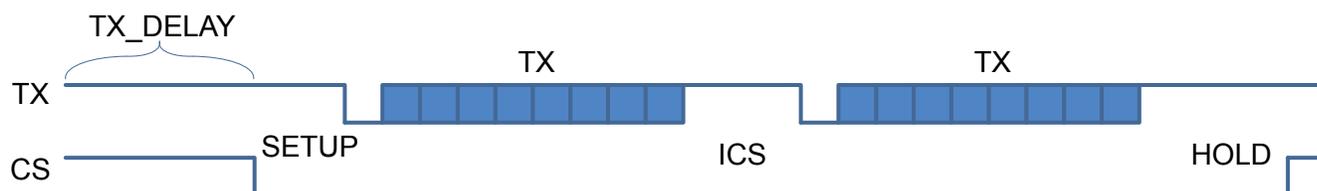

Figure 20.29. USART TXSEQ Timing

### 20.3.10.5 Inter-Character Space

In addition to delaying the start of frame transmission, it is sometimes necessary to also delay the time between each transmit character (inter-character space). After the first transmission, the inter-character space will delay the start of all subsequent transmissions until the transmit buffer is empty. See [Table 20.10 USART Application Settings for USARTn\\_TIMING and USARTn\\_TIMECMPn on page 584](#) for details on setting up this example. For this example in [Figure 20.29 USART TXSEQ Timing on page 587](#) ICS is set to TCMP2 in USARTn\_TIMING. To keep CS asserted during the inter-character space, set AUTOCS in USARTn\_CTRL. There are a few small preset timing values provided for TX sequence timing. Using these preset timing values can free up the TCMPVALn for other uses. For this example, the inter-character space is set to 0x03 and a preset value could be used.

### 20.3.10.6 TX Chip Select End Delay

The assertion of CS can be extended after the final character of the frame by using CSHOLD in USARTn\_TIMING. See [Table 20.10 USART Application Settings for USARTn\\_TIMING and USARTn\\_TIMECMPn on page 584](#) for details on setting up this example. AUTOCS in USARTn\_CTRL needs to be set to extend the CS assertion after the last TX character is transmitted as shown in [Figure 20.29 USART TXSEQ Timing on page 587](#).

### 20.3.10.7 Response Delay

A response delay can be used to hold off the transmitter until a certain number of baud-times after the RX frame. See [Table 20.10 USART Application Settings for USARTn\\_TIMING and USARTn\\_TIMECMPn on page 584](#) for details on setting up this example. TXARX1EN in USARTn\_TRIGCTRL tells the TX sequencer to trigger after RX EOF plus tcmp1val baud times.

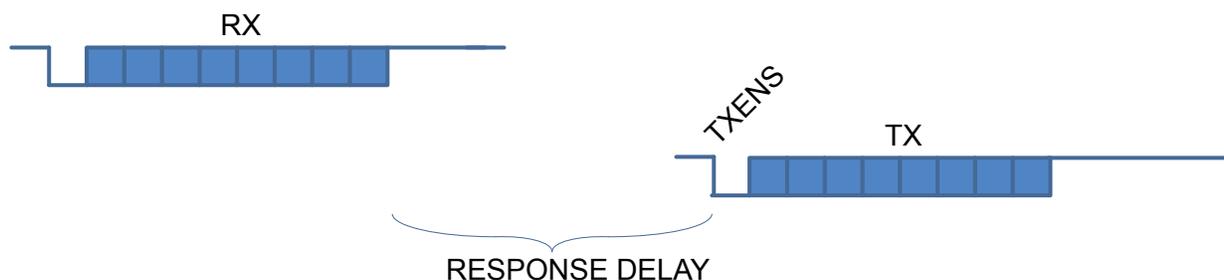

Figure 20.30. USART Response Delay

### 20.3.10.8 Combined TX and RX Example

This example describes how to alternate between TX and RX frames. This has a 28 baud-time space after RX and a 16 baud-time space after TX. The TSTART1 in USARTn\_TIMECMP1 is set to RXEOF which uses the the receiver end of frame to start the timer. The TSTOP1 is set to TCMP1 to generate an event after 28 baud times. Set TXARX1EN in USARTn\_TRIGCTRL, and the transmitter is held off until 28 baud times. TCMPVAL in USARTn\_TIMECMP1 is set to 0x1C for 28 baud times. By setting TSTART0 in USARTn\_TIMECMP0 to TXEOF, the timer will be started after the transmission has completed. RXATX0EN in USARTn\_TRIGCTRL is used to delay enabling of the receiver until 16 baud times after the transmitter has completed. Write 0x10 into TCMPVAL of USARTn\_TIMECMP0 for a 16 baud time delay. CS is also asserted 7 baud-times before start of transmission by setting CSSETUP to 0x7 in USARTn\_TIMING. To keep CS asserted for 3 baud-times after transmission completes, CSHOLD is set to 0x3 in USARTn\_TIMING. See [Table 20.10 USART Application Settings for USARTn\\_TIMING and USARTn\\_TIMECMPn on page 584](#) for details on setting up this example.

### 20.3.10.9 Combined TX Delay and RX Break Detect

This example describes how to delay TX transmission after an RX frame and how to have a break condition signal an interrupt. See [Table 20.10 USART Application Settings for USARTn\\_TIMING and USARTn\\_TIMECMPn on page 584](#) for details on setting up this example. The TX delay is set up by using transmit after RX, TXARX0EN in USARTn\_TRIGCTRL to start the timer. TSTART0 in USARTn\_TIMECMP0 is set to RXEOF which enables the transitter of the timer delay. For this example TCMPVAL in USARTn\_TIMECMP0 is set to 0x20 to create a 32 baud-time delay between the end of the RX frame and the start of the TX frame. The break detect is configured by setting TSTART1 to RXACT to detect the start bit, and setting TSTOP1 to RXACTN to detect RX going high. In this case the interrupt asserts after RX stays low for 12 baud-times, so TCMPVAL1 is set to 0x0C.

### 20.3.10.10 Other Stop Conditions

There is also a timer stop on TX start using the TXST setting in TSTOP of USARTn\_TIMECMPn. This can be used to see that the DMA has not written to the TXBUFFER for a given time.

### 20.3.11 Interrupts

The interrupts generated by the USART are combined into two interrupt vectors. Interrupts related to reception are assigned to one interrupt vector, and interrupts related to transmission are assigned to the other. Separating the interrupts in this way allows different priorities to be set for transmission and reception interrupts.

The transmission interrupt vector groups the transmission-related interrupts generated by the following interrupt flags:

- TXC
- TXBL
- TXOF
- CCF
- TXIDLE

The reception interrupt on the other hand groups the reception-related interrupts, triggered by the following interrupt flags:

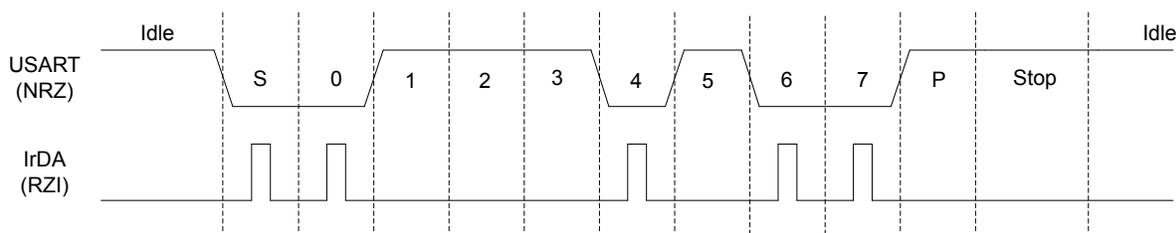

- RXDATAV
- RXFULL
- RXOF
- RXUF
- PERR
- FERR
- MPAF
- SSM
- TCMPn

If USART interrupts are enabled, an interrupt will be made if one or more of the interrupt flags in USART\_IF and their corresponding bits in USART\_IEN are set.

### 20.3.12 IrDA Modulator/ Demodulator

The IrDA modulator implements the physical layer of the IrDA specification, which is necessary for communication over IrDA. The modulator takes the signal output from the USART module, and modulates it before it leaves the USART. In the same way, the input signal is demodulated before it enters the actual USART module. The modulator implements the original Rev. 1.0 physical layer and one high speed extension which supports speeds from 2.4 kbps to 1.152 Mbps.

The data from and to the USART is represented in a NRZ (Non Return to Zero) format, where the signal value is at the same level through the entire bit period. For IrDA, the required format is RZI (Return to Zero Inverted), a format where a “1” is signalled by holding the line low, and a “0” is signalled by a short high pulse. An example is given in [Figure 20.31 USART Example RZI Signal for a given Asynchronous USART Frame on page 589](#).

**Figure 20.31. USART Example RZI Signal for a given Asynchronous USART Frame**

The IrDA module is enabled by setting IREN. The USART transmitter output and receiver input is then routed through the IrDA modulator.

The width of the pulses generated by the IrDA modulator is set by configuring IRPW in USARTn\_IRCTRL. Four pulse widths are available, each defined relative to the configured bit period as listed in [Table 20.11 USART IrDA Pulse Widths on page 589](#).

**Table 20.11. USART IrDA Pulse Widths**

IRPW	Pulse width OVS=0	Pulse width OVS=1	Pulse width OVS=2	Pulse width OVS=3
00	1/16	1/8	1/6	1/4
01	2/16	2/8	2/6	N/A
10	3/16	3/8	N/A	N/A
11	4/16	N/A	N/A	N/A

By default, no filter is enabled in the IrDA demodulator. A filter can be enabled by setting IRFILF in USARTn\_IRCTRL. When the filter is enabled, an incoming pulse has to last for 4 consecutive clock cycles to be detected by the IrDA demodulator.

Note that by default, the idle value of the USART data signal is high. This means that the IrDA modulator generates negative pulses, and the IrDA demodulator expects negative pulses. To make the IrDA module use RZI signalling, both TXINV and RXINV in USARTn\_CTRL must be set.

## 20.4 USART Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	USART_IPVERSION	R	IPVERSION
0x004	USART_EN	RW	USART Enable

## 20.5 USART Register Description

### 20.5.1 USART\_IPVERSION - IPVERSION

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0
<b>Access</b>																																R
<b>Name</b>																																IPVERSION

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x0	R	<b>IPVERSION</b>
The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.				

### 20.5.2 USART\_EN - USART Enable

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0
<b>Access</b>																																RW
<b>Name</b>																																EN

Bit	Name	Reset	Access	Description
31:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	EN	0x0	RW	<b>USART Enable</b>
The ENABLE bit enables the module.				

## 20.5.3 USART\_CTRL - Control Register

Offset	Bit Position																																
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Access	RW	RW	RW	RW			RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW			RW		RW	RW	RW	RW	RW
Name	SMSDELAY	MVDIS	AUTOTX	BYTESWAP			SSSEARLY	ERRSTX	ERRSRX	ERRSDMA	BIT8DV	SKIPPERRF	SCRETRANS	SCMODE	AUTOTRI	AUTOCS	CSINV	TXINV	RXINV	TXBIL	CSMA	MSBF	CLKPHA	CLKPOL			OVS		MPAB	MPM	CCEN	LOOPBK	SYNC

Bit	Name	Reset	Access	Description
31	SMSDELAY	0x0	RW	<b>Synchronous Main Sample Delay</b> Delay Synchronous Main interface sample point to the next setup edge to improve timing and allow communication at higher speeds
30	MVDIS	0x0	RW	<b>Majority Vote Disable</b> Disable majority vote for 16x, 8x and 6x oversampling modes.
29	AUTOTX	0x0	RW	<b>Always Transmit When RX Not Full</b> Transmits as long as RX is not full. If TX is empty, underflows are generated.
28	BYTESWAP	0x0	RW	<b>Byteswap In Double Accesses</b> Set to switch the order of the bytes in double accesses.
	Value	Mode		Description
	0	DISABLE		Normal byte order
	1	ENABLE		Byte order swapped
27:26	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
25	SSSEARLY	0x0	RW	<b>Synchronous Secondary Setup Early</b> Setup data on sample edge in synchronous secondary interface mode to improve MOSI setup time
24	ERRSTX	0x0	RW	<b>Disable TX On Error</b> When set, the transmitter is disabled on framing and parity errors (asynchronous mode only) in the receiver.
	Value	Mode		Description
	0	DISABLE		Received framing and parity errors have no effect on transmitter
	1	ENABLE		Received framing and parity errors disable the transmitter
23	ERRSRX	0x0	RW	<b>Disable RX On Error</b> When set, the receiver is disabled on framing and parity errors (asynchronous mode only).
	Value	Mode		Description
	0	DISABLE		Framing and parity errors have no effect on receiver
	1	ENABLE		Framing and parity errors disable the receiver

Bit	Name	Reset	Access	Description
22	ERRSDMA	0x0	RW	<b>Halt DMA On Error</b> When set, DMA requests will be cleared on framing and parity errors (asynchronous mode only).
	Value	Mode		Description
	0	DISABLE		Framing and parity errors have no effect on DMA requests from the USART
	1	ENABLE		DMA requests from the USART are blocked while the PERR or FERR interrupt flags are set
21	BIT8DV	0x0	RW	<b>Bit 8 Default Value</b> The default value of the 9th bit. If 9-bit frames are used, and an 8-bit write operation is done, leaving the 9th bit unspecified, the 9th bit is set to the value of BIT8DV.
20	SKIPPERRF	0x0	RW	<b>Skip Parity Error Frames</b> When set, the receiver discards frames with parity errors (asynchronous mode only). The PERR interrupt flag is still set.
19	SCRETRANS	0x0	RW	<b>SmartCard Retransmit</b> When in SmartCard mode, a NACK'ed frame will be kept in the shift register and retransmitted if the transmitter is still enabled.
18	SCMODE	0x0	RW	<b>SmartCard Mode</b> Use this bit to enable or disable SmartCard mode.
17	AUTOTRI	0x0	RW	<b>Automatic TX Tristate</b> When enabled, TXTRI is set by hardware whenever the transmitter is idle, and TXTRI is cleared by hardware when transmission starts.
	Value	Mode		Description
	0	DISABLE		The output on U(S)n_TX when the transmitter is idle is defined by TXINV
	1	ENABLE		U(S)n_TX is tristated whenever the transmitter is idle
16	AUTOCS	0x0	RW	<b>Automatic Chip Select</b> When enabled, the output on USn_CS will be activated one baud-period before transmission starts, and deactivated when transmission ends.
15	CSINV	0x0	RW	<b>Chip Select Invert</b> Default value is active low. This affects both the selection of external secondaries, as well as the selection of the micro-controller as a secondary interface.
	Value	Mode		Description
	0	DISABLE		Chip select is active low
	1	ENABLE		Chip select is active high
14	TXINV	0x0	RW	<b>Transmitter output Invert</b> The output from the USART transmitter can optionally be inverted by setting this bit.
	Value	Mode		Description
	0	DISABLE		Output from the transmitter is passed unchanged to U(S)n_TX
	1	ENABLE		Output from the transmitter is inverted before it is passed to U(S)n_TX

Bit	Name	Reset	Access	Description
13	RXINV	0x0	RW	<b>Receiver Input Invert</b> Setting this bit will invert the input to the USART receiver.
	Value	Mode		Description
	0	DISABLE		Input is passed directly to the receiver
	1	ENABLE		Input is inverted before it is passed to the receiver
12	TXBIL	0x0	RW	<b>TX Buffer Interrupt Level</b> Determines the interrupt and status level of the transmit buffer.
	Value	Mode		Description
	0	EMPTY		TXBL and the TXBL interrupt flag are set when the transmit buffer becomes empty. TXBL is cleared when the buffer becomes nonempty.
	1	HALFFULL		TXBL and TXBLIF are set when the transmit buffer goes from full to half-full or empty. TXBL is cleared when the buffer becomes full.
11	CSMA	0x0	RW	<b>Action On Chip Select In Main Mode</b> This register determines the action to be performed when chip select is configured as an input and driven low while in main interface mode.
	Value	Mode		Description
	0	NOACTION		No action taken
	1	GOTOSLAVEMODE		Go to secondary mode
10	MSBF	0x0	RW	<b>Most Significant Bit First</b> Decides whether data is sent with the least significant bit first, or the most significant bit first.
	Value	Mode		Description
	0	DISABLE		Data is sent with the least significant bit first
	1	ENABLE		Data is sent with the most significant bit first
9	CLKPHA	0x0	RW	<b>Clock Edge For Setup/Sample</b> Determines where data is set-up and sampled according to the bus clock when in synchronous mode.
	Value	Mode		Description
	0	SAMPLELEADING		Data is sampled on the leading edge and set-up on the trailing edge of the bus clock in synchronous mode
	1	SAMPLETRAILING		Data is set-up on the leading edge and sampled on the trailing edge of the bus clock in synchronous mode
8	CLKPOL	0x0	RW	<b>Clock Polarity</b> Determines the clock polarity of the bus clock used in synchronous mode.
	Value	Mode		Description
	0	IDLELOW		The bus clock used in synchronous mode has a low base value

Bit	Name	Reset	Access	Description
1		IDLEHIGH		The bus clock used in synchronous mode has a high base value
7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6:5	OVS	0x0	RW	<b>Oversampling</b> Sets the number of clock periods in a UART bit-period. More clock cycles gives better robustness, while less clock cycles gives better performance.
	Value	Mode	Description	
	0	X16	Regular UART mode with 16X oversampling in asynchronous mode	
	1	X8	Double speed with 8X oversampling in asynchronous mode	
	2	X6	6X oversampling in asynchronous mode	
	3	X4	Quadruple speed with 4X oversampling in asynchronous mode	
4	MPAB	0x0	RW	<b>Multi-Processor Address-Bit</b> Defines the value of the multi-processor address bit. An incoming frame with its 9th bit equal to the value of this bit marks the frame as a multi-processor address frame.
3	MPM	0x0	RW	<b>Multi-Processor Mode</b> Multi-processor mode uses the 9th bit of the USART frames to tell whether the frame is an address frame or a data frame.
	Value	Mode	Description	
	0	DISABLE	The 9th bit of incoming frames has no special function	
	1	ENABLE	An incoming frame with the 9th bit equal to MPAB will be loaded into the receive buffer regardless of RXBLOCK and will result in the MPAB interrupt flag being set	
2	CCEN	0x0	RW	<b>Collision Check Enable</b> Enables collision checking on data when operating in half duplex modus.
	Value	Mode	Description	
	0	DISABLE	Collision check is disabled	
	1	ENABLE	Collision check is enabled. The receiver must be enabled for the check to be performed	
1	LOOPBK	0x0	RW	<b>Loopback Enable</b> Allows the receiver to be connected directly to the USART transmitter for loopback and half duplex communication.
	Value	Mode	Description	
	0	DISABLE	The receiver is connected to and receives data from U(S)n_RX	
	1	ENABLE	The receiver is connected to and receives data from U(S)n_TX	
0	SYNC	0x0	RW	<b>USART Synchronous Mode</b> Determines whether the USART is operating in asynchronous or synchronous mode.
	Value	Mode	Description	

Bit	Name	Reset	Access	Description
0		DISABLE		The USART operates in asynchronous mode
1		ENABLE		The USART operates in synchronous mode

## 20.5.4 USART\_FRAME - USART Frame Format Register

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																	0x1		0x0			0x5										
Access																	RW		RW			RW										
Name																	STOPBITS		PARITY			DATABITS										

Bit	Name	Reset	Access	Description															
31:14	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>																	
13:12	STOPBITS	0x1	RW	<b>Stop-Bit Mode</b> Determines the number of stop-bits used. <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>HALF</td> <td>The transmitter generates a half stop bit. Stop-bits are not verified by receiver</td> </tr> <tr> <td>1</td> <td>ONE</td> <td>One stop bit is generated and verified</td> </tr> <tr> <td>2</td> <td>ONEANDAHALF</td> <td>The transmitter generates one and a half stop bit. The receiver verifies the first stop bit</td> </tr> <tr> <td>3</td> <td>TWO</td> <td>The transmitter generates two stop bits. The receiver checks the first stop-bit only</td> </tr> </tbody> </table>	Value	Mode	Description	0	HALF	The transmitter generates a half stop bit. Stop-bits are not verified by receiver	1	ONE	One stop bit is generated and verified	2	ONEANDAHALF	The transmitter generates one and a half stop bit. The receiver verifies the first stop bit	3	TWO	The transmitter generates two stop bits. The receiver checks the first stop-bit only
Value	Mode	Description																	
0	HALF	The transmitter generates a half stop bit. Stop-bits are not verified by receiver																	
1	ONE	One stop bit is generated and verified																	
2	ONEANDAHALF	The transmitter generates one and a half stop bit. The receiver verifies the first stop bit																	
3	TWO	The transmitter generates two stop bits. The receiver checks the first stop-bit only																	
11:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>																	
9:8	PARITY	0x0	RW	<b>Parity-Bit Mode</b> Determines whether parity bits are enabled, and whether even or odd parity should be used. Only available in asynchronous mode. <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>NONE</td> <td>Parity bits are not used</td> </tr> <tr> <td>2</td> <td>EVEN</td> <td>Even parity are used. Parity bits are automatically generated and checked by hardware.</td> </tr> <tr> <td>3</td> <td>ODD</td> <td>Odd parity is used. Parity bits are automatically generated and checked by hardware.</td> </tr> </tbody> </table>	Value	Mode	Description	0	NONE	Parity bits are not used	2	EVEN	Even parity are used. Parity bits are automatically generated and checked by hardware.	3	ODD	Odd parity is used. Parity bits are automatically generated and checked by hardware.			
Value	Mode	Description																	
0	NONE	Parity bits are not used																	
2	EVEN	Even parity are used. Parity bits are automatically generated and checked by hardware.																	
3	ODD	Odd parity is used. Parity bits are automatically generated and checked by hardware.																	
7:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>																	
3:0	DATABITS	0x5	RW	<b>Data-Bit Mode</b> This register sets the number of data bits in a USART frame. <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>FOUR</td> <td>Each frame contains 4 data bits</td> </tr> <tr> <td>2</td> <td>FIVE</td> <td>Each frame contains 5 data bits</td> </tr> </tbody> </table>	Value	Mode	Description	1	FOUR	Each frame contains 4 data bits	2	FIVE	Each frame contains 5 data bits						
Value	Mode	Description																	
1	FOUR	Each frame contains 4 data bits																	
2	FIVE	Each frame contains 5 data bits																	

Bit	Name	Reset	Access	Description
3		SIX		Each frame contains 6 data bits
4		SEVEN		Each frame contains 7 data bits
5		EIGHT		Each frame contains 8 data bits
6		NINE		Each frame contains 9 data bits
7		TEN		Each frame contains 10 data bits
8		ELEVEN		Each frame contains 11 data bits
9		TWELVE		Each frame contains 12 data bits
10		THIRTEEN		Each frame contains 13 data bits
11		FOURTEEN		Each frame contains 14 data bits
12		FIFTEEN		Each frame contains 15 data bits
13		SIXTEEN		Each frame contains 16 data bits

## 20.5.5 USART\_TRIGCTRL - USART Trigger Control Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset														0x0	0x0	0x0	0x0															
Access														RW	RW	RW	RW	RW	RW	RW	RW											
Name														RXATX2EN	RXATX1EN	RXATX0EN	TXARX2EN	TXARX1EN	TXARX0EN	AUTOTXTEN	TXTEN	RXTEN										

Bit	Name	Reset	Access	Description
31:13	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
12	RXATX2EN	0x0	RW	<b>Enable Receive Trigger after TX end of f</b> When set, a TX end of frame will trigger the receiver after a TCMPVAL2 baud-time delay
11	RXATX1EN	0x0	RW	<b>Enable Receive Trigger after TX end of f</b> When set, a TX end of frame will trigger the receiver after a TCMPVAL1 baud-time delay
10	RXATX0EN	0x0	RW	<b>Enable Receive Trigger after TX end of f</b> When set, a TX end of frame will trigger the receiver after a TCMPVAL0 baud-time delay
9	TXARX2EN	0x0	RW	<b>Enable Transmit Trigger after RX End of</b> When set, an RX end of frame will trigger the transmitter after TCMP2VAL bit times to force a minimum response delay
8	TXARX1EN	0x0	RW	<b>Enable Transmit Trigger after RX End of</b> When set, an RX end of frame will trigger the transmitter after TCMP1VAL bit times to force a minimum response delay
7	TXARX0EN	0x0	RW	<b>Enable Transmit Trigger after RX End of</b> When set, an RX end of frame will trigger the transmitter after TCMP0VAL bit times to force a minimum response delay
6	AUTOTXTEN	0x0	RW	<b>AUTOTX Trigger Enable</b> When set, AUTOTX is enabled as long as the PRS channel selected by TSEL has a high value
5	TXTEN	0x0	RW	<b>Transmit Trigger Enable</b> When set, the PRS channel selected by TSEL sets TXEN, enabling the transmitter on positive trigger edges.
4	RXTEN	0x0	RW	<b>Receive Trigger Enable</b> When set, the PRS channel selected by TSEL sets RXEN, enabling the receiver on positive trigger edges.
3:0	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		

### 20.5.6 USART\_CMD - Command Register

Offset	Bit Position																																																			
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Access</b>																					W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)
<b>Name</b>																					CLEARRX	CLEARTX	TXTRIDIS	TXTRIEEN	RXBLOCKDIS	RXBLOCKEN	MASTERDIS	MASTEREN	TXDIS	TXEN	RXDIS	RXEN																				

Bit	Name	Reset	Access	Description
31:12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
11	CLEARRX	0x0	W(nB)	<b>Clear RX</b> Set to clear receive buffer and the RX shift register.
10	CLEARTX	0x0	W(nB)	<b>Clear TX</b> Set to clear transmit buffer and the TX shift register.
9	TXTRIDIS	0x0	W(nB)	<b>Transmitter Tristate Disable</b> Disables tristating of the transmitter output.
8	TXTRIEEN	0x0	W(nB)	<b>Transmitter Tristate Enable</b> Tristates the transmitter output.
7	RXBLOCKDIS	0x0	W(nB)	<b>Receiver Block Disable</b> Set to clear RXBLOCK, resulting in all incoming frames being loaded into the receive buffer.
6	RXBLOCKEN	0x0	W(nB)	<b>Receiver Block Enable</b> Set to set RXBLOCK, resulting in all incoming frames being discarded.
5	MASTERDIS	0x0	W(nB)	<b>Main Mode Disable</b> Set to disable main interface mode, clearing the MASTER status bit and putting the USART in secondary interface mode.
4	MASTEREN	0x0	W(nB)	<b>Main Mode Enable</b> Set to enable main interface mode, setting the MASTER status bit. Main mode should not be enabled while TXENS is set to 1. To enable both main interface and TX mode, write MASTEREN before TXEN, or enable them both in the same write operation.
3	TXDIS	0x0	W(nB)	<b>Transmitter Disable</b> Set to disable transmission.
2	TXEN	0x0	W(nB)	<b>Transmitter Enable</b> Set to enable data transmission.
1	RXDIS	0x0	W(nB)	<b>Receiver Disable</b> Set to disable data reception. If a frame is under reception when the receiver is disabled, the incoming frame is discarded.
0	RXEN	0x0	W(nB)	<b>Receiver Enable</b>

---

Bit	Name	Reset	Access	Description
				Set to activate data reception on U(S)n_RX.

---

## 20.5.7 USART\_STATUS - USART Status Register

Offset	Bit Position																																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
<b>Reset</b>															0x0		0x0	0x1	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x1	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0			
<b>Access</b>															R		R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	
<b>Name</b>															TXBUFCNT		TIMERRESTARTED	TXIDLE	RXFULLRIGHT	RXDATAVRIGHT	TXBSRIGHT	TXBDRIGHT	RXFULL	RXDATAV	TXBL	TXC	TXTRI	RXBLOCK	MASTER	TXENS	TXENS																	

Bit	Name	Reset	Access	Description
31:18	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
17:16	TXBUFCNT	0x0	R	<b>TX Buffer Count</b>  Count of TX buffer entry 0, entry 1, and TX shift register. For large frames, the count is only of TX buffer entry 0 and the TX shifter register.
15	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
14	TIMERRESTARTED	0x0	R	<b>The USART Timer restarted itself</b>  When the timer is restarting itself on each TCMP event, a TIMERRESTARTED value of 0x0 indicates the first TCMP event in the sequence of multiple TCMP events. Any non TCMP timer start events will clear TIMERRESTARTED. When there is a TCMP interrupt and TIMERRESTARTED is 0x0, an interrupt service routine can set a TCMP event counter variable in memory to 0x1 to indicate the first TCMP interrupt of the sequence.
13	TXIDLE	0x1	R	<b>TX Idle</b>  Set when TX idle
12	RXFULLRIGHT	0x0	R	<b>RX Full of Right Data</b>  When set, the entire RX buffer contains right data. Only used in I2S mode
11	RXDATAVRIGHT	0x0	R	<b>RX Data Right</b>  When set, reading RXDATA or RXDATAV gives right data. Else left data is read. Only used in I2S mode
10	TXBSRIGHT	0x0	R	<b>TX Buffer Expects Single Right Data</b>  When set, the TX buffer expects at least a single right data. Else it expects left data. Only used in I2S mode
9	TXBDRIGHT	0x0	R	<b>TX Buffer Expects Double Right Data</b>  When set, the TX buffer expects double right data. Else it may expect a single right data or left data. Only used in I2S mode
8	RXFULL	0x0	R	<b>RX FIFO Full</b>  Set when the RXFIFO is full. Cleared when the receive buffer is no longer full. When this bit is set, there is still room for one more frame in the receive shift register.
7	RXDATAV	0x0	R	<b>RX Data Valid</b>  Set when data is available in the receive buffer. Cleared when the receive buffer is empty.
6	TXBL	0x1	R	<b>TX Buffer Level</b>

Bit	Name	Reset	Access	Description
				Indicates the level of the transmit buffer. If TXBIL is 0x0, TXBL is set whenever the transmit buffer is completely empty. Otherwise TXBL is set whenever the TX Buffer becomes half full.
5	TXC	0x0	R	<b>TX Complete</b> Set when a transmission has completed and no more data is available in the transmit buffer and shift register. Cleared when data is written to the transmit buffer.
4	TXTRI	0x0	R	<b>Transmitter Tristated</b> Set when the transmitter is tristated, and cleared when transmitter output is enabled. If AUTOTRI in USARTn_CTRL is set this bit is always read as 0.
3	RXBLOCK	0x0	R	<b>Block Incoming Data</b> When set, the receiver discards incoming frames. An incoming frame will not be loaded into the receive buffer if this bit is set at the instant the frame has been completely received.
2	MASTER	0x0	R	<b>SPI Main Mode</b> Set when the USART operates as a main interface. Set using the MASTEREN command and clear using the MASTER-DIS command.
1	TXENS	0x0	R	<b>Transmitter Enable Status</b> Set when the transmitter is enabled.
0	RXENS	0x0	R	<b>Receiver Enable Status</b> Set when the receiver is enabled.

### 20.5.8 USART\_CLKDIV - Clock Control Register

Offset	Bit Position																																
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>	0x0																	0x0															
<b>Access</b>	RW																	RW															
<b>Name</b>	AUTOBAUDEN																	DIV															

Bit	Name	Reset	Access	Description
31	AUTOBAUDEN	0x0	RW	<b>AUTOBAUD detection enable</b> Detects the baud rate based on receiving a 0x55 frame (0x00 for IrDA). This is used in Asynchronous mode.
30:23	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
22:3	DIV	0x0	RW	<b>Fractional Clock Divider</b> Specifies the fractional clock divider for the USART. Setting AUTOBAUDEN in USARTn_CLKDIV will overwrite the DIV field.
2:0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

## 20.5.9 USART\_RXDATAx - RX Buffer Data Extended Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0	0x0											0x0			
<b>Access</b>																	R	R											R			
<b>Name</b>																	FERR	PERR											RXDATA			

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15	FERR	0x0	R	<b>Data Framing Error</b> Set if data in buffer has a framing error. Can be the result of a break condition.
14	PERR	0x0	R	<b>Data Parity Error</b> Set if data in buffer has a parity error (asynchronous mode only).
13:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8:0	RXDATA	0x0	R	<b>RX Data</b> Use this register to access data read from the USART. Buffer is cleared on read access.

## 20.5.10 USART\_RXDATA - RX Buffer Data Register

Offset	Bit Position																																
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																																	0x0
<b>Access</b>																																	R
<b>Name</b>																																	RXDATA

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:0	RXDATA	0x0	R	<b>RX Data</b> Use this register to access data read from USART. Buffer is cleared on read access. Only the 8 LSB can be read using this register.

## 20.5.11 USART\_RXDOUBLEX - RX Buffer Double Data Extended Register

Offset	Bit Position																																
0x028	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>	0x0	0x0										0x0					0x0	0x0															0x0
<b>Access</b>	R	R										R					R	R														R	
<b>Name</b>	FERR1	PERR1										RXDATA1					FERR0	PERR0														RXDATA0	

Bit	Name	Reset	Access	Description
31	FERR1	0x0	R	<b>Data Framing Error 1</b> Set if data in buffer has a framing error. Can be the result of a break condition.
30	PERR1	0x0	R	<b>Data Parity Error 1</b> Set if data in buffer has a parity error (asynchronous mode only).
29:25	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
24:16	RXDATA1	0x0	R	<b>RX Data 1</b> Second frame read from buffer.
15	FERR0	0x0	R	<b>Data Framing Error 0</b> Set if data in buffer has a framing error. Can be the result of a break condition.
14	PERR0	0x0	R	<b>Data Parity Error 0</b> Set if data in buffer has a parity error (asynchronous mode only).
13:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8:0	RXDATA0	0x0	R	<b>RX Data 0</b> First frame read from buffer.

## 20.5.12 USART\_RXDOUBLE - RX FIFO Double Data Register

Offset	Bit Position																															
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0								0x0							
<b>Access</b>																	R								R							
<b>Name</b>																	RXDATA1								RXDATA0							

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15:8	RXDATA1	0x0	R	<b>RX Data 1</b> Second frame read from buffer.
7:0	RXDATA0	0x0	R	<b>RX Data 0</b> First frame read from buffer.

## 20.5.13 USART\_RXDATAXP - RX Buffer Data Extended Peek Register

Offset	Bit Position																																	
0x030	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
<b>Reset</b>																	0x0	0x0									0x0							
<b>Access</b>																	R	R									R							
<b>Name</b>																	FERRP	PERRP									RXDATAP							

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15	FERRP	0x0	R	<b>Data Framing Error Peek</b> Set if data in buffer has a framing error. Can be the result of a break condition.
14	PERRP	0x0	R	<b>Data Parity Error Peek</b> Set if data in buffer has a parity error (asynchronous mode only).
13:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8:0	RXDATAP	0x0	R	<b>RX Data Peek</b> Use this register to access data read from the USART.

## 20.5.14 USART\_RXDOUBLEXP - RX Buffer Double Data Extended Peek R...

Offset	Bit Position																																
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>	0x0	0x0										0x0					0x0	0x0															0x0
<b>Access</b>	R	R										R					R	R															R
<b>Name</b>	FERRP1	PERRP1										RXDATAP1					FERRP0	PERRP0															RXDATAPO

Bit	Name	Reset	Access	Description
31	FERRP1	0x0	R	<b>Data Framing Error 1 Peek</b> Set if data in buffer has a framing error. Can be the result of a break condition.
30	PERRP1	0x0	R	<b>Data Parity Error 1 Peek</b> Set if data in buffer has a parity error (asynchronous mode only).
29:25	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
24:16	RXDATAP1	0x0	R	<b>RX Data 1 Peek</b> Second frame read from FIFO.
15	FERRP0	0x0	R	<b>Data Framing Error 0 Peek</b> Set if data in buffer has a framing error. Can be the result of a break condition.
14	PERRP0	0x0	R	<b>Data Parity Error 0 Peek</b> Set if data in buffer has a parity error (asynchronous mode only).
13:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8:0	RXDATAPO	0x0	R	<b>RX Data 0 Peek</b> First frame read from FIFO.

## 20.5.16 USART\_TXDATA - TX Buffer Data Register

Offset	Bit Position																															
0x03C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									W(nB)							
<b>Name</b>																									TXDATA							

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:0	TXDATA	0x0	W(nB)	<b>TX Data</b>  This frame will be added to TX buffer. Only 8 LSB can be written using this register. 9th bit and control bits will be cleared.

Bit	Name	Reset	Access	Description
-----	------	-------	--------	-------------

First frame to write to buffer.

### 20.5.18 USART\_TXDOUBLE - TX Buffer Double Data Register

Offset	Bit Position																															
0x044	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0								0x0							
<b>Access</b>																	W								W							
<b>Name</b>																	TXDATA1								TXDATA0							

Bit	Name	Reset	Access	Description
-----	------	-------	--------	-------------

31:16 *Reserved* *To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in [1.2 Conventions](#)*

15:8 TXDATA1 0x0 W **TX Data**  
Second frame to write to buffer.

7:0 TXDATA0 0x0 W **TX Data**  
First frame to write to buffer.

## 20.5.19 USART\_IF - Interrupt Flag Register

Offset	Bit Position																																																
0x048	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																	
<b>Reset</b>																0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	
<b>Access</b>																RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
<b>Name</b>																TCMP2	TCMP1	TCMP0	TXIDLE	CCF	SSM	MPAF	FERR	PERR	TXUF	TXOF	RXUF	RXOF	RXFULL	RXDATAV	TXBL	TXC																	

Bit	Name	Reset	Access	Description
31:17	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
16	TCMP2	0x0	RW	<b>Timer comparator 2 Interrupt Flag</b> Set when the timer reaches the comparator 2 value, TCMP2.
15	TCMP1	0x0	RW	<b>Timer comparator 1 Interrupt Flag</b> Set when the timer reaches the comparator 1 value, TCMP1.
14	TCMP0	0x0	RW	<b>Timer comparator 0 Interrupt Flag</b> Set when the Timer reaches the comparator 0 value, TCMP0.
13	TXIDLE	0x0	RW	<b>TX Idle Interrupt Flag</b> Set when TX goes idle. At this point, transmission has ended
12	CCF	0x0	RW	<b>Collision Check Fail Interrupt Flag</b> Set when a collision check notices an error in the transmitted data.
11	SSM	0x0	RW	<b>Chip-Select In Main Mode Interrupt Flag</b> Set when the chip select is pulled active when in main interface mode.
10	MPAF	0x0	RW	<b>Multi-Processor Address Frame Interrupt</b> Set when a multi-processor address frame is detected.
9	FERR	0x0	RW	<b>Framing Error Interrupt Flag</b> Set when a frame with a framing error is received while RXBLOCK is cleared.
8	PERR	0x0	RW	<b>Parity Error Interrupt Flag</b> Set when a frame with a parity error (asynchronous mode only) is received while RXBLOCK is cleared.
7	TXUF	0x0	RW	<b>TX Underflow Interrupt Flag</b> Set when operating as a synchronous secondary, no data is available in the transmit buffer when the main interface starts transmission of a new frame.
6	TXOF	0x0	RW	<b>TX Overflow Interrupt Flag</b> Set when a write is done to the transmit buffer while it is full. The data already in the transmit buffer is preserved.
5	RXUF	0x0	RW	<b>RX Underflow Interrupt Flag</b> Set when trying to read from the receive buffer when it is empty.
4	RXOF	0x0	RW	<b>RX Overflow Interrupt Flag</b> Set when data is incoming while the receive shift register is full. The data previously in the shift register is lost.

Bit	Name	Reset	Access	Description
3	RXFULL	0x0	RW	<b>RX Buffer Full Interrupt Flag</b> Set when the receive buffer becomes full.
2	RXDATAV	0x0	RW	<b>RX Data Valid Interrupt Flag</b> Set when data becomes available in the receive buffer.
1	TXBL	0x1	RW	<b>TX Buffer Level Interrupt Flag</b> Set when buffer becomes empty if buffer level is set to 0x0, or when the number of empty TX buffer elements equals specified buffer level.
0	TXC	0x0	RW	<b>TX Complete Interrupt Flag</b> This interrupt is set after a transmission when both the TX buffer and shift register are empty.

## 20.5.20 USART\_IEN - Interrupt Enable Register

Offset	Bit Position																																																
0x04C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																	
Reset																	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	
Access																	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
Name																	TCMP2	TCMP1	TCMP0	TXIDLE	CCF	SSM	MPAF	FERR	PERR	TXUF	TXOF	RXUF	RXOF	RXFULL	RXDATAV	TXBL	TXC																

Bit	Name	Reset	Access	Description
31:17	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
16	TCMP2	0x0	RW	<b>Timer comparator 2 Interrupt Enable</b> Set when the timer reaches the comparator 2 value, TCMP2.
15	TCMP1	0x0	RW	<b>Timer comparator 1 Interrupt Enable</b> Set when the timer reaches the comparator 1 value, TCMP1.
14	TCMP0	0x0	RW	<b>Timer comparator 0 Interrupt Enable</b> Set when the Timer reaches the comparator 0 value, TCMP0.
13	TXIDLE	0x0	RW	<b>TX Idle Interrupt Enable</b> Set when TX goes idle. At this point, transmission has ended
12	CCF	0x0	RW	<b>Collision Check Fail Interrupt Enable</b> Set when a collision check notices an error in the transmitted data.
11	SSM	0x0	RW	<b>Chip-Select In Main Mode Interrupt Flag</b> Set when the chip select is pulled active when in main interface mode.
10	MPAF	0x0	RW	<b>Multi-Processor Address Frame Interrupt</b> Set when a multi-processor address frame is detected.
9	FERR	0x0	RW	<b>Framing Error Interrupt Enable</b> Set when a frame with a framing error is received while RXBLOCK is cleared.
8	PERR	0x0	RW	<b>Parity Error Interrupt Enable</b> Set when a frame with a parity error (asynchronous mode only) is received while RXBLOCK is cleared.
7	TXUF	0x0	RW	<b>TX Underflow Interrupt Enable</b> Set when operating as a synchronous secondary, no data is available in the transmit buffer when the main interface starts transmission of a new frame.
6	TXOF	0x0	RW	<b>TX Overflow Interrupt Enable</b> Set when a write is done to the transmit buffer while it is full. The data already in the transmit buffer is preserved.
5	RXUF	0x0	RW	<b>RX Underflow Interrupt Enable</b> Set when trying to read from the receive buffer when it is empty.
4	RXOF	0x0	RW	<b>RX Overflow Interrupt Enable</b> Set when data is incoming while the receive shift register is full. The data previously in the shift register is lost.

Bit	Name	Reset	Access	Description
3	RXFULL	0x0	RW	<b>RX Buffer Full Interrupt Enable</b> Set when the receive buffer becomes full.
2	RXDATAV	0x0	RW	<b>RX Data Valid Interrupt Enable</b> Set when data becomes available in the receive buffer.
1	TXBL	0x0	RW	<b>TX Buffer Level Interrupt Enable</b> Set when buffer becomes empty if buffer level is set to 0x0, or when the number of empty TX buffer elements equals specified buffer level.
0	TXC	0x0	RW	<b>TX Complete Interrupt Enable</b> This interrupt is set after a transmission when both the TX buffer and shift register are empty.

### 20.5.21 USART\_IRCTRL - IrDA Control Register

Offset	Bit Position																															
0x050	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0	0x0			
<b>Access</b>																											RW	RW	RW			
<b>Name</b>																											IRFILT	IRPW	IREN			

Bit	Name	Reset	Access	Description															
31:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>																	
3	IRFILT	0x0	RW	<b>IrDA RX Filter</b> Set to enable filter on IrDA demodulator.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>DISABLE</td> <td>No filter enabled</td> </tr> <tr> <td>1</td> <td>ENABLE</td> <td>Filter enabled. IrDA pulse must be high for at least 5 consecutive clock cycles to be detected</td> </tr> </tbody> </table>	Value	Mode	Description	0	DISABLE	No filter enabled	1	ENABLE	Filter enabled. IrDA pulse must be high for at least 5 consecutive clock cycles to be detected						
Value	Mode	Description																	
0	DISABLE	No filter enabled																	
1	ENABLE	Filter enabled. IrDA pulse must be high for at least 5 consecutive clock cycles to be detected																	
2:1	IRPW	0x0	RW	<b>IrDA TX Pulse Width</b> Configure the pulse width generated by the IrDA modulator as a fraction of the configured USART bit period.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>ONE</td> <td>IrDA pulse width is 1/16 for OVS=0 and 1/8 for OVS=1</td> </tr> <tr> <td>1</td> <td>TWO</td> <td>IrDA pulse width is 2/16 for OVS=0 and 2/8 for OVS=1</td> </tr> <tr> <td>2</td> <td>THREE</td> <td>IrDA pulse width is 3/16 for OVS=0 and 3/8 for OVS=1</td> </tr> <tr> <td>3</td> <td>FOUR</td> <td>IrDA pulse width is 4/16 for OVS=0 and 4/8 for OVS=1</td> </tr> </tbody> </table>	Value	Mode	Description	0	ONE	IrDA pulse width is 1/16 for OVS=0 and 1/8 for OVS=1	1	TWO	IrDA pulse width is 2/16 for OVS=0 and 2/8 for OVS=1	2	THREE	IrDA pulse width is 3/16 for OVS=0 and 3/8 for OVS=1	3	FOUR	IrDA pulse width is 4/16 for OVS=0 and 4/8 for OVS=1
Value	Mode	Description																	
0	ONE	IrDA pulse width is 1/16 for OVS=0 and 1/8 for OVS=1																	
1	TWO	IrDA pulse width is 2/16 for OVS=0 and 2/8 for OVS=1																	
2	THREE	IrDA pulse width is 3/16 for OVS=0 and 3/8 for OVS=1																	
3	FOUR	IrDA pulse width is 4/16 for OVS=0 and 4/8 for OVS=1																	
0	IREN	0x0	RW	<b>Enable IrDA Module</b> Enable IrDA module and rout USART signals through it.															

## 20.5.22 USART\_I2SCTRL - I2S Control Register

Offset	Bit Position																															
0x054	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>											0x0						0x0		0x0		0x0		0x0		0x0							
<b>Access</b>											RW						RW		RW		RW		RW		RW							
<b>Name</b>											FORMAT						DELAY		DMASPLIT		JUSTIFY		MONO		EN							

Bit	Name	Reset	Access	Description
31:11	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
10:8	FORMAT	0x0	RW	<b>I2S Word Format</b> Configure the data-width used internally for I2S data
	Value	Mode		Description
	0	W32D32		32-bit word, 32-bit data
	1	W32D24M		32-bit word, 32-bit data with 8 lsb masked
	2	W32D24		32-bit word, 24-bit data
	3	W32D16		32-bit word, 16-bit data
	4	W32D8		32-bit word, 8-bit data
	5	W16D16		16-bit word, 16-bit data
	6	W16D8		16-bit word, 8-bit data
	7	W8D8		8-bit word, 8-bit data
7:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	DELAY	0x0	RW	<b>Delay on I2S data</b> Set to add a one-cycle delay between a transition on the word-clock and the start of the I2S word. Should be set for standard I2S format
3	DMASPLIT	0x0	RW	<b>Separate DMA Request For Left/Right Data</b> When set DMA requests for right-channel data are put on the TXBLRIGHT and RXDATAVRIGHT DMA requests.
2	JUSTIFY	0x0	RW	<b>Justification of I2S Data</b> Determines whether the I2S data is left or right justified
	Value	Mode		Description
	0	LEFT		Data is left-justified
	1	RIGHT		Data is right-justified
1	MONO	0x0	RW	<b>Stereo or Mono</b> Switch between stereo and mono mode. Set for mono
0	EN	0x0	RW	<b>Enable I2S Mode</b>

---

Bit	Name	Reset	Access	Description
				Set the U(S)ART in I2S mode.

---

## 20.5.23 USART\_TIMING - Timing Register

Offset	Bit Position																																
0x058	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>			0x0			0x0				0x0					0x0																		
<b>Access</b>			RW			RW				RW					RW																		
<b>Name</b>			CSHOLD			ICS				CSSETUP					TXDELAY																		

Bit	Name	Reset	Access	Description																											
31	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>																											
30:28	CSHOLD	0x0	RW	<b>Chip Select Hold</b>  Chip Select will be asserted after the end of frame transmission. When using TCMPn, normally set TIMECMPn_TSTART to DISABLE to stop general timer and to prevent unwanted interrupts.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>ZERO</td> <td>Disable CS being asserted after the end of transmission</td> </tr> <tr> <td>1</td> <td>ONE</td> <td>CS is asserted for 1 baud-times after the end of transmission</td> </tr> <tr> <td>2</td> <td>TWO</td> <td>CS is asserted for 2 baud-times after the end of transmission</td> </tr> <tr> <td>3</td> <td>THREE</td> <td>CS is asserted for 3 baud-times after the end of transmission</td> </tr> <tr> <td>4</td> <td>SEVEN</td> <td>CS is asserted for 7 baud-times after the end of transmission</td> </tr> <tr> <td>5</td> <td>TCMP0</td> <td>CS is asserted after the end of transmission for TCMPVAL0 baud-times</td> </tr> <tr> <td>6</td> <td>TCMP1</td> <td>CS is asserted after the end of transmission for TCMPVAL1 baud-times</td> </tr> <tr> <td>7</td> <td>TCMP2</td> <td>CS is asserted after the end of transmission for TCMPVAL2 baud-times</td> </tr> </tbody> </table>	Value	Mode	Description	0	ZERO	Disable CS being asserted after the end of transmission	1	ONE	CS is asserted for 1 baud-times after the end of transmission	2	TWO	CS is asserted for 2 baud-times after the end of transmission	3	THREE	CS is asserted for 3 baud-times after the end of transmission	4	SEVEN	CS is asserted for 7 baud-times after the end of transmission	5	TCMP0	CS is asserted after the end of transmission for TCMPVAL0 baud-times	6	TCMP1	CS is asserted after the end of transmission for TCMPVAL1 baud-times	7	TCMP2	CS is asserted after the end of transmission for TCMPVAL2 baud-times
Value	Mode	Description																													
0	ZERO	Disable CS being asserted after the end of transmission																													
1	ONE	CS is asserted for 1 baud-times after the end of transmission																													
2	TWO	CS is asserted for 2 baud-times after the end of transmission																													
3	THREE	CS is asserted for 3 baud-times after the end of transmission																													
4	SEVEN	CS is asserted for 7 baud-times after the end of transmission																													
5	TCMP0	CS is asserted after the end of transmission for TCMPVAL0 baud-times																													
6	TCMP1	CS is asserted after the end of transmission for TCMPVAL1 baud-times																													
7	TCMP2	CS is asserted after the end of transmission for TCMPVAL2 baud-times																													
27	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>																											
26:24	ICS	0x0	RW	<b>Inter-character spacing</b>  Inter-character spacing after each TX frame while the TX buffer is not empty. When using USART_TIMECMPn, normally set TSTART to DISABLE to stop general timer and to prevent unwanted interrupts.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>ZERO</td> <td>There is no space between charcters</td> </tr> <tr> <td>1</td> <td>ONE</td> <td>Create a space of 1 baud-times before start of transmission</td> </tr> <tr> <td>2</td> <td>TWO</td> <td>Create a space of 2 baud-times before start of transmission</td> </tr> <tr> <td>3</td> <td>THREE</td> <td>Create a space of 3 baud-times before start of transmission</td> </tr> <tr> <td>4</td> <td>SEVEN</td> <td>Create a space of 7 baud-times before start of transmission</td> </tr> <tr> <td>5</td> <td>TCMP0</td> <td>Create a space of before the start of transmission for TCMPVAL0 baud-times</td> </tr> </tbody> </table>	Value	Mode	Description	0	ZERO	There is no space between charcters	1	ONE	Create a space of 1 baud-times before start of transmission	2	TWO	Create a space of 2 baud-times before start of transmission	3	THREE	Create a space of 3 baud-times before start of transmission	4	SEVEN	Create a space of 7 baud-times before start of transmission	5	TCMP0	Create a space of before the start of transmission for TCMPVAL0 baud-times						
Value	Mode	Description																													
0	ZERO	There is no space between charcters																													
1	ONE	Create a space of 1 baud-times before start of transmission																													
2	TWO	Create a space of 2 baud-times before start of transmission																													
3	THREE	Create a space of 3 baud-times before start of transmission																													
4	SEVEN	Create a space of 7 baud-times before start of transmission																													
5	TCMP0	Create a space of before the start of transmission for TCMPVAL0 baud-times																													

Bit	Name	Reset	Access	Description
	6	TCMP1		Create a space of before the start of transmission for TCMPVAL1 baud-times
	7	TCMP2		Create a space of before the start of transmission for TCMPVAL2 baud-times
23	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
22:20	CSSETUP	0x0	RW	<b>Chip Select Setup</b> Chip Select will be asserted before the start of frame transmission. When using USART_TIMECMPn, normally set TSTART to DISABLE to stop general timer and to prevent unwanted interrupts.
	Value	Mode	Description	
	0	ZERO	CS is not asserted before start of transmission	
	1	ONE	CS is asserted for 1 baud-times before start of transmission	
	2	TWO	CS is asserted for 2 baud-times before start of transmission	
	3	THREE	CS is asserted for 3 baud-times before start of transmission	
	4	SEVEN	CS is asserted for 7 baud-times before start of transmission	
	5	TCMP0	CS is asserted before the start of transmission for TCMPVAL0 baud-times	
	6	TCMP1	CS is asserted before the start of transmission for TCMPVAL1 baud-times	
	7	TCMP2	CS is asserted before the start of transmission for TCMPVAL2 baud-times	
19	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
18:16	TXDELAY	0x0	RW	<b>TX frame start delay</b> Number of baud-times to delay the start of frame transmission. When using USART_TIMECMPn, normally set TSTART to DISABLE to stop general timer and to prevent unwanted interrupts.
	Value	Mode	Description	
	0	DISABLE	Disable - TXDELAY in USARTn_CTRL can be used for legacy	
	1	ONE	Start of transmission is delayed for 1 baud-times	
	2	TWO	Start of transmission is delayed for 2 baud-times	
	3	THREE	Start of transmission is delayed for 3 baud-times	
	4	SEVEN	Start of transmission is delayed for 7 baud-times	
	5	TCMP0	Start of transmission is delayed for TCMPVAL0 baud-times	
	6	TCMP1	Start of transmission is delayed for TCMPVAL1 baud-times	
	7	TCMP2	Start of transmission is delayed for TCMPVAL2 baud-times	
15:0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

## 20.5.24 USART\_CTRLX - Control Register Extended

Offset	Bit Position																																			
0x05C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

7:0	TCMPVAL	0x0	RW	<b>Timer comparator 2.</b> When the timer equals TCMPVAL, this signals a TCMP2 event and sets the TCMP2 flag. This event can also be used to enable various USART functionality. A value of 0x00 represents 256 baud times.

## 21. EUSART - Universal Synchronous Asynchronous Receiver/Transmitter

### Quick Facts

#### What?

The EUSART handles high-speed UART, SPI-bus, and IrDA communication.

#### Why?

Serial communication is frequently used in embedded systems and the EUSART allows efficient communication with a wide range of external devices.

#### How?

The EUSART has a wide selection of operating modes, frame formats and baud rates. The multi-processor mode allows the EUSART to remain idle when not addressed. 16-deep FIFOs and DMA support makes high data-rates possible with minimal CPU intervention and it is possible to transmit and receive large frames while the MCU remains in EM1 Sleep.

### 21.1 Introduction

The Enhanced Universal Synchronous Asynchronous serial Receiver and Transmitter (EUSART) is a very flexible serial I/O module. It supports full duplex asynchronous UART communication as well as SPI, MicroWire. It can also interface with IrDA devices.

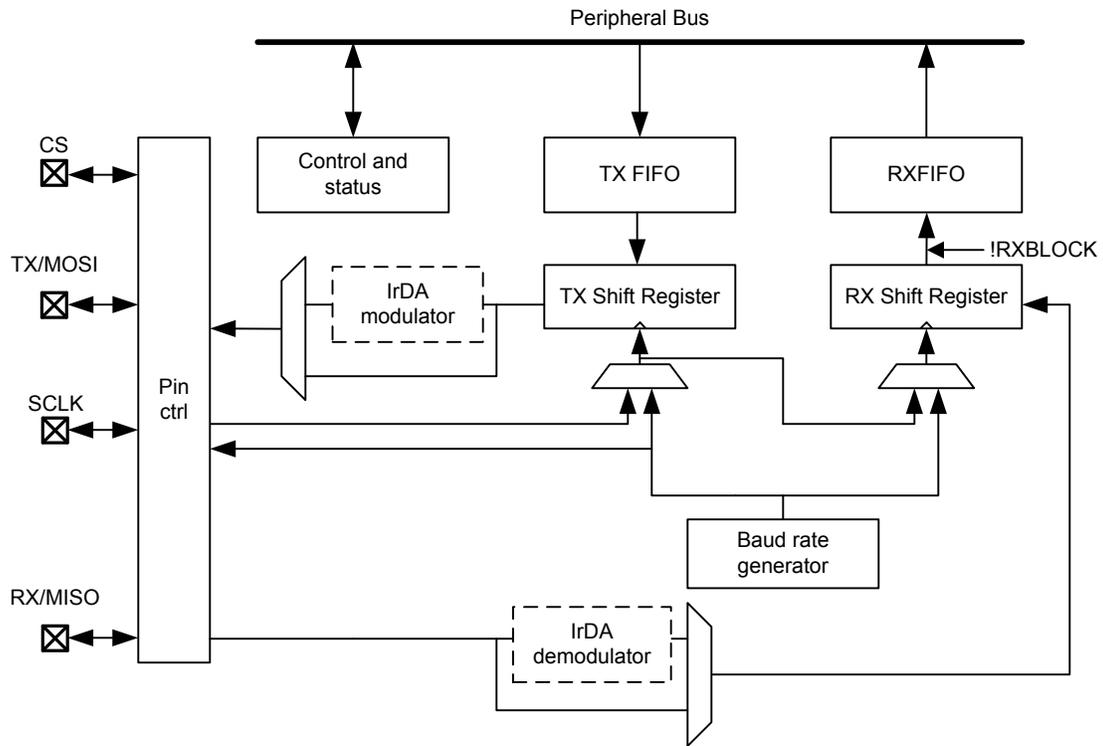

## 21.2 Features

- Asynchronous (UART) and synchronous (SPI) communication
- Full duplex and half duplex
- Separate TX/RX enable
- Separate receive / transmit 16 deep FIFOs, with additional separate shift registers
- Can operate using HF clock or LF clock (UART only)
- Programmable baud rate, generated as a fractional division from the peripheral clock ( $\text{HFPERCLK}_{\text{EUSARTn}}$ )
- Max bit-rate
  - Main SPI mode: 20 MHz
  - Secondary SPI mode: 10 MHz
  - UART mode, HF peripheral clock rate/16, 8, 6, or 4
  - UART mode, 32 KHz LF peripheral clock: 9600 (oversampling not supported with LF operation)
- Supports transmission and reception in EM0 (also EM1 and EM2 in certain modes) with
  - Full DMA support
  - UART mode, specified start-frame can start reception automatically
- UART mode, capable of sleep-mode wake-up on received frame (EM2 Capable instance only)
  - Either wake-up on any received byte or
  - Wake up only on specified start and signal frames
- SPI mode, capable of sleep-mode wake-up on received frame (EM2/3 Capable instance only)
  - Either wake-up on CS active or
  - Wake up on Receive FIFO level matching Watermark Level Setting
- Asynchronous mode supports
  - Configurable number of data bits 7-9 (plus the parity bit, if enabled)
  - HW parity bit generation and check
  - Majority vote baud-reception
  - False start-bit detection
  - Break generation/detection
  - Multi-processor mode
  - Configurable number of stop bits in asynchronous mode:
    - HF clock EM0/1 operation: 0.5, 1, 1.5, 2
    - LF clock operation: 1, 2
  - HW collision detection
  - IrDA support
    - HF clock EM0/1 operation: IrDA modulator
    - LF clock operation: Pulse extender, RX-only
  - Hardware Flow Control
  - Automatic Baud Rate Detection
- Synchronous mode supports
  - Configurable number of data bits 8-16
  - All 4 SPI clock polarity/phase configurations
  - Main and Secondary interface modes
- Data can be transmitted LSB first or MSB first
- Separate interrupt vectors for receive and transmit interrupts
- Loopback mode
  - Half duplex communication
  - Communication debugging
- PRS RX input
- DMA Support
- EM2 operation with LF clock (EM2/3 Capable instance only), wakeup to EM1 for DMA interaction
- Async mode Automatic Baud Rate Detection operating with HF clock in EM0/1

### 21.3 Functional Description

An overview of the EUSART module is shown in [Figure 21.1 EUSART Overview](#) on page 632.

This section describes all possible EUSART features. Please refer to the Device Datasheet to see what features a specific EUSART instance supports.

**Figure 21.1. EUSART Overview**

### 21.3.1 Modes of Operation

The EUSART operates in either asynchronous or synchronous mode.

In synchronous mode, a separate clock signal is transmitted with the data. This clock signal is generated by the main interface on the bus, and both the main and secondary devices sample and transmit data according to this clock. Both main and secondary interface modes are supported by the EUSART. The synchronous communication mode is compatible with the Serial Peripheral Interface Bus (SPI) standard.

In asynchronous mode, no separate clock signal is transmitted with the data on the bus. The EUSART receiver thus has to determine where to sample the data on the bus from the actual data. To make this possible, additional synchronization bits are added to the data when operating in asynchronous mode, resulting in a slight overhead.

Asynchronous or synchronous mode can be selected by configuring SYNC in EUSARTn\_CFG0. The options are listed with supported protocols in [Table 21.1 EUSART Asynchronous vs. Synchronous Mode on page 633](#). Full duplex and half duplex communication is supported in both asynchronous and synchronous mode.

**Table 21.1. EUSART Asynchronous vs. Synchronous Mode**

SYNC	Communication Mode	Supported Protocols
0	Asynchronous	RS-232, IrDA
1	Synchronous	SPI, MicroWire

[Table 21.2 EUSART Pin Usage on page 633](#) explains the functionality of the different EUSART pins when the EUSART operates in different modes. Pin functionality enclosed in square brackets is optional, and depends on additional configuration parameters. LOOPBK and MASTER are discussed in [21.3.2.7 Local Loopback](#) and [21.3.3.3 Main SPI Interface Mode \(Clock Driver\)](#) respectively.

**Table 21.2. EUSART Pin Usage**

SYNC	LOOPBK	MASTER	Pin Functionality			
			TX (MOSI)	RX (MISO)	CLK	CS
0	0	x	Data out	Data in	-	-
0	1	x	Data out/in	-	-	-
1	0	0	Data in	Data out	Clock in	Secondary select
1	0	1	Data out	Data in	Clock out	[Auto secondary select]
1	1	0	Data out/in	-	Clock in	Secondary select
1	1	1	Data out/in	-	Clock out	[Auto secondary select]

### 21.3.2 Asynchronous Operation

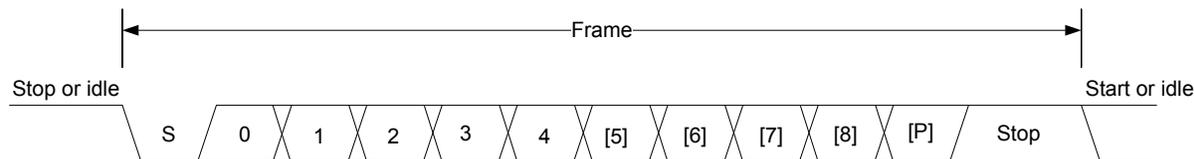

EUSART can operate in asynchronous mode when EUSARTn\_CFG0.SYNC is set to 0.

EUSART0 may operate as either a high-speed peripheral running from a high-frequency clock source (HF mode, available in EM0 and EM1), or as a low-energy peripheral operating from a low-frequency clock source (LF mode, available in EM0, EM1, or EM2). EUSART0 operates in HF mode when the EUSART0CLK clock selected in CMU\_EUSART0CLKCTRL\_CLKSEL is EM01GRPACLK or HFRCOEM23. EUSART0 operates in LF mode when the selected clock is LFXO or LFRCO. Baud rate generation differs between these two modes, and there are certain operational restrictions in LF mode discussed in this chapter. It is not generally useful to switch between modes on-the-fly in a single application.

Other EUSART instances operate only as a high-speed peripheral running from the EM01GRPCCLK selected using CMU\_EM01GRPCCLKCTRL\_CLKSEL.

### 21.3.2.1 Frame Format

The frame format used in asynchronous mode consists of a set of data bits in addition to bits for synchronization and optionally a parity bit for error checking. A frame starts with one start-bit (S), where the line is driven low for one bit-period. This signals the start of a frame, and is used for synchronization. Following the start bit are 7 to 9 data bits and an optional parity bit. Finally, a number of stop-bits, where the line is driven high that indicates the end of the frame. An example frame is shown in [Figure 21.2 Frame Format on page 634](#).

**Figure 21.2. Frame Format**

The number of data bits in a frame is set by DATABITS in EUSART<sub>n</sub>\_FRAMECFG, see [Table 21.3 Data Bits on page 634](#), and the number of stop-bits is set by STOPBITS in EUSART<sub>n</sub>\_FRAMECFG, see [Table 21.4 Stop Bits on page 634](#). Whether or not a parity bit should be included, and whether it should be even or odd is defined by PARITY, also in EUSART<sub>n</sub>\_FRAMECFG. For proper and reliable communication, all parties of a transfer must agree on the frame format prior to the start of the transfer.

**Table 21.3. Data Bits**

EUSART <sub>n</sub> _FRAMECFG_DATABITS[3:0]	Number of Data bits
0001	7
0010	8 (Default)
0011	9

**Table 21.4. Stop Bits**

EUSART <sub>n</sub> _FRAMECFG_STOPBITS[1:0]	Number of Stop bits
00	0.5 (HF clock operation only)
01	1 (Default)
10	1.5 (HF clock operation only)
11	2

The order in which the data bits are transmitted and received is defined by MSBF in EUSART<sub>n</sub>\_CFG0. When MSBF is cleared, data in a frame is sent and received with the least significant bit first. When it is set, the most significant bit comes first.

The frame format used by the transmitter can be inverted by setting TXINV in EUSART<sub>n</sub>\_CFG0, and the format expected by the receiver can be inverted by setting RXINV in EUSART<sub>n</sub>\_CFG0. These bits affect the entire frame, not only the data bits. An inverted frame has a low idle state, a high start-bit, inverted data and parity bits, and low stop-bits.

### 21.3.2.2 Parity Bit Calculation and Handling

When parity bit is enabled, hardware automatically calculates and inserts a parity bit into outgoing frames, and verifies the received parity bit in incoming frames. The possible parity modes are defined in [Table 21.5 Parity Bits on page 635](#). When even parity is chosen, a parity bit is inserted to make the number of high bits (data + parity) even. If odd parity is chosen, the parity bit makes the total number of high bits odd. When parity bit is disabled, which is the default configuration, the parity bit is omitted.

**Table 21.5. Parity Bits**

EUSART <sub>n</sub> _FRAMECFG_PARITY[1:0]	Description
00	No parity bit (Default)
01	Reserved
10	Even parity
11	Odd parity

### 21.3.2.3 Clock Generation

The EUSART clock defines the transmission and reception data rate. The baud rate is given by [Figure 21.3 EUSART Baud Rate on page 636](#).

$$br = f_{EUSARTn} / (\text{oversample} \times (1 + EUSARTn\_CLKDIV/256))$$

**Figure 21.3. EUSART Baud Rate**

where  $f_{EUSARTn}$  is the peripheral clock frequency and oversample is the oversampling rate as defined by OVS in EUSARTn\_CFG0, see [Table 21.6 Oversampling \(EUSARTn\\_CFG0\\_OVS\) on page 636](#). Note that different instances of the EUSART inside a device may use different peripheral clocks. The peripheral clock may be generically referred to in this chapter as `clk_per`.

**Note:** Please note that high frequency clocks should not be selected as UART clock source when nominal voltage is 0.9V.

**Note:**

Please note that when EUSARTn\_CFG0\_OVS is set to OVS\_DISABLE (0x4), the peripheral clock frequency must be at least three times higher than the chosen baud rate. This condition is given in [Figure 21.4 Requirement for EUSARTn\\_CFG0\\_OVS = OVS\\_DISABLE on page 636](#).

$$f_{EUSARTn} / br \geq 3.0$$

**Figure 21.4. Requirement for EUSARTn\_CFG0\_OVS = OVS\_DISABLE**

**Table 21.6. Oversampling (EUSARTn\_CFG0\_OVS)**

OVS[2:0]	Oversample
000	16 (HF clock operation only)
001	8 (HF clock operation only)
010	6 (HF clock operation only)
011	4 (HF clock operation only)
100	1 (OVS disabled - LF clock operation only)

**Note:** Please note that EUSARTn\_CFG0\_OVS must not be set to OVS\_DISABLE (0x4) when one of the high frequency clocks is selected as EUSARTn peripheral clock source. When one of the low frequency clocks (LFXO/LFRCO) is selected as EUSARTn peripheral clock source, EUSARTn\_CFG0\_OVS must be set to OVS\_DISABLE (0x4).

The EUSART has a fractional clock divider to allow the EUSART clock to be controlled more accurately than what is possible with a standard integral divider. The clock divider used in the EUSART is a 20-bit value, with a 15-bit integral part and an 5-bit fractional part. The fractional part is configured in the lower 5 bits of DIV in EUSARTn\_CLKDIV. Fractional clock division is implemented by distributing the selected fraction over thirty two baud periods. The fractional part of the divider tells how many of these periods should be extended by one peripheral clock cycle.

Given a desired baud rate  $br_{desired}$ , the clock divider EUSARTn\_CLKDIV can be calculated by using [Figure 21.5 EUSART Desired Baud Rate on page 636](#):

$$EUSARTn\_CLKDIV = 256 \times (f_{EUSARTn} / (\text{oversample} \times br_{desired}) - 1)$$

**Figure 21.5. EUSART Desired Baud Rate**

[Table 21.7 EUSART Baud Rates @ 4 MHz Peripheral Clock with 20 Bit CLKDIV on page 637](#) shows a set of desired baud rates and how accurately the EUSART is able to generate these baud rates when running at a 4 MHz peripheral clock, using 16x or 8x oversampling.

Table 21.7. EUSART Baud Rates @ 4 MHz Peripheral Clock with 20 Bit CLKDIV

Desired baud rate [baud/s]	EUSARTn_CFG0_OVS =00			EUSARTn_CFG0_OVS =01		
	EUSARTn_CLKDIV/256 (to 32nd position)	Actual baud rate [baud/s]	Error %	EUSARTn_CLKDIV/256 (to 32nd position)	Actual baud rate [baud/s]	Error <sup>1</sup> [%]

9600	2,40625	9619,963	0.21

1 In addition to error introduced by oscillator frequency variation

### 21.3.2.4 Auto Baud Detection (HF clock only)

Setting AUTOBAUDEN in EUSARTn\_CFG0 uses the first frame received to automatically set the baud rate provided that it contains 0x55 (IrDA uses 0x00) and is sent out as LSB first and there is no break in the frame. The receiver will measure the number of local clock cycles between the beginning of the START bit and the beginning of the 8th data bit. The DIV field in EUSARTn\_CLKDIV will be overwritten with the new value. The OVS in EUSARTn\_CFG0 and the +1 count of the Baud Rate equation are already factored into the result that gets written into the DIV field. To restart autobaud detection, clear AUTOBAUDEN and set it high again. Since the auto baud rate detection is done over 8 baud times, only the upper 3 bits of the fractional part of the clock divider are populated.

Auto baud detection has associated status bit EUSARTn\_STATUS\_AUTOBAUDDONE and interrupt flag EUSARTn\_IF\_AUTOBAUD-DONE. Both the status and the interrupt flag get set after auto baud detection is complete and DIV field in EUSARTn\_CLKDIV is overwritten with the new value.

#### Note:

- If autobaud detection is enabled, software must wait for autobaud detection to complete before transmitting any data.
- Autobaud should be used only during times when it is known that the transmitter will be sending the required data word.
- Autobaud detection is not available when operating with LF clock source.
- For autobaud to work with IrDA, there should be odd parity or no parity in the received data frame.

### 21.3.2.5 Data Transmission

Asynchronous data transmission is initiated by writing data to the transmit FIFO using one of the methods described in [21.3.2.5.1 Transmit FIFO Operation](#). When the transmission shift register is empty and if the transmitter is enabled, a frame from the transmit FIFO is loaded into the shift register and transmission begins. Note that the frame loading in to the shift register can also be blocked if CTSEN is set in EUSARTn\_CFG0 but the CTS input is inactive. When the frame has been transmitted, a new frame is loaded into the shift register if available, and transmission continues. If the transmit FIFO is empty, the transmitter goes to an idle state, waiting for a new frame to become available.

Transmission is enabled through the command register EUSARTn\_CMD by setting TXEN, and disabled by setting TXDIS in the same command register. When the transmitter is disabled using TXDIS, any ongoing transmission is aborted, and any frame currently being transmitted is discarded. When disabled, the TX output goes to an idle state, which by default is a high value. Whether or not the transmitter is enabled at a given time can be read from TXENS in EUSARTn\_STATUS.

When the EUSART transmitter is enabled and there is no data in the transmit shift register or transmit FIFO, the TXC status flag in EUSARTn\_STATUS and the TXC interrupt flag in EUSARTn\_IF are set, signaling that the transmission is complete. The TXC status flag is cleared when a new frame becomes available for transmission, but the TXC interrupt flag must be cleared by software.

**Note:** (1) Condition for TX to send data out: TX is enabled and there is data available in the TX FIFO and CTS is either not enabled, or if it is enabled, then it is active. (2) If TX output is tri-stated using TXDIS command or TXDISAT setting, then the TX module will still send out data (emptying the FIFO) if condition in point 1 is satisfied, even though the pad is tristated. Restriction: User should not set TXEN when the output is tristated.

### 21.3.2.5.1 Transmit FIFO Operation

The transmit FIFO is a 16 deep FIFO. A frame can be loaded into the FIFO by writing to EUSARTn\_TXDATA. Using EUSARTn\_TXDATA allows 9 bits to be written to the FIFO, as well as a set of control bits regarding the transmission of the written frame. Every frame in the FIFO is stored with 9 data bits and additional transmission control bits. A frame is loaded from the FIFO in to the shift register if the transmitter is enabled.

Figure 21.6 Transmit FIFO Operation on page 639 shows the basics of the transmit FIFO.

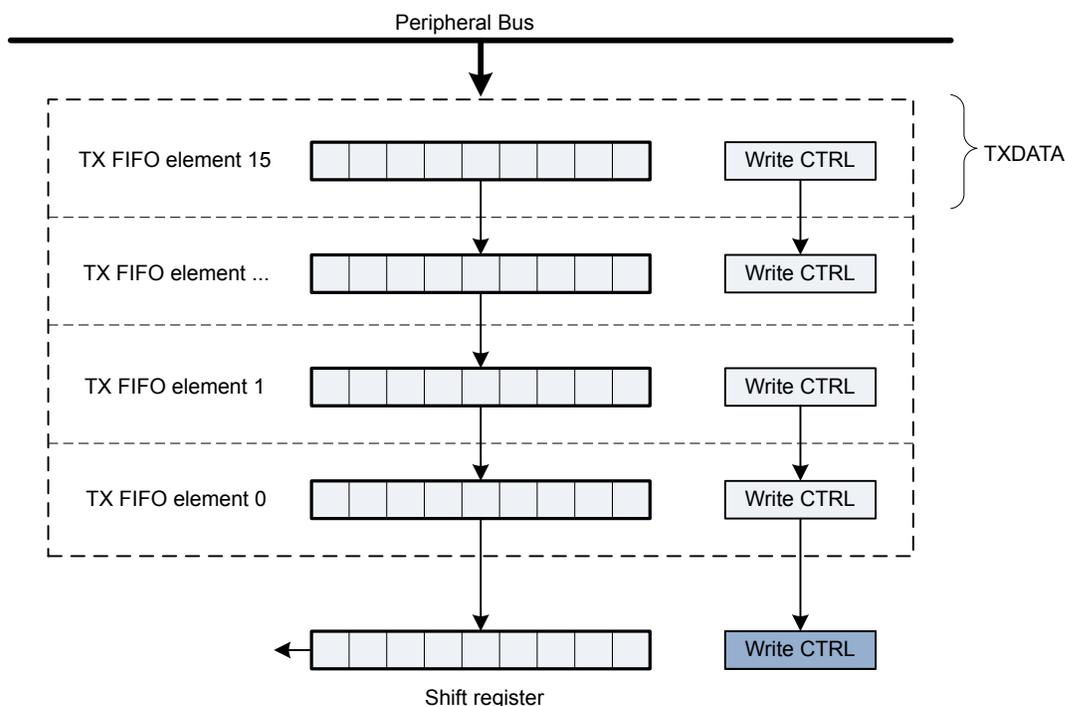

Figure 21.6. Transmit FIFO Operation

In addition to the interrupt flag TXC in EUSARTn\_IF and status flag TXC in EUSARTn\_STATUS which are set when the transmission is complete, TXFL in EUSARTn\_STATUS and the TXFL interrupt flag in EUSARTn\_IF are used to indicate the level of the transmit FIFO. TXFIW in EUSARTn\_CFG1 controls the level at which these bits are set. The user can choose a transmit FIFO watermark level in TXFIW field of EUSARTn\_CFG1 register in order to program when the TXFL interrupt should be triggered.

There is a TXIDLE status bit in EUSARTn\_STATUS to provide an indication of when the transmitter is idle. The count of TX valid FIFO entries is called TXFCNT in EUSARTn\_STATUS.

The transmit FIFO can be cleared by setting CLEARTX in EUSARTn\_CMD. Since this is an Async FIFO, the user needs to first issue the CLEARTX command and then wait on the CLEARTXBUSY status flag until it goes low. EUSART must be enabled (EUSARTn\_EN should be set) for the flush to work. EUSART should not be transmitting when CLEARTX command gets issued (can be achieved by disabling the transmitter). Any frame present in the transmit shift register currently being transmitted will not be aborted due to the flush. Transmission of this frame will be completed. Note that the transmit shift register is never used to store a transmit frame, i.e., if the transmitter is not enabled then the data stays in the transmit FIFO until the transmitter gets enabled. Whenever a frame is loaded in to the transmit shift register, the transmission starts immediately.

#### Transmit FIFO Status Flags

TX FIFO has two associated status flags: TXFL (set when there is space for data in the TX FIFO, depends on the setting in the TXFIW in CFG1 register) and TXFCNT (count of number of TX frames in the FIFO). These status flags remain set as long as the underlying condition is true, even if the EUSART is disabled (i.e., EUSARTn\_EN is 0). It is possible to write to the TX FIFO while EUSART is disabled, this will impact the two flags mentioned above.

#### Transmit FIFO Interrupt Flags

TX FIFO has two associated interrupt flags: TXFL and TXOF. TXFL is set when space becomes available in the FIFO, depends on TXFIW in CFG1 register. Reset value for TXFIW is such that TXFL gets set as soon the chip comes out of reset (so the interrupt should

be cleared once TXFIW is updated). TXFL remains set as long as the underlying condition is true even if the EUSART is disabled. This means that if a software clear is done for TXFL, then the interrupt will get set again after the clear if the underlying condition is still true (this will happen even if the EUSART is disabled). Writing more data to the FIFO or disabling the TXFL will make the TXFL go away (even if the EUSART is disabled). When writing more frames to the transmit FIFO than there is free space for, the TXOF interrupt flag in EUSARTn\_IF will be set, indicating the overflow. The data already in the transmit FIFO is preserved in this case, and no data is written. Note that TXOF can also trigger if DMA tries to write to the FIFO while a TX Flush operation is going on (Flush is activated by setting CMD.CLEAR\_TX). No data will be written to the FIFO in this case. TXOF triggers only once every time an overflow occurs.

**Note:** (EUSART0 only) In LF clock mode, the TXFL interrupt flag and the TXFL wakeup flag differ slightly in their behavior. IF.TXFL is always set out of reset since there is space available in the FIFO. However, the TXFL wakeup flag is only set after a FIFO read happens and the space that becomes available in the FIFO is the same as programmed in TXFIW in EUSART0\_CFG1.

### 21.3.2.5.2 Frame Transmission Control

The transmission control bits, which can be written using EUSARTn\_TXDATA, affect the transmission of the written frame. The following options are available:

- **Generate break:** By setting TXBREAK, the output will be held low during the stop-bit period to generate a framing error. A receiver that supports break detection detects this state, allowing it to be used e.g. for framing of larger data packets. The line is driven high before the next frame is transmitted so the next start condition can be identified correctly by the recipient. Continuous breaks lasting longer than a EUSART frame are thus not supported. GPIO can be used for this.
- **Disable transmitter after transmission:** If TXDISAT is set, the transmitter is disabled after the frame has been fully transmitted.
- **Enable receiver after transmission:** If RXENAT is set, the receiver is enabled after the frame has been fully transmitted. It is enabled in time to detect a start-bit directly after the last stop-bit has been transmitted.
- **Unblock receiver after transmission:** If UBRXAT is set, the receiver is unblocked and RXBLOCK is cleared after the frame has been fully transmitted.
- **Tristate transmitter after transmission:** If TXTRIAT is set, TXTRI is set after the frame has been fully transmitted, tristating the transmitter output. Note that if there are more frames in the TX FIFO after the tristating has happened and the transmitter is enabled, then the transmitter will try to send them out but since the output is tristated, nothing will show up at the transmitter output. The FIFO however will get emptied because of the transmitter attempting to send these frames out. If the target is to automatically tristate the TX line whenever the transmitter is idle, then that can be done by setting AUTOTRI in EUSARTn\_CFG0. If AUTOTRI is set TXTRI status flag is always read as 0.

### 21.3.2.5.3 TX Status Flags

The following status flags should be used with care keeping in mind the external sources that can impact these flags as well as the synchronization delay when the status signal crosses over from the EUSART Core clock domain to the APB clock domain. FIFO related status flags were already discussed in [21.3.2.5.1 Transmit FIFO Operation](#), the remaining flags are mentioned below:

- **TXENS:** Enable sources: (1) TXEN command from software, (2) PRS trigger (when TXTEN=1). Disable Sources: (1) TXDIS command from software, (2) PERR/FERR (when ERRSTX=1), (3) Software when TXDISAT is set to 1 for a frame.
- **TXTRI:** Enable sources: (1) TXTRIEN command from software, (2) Software when TXTRIAT is set to 1 for a frame. Disable sources: (1) TXTRIDIS command from software.
- **TXIDLE:** Set whenever the TX module is idle.
- **TXC:** Set whenever the TX module goes to idle and both the TX FIFO and the TX shift register are empty. Cleared when either TX FIFO or the TX shift register has data.

### 21.3.2.5.4 Transmission Delay

By configuring TXDELAY in EUSARTn\_CFG1, the transmitter can be forced to wait a number of bit-periods from when it is ready to transmit data, to when it actually transmits the data. This delay is only applied to the first frame transmitted after the transmitter has been idle. When transmitting frames back-to-back the delay is not introduced between the transmitted frames.

This is useful on half duplex buses, because the receiver always returns received frames to software during the first stop-bit. The bus may still be driven for up to 3 bit periods, depending on the current frame format. Using the transmission delay, a transmission can be started when a frame is received, and it is possible to make sure that the transmitter does not begin driving the output before the frame on the bus is completely transmitted.

### 21.3.2.6 Data Reception

Data reception is enabled by setting RXEN in EUSARTn\_CMD. When the receiver is enabled, it actively samples the input looking for a transition from high to low indicating the start baud of a new frame. When a start baud is found, reception of the new frame begins. When the frame has been received, it is pushed into the receive FIFO, making the shift register ready for another frame of data, and the receiver starts looking for another start baud. If a frame is received while the receive FIFO is full, the received frame is discarded and the RXOF interrupt flag in EUSARTn\_IF is set to indicate the FIFO overflow.

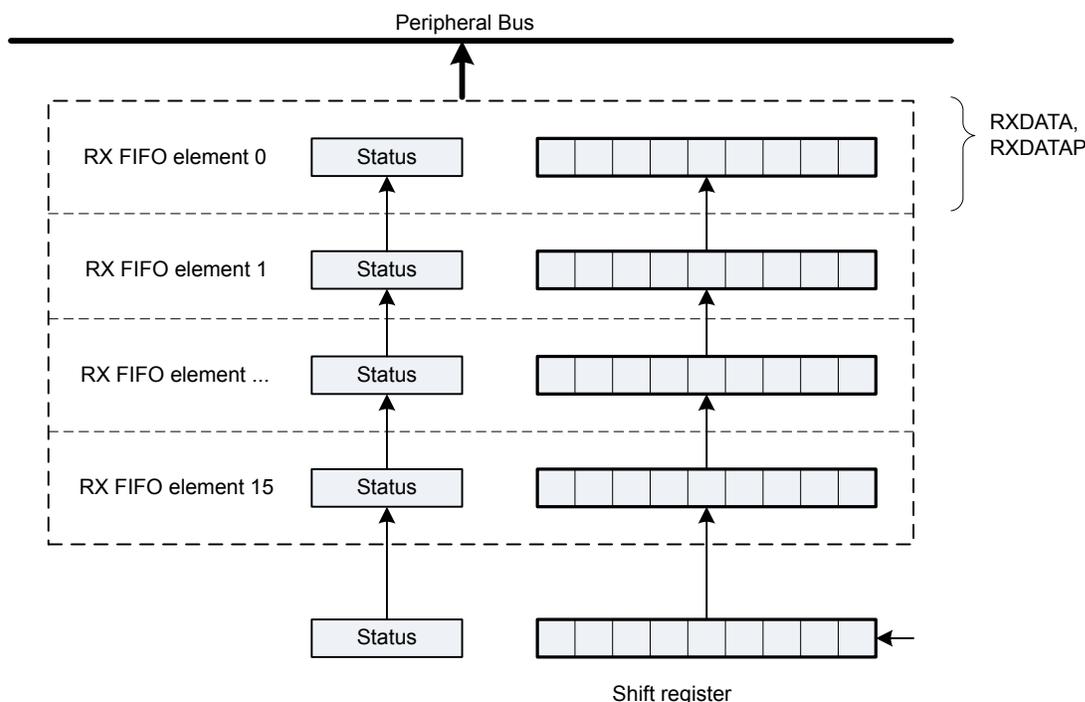

The receiver can be disabled by setting the command bit RXDIS in EUSARTn\_CMD. Any frame currently being received, when the receiver is disabled, is discarded. Whether or not the receiver is enabled at a given time can be read out from RXENS in EUSARTn\_STATUS.

### 21.3.2.6.1 Receive FIFO Operation

The receive-FIFO is a 16 deep FIFO. Data can be read from the receive FIFO via EUSARTn\_RXDATA. EUSARTn\_RXDATA gives access to the received frame. This register also contains parity error and framing error information of the received frame. When a frame is read from the receive FIFO using EUSARTn\_RXDATA, the frame is pulled out of the FIFO, making room for a new frame. If an attempt is done to read more frames from the FIFO than what is available, the RXUF interrupt flag in EUSARTn\_IF is set to signal the underflow, and the data read from the FIFO is undefined.

Frames can be read from the receive FIFO without removing the data by using EUSARTn\_RXDATAP. EUSARTn\_RXDATAP gives access to the first frame in the FIFO with status bits. The data read from this register when the receive FIFO is empty is undefined. No underflow interrupt is generated by a read using this register, i.e. RXUF in EUSARTn\_IF is never set as a result of reading from EUSARTn\_RXDATAP.

The basic operation of the receive FIFO is shown in [Figure 21.7 EUSART Receive FIFO Operation on page 642](#).

**Figure 21.7. EUSART Receive FIFO Operation**

#### Receive FIFO Status Flags

Receive FIFO has two associated status flags: RXFL (set when number of available frames in the receive FIFO is at least number of frames set by RXFIW in CFG1 register) and RXFULL (set when receive FIFO is full). These status flags remain set as long as the underlying condition is true, even if the EUSART is disabled (i.e., EUSARTn\_EN is 0). It is possible to read from the receive FIFO while EUSART is disabled, this will impact the two status flags mentioned above. The status flags RXFL and RXFULL are automatically cleared by hardware when their condition is no longer true.

#### Receive FIFO Interrupt Flags

Receive FIFO has four associated interrupt flags: RXFL, RXFULL, RXOF and RXUF. RXFL is set when number of available frames in the receive FIFO is at least number of frames set by RXFIW in CFG1 register. RXFULL is set when receive FIFO is full. Both RXFL and RXFULL remains set as long as the underlying condition is true even if EUSART is disabled. This means that if a software clear is done for RXFL / RXFULL while the underlying condition of respective interrupt is still true, the corresponding interrupt will get set again after the clear (this will happen even if EUSART is disabled). Reading data from the FIFO or disabling the RXFL / RXFULL will block the respective interrupt to get set after a software clear (even if EUSART is disabled). RXOF is set when a new frame is received while the receive FIFO is full, indicating overflow. The new frame is discarded. RXOF triggers only once every time an overflow occurs. RXUF is set when an attempt (via RXDATA or DMA) is done to read more frames from the receive FIFO than what is available, indicating underflow. The data read from the FIFO is undefined. RXUF triggers every time an underflow occurs even if EUSART is disabled.

### 21.3.2.6.2 Blocking Incoming Data

When using hardware frame recognition, as detailed in [21.3.2.6.9 Multi-Processor Mode](#) and [21.3.2.8 Collision Detection](#), it is necessary to be able to let the receiver sample incoming frames without loading them into the receive FIFO. This is accomplished by blocking incoming data.

Incoming data is blocked as long as RXBLOCK in EUSARTn\_STATUS is set. When blocked, frames received by the receiver will not be loaded into the receive FIFO, and software is not notified by the RXFL flag in EUSARTn\_STATUS or the RXFL interrupt flag in EUSARTn\_IF at their arrival. For data to be loaded into the receive FIFO, RXBLOCK must be cleared in the instant a frame is fully received by the receiver. RXBLOCK is set by setting RXBLOCKEN in EUSARTn\_CMD and disabled by setting RXBLOCKDIS also in EUSARTn\_CMD. There is one exception where data is loaded into the receive FIFO even when RXBLOCK is set. This is when an address frame is received while operating in multi-processor mode. See [21.3.2.6.9 Multi-Processor Mode](#) for more information.

Frames received containing framing or parity errors will not result in the FERR and PERR interrupt flags in EUSARTn\_IF being set while RXBLOCK in EUSARTn\_STATUS is set. Hardware recognition is not applied to these erroneous frames, and they are silently discarded.

The overflow interrupt flag RXOF in EUSARTn\_IF will also not be set while RXBLOCK in EUSARTn\_STATUS is set.

### 21.3.2.6.3 Data Sampling and Filtering

The receiver can sample incoming signal at a rate 16, 8, 6 or 4 times higher than the given baud rate, depending on the oversampling mode given by OVS in EUSARTn\_CFG0. Lower oversampling rates make higher baud rates possible, but give less room for errors.

When a high-to-low transition is registered on the input while the receiver is idle, this is recognized as a start-bit, and the baud rate generator is synchronized with the incoming frame.

For oversampling modes 16, 8 and 6, every bit in the incoming frame is sampled three times to gain a level of noise immunity. These samples are aimed at the middle of the bit-periods, as visualized in [Figure 21.8 EUSART Sampling of Start and Data Bits on page 644](#). With OVS=0 in EUSARTn\_CFG0, the start and data bits are thus sampled at locations 8, 9 and 10 in the figure, locations 4, 5 and 6 for OVS=1 and locations 3, 4, and 5 for OVS=2. The value of a sampled bit is determined by majority vote. If two or more of the three bit-samples are high, the resulting bit value is high. If the majority is low, the resulting bit value is low.

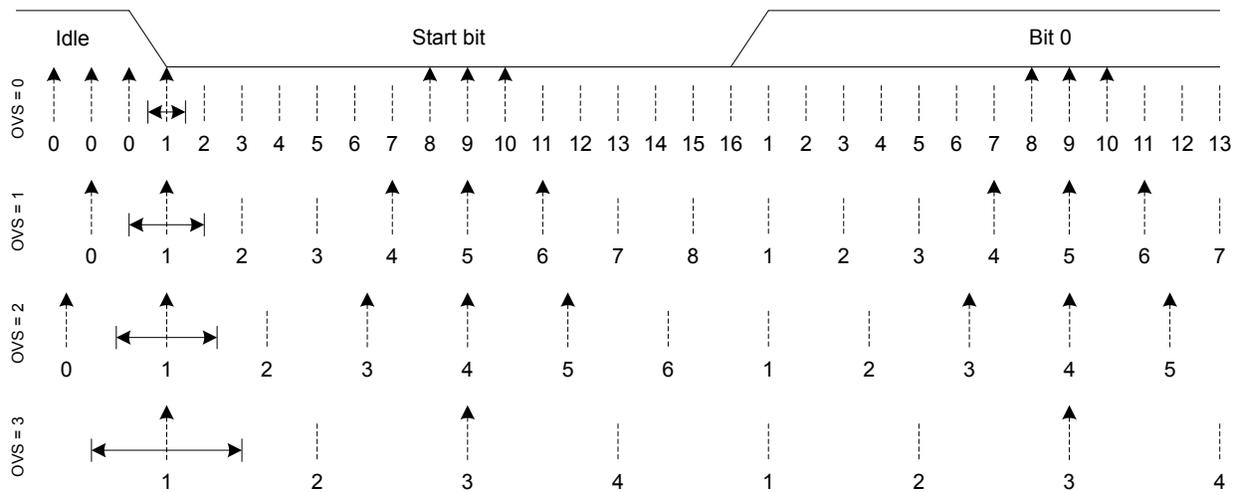

Majority vote is used for all oversampling modes except 4X oversampling and when oversampling is disabled. In 4X oversampling mode, a single sample is taken at position 3 as shown in [Figure 21.8 EUSART Sampling of Start and Data Bits on page 644](#).

When oversampling is disabled i.e. OVS = DISABLE, there is only one available location for sampling the start and data bits and so majority vote is not used.

**Note:** When operating in HF clock mode, oversampling must be set to 4, 6, 8, or 16x. When operating in LF clock mode, oversampling must be disabled.

Software can disable majority vote by setting MVDIS in EUSARTn\_CFG0. When majority vote is disabled by software, a single sample is taken at location 9 in the figure for OVS=0, location 5 for OVS=1 and location 4 for OVS=2.

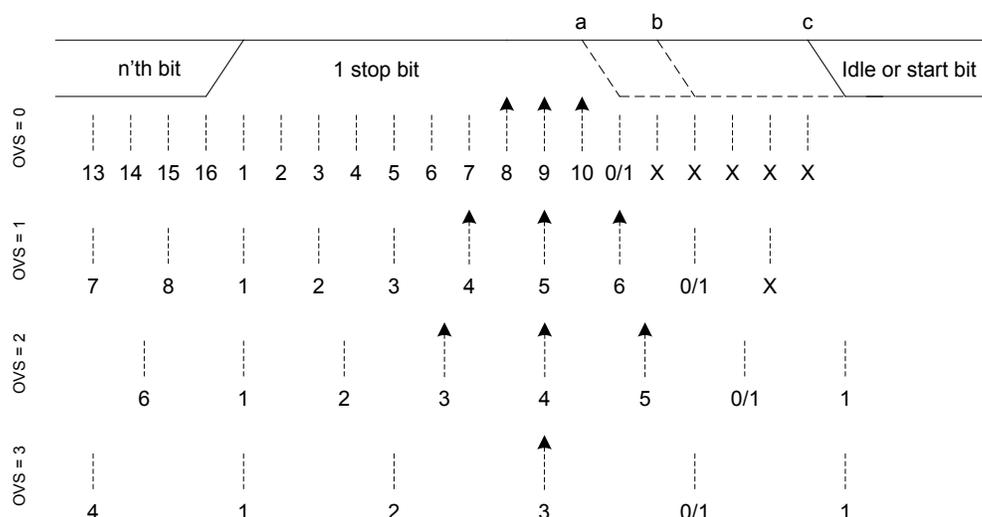

If the value of the start bit is found to be high, the reception of the frame is aborted, filtering out false start bits possibly generated by noise on the input.

**Figure 21.8. EUSART Sampling of Start and Data Bits**

If the baud rate of the transmitter and receiver differ, the location each bit is sampled will be shifted towards the previous or next bit in the frame. This is acceptable for small errors in the baud rate, but for larger errors, it will result in transmission errors.

When the number of stop bits is 1 or more, stop bits are sampled like the start and data bits as seen in [Figure 21.9 EUSART Sampling of Stop Bits when Number of Stop Bits are 1 or More on page 645](#). When a stop bit has been detected, EUSARTn is ready for a new start bit.

**Figure 21.9. EUSART Sampling of Stop Bits when Number of Stop Bits are 1 or More**

When working with stop bit lengths of half a baud period, the above sampling scheme no longer suffices. In this case, the stop-bit is not sampled, and no framing error is generated in the receiver if the stop-bit is not generated. However, the line must still be driven high before the next start bit for the EUSART to successfully identify the start bit.

#### 21.3.2.6.4 RX Status Flags

The following status flags should be used with care keeping in mind the external sources that can impact these flags as well as the synchronization delay when the status signal crosses over from the EUSART Core clock domain to the APB clock domain. FIFO related status flags were already discussed in [21.3.2.6.1 Receive FIFO Operation](#), the remaining flags are mentioned below:

- **RXENS**: set when RX is enabled. Enable sources: (1) RXEN command from software, (2) PRS trigger (when RXTEN=1), (3) TX (when RXENAT=1). Disable Sources: (1) RXDIS command from software, (2) Parity / framing error (when ERRSRX=1).
- **RXBLOCK**: set when RX is blocked which means RX keeps receiving frames but does not push received frame to receive FIFO. Enable sources: (1) RXBLOCKEN command from software. Disable Sources: (1) RXBLOCKDIS command from software, (2) STARTFRAME match (when SFUBRX=1), (3) TX (when UBRXAT=1).
- **RXIDLE**: Set when RX module completes pushing the last received frame to receive FIFO (if receive FIFO has space) and is not receiving any new frame or when RX gets disabled.
- **AUTOBAUDDONE**: Set when auto baud detection is complete and DIV field in EUSARTn\_CLKDIV is overwritten with the detected value.

#### 21.3.2.6.5 Parity Error

When parity bits are enabled, a parity check is automatically performed on incoming frames. When a parity error is detected in an incoming frame, the data parity error bit PERR in the frame is set, as well as the interrupt flag PERR in EUSARTn\_IF. Frames with parity errors are loaded into the receive FIFO like regular frames.

PERR can be accessed by reading the frame from the receive FIFO using the EUSARTn\_RXDATA, or EUSARTn\_RXDATAP registers.

If ERRSTX in EUSARTn\_CFG0 is set, the transmitter is disabled on received parity errors. If ERRSRX in EUSARTn\_CFG0 is set, the receiver is disabled on parity errors.

### 21.3.2.6.6 Framing Error and Break Detection

A framing error is the result of an asynchronous frame where the stop bit was sampled to a value of 0. This can be the result of noise and baud rate errors, but can also be the result of a break generated by the transmitter on purpose.

When a framing error is detected in an incoming frame, the framing error bit FERR in the frame is set. The interrupt flag FERR in EUSARTn\_IF is also set. Frames with framing errors are loaded into the receive FIFO like regular frames.

If ERRSTX in EUSARTn\_CFG0 is set, the transmitter is disabled on received framing errors. If ERRSRX in EUSARTn\_CFG0 is set, the receiver is disabled on framing errors.

### 21.3.2.6.7 Programmable Start Frame

The EUSART can be configured to start receiving data when a special start frame is detected on the input. This can be useful when operating in low energy modes, allowing other devices to gain the attention of the EUSART by transmitting a given frame.

When SFUBRX in EUSARTn\_CFG1 is set, an incoming frame matching the frame defined in EUSARTn\_STARTFRAME will result in RXBLOCK in EUSARTn\_STATUS being cleared. This can be used to enable reception when a specified start frame is detected. If the receiver is enabled and blocked, i.e. RXENS and RXBLOCK in EUSARTn\_STATUS are set, the receiver will receive all incoming frames, but unless an incoming frame is a start frame it will be discarded and not loaded into the receive FIFO. When a start frame is detected, the block is cleared, and frames received from that point, including the start frame, are loaded into the receive FIFO.

An incoming start frame results in the STARTFIF interrupt flag in EUSARTn\_IF being set, regardless of the value of SFUBRX in EUSARTn\_CFG1. This allows an interrupt to be made when the start frame is detected. The interrupt will be set even if the receiver is blocked i.e. EUSARTn\_STATUS\_RXBLOCK = 1.

**Note:** The receiver must be enabled for start frames to be detected. Please note that, if another UART device sends a start frame but a parity and/or framing error occurs during the reception, the received frame is not detected as a start frame.

### 21.3.2.6.8 Programmable Signal Frame

As well as the configurable start frame, a special signal frame can be specified. When a frame matching the frame defined in EUSARTn\_SIGFRAME is detected by the receiver, the SIGF interrupt flag in EUSARTn\_IF is set. As like start frame detection, the interrupt will be set even if the receiver is blocked i.e. EUSARTn\_STATUS\_RXBLOCK = 1.

One use of the programmable signal frame is to signal the end of a multi-frame message transmitted to the EUSART. An interrupt will then be triggered when the packet has been completely received, allowing software to process it. Used in conjunction with the programmable start frame and DMA, this makes it possible for the EUSART to automatically begin the reception of a packet on a specified start frame, load the entire packet into memory, and give an interrupt when reception of a packet has completed. When one of the low frequency oscillators (LFXO, LFRCO) is used as EUSART0 peripheral clock source, the device can thus wait for data packets in EM2, and only be woken up when a packet has been completely received.

**Note:** The receiver must be enabled for a signal frame to be detected. If a parity and/or framing error occurs during the reception of a signal frame, the received frame is not detected as a signal frame.

### 21.3.2.6.9 Multi-Processor Mode

To simplify communication between multiple processors, the EUSART supports a special multi-processor mode. In this mode the 9th data bit in each frame is used to indicate whether the content of the remaining 8 bits is data or an address.

When multi-processor mode is enabled, an incoming 9-bit frame with the 9th bit equal to the value of MPAB in EUSARTn\_CFG0 is identified as an address frame. When an address frame is detected, the MPAF interrupt flag in EUSARTn\_IF is set, and the address frame is loaded into the receive register. This happens regardless of the value of RXBLOCK in EUSARTn\_STATUS.

Multi-processor mode is enabled by setting MPM in EUSARTn\_CFG0, and the value of the 9th bit in address frames can be configured in EUSARTn\_CFG0\_MPAB. Note that the receiver must be enabled for address frames to be detected. The receiver can be blocked however, preventing data from being loaded into the receive FIFO while looking for address frames.

The following section explains basic usage of the multi-processor mode:

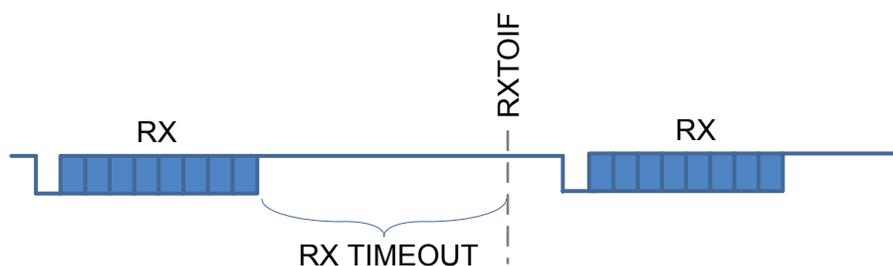

### EUSART Multi-processor Mode Example

1. All devices on the bus enable multi-processor mode and enable and block the receiver. They will now not receive data unless it is an address frame. MPAB in EUSARTn\_CFG0 is set to desired value to identify frames with the 9th bit value equal to MPAB as address frames.
2. A transmitting device sends a frame containing the address of a different device and with the 9th bit set to value of MPAB.
3. All devices receive the address frame and get an interrupt. They can read the address from the receive FIFO. The selected device unblocks the receiver to start receiving data from the transmitter.
4. The transmitter sends data with the 9th bit set to opposite value of MPAB.
5. Only the addressed device with RX enabled and unblocked receives the data. When transmission is complete, the device blocks the receiver and waits for a new address frame.

When a device has received an address frame and wants to receive the following data, it must make sure the receiver is unblocked before the next frame has been completely received in order to prevent data loss. One option is to set SFUBRX in EUSARTn\_CFG1 and set the address frame as start frame in EUSARTn\_STARTFRAME. This will handle automatic unblocking of RX when address frame is received.

#### 21.3.2.6.10 RX Timeout

A RX timeout function can be enabled by setting EUSART\_CFG1\_RXTIMEOUT to desired value. When enabled, a timer gets started after every successful frame reception. If timeout occurs before the next RX start bit is received, EUSART\_IF\_RXTO gets set which can be used to wake-up the system to handle received data. This is shown in [Figure 21.10 RX Timeout on page 647](#). If the next RX start bit is received before timeout occurs, no interrupt gets generated, the timer is reset and will only be started again after the on-going frame reception is complete.

**Figure 21.10. RX Timeout**

Please note that the timer does not get started in following scenarios:

- If auto baud rate detection is enabled and auto baud rate has not been found, the timer does not get started after the first frame which is used to detect the baud rate automatically.
- If a frame is received while RX is blocked, the timer does not get started.
- If EUSART\_CFG0\_SKIPPERF is set to '1' and a frame is received with a parity error, the timer does not get started.

Please also note that the UART RX input line must be in idle state after frame reception for the timer to start.

**Note:** When EUSARTn\_FRAMECFG\_STOPBITS is set to a fractional value i.e. 'HALF' or 'ONEANDHALF', the fractional value is rounded to nearest value and so RX timeout is extended by 0.5 baud width per frame.

### 21.3.2.7 Local Loopback

The EUSARTn receiver samples RX by default, and the transmitter drives TX by default. This is not the only option however. When LOOPBK in EUSARTn\_CFG0 is set, the RX pin is connected to the TX pin as shown in [Figure 21.11 EUSART Local Loopback on page 648](#). This is useful for debugging, as the EUSARTn can receive the data it transmits, but it is also used to allow the EUSARTn to read and write to the same pin, which is required for some half duplex communication modes. In this mode, the TX pin must be enabled as an output in the GPIO.

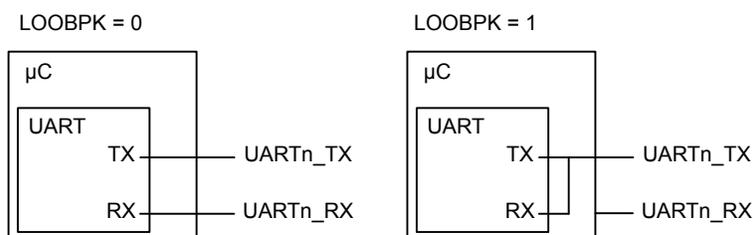

Figure 21.11. EUSART Local Loopback

### 21.3.2.8 Collision Detection

EUSARTn supports a basic form of collision detection. When the receiver is connected to the output of the transmitter, either by using the LOOPBK bit in EUSARTn\_CFG0 or through an external connection, this feature can be used to detect whether data transmitted on the bus by the EUSARTn did get corrupted by a simultaneous transmission by another device on the bus.

For collision detection to be enabled, CCEN in EUSARTn\_CFG0 must be set, and the receiver enabled. The data sampled by the receiver is then continuously compared with the data output by the transmitter. If they differ, the CCF interrupt flag in EUSARTn\_IF is set. The collision check includes all bits of the transmitted frames. The CCF interrupt flag is set once for each bit sampled by the receiver that differs from the bit output by the transmitter. When the transmitter output is disabled, i.e. the transmitter is tristated, collisions are not registered.

**Note:** Please note that collision detection supports only baudrates up to 1mbps.

### 21.3.2.9 Half Duplex Communication

When doing full duplex communication, two data links are provided, making it possible for data to be sent and received at the same time. In half duplex mode, data is only sent in one direction at a time. There are several possible half duplex setups, as described in the following sections.

#### 21.3.2.9.1 Single Data-link

In this setup, the EUSART both receives and transmits data on the same pin. This is enabled by setting LOOPBK in EUSARTn\_CFG0, which connects the receiver to the transmitter output. Because they are both connected to the same line, it is important that the EUSART transmitter does not drive the line when receiving data, as this would corrupt the data on the line.

When communicating over a single data-link, the transmitter must thus be tristated whenever not transmitting data. This is done by setting the command bit TXTRIE in EUSARTn\_CMD, which tristates the transmitter. Before transmitting data, the command bit TXTRIDIS, also in EUSARTn\_CMD, must be set to enable transmitter output again. Whether or not the output is tristated at a given time can be read from TXTRI in EUSARTn\_STATUS. If TXTRI is set when transmitting data, the data is shifted out of the shift register, but is not put out on TX line.

When operating a half duplex data bus, it is common to have a main bus controller, which first transmits a request to one of the secondary devices on the bus, then receives a reply. In this case, the frame transmission control bits, which can be set by writing to EUSARTn\_TXDATA, can be used to make the EUSART automatically disable transmission, tristate the transmitter and enable reception when the request has been transmitted, making it ready to receive a response from the secondary device.

Tristating the transmitter can also be performed automatically by the EUSART by using AUTOTRI in EUSARTn\_CFG0. When AUTOTRI is set, the EUSART automatically tristates TX line whenever the transmitter is idle, and enables transmitter output when the transmitter goes active. If AUTOTRI is set TXTRI is always read as 0.

**Note:** Another way to tristate the transmitter is to enable wired-and or wired-or mode in GPIO. For wired-and mode, outputting a 1 will be the same as tristating the output, and for wired-or mode, outputting a 0 will be the same as tristating the output. This can only be done on buses with a pull-up or pull-down resistor respectively.

### 21.3.2.9.2 Single Data-link with External Driver

Some communication schemes, such as RS-485 rely on an external driver. Here, the driver has an extra input which enables it, and instead of tristating the transmitter when receiving data, the external driver must be disabled.

This can be done manually by assigning a GPIO to turn the driver on or off.

Figure 21.12 EUSART Half Duplex Communication with External Driver on page 649 shows an example configuration using an external driver.

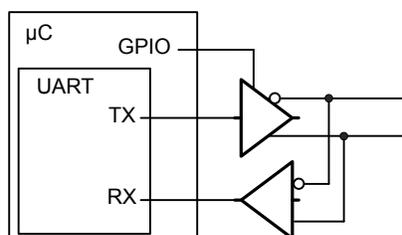

Figure 21.12. EUSART Half Duplex Communication with External Driver

### 21.3.2.9.3 Two Data-links

Some limited devices only support half duplex communication even though two data links are available. In this case software is responsible for making sure data is not transmitted when incoming data is expected.

### 21.3.2.10 Hardware Flow Control

Hardware flow control can be used to hold off the link partner's transmission until receive FIFO space is available. Use RTSPEN in GPIO\_DBUSEUSARTn\_ROUTEEN to enable RTS pin (CTS is an input so its pin is enabled by default). Port and Pin selection for RTS and CTS can be done in GPIO\_DBUSEUSARTn\_RTROUTE/CTSROUTE. RTS is an out going signal which indicates that receive FIFO space is available to receive a frame. The link partner is being requested to send its data when RTS is active. RTS activation can be made dependent on how much space is available in the receive FIFO using RTSRXTW in EUSARTn\_CFG1. For debug use set DBGHALT in EUSARTn\_CFG1 which will force the RTS to request one frame from the link partner when the CPU core single steps. RTS is deactivated when RX is disabled.

CTS is an incoming signal to stop the next TX data from going out. CTS indicates that the link partner has receive FIFO space available, and the local transmitter is clear to send. When CTS deactivates in the middle of a frame, the frame currently being transmitted is completed before stopping. CTS operation needs to be enabled using CFG1.CTSEN.

The RTS and CTS are active low by default, but their polarity can be changed with RTSINV and CTSINV in EUSARTn\_CFG1 respectively.

### 21.3.2.11 Debug Halt

During single stepping, debug halt feature allows halting EUSART frame reception by deactivating RTS when the core is halted and continuing frame reception by activating RTS when the core is unhalted. EUSART debug halt can be enabled by setting DBGHALT in EUSART\_CFG1 to '1'. EUSART receiver must be enabled for debug halting.

When EUSART\_CFG1\_DBGHALT is not set or EUSART\_CFG1\_DBGHALT is set but chip halt is low, RTS is only dependent on the receive FIFO having space available to receive at least number of frames given by EUSART\_CFG1\_RTSRXTW settings.

When EUSART\_CFG1\_DBGHALT is set, RTS will remain deactivated as long as chip halt is high. When a low pulse is detected on chip halt while DBGHALT is set, RTS will be activated if receive FIFO has space available to receive at least number of frames given by EUSART\_CFG1\_RTSRXTW settings and no frame is being received. RTS will be deactivated again if chip halt goes back to high and receiver starts receiving a new frame or if receive FIFO does not have space available to receive at least number of frames given by EUSART\_CFG1\_RTSRXTW settings. This behavior allows single stepping to pulse the chip halt low for a cycle, and receive the next frame.

Please note that, if chip halt remains low for a short duration after RX is enabled while DBGHALT is set, initial low value of chip halt will be treated the same as a low pulse on chip halt.

As incoming frame is always received until receive FIFO is full regardless of the state of DBGHALT or chip halt, the link partner must stop transmitting when RTS is deactivated, or the receive FIFO could overflow.

All data in the transmit FIFO is sent out even when chip halt is asserted; therefore, DMA will need to be set to stop sending EUSART TX data during chip halt.

### 21.3.2.12 PRS-triggered Transmissions

If a transmission must be started on an event with very little delay, the PRS system can be used to trigger the transmission. The PRS channel to use as a trigger can be selected using `EUSARTn_TRIGGER.PRSSEL` in PRS. When a positive edge is detected on PRS signal, the receiver is enabled if `RXTEN` in `EUSARTn_TRIGCTRL` is set, and the transmitter is enabled if `TXTEN` in `EUSARTn_TRIGCTRL` is set. Only one signal input is supported by the EUSART.

### 21.3.2.13 PRS RX Input

The EUSART can be configured to receive data directly from a PRS channel by setting `RXPRSEN` in `EUSARTn_CFG1`. The PRS channel used is selected using `EUSARTn_RX.PRSSEL` in PRS.

### 21.3.2.14 DMA Support

The EUSART has full DMA support. The DMA controller can write to the transmit FIFO using the register `EUSARTn_TXDATA`, and it can read from the receive FIFO using the register `EUSARTn_RXDATA`. This enables 9 bit data + control/status bits transfers both to and from the EUSART.

A request for the DMA controller to read from the EUSART receive buffer can come from the following source:

- Receive FIFO is loaded with at least number of frames set by `RXFIW`.

A write request can come from the following source:

- Transmit FIFO has space for at least number of frames set by `TXFIW`

In some cases, it may be sensible to temporarily stop DMA read access to the EUSART when an error such as parity or framing error has occurred. This is enabled by setting `ERRSDMA` in `EUSARTn_CFG0`.

EUSART0 (EM2 Capable instance only) can also work with the DMA in low power mode so that the system does not have to wake up to EM0 to consume data. This can happen if `TXDMAWU` or `RXDMAWU` in the `EUSARTn_CFG1` is set. The DMA will be triggered when `TXFIW/RXFIW` samples are in the corresponding FIFO. The chip will enter EM1, DMA will then pop/ push all the elements of the corresponding FIFO and then the system will be put back to EM2.

### 21.3.2.15 Interrupts

The interrupts generated by the EUSART are combined into two interrupt vectors. Interrupts related to reception are assigned to one interrupt vector, and interrupts related to transmission are assigned to the other. Separating the interrupts in this way allows different priorities to be set for transmission and reception interrupts.

The transmission interrupt vector groups the transmission-related interrupts generated by the following interrupt flags:

- TXC
- TXFL
- TXOF
- CCF
- TXIDLE

The reception interrupt on the other hand groups the reception-related interrupts, triggered by the following interrupt flags:

- RXFL
- RXFULL
- RXOF
- RXUF
- PERR
- FERR
- MPAF
- START
- SIGF
- AUTOBAUDDONE
- RXTO

If EUSARTn interrupts are enabled, an interrupt will be made if one or more of the interrupt flags in `EUSARTn_IF` and their corresponding bits in `EUSARTn_IEN` are set. All interrupts can serve as wake up interrupts if enabled (EM2 Capable instance only).

### 21.3.2.16 EM2 operation (EUSART0 Only)

EUSART0 can operate in EM2 when running from an LF oscillator source (LF mode). Note that sending and receiving data in EM2 requires that the EUSART be connected to GPIO that are capable of operating in EM2. This includes all pins on Port A and Port B. Pins on Port C and Port D are not available for digital peripheral signalling in EM2 or EM3.

EM2 operation allows the EUSART to wait for an incoming UART frame, or even wait on the programmable start or signal frames while the system is consuming very little energy. When a UART frame is completely received, or a start/signal frame is detected, the CPU can quickly be woken up. Alternatively, multiple frames can be transferred via the Direct Memory Access (DMA) module into RAM memory before waking up the CPU. Similarly, data can be transmitted in EM2 with data from the CPU or through use of the DMA.

All interrupts can be used as wake up interrupts if enabled. None of the interrupts are sticky, i.e., the interrupt triggers only once whenever the interrupt condition is reached.

**Note:** When RXDMAWU or TXDMAWU is set in EUSART0\_CFG1, the system will not be able to go to EM2 before all related EUSART0 DMA requests have been processed. This means that if RXDMAWU is set and the EUSART receives a frame, the system will wait to go to EM2 before the frame has been read from the EUSART. In order for the system to go back to EM2 during or after the final transmission (i.e. when DMA will no add more data to the TX FIFO), the wake request to DMA must be removed. There are two methods for doing this:

1. If RX does not need to remain active, software can disable the peripheral and clear the TXDMAWU bit in the ISR to prevent further DMA requests. The peripheral may be re-enabled after TXDMAWU is cleared. Note that while the peripheral is disabled, the EUSART cannot receive any new data, so this option should only be used if no data is expected.
2. If RX must remain active, it is recommended to disable TX, and then write dummy information into the FIFO until the TXFL flag will no longer trigger a new wakeup. This will prevent new DMA requests.

### 21.3.2.17 PRS

All PRS inputs are synchronized to the peripheral clock (clk\_per) for the EUSART instance.

- RX PRS: Input goes to RX module for data reception if RXPRSEN set to 1
- TRIGGER PRS: Can be used to Enable TX and/or RX if TXTEN/RXTEN are set to 1

All PRS outputs come from clk\_per flops.

- PRS\_TX: Same as TX output (tx\_out) of EUSART
- PRS\_TXC: Same as the TXC status flag
- PRS\_IRDA\_TX: Registered (clk\_per) version of IRHF output
- PRS\_RXFL: Set if (rxdata\_fifo\_cnt > RXFIW)
- PRS\_RTS: Same as RTS output (rts\_out) of EUSART

### 21.3.2.18 IrDA operation

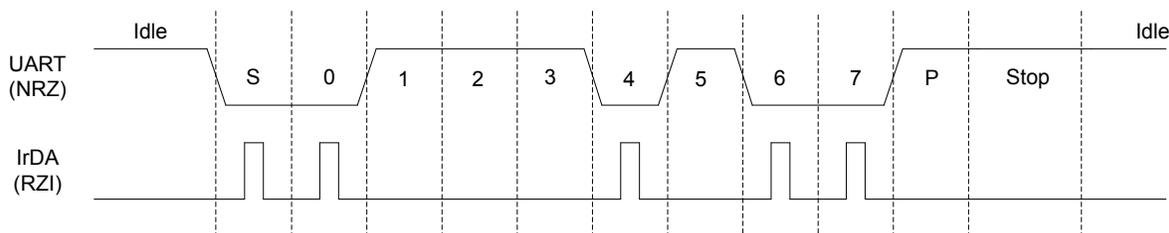

The EUSART supports IrDA operation using both HF and LF clocks. For IrDA with HF clock, the controls are given in IRHF\_CFG register. For IrDA with LF clock (32.768 kHz), only RX is supported and the controls are given in IRLF\_CFG register. Note that OVS must be disabled for LF operation.

**Note:** Note that break generation/ detection feature is not supported while IrDA is enabled, i.e., either IRHFEN or IRLFEN is set.

### 21.3.2.18.1 IRHF

The IRHF modulator implements the physical layer of the IrDA specification, which is necessary for communication over IrDA. The modulator takes the signal output from the EUSART module, and modulates it before it leaves the EUSART. In the same way, the input signal is demodulated before it enters the actual EUSART module. The modulator implements the original Rev. 1.0 physical layer and one high speed extension which supports speeds from 2.4 kbps to 1.152 Mbps.

The data from and to the EUSART is represented in a NRZ (Non Return to Zero) format, where the signal value is at the same level through the entire bit period. For IrDA, the required format is RZI (Return to Zero Inverted), a format where a “1” is signalled by holding the line low, and a “0” is signalled by a short high pulse. An example is given in [Figure 21.13 EUSART Example RZI Signal for a given EUSART Frame on page 652](#).

**Figure 21.13. EUSART Example RZI Signal for a given EUSART Frame**

The IrDA HF module is enabled by setting IRHFEN in IRHFCFG. The EUSART transmitter output and receiver input is then routed through the IrDA HF modulator.

The width of the pulses generated by the IrDA HF modulator is set by configuring IRHFPW in IRHFCFG register. Four pulse widths are available, each defined relative to the configured bit period as listed in [Table 21.9 EUSART IrDA Pulse Widths on page 652](#).

**Table 21.9. EUSART IrDA Pulse Widths**

IRHFPW	Pulse width OVS=0	Pulse width OVS=1	Pulse width OVS=2	Pulse width OVS=3
00	1/16	1/8	1/6	1/4
01	2/16	2/8	2/6	N/A
10	3/16	3/8	N/A	N/A
11	4/16	N/A	N/A	N/A

By default, no filter is enabled in the IrDA HF demodulator. A filter can be enabled by setting IRHFFILT in IRHFCFG. When the filter is enabled, an incoming pulse has to last for 5 consecutive clock cycles to be detected by the IrDA demodulator. When the filter is enabled, the minimum clock frequency required is based on the baud rate and OVS chosen. The frequency requirements are listed in [table 21.10 EUSART IrDA IRHFFILT=1, Min Clock Frequency Requirement \(MHz\) on page 652](#).

**Table 21.10. EUSART IrDA IRHFFILT=1, Min Clock Frequency Requirement (MHz)**

OVS	2.4 kb/s	9.6 kb/s	19.2 kb/s	38.4 kb/s	57.6 kb/s	115.2 kb/s	0.576 Mb/s	1.152 Mb/s
3 (x4)	1.0 MHz	1.0 MHz	1.0 MHz	1.0 MHz	1.4 MHz	2.8 MHz	13.8 MHz	27.6 MHz
2 (x6)	1.0 MHz	1.0 MHz	1.0 MHz	1.4 MHz	2.1 MHz	4.1 MHz	20.7 MHz	41.5 MHz
1 (x8)	1.0 MHz	1.0 MHz	1.0 MHz	1.0 MHz	1.4 MHz	2.8 MHz	13.8 MHz	27.6 MHz
0 (x16)	1.0 MHz	1.0 MHz	1.0 MHz	1.0 MHz	1.1 MHz	2.2 MHz	11.1 MHz	22.1 MHz

Note that by default, the idle value of the EUSART data signal is high. This means that the IrDA modulator generates negative pulses, and the IrDA demodulator expects negative pulses. To make the IrDA module use RZI signalling, both TXINV and RXINV in EUSARTn\_CFG0 must be set.

Since the incoming signal is only sampled on positive clock edges, the width of the incoming pulses must be at least two clk\_per periods wide for reliable detection by the receiver.

### 21.3.2.18.2 IRLF

IRLF only supports RX operation. This feature will stay operational even in EM2. It is possible to cause a wake up when a certain frame is received and then switch to IRHF if TX is required. IRLFEN in IRLFCFG must be set for this to work.

### 21.3.3 Synchronous Operation

Synchronous mode shares some common features with asynchronous mode such as: Loopback, inversion of RX/TX, MSBF, TX/RX Interrupt watermarks. They both share the EUSARTn\_TRIGCTRL, CMD, TXDATA, RXDATA, STATUS and Interrupt registers.

In synchronous mode, EUSART can be configured to work either as a main (clock driver) or secondary (clock receiver) interface through EUSARTn\_CFG2.MASTER.

#### 21.3.3.1 Frame Format

The frames used in synchronous mode need no start and stop bits since a single clock is available to all parts participating in the communication. Parity bits cannot be used in synchronous mode.

The EUSART supports frame lengths of 8 to 16 bits per frame. Larger frames can be simulated by transmitting multiple smaller frames, i.e. a 22 bit frame can be sent using two 11-bit frames, and a 24 bit frame can be generated by transmitting three 8-bit frames. The number of bits in a frame is set using DATABITS in EUSARTn\_FRAMECFG.

The frames in synchronous mode are by default transmitted with the least significant bit first like in asynchronous mode. The bit-order can be reversed by setting MSBF in EUSARTn\_CFG0.

The frame format used by the transmitter can be inverted by setting TXINV in EUSARTn\_CFG0, and the format expected by the receiver can be inverted by setting RXINV, also in EUSARTn\_CFG0.

### 21.3.3.2 Clock Generation

The bit-rate in synchronous mode is given by [Figure 21.14 EUSART Synchronous Mode Bit Rate on page 654](#). The clock division is derived from EUSARTn\_CFG2.SDIV, which is applicable when acting as a Main interface only.

$$br = f_{HFPERCLK} / (1 + EUSARTn\_CFG2.SDIV)$$

**Figure 21.14. EUSART Synchronous Mode Bit Rate**

Given a desired baud rate  $br_{desired}$ , the clock divider EUSARTn\_CFG2.SDIV can be calculated using [Figure 21.15 EUSART Synchronous Mode Clock Division Factor on page 654](#)

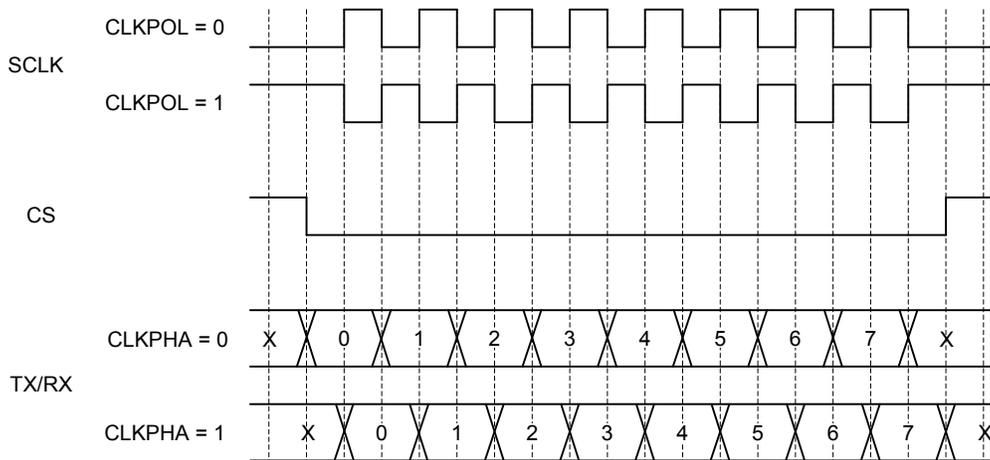

$$EUSARTn\_CFG2.SDIV = (f_{HFPERCLK} / br_{desired} - 1)$$

**Figure 21.15. EUSART Synchronous Mode Clock Division Factor**

On every clock edge data on the data lines, MOSI and MISO, is either set up or sampled. When CLKPHA in EUSARTn\_CTRL is cleared, data is sampled on the leading clock edge and set-up is done on the trailing edge. If CLKPHA is set however, data is set-up on the leading clock edge, and sampled on the trailing edge. In addition to this, the polarity of the clock signal can be changed by setting CLKPOL in EUSARTn\_CTRL, which also defines the idle state of the clock. This results in four different modes which are summarized in [Table 21.11 EUSART SPI Modes on page 654](#). [Figure 21.16 EUSART SPI Timing on page 654](#) shows the resulting timing of data set-up and sampling relative to the bus clock.

**Table 21.11. EUSART SPI Modes**

SPI mode	CLKPOL	CLKPHA	Leading edge	Trailing edge
0	0	0	Rising, sample	Falling, set-up
1	0	1	Rising, set-up	Falling, sample
2	1	0	Falling, sample	Rising, set-up
3	1	1	Falling, set-up	Rising, sample

**Figure 21.16. EUSART SPI Timing**

The RX overflow interrupt flag, RXOF, is set at the end of the overflow frame if the receive FIFO is full. When a transfer has been performed, interrupt flags TXC are updated on the first setup clock edge of the succeeding frame, or when CS is deasserted.

### 21.3.3.3 Main SPI Interface Mode (Clock Driver)

EUSART operating as a main SPI interface is available only in EM0/EM1 with an HF clock source selected. When configured as a main interface, the EUSART is in full control of the data flow on the synchronous bus. When operating in full duplex mode, the secondary devices cannot transmit data to the main device without the main device transmitting to the secondary. The main device outputs the bus clock on SCLK.

Communication starts whenever there is data in the transmit FIFO and the transmitter is enabled. The EUSART clock then starts, and the main device shifts bits out from the transmit shift register using the internal clock.

When there are no more frames in the transmit FIFO and the transmit shift register is empty, the clock stops, and communication ends. When the receiver is enabled, it samples incoming data when the transmitter transmits data. Operation of the RX and TX FIFOs is as in asynchronous mode.

EUSARTn\_CFG2.RXBLOCK can be used to block incoming RX data from pushing into RX FIFO.

### 21.3.3.4 Operation of CS Pin

When operating as a main interface, the CS pin can have one of two functions, or it can be disabled by clearing CSPEN in GPIO\_EUSARn\_ROUTEEN register.

If CS is disabled and there is a need to disable TX during the operation, then TX should be disabled at the end of transaction only indicated by the trigger of TXC interrupt to maintain synchronicity between TX and RX and avoid causing sudden stop to secondary devices.

If CS is configured as an output, it can be used to automatically generate a chip select for a single secondary device by setting AUTOCS in EUSARTn\_CTRL. If AUTOCS is set, CS is activated before a transmission begins, and deactivated after the last bit has been transmitted and there is no more data in the transmit FIFO.

The time duration between assertion of CS and the start of transmission can be controlled using CSSETUP in EUSARTn\_TIMINGCFG. If new data is ready for transmission before CS is deasserted, the data is sent without deasserting CS in between. CSHOLD in EUSARTn\_TIMINGCFG keeps CS asserted after the end of frame for the number of baud-times specified.

By default, CS is active low, but its polarity can be inverted by setting CSINV in EUSARTn\_CFG2.

### 21.3.3.5 AUTOTX

The main device on a synchronous bus is required to transmit data (send a clock) to a secondary device in order to receive data from that device. In some cases, only a few words are transmitted and a lot of data is then received from the secondary device. In that case, one solution is to keep feeding the TX with data to transmit, but that consumes system bandwidth. Instead AUTOTX can be used.

When AUTOTX in EUSARTn\_CFG2 is set and TX FIFO is filled with initial data, EUSART will fully transmit the loaded data and then continue transmitting the last sent bit as long as there is available space in the RX FIFO for the chosen frame size. This happens even though there is no more data in the TX FIFO. The TX underflow interrupt flag TXUF in EUSARTn\_IF is set on the first word that is transmitted which does not contain valid data.

During AUTOTX the EUSART will always send the previous sent bit, thus reducing the number of transitions on the TX output. So if the last bit sent was a 0, 0's will be sent during AUTOTX and if the last bit sent was a 1, 1's will be sent during AUTOTX.

### 21.3.3.6 Secondary SPI Interface Mode (Clock Receiver)

When the EUSART is in secondary interface mode, data transmission is not controlled by the EUSART, but by an external main SPI device. The EUSART is therefore not able to initiate a transmission, and has no control over the number of bytes written to the external main device.

The output and input to the EUSART are also swapped when in secondary mode, making the receiver take its input from TX (MOSI) and the transmitter drive RX (MISO).

To transmit data when in secondary mode, the device must load data into the transmit FIFO and enable the transmitter. The data will remain in the EUSART until the main device starts a transmission by pulling the CS input low and transmitting data. For every frame transmitted from main to secondary device, a frame is transferred from secondary to main as well.

If the transmitter is enabled in synchronous secondary mode and the main device starts transmission of a frame, the underflow interrupt flag TXUF in EUSARTn\_IF will be set if no data is available for transmission. At the same time, the secondary device will transmit the default TX data, which can be set through EUSARTn\_DTXDATCFG for the current and subsequent frames until the FIFO is filled. Note that when TX is enabled (with or without data in TXFIFO) in the middle of transaction, TXUF can be triggered if it's transmitting default TX data.

Similar to when operating as a synchronous main interface, EUSARTn\_CFG2.RXBLOCK can be used to block incoming RX data from pushing into RX FIFO.

If the secondary device needs to control its own chip select signal, this can be achieved by clearing CSPEN in the GPIO\_EUSARTn\_ROUTEEN register. The internal chip select signal can then be controlled through CSINV in the CTRL register. The chip select signal will be CSINV inverted, i.e. if CSINV is cleared, the chip select is active and vice versa. In such cases, SCLK could arrive any-time that the device doesn't have prior notification from CS. Hence, EUSARTn\_CFG2.FORCELOAD bit can be used to control how the device transmits the first dataword. If this bit is not set, the next outgoing dataword will be a DEFAULT TX data even if the FIFO had been loaded before SCLK arrives, followed by the loaded TX data. EUSARTn\_IF.LOADERRIF Interrupt will never be triggered when EUSARTn\_CFG2.FORCELOAD is not set. If this bit is set, as soon as the transmitter becomes ready the shift register will be loaded immediately and send data once SCLK arrives. The transmitter becomes ready when TX is enabled and TXFIFO is filled. On top of that, at word-boundary it will automatically trigger setup window check against the programmed EUSARTn\_TIMINGCFG.SETUPWINDOW, which specifies the minimum duration (in APB bus clock cycles) between transmitter becoming ready and the incoming SCLK. If the measured duration is less than SETUPWINDOW bus clock cycles, an EUSARTn\_IF.LOADERRIF Interrupt will be triggered. Besides, if the transmitter is enabled or disabled or the empty TXFIFO is loaded not at word-boundary during a transaction (SCLK is toggling), LOADERRIF will also be triggered immediately without checking for SETUPWINDOW. It's recommended that the transmitter should be ready while SCLK is idling or at word-boundary and at sufficient margin before SCLK toggles. Once LOADERRIF Interrupt is set, it may require to reset the secondary interface by disabling the module and re-enabling it because the transmitted data could be undeterministic.

### 21.3.4 Debug Halt

When DBGHALT in EUSART\_CTRLX is clear, RTS is only dependent on the RX FIFO having space available to receive data. Incoming data is always received until both the RX FIFO is full and the RX shift register is full regardless of the state of DBGHALT or chip halt. Additional incoming data is discarded. When DBGHALT is set, RTS deasserts on RX FIFO full or when chip halt is high. However, a low pulse detected on chip halt will keep RTS asserted when no frame is being received. At the start of frame reception, RTS will deassert if chip halt is high and DBGHALT is set. This behavior allows single stepping to pulse the chip halt low for a cycle, and receive the next frame. The link partner must stop transmitting when RTS is deasserted, or the RX FIFO could overflow. All data in the transmit FIFO is sent out even when chip halt is asserted; therefore, the DMA will need to be set to stop sending the EUSART TX data during chip halt.

### 21.3.5 PRS-triggered Transmissions

If a transmission must be started on an event with very little delay, the PRS system can be used to trigger the transmission. The PRS channel to use as a trigger can be selected using TSEL in EUSARTn\_TRIGCTRL. When a positive edge is detected on this signal, the receiver is enabled if RXTEN in EUSARTn\_TRIGCTRL is set, and the transmitter is enabled if TXTEN in EUSARTn\_TRIGCTRL is set. Only one signal input is supported by the EUSART.

AUTOTXTEN can also be combined with TXTEN to make the EUSART transmit a command to the external device prior to clocking out data. To do this, disable TX using the TXDIS command, load the TX FIFO with the command and enable AUTOTXTEN and TXTEN. When the selected PRS input goes high, the EUSART will now transmit the loaded command, and then continue clocking out while both the PRS input is high and there is room in the RX FIFO

### 21.3.6 PRS RX Input

The EUSART can be configured to receive data directly from a PRS channel by setting RXPRS in EUSARTn\_INPUT. The PRS channel used is selected using RXPRSEL in EUSARTn\_INPUT. This way, for example, a differential RX signal can be input to the ACMP and the output routed via PRS to the EUSART.

### 21.3.7 PRS CLK Input

The EUSART can be configured to receive clock directly from a PRS channel by setting CLKPRS in EUSARTn\_INPUT. The PRS channel used is selected using CLKPRSEL in EUSARTn\_INPUT. This is useful in secondary synchronous mode and can together with RX PRS input be used to input data from PRS.

### 21.3.8 DMA Support

The EUSART has full DMA support. The DMA controller can write to the transmit FIFO using the registers EUSARTn\_TXDATA and it can read from the receive FIFO using the registers EUSARTn\_RXDATA. This enables single byte transfers, 9 bit data + control/status bits, double byte and double byte + control/status transfers both to and from the EUSART.

A request for the DMA controller to read from the EUSART receive FIFO can come from the following source:

- Receive FIFO level satisfying EUSARTn\_CFG1.RXFIW setting

A write request can come from one of the following sources:

- Transmit FIFO level satisfying EUSARTn\_CFG1.TXFIW setting.

Even though there are two sources for write requests to the DMA, only one should be used at a time, since the requests from both sources are cleared even though only one of the requests are used.

In some cases, it may be sensible to temporarily stop DMA access to the EUSART when an error such as a framing error has occurred. This is enabled by setting ERRSDMA in EUSARTn\_CTRL.

Note: For Synchronous mode full duplex operation, if both receive FIFO and transmit FIFO are served by DMA, to make sure receive FIFO is not overflowed the settings below should be followed.

- The DMA channel that serves receive FIFO should have higher priority than the DMA channel that serves transmit FIFO.
- IGNORESREQ should be set for both DMA channel.

## 21.4 EUSART Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	EUSART_IPVERSION	R	IP Version ID
0x004	EUSART_EN	RW ENABLE	Enable Register

## 21.5 EUSART Register Description

### 21.5.1 EUSART\_IPVERSION - IP Version ID

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x1
<b>Access</b>																																R
<b>Name</b>																																IPVERSION

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x1	R	<b>IP version ID</b>
<p>The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.</p>				

## 21.5.2 EUSART\_EN - Enable Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																														0x0	0x0	
<b>Access</b>																														R	RW	
<b>Name</b>																														DISABLING	EN	

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISABLING	0x0	R	<b>Disablement busy status</b> Disabling status when the module is disabled.
0	EN	0x0	RW	<b>Module enable</b> Set to enable the module.

### 21.5.3 EUSART\_CFG0 - Configuration 0 Register

Offset	Bit Position																																
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Reset	0x0	0x0						0x0	0x0	0x0		0x0			0x0			0x0	0x0			0x0				0x0			0x0	0x0	0x0	0x0	0x0
Access	RW	RW						RW	RW	RW		RW			RW			RW	RW			RW				RW			RW	RW	RW	RW	RW
Name	AUTOBAUDEN	MVDIS						ERRSTX	ERRSRX	ERRSDMA		SKIPPERRF			AUTOTRI			TXINV	RXINV			MSBF				OVS			MPAB	MPM	CCEN	LOOPBK	SYNC

Bit	Name	Reset	Access	Description									
31	AUTOBAUDEN	0x0	RW	<b>AUTOBAUD detection enable</b> Detects the baud rate based on receiving a 0x55 frame (0x00 for IrDA). Only applicable when CFG0.SYNC bit is set to 'ASYNC'.									
30	MVDIS	0x0	RW	<b>Majority Vote Disable</b> Disable majority vote for 16x, 8x and 6x oversampling modes. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.									
29:25	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											
24	ERRSTX	0x0	RW	<b>Disable TX On Error</b> When set, the transmitter is disabled on framing and parity errors in the receiver. Only applicable when CFG0.SYNC bit is set to 'ASYNC'. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>DISABLE</td> <td>Received framing and parity errors have no effect on transmitter</td> </tr> <tr> <td>1</td> <td>ENABLE</td> <td>Received framing and parity errors disable the transmitter</td> </tr> </tbody> </table>	Value	Mode	Description	0	DISABLE	Received framing and parity errors have no effect on transmitter	1	ENABLE	Received framing and parity errors disable the transmitter
Value	Mode	Description											
0	DISABLE	Received framing and parity errors have no effect on transmitter											
1	ENABLE	Received framing and parity errors disable the transmitter											
23	ERRSRX	0x0	RW	<b>Disable RX On Error</b> When set, the receiver is disabled on framing and parity errors. Only applicable when CFG0.SYNC bit is set to 'ASYNC'. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>DISABLE</td> <td>Framing and parity errors have no effect on receiver</td> </tr> <tr> <td>1</td> <td>ENABLE</td> <td>Framing and parity errors disable the receiver</td> </tr> </tbody> </table>	Value	Mode	Description	0	DISABLE	Framing and parity errors have no effect on receiver	1	ENABLE	Framing and parity errors disable the receiver
Value	Mode	Description											
0	DISABLE	Framing and parity errors have no effect on receiver											
1	ENABLE	Framing and parity errors disable the receiver											
22	ERRSDMA	0x0	RW	<b>Halt DMA Read On Error</b> When set, DMA read requests will be cleared on framing and parity errors. Only applicable when CFG0.SYNC bit is set to 'ASYNC'. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>DISABLE</td> <td>Framing and parity errors have no effect on DMA requests from the EUSART</td> </tr> <tr> <td>1</td> <td>ENABLE</td> <td>DMA requests from the EUSART are blocked while the PERR or FERR interrupt flags are set</td> </tr> </tbody> </table>	Value	Mode	Description	0	DISABLE	Framing and parity errors have no effect on DMA requests from the EUSART	1	ENABLE	DMA requests from the EUSART are blocked while the PERR or FERR interrupt flags are set
Value	Mode	Description											
0	DISABLE	Framing and parity errors have no effect on DMA requests from the EUSART											
1	ENABLE	DMA requests from the EUSART are blocked while the PERR or FERR interrupt flags are set											
21	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											

Bit	Name	Reset	Access	Description
20	SKIPPERRF	0x0	RW	<b>Skip Parity Error Frames</b>  When set, the receiver discards frames with parity errors. The PERR interrupt flag is still set. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
19:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
17	AUTOTRI	0x0	RW	<b>Automatic TX Tristate</b>  When enabled, TXTRI is set by hardware whenever the transmitter is idle, and TXTRI is cleared by hardware when transmission starts. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
	Value	Mode	Description	
	0	DISABLE	The output on UARTn_TX when the transmitter is idle is defined by TXINV	
	1	ENABLE	UARTn_TX is tristated whenever the transmitter is idle	
16:15	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
14	TXINV	0x0	RW	<b>Transmitter output Invert</b>  The output from the EUSART transmitter can optionally be inverted by setting this bit.
	Value	Mode	Description	
	0	DISABLE	Output from the transmitter is passed unchanged to UARTn_TX	
	1	ENABLE	Output from the transmitter is inverted before it is passed to UARTn_TX	
13	RXINV	0x0	RW	<b>Receiver Input Invert</b>  Setting this bit will invert the input to the EUSART receiver.
	Value	Mode	Description	
	0	DISABLE	Input is passed directly to the receiver	
	1	ENABLE	Input is inverted before it is passed to the receiver	
12:11	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
10	MSBF	0x0	RW	<b>Most Significant Bit First</b>  Decides whether data is sent with the least significant bit first, or the most significant bit first.
	Value	Mode	Description	
	0	DISABLE	Data is sent with the least significant bit first	
	1	ENABLE	Data is sent with the most significant bit first	
9:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:5	OVS	0x0	RW	<b>Oversampling</b>  Sets the number of clock periods in a EUSART bit-period. More clock cycles gives better robustness, while less clock cycles gives better performance. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
	Value	Mode	Description	

Bit	Name	Reset	Access	Description
	0	X16		16X oversampling
	1	X8		8X oversampling
	2	X6		6X oversampling
	3	X4		4X oversampling
	4	DISABLE		Disable oversampling (for LF operation)
4	MPAB	0x0	RW	<b>Multi-Processor Address-Bit</b> Defines the value of the multi-processor address bit. An incoming frame with its 9th bit equal to the value of this bit marks the frame as a multi-processor address frame. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
3	MPM	0x0	RW	<b>Multi-Processor Mode</b> Multi-processor mode uses the 9th bit of the EUSART frames to tell whether the frame is an address frame or a data frame. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
	Value	Mode		Description
	0	DISABLE		The 9th bit of incoming frames has no special function
	1	ENABLE		An incoming frame with the 9th bit equal to MPAB will be loaded into the RX FIFO regardless of RXBLOCK and will result in the MPAB interrupt flag being set
2	CCEN	0x0	RW	<b>Collision Check Enable</b> Enables collision checking on data when operating in half duplex modus. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
	Value	Mode		Description
	0	DISABLE		Collision check is disabled
	1	ENABLE		Collision check is enabled. The receiver must be enabled for the check to be performed
1	LOOPBK	0x0	RW	<b>Loopback Enable</b> Allows the receiver to be connected directly to the EUSART transmitter for loopback and half duplex communication.
	Value	Mode		Description
	0	DISABLE		The receiver is connected to and receives data from UARTn_RX
	1	ENABLE		The receiver is connected to and receives data from UARTn_TX
0	SYNC	0x0	RW	<b>Synchronous Mode</b> Determines whether the EUSART is operating in asynchronous or synchronous mode. When switching between SYNC and ASYNC mode, module Disablement is required.
	Value	Mode		Description
	0	ASYNC		The EUSART operates in asynchronous mode
	1	SYNC		The EUSART operates in synchronous mode

### 21.5.4 EUSART\_CFG1 - Configuration 1 Register

Offset	Bit Position																																	
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Access</b>			RW					RW						RW			RW					RW	RW	RW				RW			RW	RW	RW	RW
<b>Name</b>			RXFIW					RTSRXFW						TXFIW			RXPRSEN					SFUBRX	RXDMAWU	TXDMAWU				RXTIMEOUT			RTSINV	CTSEN	CTSINV	DBGHALT

Bit	Name	Reset	Access	Description
31	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
30:27	RXFIW	0x0	RW	<b>RX FIFO Interrupt Watermark</b>  Determines the interrupt and status level of the Receive FIFO. Also impacts RX DMA request.
	Value	Mode	Description	
	0	ONEFRAME	RXFL status flag and IF are set when the RX FIFO has at least one frame in it.	
	1	TWOFRAMES	RXFL status flag and IF are set when the RX FIFO has at least two frames in it.	
	2	THREEFRAMES	RXFL status flag and IF are set when the RX FIFO has at least three frames in it.	
	3	FOURFRAMES	RXFL status flag and IF are set when the RX FIFO has at least four frames in it.	
	4	FIVEFRAMES	RXFL status flag and IF are set when the RX FIFO has at least five frames in it.	
	5	SIXFRAMES	RXFL status flag and IF are set when the RX FIFO has at least six frames in it.	
	6	SEVENFRAMES	RXFL status flag and IF are set when the RX FIFO has at least seven frames in it.	
	7	EIGHTFRAMES	RXFL status flag and IF are set when the RX FIFO has at least eight frames in it.	
	8	NINEFRAMES	RXFL status flag and IF are set when the RX FIFO has at least nine frames in it.	
	9	TENFRAMES	RXFL status flag and IF are set when the RX FIFO has at least ten frames in it.	
	10	ELEVENFRAMES	RXFL status flag and IF are set when the RX FIFO has at least eleven frames in it.	
	11	TWELVEFRAMES	RXFL status flag and IF are set when the RX FIFO has at least twelve frames in it.	
	12	THIRTEENFRAMES	RXFL status flag and IF are set when the RX FIFO has at least thirteen frames in it.	
	13	FOURTEENFRAMES	RXFL status flag and IF are set when the RX FIFO has at least fourteen frames in it.	

Bit	Name	Reset	Access	Description
	14	FIFTEENFRAMES		RXFL status flag and IF are set when the RX FIFO has at least fifteen frames in it.
	15	SIXTEENFRAMES		RXFL status flag and IF are set when the RX FIFO has at least sixteen frames in it.
26	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
25:22	RTSRXFW	0x0	RW	<b>Request-to-send RX FIFO Watermark</b> Set Request-to-send watermark level. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
	Value	Mode	Description	
	0	ONEFRAME	RTS is set if there is space for at least one more frame in the RX FIFO.	
	1	TWOFRAMES	RTS is set if there is space for at least two more frames in the RX FIFO.	
	2	THREEFRAMES	RTS is set if there is space for at least three more frames in the RX FIFO.	
	3	FOURFRAMES	RTS is set if there is space for four more frames in the RX FIFO.	
	4	FIVEFRAMES	RTS is set if there is space for five more frames in the RX FIFO.	
	5	SIXFRAMES	RTS is set if there is space for six more frames in the RX FIFO.	
	6	SEVENFRAMES	RTS is set if there is space for seven more frames in the RX FIFO.	
	7	EIGHTFRAMES	RTS is set if there is space for eight more frames in the RX FIFO.	
	8	NINEFRAMES	RTS is set if there is space for nine more frames in the RX FIFO.	
	9	TENFRAMES	RTS is set if there is space for ten more frames in the RX FIFO.	
	10	ELEVENFRAMES	RTS is set if there is space for eleven more frames in the RX FIFO.	
	11	TWELVEFRAMES	RTS is set if there is space for twelve more frames in the RX FIFO.	
	12	THIRTEENFRAMES	RTS is set if there is space for thirteen more frames in the RX FIFO.	
	13	FOURTEENFRAMES	RTS is set if there is space for fourteen more frames in the RX FIFO.	
	14	FIFTEENFRAMES	RTS is set if there is space for fifteen more frames in the RX FIFO.	
	15	SIXTEENFRAMES	RTS is set if there is space for sixteen more frames in the RX FIFO.	
21:20	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	TXFIW	0x0	RW	<b>TX FIFO Interrupt Watermark</b> Determines the interrupt and status level of the transmit FIFO. Also impacts TX DMA request.
	Value	Mode	Description	

Bit	Name	Reset	Access	Description
0		ONEFRAME		TXFL status flag and IF are set when the TX FIFO has space for at least one more frame.
1		TWOFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least two more frames.
2		THREEFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least three more frames.
3		FOURFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least four more frames.
4		FIVEFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least five more frames.
5		SIXFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least six more frames.
6		SEVENFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least seven more frames.
7		EIGHTFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least eight more frames.
8		NINEFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least nine more frames.
9		TENFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least ten more frames.
10		ELEVENFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least eleven more frames.
11		TWELVEFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least twelve more frames.
12		THIRTEENFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least thirteen more frames.
13		FOURTEENFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least fourteen more frames.
14		FIFTEENFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least fifteen more frames.
15		SIXTEENFRAMES		TXFL status flag and IF are set when the TX FIFO has space for at least sixteen more frames.
15	RXPRSEN	0x0	RW	<b>PRS RX Enable</b> When set, the PRS channel selected as input to RX.
14:12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
11	SFUBRX	0x0	RW	<b>Start Frame Unblock Receiver</b> Set to unblock RX on Start frame reception. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
10	RXDMAWU	0x0	RW	<b>Receiver DMA Wakeup</b> Set to enable wakeup from EM2 to EM1 for DMA/ RX interaction. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
9	TXDMAWU	0x0	RW	<b>Transmitter DMA Wakeup</b> Set to enable wakeup from EM2 to EM1 for DMA/ TX interaction. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.

Bit	Name	Reset	Access	Description
8:7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6:4	RXTIMEOUT	0x0	RW	<b>RX Timeout</b>  When enabled, determines how long, in units of frame, RX needs to remain idle after a frame reception before RXTOIF gets set. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
	Value	Mode	Description	
	0	DISABLED		
	1	ONEFRAME		
	2	TWOFRAMES		
	3	THREEFRAMES		
	4	FOURFRAMES		
	5	FIVEFRAMES		
	6	SIXFRAMES		
	7	SEVENFRAMES		
3	RTSINV	0x0	RW	<b>Request-to-send Invert Enable</b>  When set, the RTS pin polarity is inverted. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
	Value	Mode	Description	
	0	DISABLE	The RTS pin is active low	
	1	ENABLE	The RTS pin is active high	
2	CTSEN	0x0	RW	<b>Clear-to-send Enable</b>  When set, frames in the TX FIFO will not be sent until link partner asserts CTS. Any data in the TX shift register will continue transmitting, the next TX FIFO data will not load into the TX shift register. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
	Value	Mode	Description	
	0	DISABLE	Ignore CTS	
	1	ENABLE	Stop transmitting when CTS is inactive	
1	CTSINV	0x0	RW	<b>Clear-to-send Invert Enable</b>  When set, the CTS pin polarity is inverted. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
	Value	Mode	Description	
	0	DISABLE	The CTS pin is active low	
	1	ENABLE	The CTS pin is active high	
0	DBGHALT	0x0	RW	<b>Debug halt</b>  Set to halt operation when core is halted. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
	Value	Mode	Description	
	0	DISABLE	Continue normal EUSART operation even if core is halted	

---

Bit	Name	Reset	Access	Description
	1	ENABLE		If core is halted, receive one frame and then halt reception by deactivating RTS. Next frame reception happens when the core is unhalted during single stepping.

---

### 21.5.5 EUSART\_CFG2 - Configuration 2 Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																0x0	0x0	0x1	0x0	0x0	0x0	0x0	0x0	0x0							
<b>Access</b>	RW																RW	RW	RW	RW	RW	RW	RW	RW	RW							
<b>Name</b>	SDIV																FORCELOAD	CLKPRSEN	AUTOCS	AUTOTX	CSINV	CLKPHA	CLKPOL	MASTER								

Bit	Name	Reset	Access	Description
31:24	SDIV	0x0	RW	<b>Sync Clock Div</b>  Sets the clock rate for synchronous main mode operation only (To set the clock rate for asynchronous operation, see the CLKDIV field). Clock division value = SDIV + 1. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'MASTER'.
23:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7	FORCELOAD	0x0	RW	<b>Force Load to Shift Register</b>  When this bit is set, if TXEN is already enabled, any loading of an empty FIFO will immediately load the data into the shift register. This bit is recommended to be used in 3-wire setting where CS is not used, or in a custom 4-wire mode where SCLK is in long idle state between two transactions with CS always in active mode (this typically happens between 2 transactions where the main interface holds SCLK idling to give additional time for the secondary interface to load data). If FORCELOAD bit is not set, the next out-going frame will be a DEFAULT TX data, followed by the loaded TX data in TX FIFO. When FORCELOAD is set, it will automatically trigger setup window check against the programmed EUSARTn_TLMINGCFG.SETUPWINDOW, which specifies the minimum duration between empty fifo loading event and first encountered edge of SCLK. If the measured duration is less than SETUPWINDOW bus clock cycles, a EUSARTn_IF.LOADERIF Interrupt will be triggered. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'SLAVE'.
6	CLKPRSEN	0x0	RW	<b>PRS CLK Enable</b>  When set, the PRS channel selected as input to CLK. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'SLAVE'.
5	AUTOCS	0x1	RW	<b>Automatic Chip Select</b>  When enabled, the output on CS will be activated one baud-period before transmission starts, and deactivated when transmission ends. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'MASTER'.
4	AUTOTX	0x0	RW	<b>Always Transmit When RXFIFO Not Full</b>  Transmits as long as RXFIFO is not full. If TX is empty, underflows are generated. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'MASTER'.
3	CSINV	0x0	RW	<b>Chip Select Invert</b>  Default value is active low. This affects both the selection of external secondary devices, as well as the selection of the microcontroller in secondary mode. Only applicable when CFG0.SYNC bit is set to 'SYNC'.
	Value	Mode	Description	
	0	AL	Chip select is active low	
	1	AH	Chip select is active high	
2	CLKPHA	0x0	RW	<b>Clock Edge for Setup/Sample</b>

Bit	Name	Reset	Access	Description
				Determines where data is set-up and sampled according to the bus clock when in synchronous mode. Only applicable when CFG0.SYNC bit is set to 'SYNC'.
	Value	Mode		Description
	0	SAMPLELEADING		Data is sampled on the leading edge and set-up on the trailing edge of the bus clock in synchronous mode
	1	SAMPLETRAILING		Data is set-up on the leading edge and sampled on the trailing edge of the bus clock in synchronous mode
1	CLKPOL	0x0	RW	<b>Clock Polarity</b>
				Determines the clock polarity of the bus clock used in synchronous mode. Only applicable when CFG0.SYNC bit is set to 'SYNC'.
	Value	Mode		Description
	0	IDLELOW		The bus clock used in synchronous mode has a low base value
	1	IDLEHIGH		The bus clock used in synchronous mode has a high base value
0	MASTER	0x0	RW	<b>Main mode</b>
				Set this bit to put EUSART to main interface mode. When unset, EUSART operates in secondary interface mode. When changing between Main and Secondary mode, module Disablement is required. Only applicable when CFG0.SYNC bit is set to 'SYNC'.
	Value	Mode		Description
	0	SLAVE		Secondary mode
	1	MASTER		Main mode

### 21.5.6 EUSART\_FRAMECFG - Frame Format Register

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x1			0x0					0x2											
<b>Access</b>													RW			RW					RW											
<b>Name</b>													STOPBITS			PARITY					DATABITS											

Bit	Name	Reset	Access	Description
31:14	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
13:12	STOPBITS	0x1	RW	<b>Stop-Bit Mode</b> Determines the number of stop-bits used. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
	Value	Mode	Description	
	0	HALF	The transmitter generates a half stop bit. Stop-bits are not verified by receiver	
	1	ONE	One stop bit is generated and verified	
	2	ONEANDAHALF	The transmitter generates one and a half stop bit. The receiver verifies the first stop bit	
	3	TWO	The transmitter generates two stop bits. The receiver checks the first stop-bit only	
11:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9:8	PARITY	0x0	RW	<b>Parity-Bit Mode</b> Determines whether parity bits are enabled, and whether even or odd parity should be used. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
	Value	Mode	Description	
	0	NONE	Parity bits are not used	
	2	EVEN	Even parity are used. Parity bits are automatically generated and checked by hardware.	
	3	ODD	Odd parity is used. Parity bits are automatically generated and checked by hardware.	
7:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
3:0	DATABITS	0x2	RW	<b>Data-Bit Mode</b> Sets the number of data bits in a EUSART frame.
	Value	Mode	Description	
	1	SEVEN	Each frame contains 7 data bits	
	2	EIGHT	Each frame contains 8 data bits	

Bit	Name	Reset	Access	Description
3		NINE		Each frame contains 9 data bits
4		TEN		Each frame contains 10 data bits
5		ELEVEN		Each frame contains 11 data bits
6		TWELVE		Each frame contains 12 data bits
7		THIRTEEN		Each frame contains 13 data bits
8		FOURTEEN		Each frame contains 14 data bits
9		FIFTEEN		Each frame contains 15 data bits
10		SIXTEEN		Each frame contains 16 data bits

### 21.5.7 EUSART\_DTXDATCFG - Default TX DATA Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	RW															
<b>Name</b>																	DTXDAT															

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15:0	DTXDAT	0x0	RW	<b>Default TX DATA</b>  This is the default transmitted data when the TXFIFO is empty. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'SLAVE'.

## 21.5.8 EUSART\_IRHFCFG - HF IrDA Mod Config Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0	0x0			
<b>Access</b>																											RW	RW	RW			
<b>Name</b>																											IRHFFILT	IRHFPW	IRHFEN			

Bit	Name	Reset	Access	Description															
31:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>																	
3	IRHFFILT	0x0	RW	<b>IrDA RX Filter</b> Set to enable filter on demodulator.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>DISABLE</td> <td>No filter enabled</td> </tr> <tr> <td>1</td> <td>ENABLE</td> <td>Filter enabled. IrDA pulse must be high for at least 5 consecutive clock cycles to be detected</td> </tr> </tbody> </table>	Value	Mode	Description	0	DISABLE	No filter enabled	1	ENABLE	Filter enabled. IrDA pulse must be high for at least 5 consecutive clock cycles to be detected						
Value	Mode	Description																	
0	DISABLE	No filter enabled																	
1	ENABLE	Filter enabled. IrDA pulse must be high for at least 5 consecutive clock cycles to be detected																	
2:1	IRHFPW	0x0	RW	<b>IrDA TX Pulse Width</b> Configure the pulse width generated by the modulator as a fraction of the configured EUSART bit period.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>ONE</td> <td>IrDA pulse width is 1/16 for OVS=0 and 1/8 for OVS=1</td> </tr> <tr> <td>1</td> <td>TWO</td> <td>IrDA pulse width is 2/16 for OVS=0 and 2/8 for OVS=1</td> </tr> <tr> <td>2</td> <td>THREE</td> <td>IrDA pulse width is 3/16 for OVS=0 and 3/8 for OVS=1</td> </tr> <tr> <td>3</td> <td>FOUR</td> <td>IrDA pulse width is 4/16 for OVS=0 and 4/8 for OVS=1</td> </tr> </tbody> </table>	Value	Mode	Description	0	ONE	IrDA pulse width is 1/16 for OVS=0 and 1/8 for OVS=1	1	TWO	IrDA pulse width is 2/16 for OVS=0 and 2/8 for OVS=1	2	THREE	IrDA pulse width is 3/16 for OVS=0 and 3/8 for OVS=1	3	FOUR	IrDA pulse width is 4/16 for OVS=0 and 4/8 for OVS=1
Value	Mode	Description																	
0	ONE	IrDA pulse width is 1/16 for OVS=0 and 1/8 for OVS=1																	
1	TWO	IrDA pulse width is 2/16 for OVS=0 and 2/8 for OVS=1																	
2	THREE	IrDA pulse width is 3/16 for OVS=0 and 3/8 for OVS=1																	
3	FOUR	IrDA pulse width is 4/16 for OVS=0 and 4/8 for OVS=1																	
0	IRHFEN	0x0	RW	<b>Enable IrDA Module</b> Enable IrDA module and route EUSART signals through it. Used when EUSART has HF clock. Only applicable when CFG0.SYNC bit is set to 'ASYNCR'															

## 21.5.9 EUSART\_IRLFCFG - LF IrDA Pulse Config Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0
<b>Access</b>																																RW
<b>Name</b>																																IRLFEN

Bit	Name	Reset	Access	Description
31:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	IRLFEN	0x0	RW	<b>Pulse Generator/Extender Enable</b> Filter EUSART output through pulse generator and the EUSART input through the pulse extender. Used for LF operation. Only applicable when CFG0.SYNC bit is set to 'ASYNC'

### 21.5.10 EUSART\_TIMINGCFG - Timing Register

Offset	Bit Position																																							
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0								
<b>Reset</b>														0x5						0x0						0x0						0x0								
<b>Access</b>														RW						RW						RW						RW								
<b>Name</b>														SETUPWINDOW						ICS						CSHOLD						CSSETUP						TXDELAY		

Bit	Name	Reset	Access	Description
31:20	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	SETUPWINDOW	0x5	RW	<b>Setup Window</b>  When CFG2.FORCELOAD is set, this defines the number of bus clock cycles that empty FIFO load or enabling of TX or disabling of TX must be performed before the sampling edge of SCLK at word-boundary to avoid load error. Word boundary is defined as followings: before the transaction starts, or between 2 transactions or the first bit between 2 datawords. If baud-rate is more than 5 MHz, a value of 4 is recommended, any values smaller than that can be tried out but avoid using 0. If baud-rate is less than 5 MHz, value of 5 is recommended, any values higher than 5 can be used but it may make the load error easy to occur. The recommended values for frequency bands should be sufficient to work all the time. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'SLAVE' and CFG2.FORCELOAD is set.
15	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
14:12	ICS	0x0	RW	<b>Inter-Character Spacing</b>  Inter-character spacing after each TX frame while the TX FIFO is not empty. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'MASTER'.
	Value	Mode	Description	
	0	ZERO	There is no space between charcters	
	1	ONE	Create a space of 1 baud-times between frames	
	2	TWO	Create a space of 2 baud-times between frames	
	3	THREE	Create a space of 3 baud-times between frames	
	4	FOUR	Create a space of 4 baud-times between frames	
	5	FIVE	Create a space of 5 baud-times between frames	
	6	SIX	Create a space of 6 baud-times between frames	
	7	SEVEN	Create a space of 7 baud-times between frames	
11	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
10:8	CSHOLD	0x0	RW	<b>Chip Select Hold</b>  Chip Select will be de-asserted after the end of frame transmission. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'MASTER'.
	Value	Mode	Description	

Bit	Name	Reset	Access	Description
0		ZERO		CS is de-asserted half or 1 baud-time after the end of transmission depending on CLKPHASE equal to 1 or 0 respectively
1		ONE		CS is de-asserted 1 additional baud-time after the end of transmission
2		TWO		CS is de-asserted 2 additional baud-times after the end of transmission
3		THREE		CS is de-asserted 3 additional baud-times after the end of transmission
4		FOUR		CS is de-asserted 4 additional baud-times after the end of transmission
5		FIVE		CS is de-asserted 5 additional baud-times after the end of transmission
6		SIX		CS is de-asserted 6 additional baud-times after the end of transmission
7		SEVEN		CS is de-asserted 7 additional baud-times after the end of transmission

7 *Reserved* *To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in [1.2 Conventions](#)*

6:4 CSSETUP 0x0 RW **Chip Select Setup**

Chip Select will be asserted before the start of frame transmission. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'MASTER'.

Value	Mode	Description
0	ZERO	CS is asserted half or 1 baud-time before the start of transmission depending on CLKPHASE equal to 1 or 0 respectively
1	ONE	CS is asserted 1 additional baud-time before start of transmission
2	TWO	CS is asserted 2 additional baud-times before start of transmission
3	THREE	CS is asserted 3 additional baud-times before start of transmission
4	FOUR	CS is asserted 4 additional baud-times before start of transmission
5	FIVE	CS is asserted 5 additional baud-times before start of transmission
6	SIX	CS is asserted 6 additional baud-times before start of transmission
7	SEVEN	CS is asserted 7 additional baud-times before start of transmission

3:2 *Reserved* *To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in [1.2 Conventions](#)*

1:0 TXDELAY 0x0 RW **TX Delay Transmission**

Configurable delay before new transfers. Frames sent back-to-back are not delayed. Only applicable when CFG0.SYNC bit is set to 'ASYNCR'.

Value	Mode	Description
-------	------	-------------

Bit	Name	Reset	Access	Description
0		NONE		Frames are transmitted immediately.
1		SINGLE		Transmission of new frames is delayed by a single bit period.
2		DOUBLE		Transmission of new frames is delayed by a two bit periods.
3		TRIPPLE		Transmission of new frames is delayed by a three bit periods.

### 21.5.11 EUSART\_STARTFRAMECFG - Start Frame Register

Offset	Bit Position																															
0x028	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									RW							
<b>Name</b>																									STARTFRAME							

Bit	Name	Reset	Access	Description
31:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8:0	STARTFRAME	0x0	RW	<b>Start Frame</b>  When a frame matching STARTFRAME is received, the receiver detects that and STARTF interrupt flag is set. If SFUBRX is set, RXBLOCK is cleared and the start frame is loaded in to the RX FIFO. Only applicable when CFG0.SYNC bit is set to 'ASYNCR'.

### 21.5.12 EUSART\_SIGFRAMECFG - Signal Frame Register

Offset	Bit Position																															
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									RW							
<b>Name</b>																									SIGFRAME							

Bit	Name	Reset	Access	Description
31:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8:0	SIGFRAME	0x0	RW	<b>Signal Frame Value</b>  When a frame matching SIGFRAME is detected by the receiver, SIGF interrupt flag is set. Only applicable when CFG0.SYNC bit is set to 'ASYNCR'.

### 21.5.13 EUSART\_CLKDIV - Clock Divider Register

Offset	Bit Position																															
0x030	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>												0x0																				
<b>Access</b>												RW																				
<b>Name</b>												DIV																				

Bit	Name	Reset	Access	Description
31:23	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
22:3	DIV	0x0	RW	<b>Fractional Clock Divider</b>  Specifies the fractional clock divider. Setting AUTOBAUDEN in CFG1 register will overwrite the DIV field. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
2:0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

### 21.5.14 EUSART\_TRIGCTRL - Trigger Control Register

Offset	Bit Position																															
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0	0x0			
<b>Access</b>																											RW	RW	RW			
<b>Name</b>																											AUTOTXTEN	TXTEN	RXTEN			

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	AUTOTXTEN	0x0	RW	<b>AUTOTX Trigger Enable</b>  When set, AUTOTX is enabled as long as the selected PRS channel has a high value. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'MASTER'.
1	TXTEN	0x0	RW	<b>Transmit Trigger Enable</b>  When set, the positive edge of the selected PRS channel sets TXEN, enabling the transmitter.
0	RXTEN	0x0	RW	<b>Receive Trigger Enable</b>  When set, the positive edge of the selected PRS channel sets RXEN, enabling the receiver.

### 21.5.15 EUSART\_CMD - Command Register

Offset	Bit Position																																																				
0x038	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																					
<b>Reset</b>																								0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0
<b>Access</b>																								W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)	W(nB)
<b>Name</b>																								CLEARTX	TXTRIDIS	TXTRIEN	RXBLOCKDIS	RXBLOCKEN	TXDIS	TXEN	RXDIS	RXEN																					

Bit	Name	Reset	Access	Description
31:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8	CLEARTX	0x0	W(nB)	<b>Clear TX FIFO</b>  Set to clear TX FIFO. Only applicable when CFG0.SYNC bit is set to 'ASYNCR'. Note that before issuing this command, firmware should first set the transmitter disable bit (CMD.TXDIS) and then poll the transmitter enable status bit until cleared (STATUS.TXENS).
7	TXTRIDIS	0x0	W(nB)	<b>Transmitter Tristate Disable</b>  Disables tristating of the transmitter output.
6	TXTRIEN	0x0	W(nB)	<b>Transmitter Tristate Enable</b>  Tristates the transmitter output. Only applicable when CFG0.SYNC bit is set to 'ASYNCR'.
5	RXBLOCKDIS	0x0	W(nB)	<b>Receiver Block Disable</b>  Set to clear RXBLOCK, resulting in all incoming frames being loaded into the RX FIFO.
4	RXBLOCKEN	0x0	W(nB)	<b>Receiver Block Enable</b>  Set to set RXBLOCK, resulting in all incoming frames being discarded.
3	TXDIS	0x0	W(nB)	<b>Transmitter Disable</b>  Set to disable transmission. STATUS.TXENS should be polled to ensure disabled status in Synchronous mode.
2	TXEN	0x0	W(nB)	<b>Transmitter Enable</b>  Set to enable data transmission. STATUS.TXENS should be polled to ensure enabled status in Synchronous mode.
1	RXDIS	0x0	W(nB)	<b>Receiver Disable</b>  Set to disable data reception. If a frame is under reception when the receiver is disabled, the incoming frame is discarded. STATUS.RXENS should be polled to ensure disabled status in Synchronous mode.
0	RXEN	0x0	W(nB)	<b>Receiver Enable</b>  Set to activate data reception. STATUS.RXENS should be polled to ensure enabled status in Synchronous mode.

## 21.5.16 EUSART\_RXDATA - RX Data Register

Offset	Bit Position																																
0x03C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																																	0x0
<b>Access</b>																																	R
<b>Name</b>																																	RXDATA

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15:0	RXDATA	0x0	R	<b>RX Data and Control bits</b>
Use this register to access data read from the EUSART, cleared on read access. In Synchronous mode, Bit 15:0 is actual RXDATA. In Asynchronous mode, Bit 8:0 is actual RXDATA, bit 9 is PERR (set if received data has a parity error.), bit 10 is FERR (set if received data has a framing error, can be result of a break condition). Note that FIFO is not retained in EM2.				

## 21.5.17 EUSART\_RXDATAP - RX Data Peek Register

Offset	Bit Position																																
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																																	0x0
<b>Access</b>																																	R
<b>Name</b>																																	RXDATAP

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15:0	RXDATAP	0x0	R	<b>RX Data Peek</b>
Use this register to access data read from the EUSART without popping the FIFO.				

## 21.5.18 EUSART\_TXDATA - TX Data Register

Offset	Bit Position																															
0x044	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	W															
<b>Name</b>																	TXDATA															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		

Bit	Name	Reset	Access	Description
15:0	TXDATA	0x0	W	<b>TX Data and Control bits</b>
<p>Use this register to write data to the EUSART. If TXEN is set, a transfer will be initiated at the first opportunity. In Synchronous mode, 15:0 is TXDATA. In asynchronous mode, 8:0 is TXDATA, bit 9 is UBRXAT (Set to clear RXBLOCK after transmission, unblocking the receiver), bit 10 is TXTRIAT (Set to tristate transmitter by setting TXTRI after transmission), bit 11 is TXBREAK (Set to send data as a break. Recipient will see a framing error or a break condition depending on its configuration and the value of TXDATA), bit 12 is TXDISAT (Set to disable transmitter and release data bus directly after transmission), bit 13 is RXENAT (Set to enable reception after transmission). Note that FIFO is not retained in EM2</p>				

### 21.5.19 EUSART\_STATUS - Status Register

Offset	Bit Position																																									
0x048	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0										
<b>Reset</b>							0x0	0x0							0x0												0x0	0x0	0x1	0x1			0x0	0x0	0x1	0x0	0x0	0x0		0x0	0x0	
<b>Access</b>							R	R							R												R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
<b>Name</b>							CLEAR_TXBUSY	AUTOBAUDDONE							TXFCNT												TXIDLE	RXIDLE			RXFULL	RXFL	TXFL	TXC	TXTRI	RXBLOCK			TXENS	RXENS		

Bit	Name	Reset	Access	Description
31:26	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
25	CLEAR_TXBUSY	0x0	R	<b>TX FIFO Clear Busy</b> After issuing CLEAR_TX command, wait on this status flag until it goes low.
24	AUTOBAUDDONE	0x0	R	<b>Auto Baud Rate Detection Completed</b> Set when auto baud rate has been detected and CLKDIV has been updated with required value. If AUTOBAUDEN is not set in CFG0 register, this bit is always read as '0'. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
23:21	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
20:16	TXFCNT	0x0	R	<b>Valid entries in TX FIFO</b> Count of TX valid FIFO entries.
15:14	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
13	TXIDLE	0x1	R	<b>TX Idle</b> Set when TX idle. In Synchronous secondary mode, TX is not considered idle when transmitting Default TX data.
12	RXIDLE	0x1	R	<b>RX Idle</b> Set when RX is idle.
11:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8	RXFULL	0x0	R	<b>RX FIFO Full</b> Set when the RX FIFO is full.
7	RXFL	0x0	R	<b>RX FIFO Level</b> Set when data is available in the RX FIFO. Depends on the RXFIW setting in the CFG1 register.
6	TXFL	0x1	R	<b>TX FIFO Level</b> Set when there is space for data in the TX FIFO. Depends on the TXFIW setting in CFG1 register.
5	TXC	0x0	R	<b>TX Complete</b> Set when a transmission has completed and no more data is available in the TX FIFO and shift register.
4	TXTRI	0x0	R	<b>Transmitter Tristated</b>

Bit	Name	Reset	Access	Description
				Set when the transmitter is tristated, and cleared when transmitter output is enabled. If AUTOTRI in UARTn_CFG is set, then this bit is always read as 0. Only applicable when CFG0.SYNC bit is set to 'ASYNC'.
3	RXBLOCK	0x0	R	<p><b>Block Incoming Data</b></p> <p>When set, the receiver discards incoming frames. An incoming frame will not be loaded into the RX FIFO if this bit is set at the instant the frame has been completely received.</p>
2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	TXENS	0x0	R	<p><b>Transmitter Enable Status</b></p> <p>Set when the transmitter is enabled. In Synchronous secondary mode, default TX data will be transmitted when the transmitter is disabled.</p>
0	RXENS	0x0	R	<p><b>Receiver Enable Status</b></p> <p>Set when the receiver is enabled.</p>

## 21.5.20 EUSART\_IF - Interrupt Flag Register

<b>Access</b>							RW	RW					RW	RW		RW			RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	
<b>Name</b>							RXTO	AUTOBAUDDONE					SIGF	STARTF		CSWU			TXIDLE	CCF	LOADERR	MPAF	FERR	PERR	TXUF	TXOF	RXUF	RXOF	RXFULL	RXFL	TXFL	TXC	

Bit	Name	Reset	Access	Description
31:26	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
25	RXTO	0x0	RW	<b>RX Timeout Interrupt Flag</b> Set when RX timeout occurs. Only applicable when CFG0.SYNC bit is set to 'ASYN'.
24	AUTOBAUDDONE	0x0	RW	<b>Auto Baud Complete Interrupt Flag</b> Set when auto baud rate detection is complete. Only applicable when CFG0.SYNC bit is set to 'ASYN'.
23:20	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
19	SIGF	0x0	RW	<b>Signal Frame Interrupt Flag</b> Set when a signal frame is detected. Please note that when MPA, START, and SIGNAL are set to match the same frame, corresponding interrupts might get triggered in arbitrary sequence due to synchronization uncertainty. Only applicable when CFG0.SYNC bit is set to 'ASYN'.
18	STARTF	0x0	RW	<b>Start Frame Interrupt Flag</b> Set when a start frame is detected. Please note that when MPA, START, and SIGNAL are set to match the same frame, corresponding interrupts might get triggered in arbitrary sequence due to synchronization uncertainty. Only applicable when CFG0.SYNC bit is set to 'ASYN'.
17	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
16	CSWU	0x0	RW	<b>CS Wake-up Interrupt Flag</b> Set when the CS asserts. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'SLAVE'.
15:14	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
13	TXIDLE	0x0	RW	<b>TX Idle Interrupt Flag</b> Set when TX goes idle. In Synchronous mode, if TX is disabled during the middle of the transactions, TXIDLEIF won't be triggered when the engine becomes disabled.
12	CCF	0x0	RW	<b>Collision Check Fail Interrupt Flag</b> Set when a collision check notices an error in the transmitted data. Only applicable when CFG0.SYNC bit is set to 'ASYN'.
11	LOADERR	0x0	RW	<b>Load Error Interrupt Flag</b>

Bit	Name	Reset	Access	Description
				Set when the empty TX FIFO is loaded less than the required TIMINGCFG.SETUPWINDOW bus clock cycles before the first edge of the incoming SCLK. Only applicable when CFG0.SYNC bit is set to 'SYNC' and CFG2.MASTER is set to 'SLAVE' and CFG2.FORCELOAD is set.
10	MPAF	0x0	RW	<b>Multi-Processor Address Frame Interrupt</b> Set when a multi-processor address frame is detected. Only applicable when CFG0.SYNC bit is set to 'ASYNc'.
9	FERR	0x0	RW	<b>Framing Error Interrupt Flag</b> Set when a frame with a framing error is received while RXBLOCK is cleared. Only applicable when CFG0.SYNC bit is set to 'ASYNc'.
8	PERR	0x0	RW	<b>Parity Error Interrupt Flag</b> Set when a frame with a parity error is received while RXBLOCK is cleared. Only applicable when CFG0.SYNC bit is set to 'ASYNc'.
7	TXUF	0x0	RW	<b>TX FIFO Underflow Interrupt Flag</b> In Sync secondary mode, Set when reading an empty TX FIFO with TX enabled. In Synchronous main Mode with AUTOTX enabled, set when transmitting the word that does not contain valid data.
6	TXOF	0x0	RW	<b>TX FIFO Overflow Interrupt Flag</b> Set when a write is done to the TX FIFO while it is full. The data already in the TX FIFO is preserved.
5	RXUF	0x0	RW	<b>RX FIFO Underflow Interrupt Flag</b> Set when trying to read from the RX FIFO when it is empty.
4	RXOF	0x0	RW	<b>RX FIFO Overflow Interrupt Flag</b> Set when data is completely received in the receive shift register but the RX FIFO is full. RX FIFO is not overwritten by new data.
3	RXFULL	0x0	RW	<b>RX FIFO Full Interrupt Flag</b> Set when the RX FIFO becomes full.
2	RXFL	0x0	RW	<b>RX FIFO Level Interrupt Flag</b> Set when data becomes available in the RX FIFO. This field depends on the RXFIW field in the CFG1 register.
1	TXFL	0x0	RW	<b>TX FIFO Level Interrupt Flag</b> Set when space becomes available in the TX FIFO. This depends on the TXFIW field in the CFG1 register.
0	TXC	0x0	RW	<b>TX Complete Interrupt Flag</b> This interrupt is set after a transmission when both the TX FIFO and shift register are empty.

## 21.5.21 EUSART\_IEN - Interrupt Enable Register

Offset	Bit Position

11	AUTOTXTEN	0x0	R	<b>SYNCBUSY for AUTOTXTEN in TRIGCTRL</b>  This bit is set when there is an ongoing synchronization of AUTOTXTEN field. Do not do another write to the same field while this bit is set.
10	TXTRIDIS	0x0	R	<b>SYNCBUSY in TXTRIDIS in CMD</b>  This bit is set when there is an ongoing synchronization of TXTRIDIS field. Do not do another write to the same field while this bit is set. Only applicable when CFG0.SYNC bit is set to 'ASYN'.
9	TXTRIEN	0x0	R	<b>SYNCBUSY for TXTRIEN in CMD</b>  This bit is set when there is an ongoing synchronization of TXTRIEN field. Do not do another write to the same field while this bit is set.
8	RXBLOCKDIS	0x0	R	<b>SYNCBUSY for RXBLOCKDIS in CMD</b>  This bit is set when there is an ongoing synchronization of RXBLOCKDIS field. Do not do another write to the same field while this bit is set.
7	RXBLOCKEN	0x0	R	<b>SYNCBUSY for RXBLOCKEN in CMD</b>  This bit is set when there is an ongoing synchronization of RXBLOCKEN field. Do not do another write to the same field while this bit is set.
6	TXDIS	0x0	R	<b>SYNCBUSY for TXDIS in CMD</b>  This bit is set when there is an ongoing synchronization of TXDIS field. Do not do another write to the same field while this bit is set.
5	TXEN	0x0	R	<b>SYNCBUSY for TXEN in CMD</b>  This bit is set when there is an ongoing synchronization of TXEN field. Do not do another write to the same field while this bit is set.
4	RXDIS	0x0	R	<b>SYNCBUSY for RXDIS in CMD</b>  This bit is set when there is an ongoing synchronization of RXDIS field. Do not do another write to the same field while this bit is set.
3	RXEN	0x0	R	<b>SYNCBUSY for RXEN in CMD</b>  This bit is set when there is an ongoing synchronization of RXEN field. Do not do another write to the same field while this bit is set.
2	TXTEN	0x0	R	<b>SYNCBUSY for TXTEN in TRIGCTRL</b>  This bit is set when there is an ongoing synchronization of TXTEN field. Do not do another write to the same field while this bit is set.

Bit	Name	Reset	Access	Description
1	RXTEN	0x0	R	<b>SYNCBUSY for RXTEN in TRIGCTRL</b>  This bit is set when there is an ongoing synchronization of RXTEN field. Do not do another write to the same field while this bit is set.
0	DIV	0x0	R	<b>SYNCBUSY for DIV in CLKDIV</b>  This bit is set when there is an ongoing synchronization of DIV field. Do not do another write to the same field while this bit is set.

## 22. I<sup>2</sup>C - Inter-Integrated Circuit Interface

### Quick Facts

#### What?

The I<sup>2</sup>C interface allows communication on I<sup>2</sup>C-buses with the lowest energy consumption possible.

#### Why?

I<sup>2</sup>C is a popular serial bus that enables communication with a number of external devices using only two I/O pins.

#### How?

With the help of DMA, the I<sup>2</sup>C interface allows I<sup>2</sup>C communication with minimal CPU intervention. Address recognition is available in all energy modes (except EM4), allowing the MCU to wait for data on the I<sup>2</sup>C-bus with sub- $\mu$ A current consumption.

### 22.1 Introduction

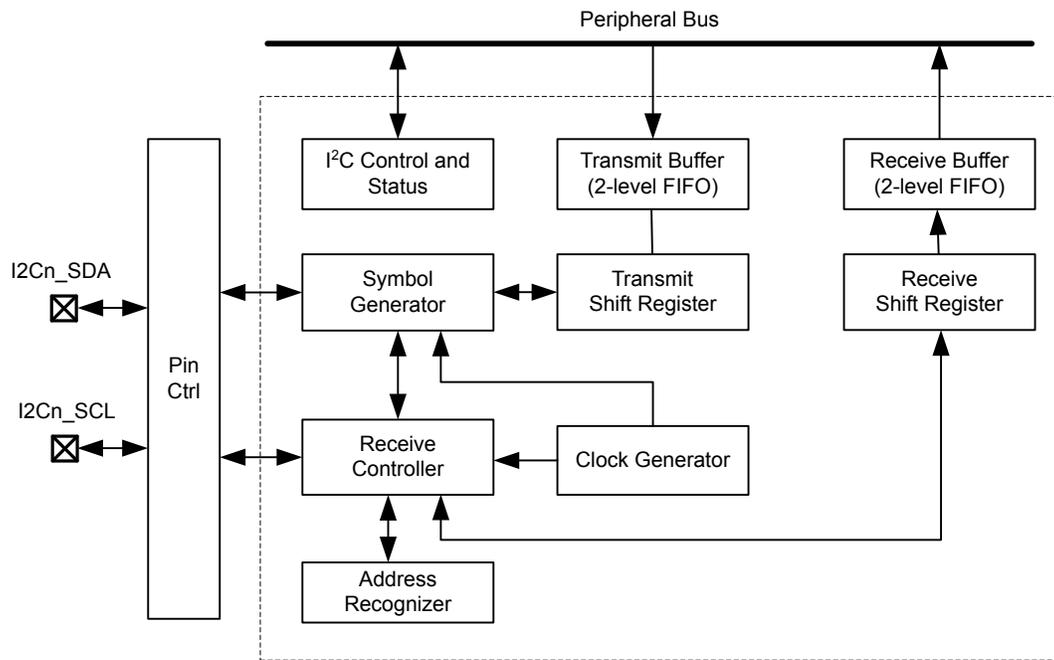

The I<sup>2</sup>C module provides an interface between the MCU and a serial I<sup>2</sup>C-bus. It is capable of acting as both a leader and a follower and supports multi-leader buses. Standard-mode, fast-mode and fast-mode plus speeds are supported, allowing transmission rates all the way from 10 kbit/s up to 1 Mbit/s. Follower arbitration and timeouts are also provided to allow implementation of an SMBus compliant system. The interface provided to software by the I<sup>2</sup>C module allows precise control of the transmission process and highly automated transfers. Automatic recognition of follower addresses is provided in all energy modes (except EM4).

### 22.2 Features

- True multi-leader capability
- Support for different bus speeds
  - Standard-mode (Sm) bit rate up to 100 kbit/s
  - Fast-mode (Fm) bit rate up to 400 kbit/s
  - Fast-mode Plus (Fm+) bit rate up to 1 Mbit/s
- Arbitration for both leader and follower (allows SMBus ARP)
- Clock synchronization and clock stretching
- Hardware address recognition
  - 7-bit masked address
  - General call address
  - Supported in EM2/3 (I2C0-only)
- 10-bit address support
- Error handling
  - Clock low timeout
  - Bus idle (clock high) timeout
  - Arbitration lost
  - Bus error detection
- Separate receive/ transmit 2-level buffers, with additional separate shift registers
- Full DMA support

### 22.3 Functional Description

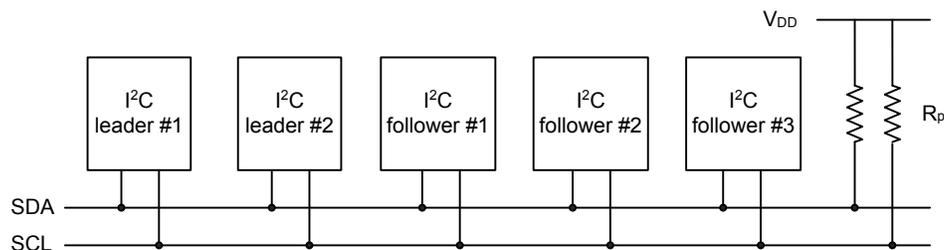

An overview of the I2C module is shown in [Figure 22.1 I2C Overview on page 692](#).

**Figure 22.1. I2C Overview**

### 22.3.1 I2C-Bus Overview

The I<sup>2</sup>C-bus uses two wires for communication; a serial data line (SDA) and a serial clock line (SCL) as shown in [Figure 22.2 I2C-Bus Example on page 693](#). As a true multi-leader bus it includes collision detection and arbitration to resolve situations where multiple leaders transmit data at the same time without data loss.

**Figure 22.2. I2C-Bus Example**

Each device on the bus is addressable by a unique address, and an I<sup>2</sup>C leader can address all the devices on the bus, including other leaders.

Both the bus lines are open-drain. The maximum value of the pull-up resistor can be calculated as a function of the maximal rise-time **t<sub>r</sub>** for the given bus speed, and the estimated bus capacitance **C<sub>b</sub>** as shown in [Figure 22.3 I2C Pull-up Resistor Equation on page 693](#).

$$R_{p(\max)} = t_r / (0.8473 \times C_b).$$

**Figure 22.3. I2C Pull-up Resistor Equation**

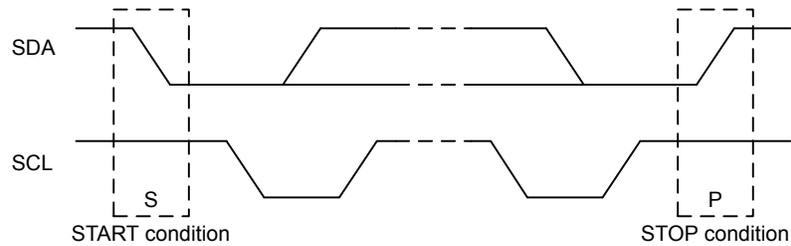

The maximal rise times for 100 kHz, 400 kHz and 1 MHz I<sup>2</sup>C are 1 μs, 300 ns and 120 ns respectively.

**Note:** The GPIO slew rate control should be set for the desired slew rate..

**Note:** If V<sub>dd</sub> drops below the voltage on SCL and SDA lines, the MCU could become back powered and pull the SCL and SDA lines low.

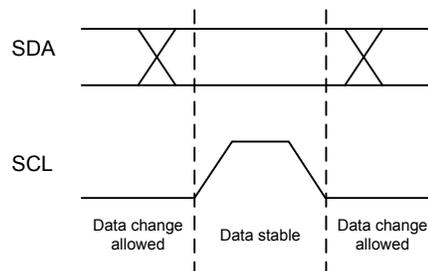

### 22.3.1.1 START and STOP Conditions

START and STOP conditions are used to initiate and stop transactions on the I<sup>2</sup>C-bus. All transactions on the bus begin with a START condition (S) and end with a STOP condition (P). As shown in [Figure 22.4 I<sup>2</sup>C START and STOP Conditions on page 694](#), a START condition is generated by pulling the SDA line low while SCL is high, and a STOP condition is generated by pulling the SDA line high while SCL is high.

**Figure 22.4. I<sup>2</sup>C START and STOP Conditions**

The START and STOP conditions are easily identifiable bus events as they are the only conditions on the bus where a transition is allowed on SDA while SCL is high. During the actual data transmission, SDA is only allowed to change while SCL is low, and must be stable while SCL is high. One bit is transferred per clock pulse on the I<sup>2</sup>C-bus as shown in [Figure 22.5 I<sup>2</sup>C Bit Transfer on I<sup>2</sup>C-Bus on page 694](#).

**Figure 22.5. I<sup>2</sup>C Bit Transfer on I<sup>2</sup>C-Bus**

### 22.3.1.2 Bus Transfer

When a leader wants to initiate a transfer on the bus, it waits until the bus is idle and transmits a START condition on the bus. The leader then transmits the address of the follower it wishes to interact with and a single R/W bit telling whether it wishes to read from the follower (R/W bit set to 1) or write to the follower (R/W bit set to 0).

After the 7-bit address and the R/W bit, the leader releases the bus, allowing the follower to acknowledge the request. During the next bit-period, the follower pulls SDA low (ACK) if it acknowledges the request, or keeps it high if it does not acknowledge it (NACK).

Following the address acknowledge, either the follower or leader transmits data, depending on the value of the R/W bit. After every 8 bits (one byte) transmitted on the SDA line, the transmitter releases the line to allow the receiver to transmit an ACK or a NACK. Both the data and the address are transmitted with the most significant bit first.

The number of bytes in a bus transfer is unrestricted. The leader ends the transmission after a (N)ACK by sending a STOP condition on the bus. After a STOP condition, any leader wishing to initiate a transfer on the bus can try to gain control of it. If the current leader wishes to make another transfer immediately after the current, it can start a new transfer directly by transmitting a repeated START condition (Sr) instead of a STOP followed by a START.

Examples of I<sup>2</sup>C transfers are shown in [Figure 22.6 I2C Single Byte Write to Follower on page 695](#), [Figure 22.7 I2C Double Byte Read from Follower on page 695](#), and [Figure 22.8 I2C Single Byte Write, then Repeated Start and Single Byte Read on page 695](#). The identifiers used are:

- ADDR - Address
- DATA - Data
- S - Start bit
- Sr - Repeated start bit
- P - Stop bit
- W/R - Read(1)/Write(0)
- A - ACK
- N - NACK

**Figure 22.6. I2C Single Byte Write to Follower**

**Figure 22.7. I2C Double Byte Read from Follower**

**Figure 22.8. I2C Single Byte Write, then Repeated Start and Single Byte Read**

### 22.3.1.3 Addresses

I<sup>2</sup>C supports both 7-bit and 10-bit addresses. When using 7-bit addresses, the first byte transmitted after the START-condition contains the address of the follower that the leader wants to contact. In the 7-bit address space, several addresses are reserved. These addresses are summarized in [Table 22.1 I2C Reserved I2C Addresses on page 696](#), and include a General Call address which can be used to broadcast a message to all followers on the I<sup>2</sup>C-bus.

**Table 22.1. I2C Reserved I2C Addresses**

I <sup>2</sup> C Address	R/W	Description
0000-000	0	General Call address
0000-000	1	START byte
0000-001	X	Reserved for the C-Bus format
0000-010	X	Reserved for a different bus format
0000-011	X	Reserved for future purposes
0000-1XX	X	Reserved for future purposes
1111-1XX	X	Reserved for future purposes
1111-0XX	X	10 Bit follower addressing mode

### 22.3.1.4 10-bit Addressing

To address a follower using a 10-bit address, two bytes are required to specify the address instead of one. The seven first bits of the first byte must then be 1111 0XX, where XX are the two most significant bits of the 10-bit address. As with 7-bit addresses, the eighth bit of the first byte determines whether the leader wishes to read from or write to the follower. The second byte contains the eight least significant bits of the follower address.

When a follower receives a 10-bit address, it must acknowledge both the address bytes if they match the address of the follower.

When performing a leader transmitter operation, the leader transmits the two address bytes and then the remaining data, as shown in [Figure 22.9 I2C Leader Transmitter/Follower Receiver with 10-bit Address on page 696](#).

**Figure 22.9. I2C Leader Transmitter/Follower Receiver with 10-bit Address**

When performing a leader receiver operation however, the leader first transmits the two address bytes in a leader transmitter operation, then sends a repeated START followed by the first address byte and then receives data from the addressed follower. The follower addressed by the 10-bit address in the first two address bytes must remember that it was addressed, and respond with data if the address transmitted after the repeated start matches its own address. An example of this (with one byte transmitted) is shown in [Figure 22.10 I2C Leader Receiver/Follower Transmitter with 10-bit Address on page 696](#).

**Figure 22.10. I2C Leader Receiver/Follower Transmitter with 10-bit Address**

### 22.3.1.5 Arbitration, Clock Synchronization, Clock Stretching

Arbitration and clock synchronization are features aimed at allowing multi-leader buses. Arbitration occurs when two devices try to drive the bus at the same time. If one device drives it low, while the other drives it high, the one attempting to drive it high will not be able to do so due to the open-drain bus configuration. Both devices sample the bus, and the one that was unable to drive the bus in the desired direction detects the collision and backs off, letting the other device continue communication on the bus undisturbed.

Clock synchronization is a means of synchronizing the clock outputs from several leaders driving the bus at once, and is a requirement for effective arbitration.

Followers on the bus are allowed to force the clock output on the bus low in order to pause the communication on the bus and give themselves time to process data or perform any real-time tasks they might have. This is called clock stretching.

Arbitration is supported by the I<sup>2</sup>C module for both leaders and followers. Clock synchronization and clock stretching is also supported.

### 22.3.2 Enable and Reset

The I<sup>2</sup>C is enabled by setting the EN bit in the I2C\_EN register.

To reset the internal state of the I<sup>2</sup>C module and terminate any ongoing transfers, set the CORERST bit in I2C\_CTRL. After resetting, the CORERST bit must be cleared to resume I<sup>2</sup>C operation.

**Note:** When enabling the I<sup>2</sup>C, the ABORT command or the Bus Idle Timeout feature must be applied prior to use even if the BUSY flag is not set.

### 22.3.3 Pin Configuration

The I<sup>2</sup>C SDA and SCL pins are configured and enabled in the GPIO\_I2Cn\_ROUTEEN, GPIO\_I2Cn\_SCLROUTE, and GPIO\_I2Cn\_SDAROUTE registers.

The I<sup>2</sup>C module must be configured to use pins on either Port A or B if wakeup on address recognition from EM2/3 is desired. All other ports are available only in EM0/1. See GPIO chapter for more details on Port limitations.

If the I<sup>2</sup>C module is configured to use pins other than Port A or B, firmware should reset the module before entering EM2/3 by setting the CORERST bit in I2C\_CTRL. After resuming EM0/1 operation, firmware should then clear CORERST.

### 22.3.4 Safely Disabling and Changing Follower Configuration

The I<sup>2</sup>C follower is partially asynchronous, and some precautions are necessary to always ensure a safe follower disable or follower configuration change. These measures should be taken, if (while the follower is enabled) the user cannot guarantee that an address match will not occur at the exact time of follower disable or follower configuration change.

Worst case consequences for an address match while disabling follower or changing configuration is that the follower may end up in an undefined state. To reset the follower back to a known state, the EN bit in I2C\_EN must be cleared. This should be done regardless of whether the follower is going to be re-enabled or not.

### 22.3.5 Clock Generation

The I<sup>2</sup>C peripheral clock (I2CCLK) for I2C0 is derived from the LSPCLK, and for I2C1 is derived from the PCLK.

The SCL signal generated by the I<sup>2</sup>C leader determines the maximum transmission rate on the bus. The clock is generated as a division of the peripheral clock (I2CCLK), and is given by the following equation:

$$f_{SCL} = f_{I2CCLK} / (((N_{low} + N_{high}) \times (DIV + 1)) + 8 + N_{fall} + N_{rise})$$

**Figure 22.11. I2C Maximum Transmission Rate**

Where DIV is the clock divider value set in I2C\_CLKDIV, the values of  $N_{low}$  and  $N_{high}$  (and thus the ratio between the high and low parts of the clock signal) are controlled by CLHR in the I2C\_CTRL register, and  $N_{fall}$  and  $N_{rise}$  represent the number of I2CCLK cycles required for clock synchronization.

The values of  $N_{low}$  and  $N_{high}$  specify the number of prescaled clock cycles in the low and high periods of the clock signal respectively. The worst case low and high periods of the signal are:

$$t_{high} \geq (N_{high} \times (DIV + 1) + 4) / f_{I2CCLK}$$

$$t_{low} \geq (N_{low} \times (DIV + 1) + 4) / f_{I2CCLK}$$

**Figure 22.12. I2C High and Low Cycles Equations**

Clock synchronization is used to ensure that requested low and high times are met on the bus. The counters establishing high and low time are only active once the pin logic has reached the high or low logic levels, and so the rise and fall times will impact the maximum transmission rate on the bus. The clock logic level is sampled at a rate of  $f_{I2CCLK}$ , and will therefore be quantized to an integer number of I2CCLK clock cycles, as:

$$N_{rise} = \text{CEILING}(t_{rise} / t_{I2CCLK})$$

$$N_{fall} = \text{CEILING}(t_{fall} / t_{I2CCLK})$$

**Figure 22.13. I2C Clock Synchronization Cycles**

Note that there is an inherent propagation delay between driving SCL and sampling the signal, so the above equations can result in  $N = 0$  for fast rise or fall times.

For example, a system with a weak pull-up on SCL may result in long  $t_{rise}$ , requiring several  $N_{rise}$  synchronization cycles, and subsequently impact the I2C transmission rate. In the same system,  $t_{fall}$  may be faster than the sampling delay, resulting in  $N_{fall} = 0$ .

**Note:** DIV must be set to 1 during follower mode operation.

### 22.3.6 Arbitration

Arbitration is enabled by default, but can be disabled by setting the ARBDIS bit in I2C\_CTRL. When arbitration is enabled, the value on SDA is sensed every time the I<sup>2</sup>C module attempts to change its value. If the sensed value is different than the value the I<sup>2</sup>C module tried to output, it is interpreted as a simultaneous transmission by another device, and that the I<sup>2</sup>C module has lost arbitration.

Whenever arbitration is lost, the ARBLOST interrupt flag in I2C\_IF is set, any lines held are released, and the I<sup>2</sup>C device goes idle. If an I<sup>2</sup>C leader loses arbitration during the transmission of an address, another leader may be trying to address it. The leader therefore receives the rest of the address, and if the address matches the follower address of the leader, the leader goes into either follower transmitter or follower receiver mode.

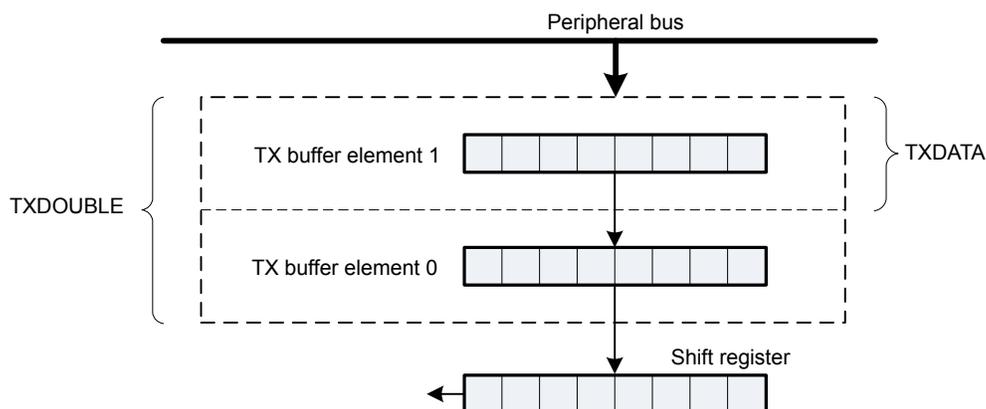

**Note:**

Arbitration can be lost both when operating as a leader and when operating as a follower.

### 22.3.7 Buffers

### 22.3.7.1 Transmit Buffer and Shift Register

The I<sup>2</sup>C transmitter has a 2-level FIFO transmit buffer and a transmit shift register as shown in [Figure 22.1 I2C Overview on page 692](#). A byte is loaded into the transmit buffer by writing to I2C\_TXDATA or 2 bytes can be loaded simultaneously in the transmit buffer by writing to I2C\_TXDOUBLE. [Figure 22.14 I2C Transmit Buffer Operation on page 699](#) shows the basics of the transmit buffer. When the transmit shift register is empty and ready for new data, the byte from the transmit buffer is then loaded into the shift register. The byte is then kept in the shift register until it is transmitted. When a byte has been transmitted, a new byte is loaded into the shift register (if available in the transmit buffer). If the transmit buffer is empty, then the shift register also remains empty. The TXC flag in I2C\_STATUS and the TXC interrupt flags in I2C\_IF are then set, signaling that the transmit shift register is out of data. TXC is cleared when new data becomes available, but the TXC interrupt flag must be cleared by software.

**Figure 22.14. I2C Transmit Buffer Operation**

The TXBL flags in I2C\_STATUS and I2C\_IF are used to indicate the level of the transmit buffer. The TXBIL bit in I2C\_CTRL controls the level at which these flag bits are set:

- If TXBIL is cleared, the TXBL flags are set whenever the transmit buffer becomes empty (used when transmitting using I2C\_TXDOUBLE).
- If TXBIL is set, the TXBL flags are set whenever the transmit buffer goes from full to half-empty or empty (used when transmitting with I2C\_TXDATA).

The TXBL status flag in I2C\_STATUS is cleared automatically when the condition becomes false. After the transmit FIFOs are filled, software needs to manually clear the TXBL interrupt flag. Note that the TXBL interrupt flag is 0 by default, but immediately after software sets I2C\_EN.EN = 1, the TXBL interrupt flag will be set to indicate the transmit FIFO is empty. When the I<sup>2</sup>C module is disabled (I2C\_EN.EN= 0), software needs to manually clear the TXBL interrupt flag (or ignore it).

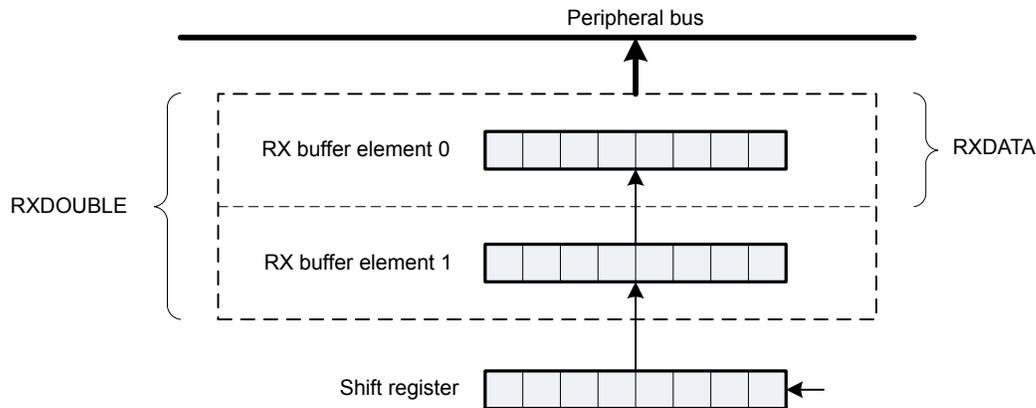

Additionally, the TXBUFCNT bitfield in I2C\_STATUS can be read to determine the exact number of transmit buffers filled with valid data. This is particularly useful for determining whether the transmit buffers are full. For example, if TXBUFCNT = '2', firmware can determine that both transmit buffers are filled, and that any additional data written to the transmit buffer would result in an overflow condition. Note that the TXBUFCNT count does not include the TX shift register.

If an attempt is made to write more bytes to the transmit buffer than the space available, the TXOF interrupt flag in I2C\_IF is set, indicating the overflow. The data already in the buffer remains preserved, and no new data is written.

The transmit buffer and the transmit shift register can be cleared by setting command bit CLEAR\_TX in I2C\_CMD. This will prevent the I<sup>2</sup>C module from transmitting the data in the buffer and the shift register, and will make them available for new data. Any byte currently being transmitted will not be aborted. Transmission of this byte will be completed.

### 22.3.7.2 Receive Buffer and Shift Register

The I<sup>2</sup>C receiver uses a 2-level FIFO receive buffer and a receive shift register as shown in [Figure 22.15 I2C Receive Buffer Operation on page 700](#). When a byte has been fully received by the receive shift register, it is loaded into the receive buffer if there is room for it, making the shift register empty to receive another byte. Otherwise, the byte waits in the shift register until space becomes available in the buffer.

**Figure 22.15. I2C Receive Buffer Operation**

When a byte becomes available in the receive buffer, the RXDATAV flags in I2C\_STATUS and I2C\_IF are set. When the buffer becomes full, the RXFULL flags in I2C\_STATUS and I2C\_IF are set. The RXDATAV and RXFULL flags in I2C\_STATUS are automatically cleared by hardware when their condition is no longer true. The RXDATAV and RXFULL flags in I2C\_IF must be manually cleared by software after the receive FIFO is emptied. Note that when the RXFULL flag is set, indicating the buffer is full, space is still available in the receive shift register for one more byte.

The data can be fetched from the buffer in two ways. I2C\_RXDATA gives access to the received byte (if two bytes are received then the one received first is fetched first). I2C\_RXDOUBLE makes it possible to read the two received bytes simultaneously. If an attempt is made to read more bytes from the buffer than available, the RXUF interrupt flag in I2C\_IF is set to signal the underflow, and the data read from the buffer is undefined.

When using I2C\_RXDOUBLE to pick data, AUTOACK in I2C\_CTRL should be set to 1. This ensures that an ACK is automatically sent out after the first byte is received so that the reception of the next byte can begin. In order to stop receiving data bytes, a NACK must be sent out through the I2C\_CMD register.

I2C\_RXDATAP and I2C\_RXDOUBLEP can be used to read data from the receive buffer without removing it from the buffer. The RXUF interrupt flag in I2C\_IF will never be set as a result of reading from I2C\_RXDATAP and I2C\_RXDOUBLEP, but the data read through I2C\_RXDATAP when the receive buffer is empty is still undefined.

Once a transaction is complete (STOP sent or received), the receive buffer needs to be flushed (all received data must be read) before starting a new transaction.

### 22.3.8 Leader Operation

A bus transaction is initiated by transmitting a START condition (S) on the bus. This is done by setting the START bit in I2C\_CMD. The command schedules a START condition, and makes the I<sup>2</sup>C module generate a start condition whenever the bus becomes free.

The I<sup>2</sup>C-bus is considered busy whenever another device on the bus transmits a START condition. Until a STOP condition is detected, the bus is owned by the leader issuing the START condition. The bus is considered free when a STOP condition is transmitted on the bus. After a STOP is detected, all leaders that have data to transmit send a START condition and begin transmitting data. Arbitration ensures that collisions are avoided.

When the START condition has been transmitted, the leader must transmit a follower address (ADDR) with an R/W bit on the bus. If this address is available in the transmit buffer, the leader transmits it immediately, but if the buffer is empty, the leader holds the I<sup>2</sup>C-bus while waiting for software to write the address to the transmit buffer.

After the address has been transmitted, a sequence of bytes can be read from or written to the follower, depending on the value of the R/W bit (bit 0 in the address byte). If the bit was cleared, the leader has entered a leader transmitter role, where it now transmits data to the follower. If the bit was set, it has entered a leader receiver role, where it now should receive data from the follower. In either case, an unlimited number of bytes can be transferred in one direction during the transmission.

At the end of the transmission, the leader either transmits a repeated START condition (Sr) if it wishes to continue with another transfer, or transmits a STOP condition (P) if it wishes to release the bus. When operating in the leader mode, I2CCLK frequency must be higher than 2 MHz for Standard-mode, 9 MHz for Fast-mode, and 20 MHz for Fast-mode Plus.

### 22.3.8.1 Leader State Machine

The leader state machine is shown in [Figure 22.16 I2C Leader State Machine on page 702](#). A leader operation starts in the far left of the state machine, and follows the solid lines through the state machine, ending the operation or continuing with a new operation when arriving at the right side of the state machine.

Branches in the path through the state machine are the results of bus events and choices made by software, either directly or indirectly. The dotted lines show where I<sup>2</sup>C-specific interrupt flags are set along the path and the full-drawn circles show places where interaction may be required by software to let the transmission proceed.

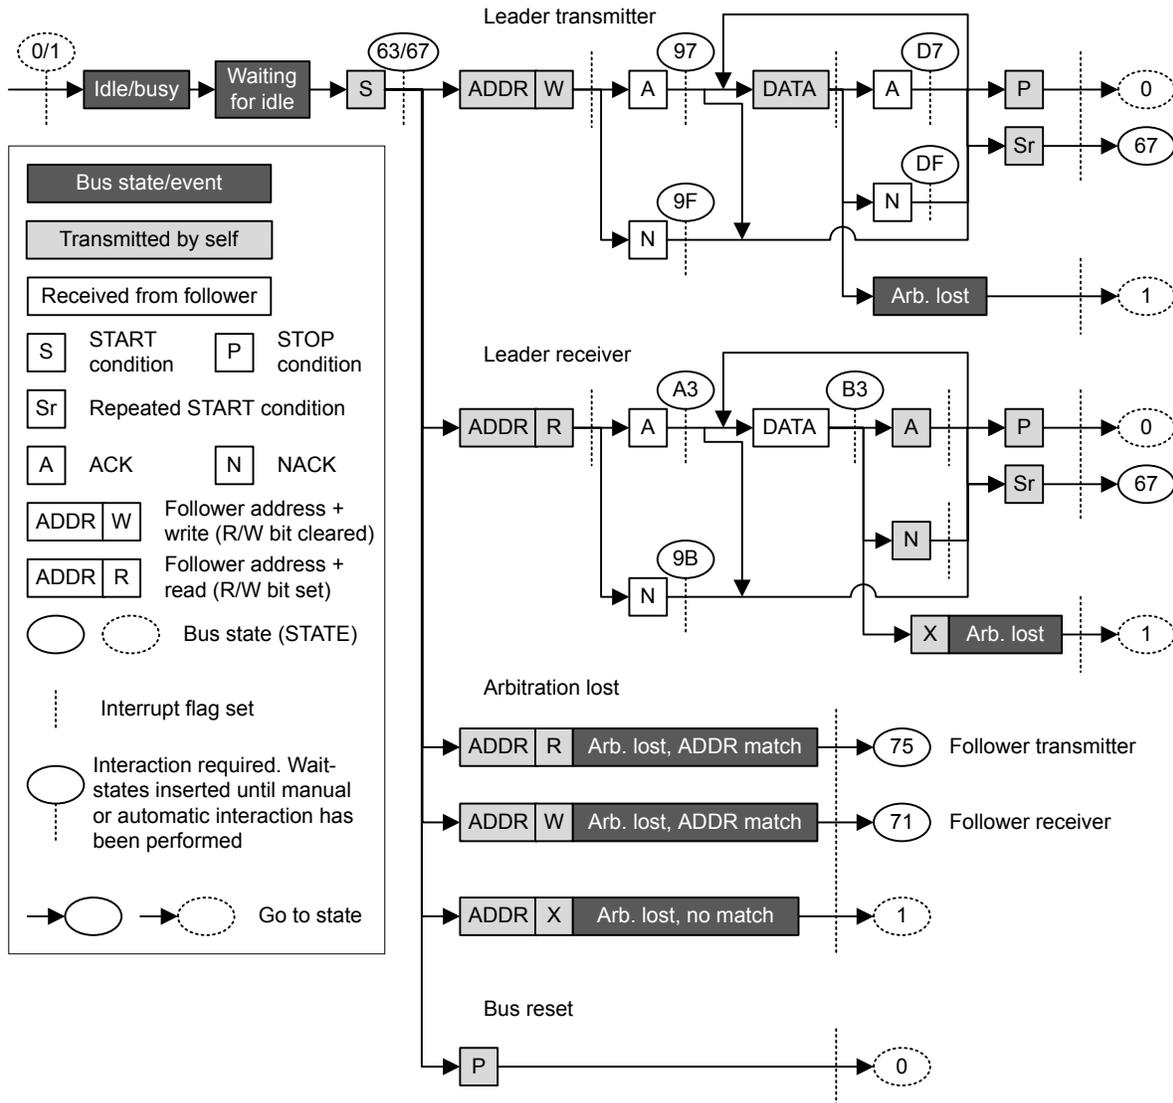

Figure 22.16. I2C Leader State Machine

### 22.3.8.2 Interactions

Whenever the I<sup>2</sup>C module is waiting for interaction from software, it holds the bus clock SCL low, freezing all bus activities, and the BUSHOLD interrupt flag in I2C\_IF is set. The action(s) required by software depends on the current state the of the I<sup>2</sup>C module. This state can be read from the I2C\_STATE register.

As an example, [Table 22.3 I2C Leader Transmitter on page 705](#) shows the different states the I<sup>2</sup>C goes through when operating as a Leader Transmitter, i.e., a leader that transmits data to a follower. As seen in the table, when a start condition has been transmitted, a requirement is that there is an address and an R/W bit in the transmit buffer. If the transmit buffer is empty, then the BUSHOLD interrupt flag is set, and the bus is held until data becomes available in the buffer. While waiting for the address, I2C\_STATE has a value 0x67, which can be used to identify exactly what the I<sup>2</sup>C module is waiting for.

**Note:** The bus would never stop at state 0x67 if the address was available in the transmit buffer.

The BUSHOLD interrupt flag needs to be manually cleared by software after the appropriate action has been taken.

The different interactions used by the I<sup>2</sup>C module are listed in [Table 22.2 I2C Interactions in Prioritized Order on page 703](#) in a prioritized order. If the I<sup>2</sup>C module is in such a state that multiple courses of action are possible, then the action chosen is the one that has the highest priority. For example, after sending out a START, if an address is present in the buffer and a STOP is also pending, then the I<sup>2</sup>C will send out the STOP since it has the higher priority.

**Table 22.2. I2C Interactions in Prioritized Order**

Interaction	Priority	Software action	Automatically continues if
STOP*	1	Set the STOP command bit in I2C_CMD	PSTOP is set (STOP pending) in I2C_STATUS
ABORT	2	Set the ABORT command bit in I2C_CMD	Never, the transmission is aborted
CONT*	3	Set the CONT command bit in I2C_CMD	PCONT is set in I2C_STATUS (CONT pending)
NACK*	4	Set the NACK command bit in I2C_CMD	PNACK is set in I2C_STATUS (NACK pending)
ACK*	5	Set the ACK command bit in I2C_CMD	AUTOACK is set in I2C_CTRL or PACK is set in I2C_STATUS (ACK pending)
ADDR+W -> TXDATA	6	Write an address to the transmit buffer with the R/W bit set	Address is available in transmit buffer with R/W bit set
ADDR+R -> TXDATA	7	Write an address to the transmit buffer with the R/W bit cleared	Address is available in transmit buffer with R/W bit cleared
START*	8	Set the START command bit in I2C_CMD	PSTART is set in I2C_STATUS (START pending)
TXDATA/ TXDOUBLE	9	Write data to the transmit buffer	Data is available in transmit buffer
RXDATA/ RXDOUBLE	10	Read data from receive buffer	Space is available in receive buffer
None	11	No interaction is required	

The commands marked with a \* in [Table 22.2 I2C Interactions in Prioritized Order on page 703](#) can be issued before an interaction is required. When such a command is issued before it can be used/consumed by the I<sup>2</sup>C module, the command is set in a pending state, which can be read from the STATUS register. A pending START command can for instance be identified by PSTART having a high value.

Whenever the I<sup>2</sup>C module requires an interaction, it checks the pending commands. If one or a combination of these can fulfill an interaction, they are consumed by the module and the transmission continues without setting the BUSHOLD interrupt flag in I2C\_IF to get an interaction from software. The pending status of a command goes low when it is consumed.

When several interactions are possible from a set of pending commands, the interaction with the highest priority, i.e., the interaction closest to the top of [Table 22.2 I2C Interactions in Prioritized Order on page 703](#) is applied to the bus.

Pending commands can be cleared by setting the CLEARPC command bit in I2C\_CMD.

### 22.3.8.3 Automatic ACK Interaction

When receiving addresses and data, an ACK command in I2C\_CMD is normally required after each received byte. When AUTOACK is set in I2C\_CTRL, an ACK is always pending, and the ACK-pending bit PACK in I2C\_STATUS is thus always set, even after an ACK has been consumed. This is used when data is picked using I2C\_RXDOUBLE and can also be used with I2C\_RXDATA in order to reduce the amount of software interaction required during a transfer.

### 22.3.8.4 Reset State

After a reset, the state of the I<sup>2</sup>C-bus is unknown. To avoid interrupting transfers on the I<sup>2</sup>C-bus after a reset of the I<sup>2</sup>C module or the entire MCU, the I<sup>2</sup>C-bus is assumed to be busy when coming out of a reset, and the BUSY flag in I2C\_STATUS is thus set. To be able to carry through leader operations on the I<sup>2</sup>C-bus, the bus must be idle.

The bus goes idle when a STOP condition is detected on the bus, but on buses with little activity, the time before the I<sup>2</sup>C module detects that the bus is idle can be significant. There are two ways of assuring that the I<sup>2</sup>C module gets out of the busy state.

- Use the ABORT command in I2C\_CMD. When the ABORT command is issued, the I<sup>2</sup>C module is instructed that the bus is idle. The I<sup>2</sup>C module can then initiate leader operations.
- Use the Bus Idle Timeout. When SCL has been high for a long period of time, it is very likely that the bus is idle. Set BITO in I2C\_CTRL to an appropriate timeout period and set GIBITO in I2C\_CTRL. If activity has not been detected on the bus within the timeout period, the bus is then automatically assumed idle, and leader operations can be initiated.

**Note:** If operating in follower mode, the above approach is not necessary.

### 22.3.8.5 Leader Transmitter

To transmit data to a follower, the leader must operate as a leader transmitter. [Table 22.3 I2C Leader Transmitter on page 705](#) shows the states the I<sup>2</sup>C module goes through while acting as a leader transmitter. Every state where an interaction is required has the possible interactions listed, along with the result of the interactions. The table also shows which interrupt flags are set in the different states. The interrupt flags enclosed in parenthesis may be set. If the BUSHOLD interrupt in I2C\_IF is set, the module is waiting for an interaction, and the bus is frozen. The value of I2C\_STATE will be equal to the values given in the table when the BUSHOLD interrupt flag is set, and can be used to determine which interaction is required to make the transmission continue.

The interrupt flag START in I2C\_IF is set when the I<sup>2</sup>C module transmits the START.

A leader operation is started by issuing a START command by setting START in I2C\_CMD. ADDR+W, i.e., the address of the follower + the R/W bit is then required by the I<sup>2</sup>C module. If this is not available in the transmit buffer, then the bus is held and the BUSHOLD interrupt flag is set. The value of I2C\_STATE will then be 0x67. As seen in the table, the I<sup>2</sup>C module also stops in this state if the address is not available after a repeated start condition.

To continue, write a byte to I2C\_TXDATA with the address of the follower in the 7 most significant bits and the least significant bit cleared (ADDR+W). This address will then be transmitted, and the follower will reply with an ACK or a NACK. If no follower replies to the address, the response will also be NACK. If the address was acknowledged, the leader now has four choices. It can send data by placing it in I2C\_TXDATA/ I2C\_TXDOUBLE (the leader should check the TXBL interrupt flag before writing to the transmit buffer), this data is then transmitted. The leader can also stop the transmission by sending a STOP, it can send a repeated start by sending START, or it can send a STOP and then a START as soon as possible. If the leader wishes to make another transfer immediately after the current, the preferred way is to start a new transfer directly by transmitting a repeated START instead of a STOP followed by a START. This is so because if a STOP is sent out, then any leader wishing to initiate a transfer on the bus can try to gain control of it.

If a NACK was received, the leader has to issue a CONT command in addition to providing data in order to continue transmission. This is not standard I<sup>2</sup>C, but is provided for flexibility. The rest of the options are similar to when an ACK was received.

If a new byte was transmitted, an ACK or NACK is received after the transmission of the byte, and the leader has the same options as for when the address was sent.

The leader may lose arbitration at any time during transmission. In this case, the ARBLOST interrupt flag in I2C\_IF is set. If the arbitration was lost during the transfer of an address, and SLAVE in I2C\_CTRL is set, the leader then checks which address was transmitted. If it was the address of the leader, then the leader goes to follower mode.

After a leader has transmitted a START and won any arbitration, it owns the bus until it transmits a STOP. After a STOP, the bus is released, and arbitration decides which bus leader gains the bus next. The MSTOP interrupt flag in I2C\_IF is set when a STOP condition is transmitted by the leader.

**Table 22.3. I2C Leader Transmitter**

I2C_STATE	Description	I2C_IF	Required interaction	Response
0x67	Start transmitted	START interrupt flag (BUSHOLD interrupt flag)	ADDR+W -> TXDATA	ADDR+W will be sent
			STOP	STOP will be sent and bus released.
			STOP + START	STOP will be sent and bus released. Then a START will be sent when bus becomes idle.
0x67	Repeated start transmitted	START interrupt flag (BUSHOLD interrupt flag)	ADDR+W -> TXDATA	ADDR+W will be sent
			STOP	STOP will be sent and bus released.
			STOP + START	STOP will be sent and bus released. Then a START will be sent when bus becomes idle.
-	ADDR+W transmitted	TXBL interrupt flag (TXC interrupt flag)	None	

I2C_STATE	Description	I2C_IF	Required interaction	Response
0x97	ADDR+W transmitted, ACK received	ACK interrupt flag (BUSHOLD interrupt flag)	TXDATA	DATA will be sent
			STOP	STOP will be sent. Bus will be released
			START	Repeated start condition will be sent
			STOP + START	STOP will be sent and the bus released. Then a START will be sent when the bus becomes idle
0x9F	ADDR+W transmitted, NACK received	NACK (BUSHOLD interrupt flag)	CONT + TXDATA	DATA will be sent
			STOP	STOP will be sent. Bus will be released
			START	Repeated start condition will be sent
			STOP + START	STOP will be sent and the bus released. Then a START will be sent when the bus becomes idle
-	Data transmitted	TXBL interrupt flag (TXC interrupt flag)	None	
0xD7	Data transmitted, ACK received	ACK interrupt flag (BUSHOLD interrupt flag)	TXDATA	DATA will be sent
			STOP	STOP will be sent. Bus will be released
			START	Repeated start condition will be sent
			STOP + START	STOP will be sent and the bus released. Then a START will be sent when the bus becomes idle
0xDF	Data transmitted, NACK received	NACK (BUSHOLD interrupt flag)	CONT + TXDATA	DATA will be sent
			STOP	STOP will be sent. Bus will be released
			START	Repeated start condition will be sent
			STOP + START	STOP will be sent and the bus released. Then a START will be sent when the bus becomes idle
-	Stop transmitted	MSTOP interrupt flag	None	
			START	START will be sent when bus becomes idle
-	Arbitration lost	ARBLOST interrupt flag	None	
			START	START will be sent when bus becomes idle

### 22.3.8.6 Leader Receiver

To receive data from a follower, the leader must operate as a leader receiver, see [Table 22.4 I2C Leader Receiver on page 707](#). This is done by transmitting ADDR+R as the address byte instead of ADDR+W, which is transmitted to become a leader transmitter. The address byte loaded into the data register thus has to contain the 7-bit follower address in the 7 most significant bits of the byte, and have the least significant bit set.

When the address has been transmitted, the leader receives an ACK or a NACK. If an ACK is received, the ACK interrupt flag in I2C\_IF is set, and if space is available in the receive shift register, reception of a byte from the follower begins. If the receive buffer and shift register is full however, the bus is held until data is read from the receive buffer or another interaction is made. Note that the STOP and START interactions have a higher priority than the data-available interaction, so if a STOP or START command is pending, the highest priority interaction will be performed, and data will not be received from the follower.

If a NACK was received, the CONT command in I2C\_CMD has to be issued in order to continue receiving data, even if there is space available in the receive buffer and/or shift register.

After a data byte has been received the leader must ACK or NACK the received byte. If an ACK is pending or AUTOACK in I2C\_CTRL is set, an ACK is sent automatically and reception continues if space is available in the receive buffer.

If a NACK is sent, the CONT command must be used in order to continue transmission. If an ACK or NACK is issued along with a START or STOP or both, then the ACK/NACK is transmitted and the reception is ended. If START in I2C\_CMD is set alone, a repeated start condition is transmitted after the ACK/NACK. If STOP in I2C\_CMD is set, a stop condition is sent regardless of whether START is set. If START is set in this case, it is set as pending.

As when operating as a leader transmitter, arbitration can be lost as a leader receiver. When this happens the ARBLOST interrupt flag in I2C\_IF is set, and the leader has a possibility of being selected as a follower given the correct conditions.

**Table 22.4. I2C Leader Receiver**

I2C_STATE	Description	I2C_IF	Required interaction	Response
0x63	START transmitted	START interrupt flag (BUSHOLD interrupt flag)	ADDR+R -> TXDATA	ADDR+R will be sent
			STOP	STOP will be sent and bus released.
			STOP + START	STOP will be sent and bus released. Then a START will be sent when bus becomes idle.
0x67	Repeated START transmitted	START interrupt flag(BUSHOLD interrupt flag)	ADDR+R -> TXDATA	ADDR+R will be sent
			STOP	STOP will be sent and bus released.
			STOP + START	STOP will be sent and bus released. Then a START will be sent when bus becomes idle.
-	ADDR+R transmitted	TXBL interrupt flag (TXC interrupt flag)	None	
0xA3	ADDR+R transmitted, ACK received	ACK interrupt flag(BUSHOLD)	RXDATA	Start receiving
			STOP	STOP will be sent and the bus released
			START	Repeated START will be sent
			STOP + START	STOP will be sent and the bus released. Then a START will be sent when the bus becomes idle
0x9B	ADDR+R transmitted, NACK received	NACK(BUSHOLD)	CONT + RXDATA	Continue, start receiving
			STOP	STOP will be sent and the bus released
			START	Repeated START will be sent
			STOP + START	STOP will be sent and the bus released. Then a START will be sent when the bus becomes idle

I2C_STATE	Description	I2C_IF	Required interaction	Response
0xB3	Data received	RXDATA interrupt flag(BUSHOLD interrupt flag)	ACK + RXDATA	ACK will be transmitted, reception continues
			NACK + CONT + RXDATA	NACK will be transmitted, reception continues
			ACK/NACK + STOP	ACK/NACK will be sent and the bus will be released.
			ACK/NACK + START	ACK/NACK will be sent, and then a repeated start condition.
			ACK/NACK + STOP + START	ACK/NACK will be sent and the bus will be released. Then a START will be sent when the bus becomes idle
-	Stop received	MSTOP interrupt flag	None	
			START	START will be sent when bus becomes idle
-	Arbitration lost	ARBLOST interrupt flag	None	
			START	START will be sent when bus becomes idle

#### 22.3.8.7 SDA/SCL Status Monitor

The I<sup>2</sup>C module supports an SDA and SCL monitoring function. Note that this functionality is only supported when the I2C module is in single leader mode, and when the follower doesn't use clock stretching. Additionally, firmware should set the ARBDIS bit in I2C\_CTRL when using the SDA/SCL monitoring to prevent the bus being released.

The SDA monitor is enabled by setting the SDAMONEN in I2C\_CTRL. Once enabled, the SDA monitor will check the status of the SDA line at the following points:

- At a Start Condition, before SDA falls
- At Stop Condition, after SDA rises

After checking, the monitor will set the SDAERR flag in I2C\_IF if it fails to read SDA==1. To allow the SDAERR flag to generate an IRQ, set the SDAERR bit in I2C\_IEN.

Similarly, the SCL monitor is enabled by setting the SCLMONEN in I2C\_CTRL. Once enabled, the SCL monitor will check the status of the SCL line at the following points:

- At a Start Condition, before SCL falls
- At every clock cycle, before SCL falls
- At Stop Condition, after SCL rises

After checking, the monitor will set the SCLERR flag in I2C\_IF if it fails to read SCL==1. To allow the SCLERR flag to generate an IRQ, set the SCLERR bit in I2C\_IEN.

### 22.3.9 Bus States

The I<sup>2</sup>C\_STATE register can be used to determine which state the I<sup>2</sup>C module and the I<sup>2</sup>C bus are in at a given time. The register consists of the STATE bit-field, which shows which state the I<sup>2</sup>C module is at in any ongoing transmission, and a set of single-bits, which reveal the transmission mode, whether the bus is busy or idle, and whether the bus is held by this I<sup>2</sup>C module waiting for a software response.

The possible values of the STATE field are summarized in [Table 22.5 I<sup>2</sup>C STATE Values on page 709](#). When this field is cleared, the I<sup>2</sup>C module is not a part of any ongoing transmission. The remaining status bits in the I<sup>2</sup>C\_STATE register are listed in [Table 22.6 I<sup>2</sup>C Transmission Status on page 709](#).

**Table 22.5. I<sup>2</sup>C STATE Values**

Mode	Value	Description
IDLE	0	No transmission is being performed by this module.
WAIT	1	Waiting for idle. Will send a start condition as soon as the bus is idle.
START	2	Start transmit phase
ADDR	3	Address transmit or receive phase
ADDRACK	4	Address ACK/NACK transmit or receive phase
DATA	5	Data transmit or receive phase
DATAACK	6	Data ACK/NACK transmit or receive phase

**Table 22.6. I<sup>2</sup>C Transmission Status**

Bit	Description
BUSY	Set whenever there is activity on the bus. Whether or not this module is responsible for the activity cannot be determined by this byte.
MASTER	Set when operating as a leader. Cleared at all other times.
TRANSMITTER	Set when operating as a transmitter; either a leader transmitter or a follower transmitter. Cleared at all other times
BUSHOLD	Set when the bus is held by this I <sup>2</sup> C module because an action is required by software.
NACK	Only valid when bus is held and STATE is ADDRACK or DATAACK. In that case it is set if a NACK was received. In all other cases, the bit is cleared.

**Note:** I<sup>2</sup>C\_STATE reflects the internal state of the I<sup>2</sup>C module, and therefore only held constant as long as the bus is held, i.e., as long as BUSHOLD in I<sup>2</sup>C\_STATUS is set.

### 22.3.10 Follower Operation

The I<sup>2</sup>C module operates in leader mode by default. To enable follower operation, i.e., to allow the device to be addressed as an I<sup>2</sup>C follower, the SLAVE bit in I<sup>2</sup>C\_CTRL must be set. In this case the I<sup>2</sup>C module operates in a mixed mode, both capable of starting transmissions as a leader, and being addressed as a follower. When operating in the follower mode, I<sup>2</sup>CCLK frequency must be higher than 2 MHz for Standard-mode, 5 MHz for Fast-mode, and 14 MHz for Fast-mode Plus.

### 22.3.10.1 Follower State Machine

The follower state machine is shown in [Figure 22.17 I<sup>2</sup>C Follower State Machine on page 710](#). The dotted lines show where I<sup>2</sup>C-specific interrupt flags are set. The full-drawn circles show places where interaction may be required by software to let the transmission proceed.

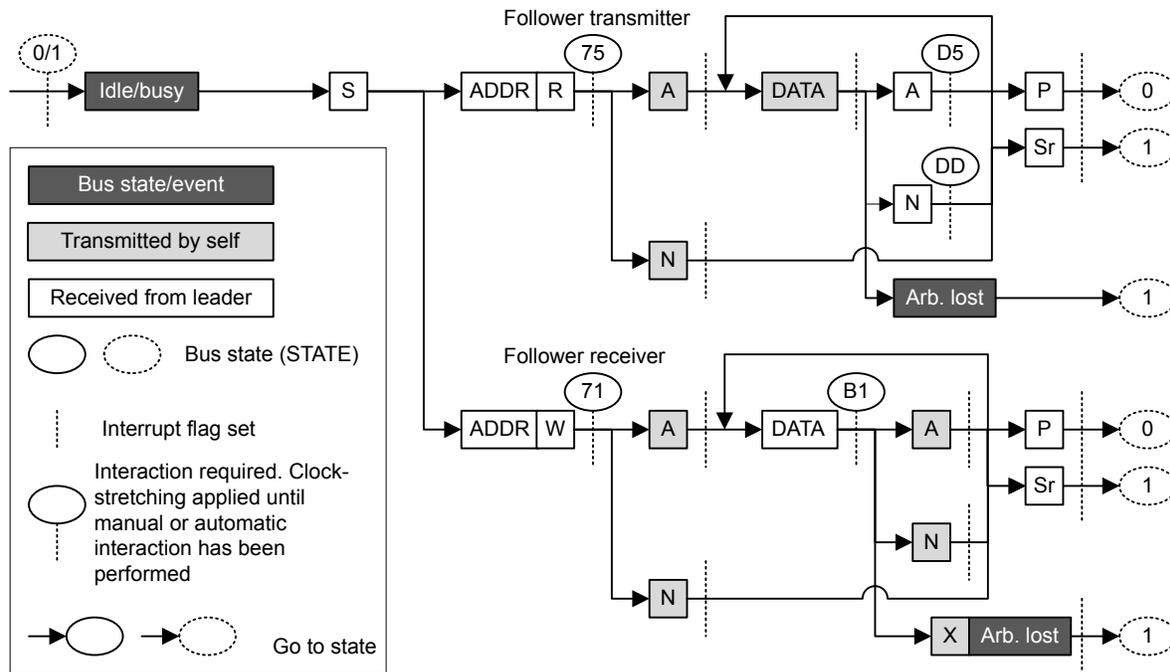

Figure 22.17. I<sup>2</sup>C Follower State Machine

### 22.3.10.2 Address Recognition

The I<sup>2</sup>C module provides automatic address recognition for 7-bit addresses. 10-bit address recognition is not fully automatic, but can be assisted by the 7-bit address comparator as shown in [22.3.12 Using 10-bit Addresses](#). Address recognition is supported in EM2/3 for I2C0 - however, the I2C0 module must be configured to use pins on either Port A or B if wakeup on address recognition from EM2/3 is desired. All other ports are available only in EM0/1. See GPIO chapter for more details.

The follower address, i.e., the address which the I<sup>2</sup>C module should be addressed with, is defined in the I2C\_SADDR register. In addition to the address, a mask must be specified, telling the address comparator which bits of an incoming address to compare with the address defined in I2C\_SADDR. The mask is defined in I2C\_SADDRMASK, and for every zero in the mask, the corresponding bit in the follower address is treated as a don't-care, i.e., the 0-masked bits are ignored.

An incoming address that fails address recognition is automatically replied to with a NACK. Since only the bits defined by the mask are checked, a mask with a value 0x00 will result in all addresses being accepted. A mask with a value 0x7F will only match the exact address defined in I2C\_SADDR, while a mask 0x70 will match all addresses where the three most significant bits in I2C\_SADDR and the incoming address are equal.

If GCAMEN in I2C\_CTRL is not set, the start-byte, i.e., the general call address with the R/W bit set is ignored unless it is included in the defined follower address and the address mask.

When an address is accepted by the address comparator, the decision of whether to ACK or NACK the address is passed to software.

### 22.3.10.3 Follower Transmitter

When SLAVE in I2C\_CTRL is set, the RSTART interrupt flag in I2C\_IF will be set when repeated START conditions are detected. After a START or repeated START condition, the bus leader will transmit an address along with an R/W bit. If there is no room in the receive shift register for the address, the bus will be held by the follower until room is available in the shift register. Transmission then continues and the address is loaded into the shift register. If this address does not pass address recognition, it is automatically NACK'ed by the follower, and the follower goes to an idle state. The address byte is in this case discarded, making the shift register ready for a new address. It is not loaded into the receive buffer.

If the address was accepted and the R/W bit was set (R), indicating that the leader wishes to read from the follower, the follower now goes into the follower transmitter mode. Software interaction is now required to decide whether the follower wants to acknowledge the request or not. The accepted address byte is loaded into the receive buffer like a regular data byte. If no valid interaction is pending, the bus is held until the follower responds with a command. The follower can reject the request with a single NACK command.

The follower will in that case go to an idle state, and wait for the next start condition. To continue the transmission, the follower must make sure data is loaded into the transmit buffer and send an ACK. The loaded data will then be transmitted to the leader, and an ACK or NACK will be received from the leader.

Data transmission can also continue after a NACK if a CONT command is issued along with the NACK. This is not standard I<sup>2</sup>C however.

If the leader responds with an ACK, it may expect another byte of data, and data should be made available in the transmit buffer. If data is not available, the bus is held until data is available.

If the response is a NACK however, this is an indication of that the leader has received enough bytes and wishes to end the transmission. The follower now automatically goes idle, unless CONT in I2C\_CMD is set and data is available for transmission. The latter is not standard I<sup>2</sup>C.

The leader ends the transmission by sending a STOP or a repeated START. The SSTOP interrupt flag in I2C\_IF is set when the leader transmits a STOP condition. If the transmission is ended with a repeated START, then the SSTOP interrupt flag is not set.

**Note:** The SSTOP interrupt flag in I2C\_IF will be set regardless of whether the follower is participating in the transmission or not, as long as SLAVE in I2C\_CTRL is set and a STOP condition is detected

If arbitration is lost at any time during transmission, the ARBLOST interrupt flag in I2C\_IF is set, the bus is released and the follower goes idle.

See [Table 22.7 I2C Follower Transmitter on page 711](#) for more information.

**Table 22.7. I2C Follower Transmitter**

I2C_STATE	Description	I2C_IF	Required interaction	Response
0x01	Repeated START received	RSTART interrupt flag (BUSHOLD interrupt flag)	RXDATA	Receive and compare address
0x75	ADDR + R received	ADDR interrupt flag	ACK + TXDATA	ACK will be sent, then DATA
		RXDATA interrupt flag	NACK	NACK will be sent, follower goes idle
		(BUSHOLD interrupt flag)	NACK + CONT + TXDATA	NACK will be sent, then DATA.
-	Data transmitted	TXBL interrupt flag (TXC interrupt flag)	None	
0xD5	Data transmitted, ACK received	ACK interrupt flag (BUSHOLD interrupt flag)	TXDATA	DATA will be transmitted
0xDD	Data transmitted, NACK received	NACK interrupt flag	None	The follower goes idle
		(BUSHOLD interrupt flag)	CONT + TXDATA	DATA will be transmitted

I2C_STATE	Description	I2C_IF	Required interaction	Response
-	Stop received	SSTOP interrupt flag	None	The follower goes idle
			START	START will be sent when bus becomes idle
-	Arbitration lost	ARBLOST interrupt flag	None	The follower goes idle
			START	START will be sent when the bus becomes idle

### 22.3.10.4 Follower Receiver

A follower receiver operation is started in the same way as a follower transmitter operation, with the exception that the address transmitted by the leader has the R/W bit cleared (W), indicating that the leader wishes to write to the follower. The follower then goes into follower receiver mode.

To receive data from the leader, the follower should respond to the address with an ACK and make sure space is available in the receive buffer. Transmission will then continue, and the follower will receive a byte from the leader.

If a NACK is sent without a CONT, the transmission is ended for the follower, and it goes idle. If the follower issues both the NACK and CONT commands and has space available in the receive buffer, it will be open for continuing reception from the leader.

When a byte has been received from the leader, the follower must ACK or NACK the byte. The responses here are the same as for the reception of the address byte.

The leader ends the transmission by sending a STOP or a repeated START. The SSTOP interrupt flag is set when the leader transmits a STOP condition. If the transmission is ended with a repeated START, then the SSTOP interrupt flag in I2C\_IF is not set.

**Note:** The SSTOP interrupt flag in I2C\_IF will be set regardless of whether the follower is participating in the transmission or not, as long as SLAVE in I2C\_CTRL is set and a STOP condition is detected

If arbitration is lost at any time during transmission, the ARBLOST interrupt flag in I2C\_IF is set, the bus is released and the follower goes idle.

See [Table 22.8 I2C - Follower Receiver](#) on page 713 for more information.

**Table 22.8. I2C - Follower Receiver**

I2C_STATE	Description	I2C_IF	Required interaction	Response
0x01	Repeated START received	RSTART interrupt flag (BUSHOLD interrupt flag)	RXDATA	Receive and compare address
0x71	ADDR + W received	ADDR interrupt flag RXDATA interrupt flag (BUSHOLD interrupt flag)	ACK + RXDATA	ACK will be sent and data will be received
			NACK	NACK will be sent, follower goes idle
			NACK + CONT + RXDATA	NACK will be sent and DATA will be received.
0xB1	Data received	RXDATA interrupt flag (BUSHOLD interrupt flag)	ACK + RXDATA	ACK will be sent and data will be received
			NACK	NACK will be sent and follower will go idle
			NACK + CONT + RXDATA	NACK will be sent and data will be received
-	Stop received	SSTOP interrupt flag	None	The follower goes idle
			START	START will be sent when bus becomes idle
-	Arbitration lost	ARBLOST interrupt flag	None	The follower goes idle
			START	START will be sent when the bus becomes idle

### 22.3.11 Transfer Automation

The I<sup>2</sup>C can be set up to complete transfers with a minimal amount of interaction.

### 22.3.11.1 DMA

DMA can be used to automatically load data into the transmit buffer and load data out from the receive buffer. When using DMA, software is thus relieved of moving data to and from memory after each transferred byte.

### 22.3.11.2 Automatic ACK

When AUTOACK in I2C\_CTRL is set, an ACK is sent automatically whenever an ACK interaction is possible and no higher priority interactions are pending.

### 22.3.11.3 Automatic STOP

A STOP can be generated automatically on two conditions. These apply only to the leader transmitter.

If AUTOSN in I2C\_CTRL is set, the I<sup>2</sup>C module ends a transmission by transmitting a STOP condition when operating as a leader transmitter and a NACK is received.

If AUTOSE in I2C\_CTRL is set, the I<sup>2</sup>C module always ends a transmission when there is no more data in the transmit buffer. If data has been transmitted on the bus, the transmission is ended after the (N)ACK has been received by the follower. If a START is sent when no data is available in the transmit buffer and AUTOSE is set, then the STOP condition is sent immediately following the START. Software must thus make sure data is available in the transmit buffer before the START condition has been fully transmitted if data is to be transferred.

## 22.3.12 Using 10-bit Addresses

When using 10-bit addresses in follower mode, set the I2C\_SADDR register to 1111 0XX where XX are the two most significant bits of the 10-bit address, and set I2C\_SADDRMASK to 0xFF. Address matches will now be given on all 10-bit addresses where the two most significant bits are correct.

When receiving an address match, the follower must acknowledge the address and receive the first data byte. This byte contains the second part of the 10-bit address. If it matches the address of the follower, the follower should ACK the byte to continue the transmission, and if it does not match, the follower should NACK it.

When the leader is operating as a leader transmitter, the data bytes will follow after the second address byte. When the leader is operating as a leader receiver however, a repeated START condition is sent after the second address byte. The address sent after this repeated START is equal to the first of the address bytes transmitted previously, but now with the R/W byte set, and only the follower that found a match on the entire 10-bit address in the previous message should ACK this address. The repeated start should take the leader into a leader receiver mode, and after the single address byte sent this time around, the follower begins transmission to the leader.

## 22.3.13 Error Handling

**Note:** Some registers in the I<sup>2</sup>C module are considered static. This means that these need to be set before an I<sup>2</sup>C transaction starts and need to stay stable during the entire transaction.

Specifically:

- The GCAMEN and SLAVE fields in the I2C\_CTRL register
- The I2C\_SADDR register
- The GPIO\_I2Cn\_ROUTEEN, GPIO\_I2Cn\_SCLROUTE, and GPIO\_I2Cn\_SDARROUTE registers

### 22.3.13.1 ABORT Command

Some bus errors may require software intervention to be resolved. The I<sup>2</sup>C module provides an ABORT command, which can be set in I2C\_CMD, to help resolve bus errors.

When the bus for some reason is locked up and the I<sup>2</sup>C module is in the middle of a transmission it cannot get out of, or for some other reason the I<sup>2</sup>C wants to abort a transmission, the ABORT command can be used.

Setting the ABORT command will make the I<sup>2</sup>C module discard any data currently being transmitted or received, release the SDA and SCL lines and go to an idle mode. ABORT effectively makes the I<sup>2</sup>C module forget about any ongoing transfers.

### 22.3.13.2 Bus Reset

A bus reset can be performed by setting the START and STOP commands in I2C\_CMD while the transmit buffer is empty. A START condition will then be transmitted, immediately followed by a STOP condition. A bus reset can also be performed by transmitting a START command with the transmit buffer empty and AUTOSE set.

### 22.3.13.3 I2C-Bus Errors

An I<sup>2</sup>C-bus error occurs when a START or STOP condition is misplaced, which happens when the value on SDA changes while SCL is high during bit-transmission on the I<sup>2</sup>C-bus. If the I<sup>2</sup>C module is part of the current transmission when a bus error occurs, any data currently being transmitted or received is discarded, SDA and SCL are released, the BUSERR interrupt flag in I2C\_IF is set to indicate the error, and the module automatically takes a course of action as defined in [Table 22.9 I2C Bus Error Response on page 715](#).

**Table 22.9. I2C Bus Error Response**

	Misplaced START	Misplaced STOP
In a leader/follower operation	Treated as START. Receive address.	Go idle. Perform any pending actions.

### 22.3.13.4 Bus Lockup

A lockup occurs when a leader or follower on the I<sup>2</sup>C-bus has locked the SDA or SCL at a low value, preventing other devices from putting high values on the bus, and thus making communication on the bus impossible.

Many follower-only devices operating on an I<sup>2</sup>C-bus are not capable of driving SCL low, but in the rare case that SCL is stuck LOW, the advice is to apply a hardware reset signal to the followers on the bus. If this does not work, cycle the power to the devices in order to make them release SCL.

When SDA is stuck low and SCL is free, a leader should send 9 clock pulses on SCL while tristating the SDA. This procedure is performed in the GPIO module after clearing the GPIO\_I2Cn\_ROUTEEN register and disabling the I2C module. The device that held the bus low should release it sometime within those 9 clocks. If not, use the same approach as for when SCL is stuck, resetting and possibly cycling power to the followers.

Lockup of SDA can be detected by keeping count of the number of continuous arbitration losses during address transmission. If arbitration is also lost during the transmission of a general call address, i.e., during the transmission of the STOP condition, which should never happen during normal operation, this is a good indication of SDA lockup.

Detection of SCL lockups can be done using the timeout functionality defined in [22.3.13.6 Clock Low Timeout](#)

### 22.3.13.5 Bus Idle Timeout

When SCL has been high for a significant amount of time, this is a good indication of that the bus is idle. On an SMBus system, the bus is only allowed to be in this state for a maximum of 50  $\mu$ s before the bus is considered idle.

The bus idle timeout BITO in I2C\_CTRL can be used to detect situations where the bus goes idle in the middle of a transmission. The timeout can be configured in BITO, and when the bus has been idle for the given amount of time, the BITO interrupt flag in I2C\_IF is set. The bus can also be set idle automatically on a bus idle timeout. This is enabled by setting GIBITO in I2C\_CTRL.

When the bus idle timer times out, it wraps around and continues counting as long as its condition is true. If the bus is not set idle using GIBITO or the ABORT command in I2C\_CMD, this will result in periodic timeouts.

**Note:** This timeout will be generated even if SDA is held low.

The bus idle timeout is active as long as the bus is busy, i.e., BUSY in I2C\_STATUS is set. The timeout can be used to get the I<sup>2</sup>C module out of the busy-state it enters when reset, see [22.3.8.4 Reset State](#).

### 22.3.13.6 Clock Low Timeout

The clock timeout, which can be configured in CLTO in I2C\_CTRL, starts counting whenever SCL goes low, and times out if SCL does not go high within the configured timeout. A clock low timeout results in CLTOIF in I2C\_IF being set, allowing software to take action.

When the timer times out, it wraps around and continues counting as long as SCL is low. An SCL lockup will thus result in periodic clock low timeouts as long as SCL is low.

### 22.3.13.7 Clock Low Error

The I<sup>2</sup>C module can continue transmission in parallel with another device for the entire transaction, as long as the two communications are identical. A case may arise when (before an arbitration has been decided upon) the I<sup>2</sup>C module decides to send out a repeated START or a STOP condition while the other device is still sending data. In the I<sup>2</sup>C protocol specifications, such a combination results in an undefined condition. The I<sup>2</sup>C deals with this by generating a clock low error. This means that if the I<sup>2</sup>C is transmitting a repeated START or a STOP condition and another device (another leader or a misbehaving follower) pulls SCL low before the I<sup>2</sup>C sends out the START/STOP condition on SDA, a clock low error is generated. The CLERR interrupt flag is then set in the I2C\_IF register, any held lines are released and the I<sup>2</sup>C device goes to idle.

### 22.3.14 DMA Support

The I<sup>2</sup>C module has full DMA support. A request for the DMA controller to write to the I<sup>2</sup>C transmit buffer can come from TXBL (transmit buffer has room for more data). The DMA controller can write to the transmit buffer using the I2C\_TXDATA or the I2C\_TXDOUBLE register. DMA must be configured to transfer one byte of data when writing to the I2C\_TXDATA and configured for transferring two bytes of data when writing to the I2C\_TXDOUBLE.

A request for the DMA controller to read from the I<sup>2</sup>C receive buffer can come from RXDATAV (data available in the receive buffer). DMA must be configured to transfer one byte of data when reading from I2C\_RXDATA and configured for transferring two bytes of data when reading from I2C\_RXDOUBLE.

### 22.3.15 Interrupts

The interrupts generated by the I<sup>2</sup>C module are combined into one interrupt vector, I2C\_INT. If I<sup>2</sup>C interrupts are enabled, an interrupt will be made if one or more of the interrupt flags in I2C\_IF and their corresponding bits in I2C\_IEN are set.

### 22.3.16 Wake-up

The I<sup>2</sup>C receive section can be active all the way down to energy mode EM3 stop, and can wake up the CPU on address interrupt. All address match modes are supported.

## 22.4 I2C Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	I2C_IPVERSION	R	IP VERSION Register
0x004	I2C_EN	RW	Enable Register
0x008	I2C_CTRL	RW	Control Register
0x00C	I2C_CMD	W	Command Register

## 22.5 I2C Register Description

### 22.5.1 I2C\_IPVERSION - IP VERSION Register

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0
<b>Access</b>																																R
<b>Name</b>																																IPVERSION

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x0	R	<b>IP version ID</b>
The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.				

### 22.5.2 I2C\_EN - Enable Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0
<b>Access</b>																																RW
<b>Name</b>																																EN

Bit	Name	Reset	Access	Description
31:1	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
0	EN	0x0	RW	<b>module enable</b>
The ENABLE bit enables the module. Software should write to CONFIG type registers before setting the ENABLE bit. Software should write to SYNC type registers only after setting the ENABLE bit.				
Value		Mode		Description
0		DISABLE		Disable Peripheral Clock
1		ENABLE		Enable Peripheral Clock

## 22.5.3 I2C\_CTRL - Control Register

Offset	Bit Position																																									
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0										
<b>Reset</b>												0x0	0x0			0x0		0x0			0x0			0x0				0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0			
<b>Access</b>												RW	RW			RW		RW			RW				RW				RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW
<b>Name</b>												SDAMONEN	SCLMONEN			CLTO		GIBITO			BITO								CLHR	TXBIL	GCAMEN	ARBDIS	AUTOSN	AUTOSE	AUTOACK	SLAVE	CORERST					

Bit	Name	Reset	Access	Description
31:22	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
21	SDAMONEN	0x0	RW	<b>SDA Monitor Enable</b>  Set to enable SDA monitor feature. This will enable SDA rise check at loopback path. This monitor can not be enabled in Multi-Leader application
	Value	Mode	Description	
	0	DISABLE	Disable SDA Monitor	
	1	ENABLE	Enable SDA Monitor	
20	SCLMONEN	0x0	RW	<b>SCL Monitor Enable</b>  Set to enable SCL monitor feature. This will enable SCL rise check at loopback path. This monitor can not be enabled in Multi-Leader application
	Value	Mode	Description	
	0	DISABLE	Disable SCL monitor	
	1	ENABLE	Enable SCL monitor	
19	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
18:16	CLTO	0x0	RW	<b>Clock Low Timeout</b>  Use to generate a timeout when CLK has been low for the given amount of time. Wraps around and continues counting when the timeout is reached. The timeout value can be calculated by $\text{timeout} = \text{PCC}/(\text{F}_{\text{scl}} \times (\text{N}_{\text{low}} + \text{N}_{\text{high}}))$
	Value	Mode	Description	
	0	OFF	Timeout disabled	
	1	I2C40PCC	Timeout after 40 prescaled clock cycles. In standard mode at 100 kHz, this results in a 50us timeout.	
	2	I2C80PCC	Timeout after 80 prescaled clock cycles. In standard mode at 100 kHz, this results in a 100us timeout.	
	3	I2C160PCC	Timeout after 160 prescaled clock cycles. In standard mode at 100 kHz, this results in a 200us timeout.	
	4	I2C320PCC	Timeout after 320 prescaled clock cycles. In standard mode at 100 kHz, this results in a 400us timeout.	

Bit	Name	Reset	Access	Description
	5	I2C1024PCC		Timeout after 1024 prescaled clock cycles. In standard mode at 100 kHz, this results in a 1280us timeout.
15	GIBITO	0x0	RW	<b>Go Idle on Bus Idle Timeout</b> When set, the bus automatically goes idle on a bus idle timeout, allowing new transfers to be initiated.
	Value	Mode		Description
	0	DISABLE		A bus idle timeout has no effect on the bus state.
	1	ENABLE		A bus idle timeout tells the I2C module that the bus is idle, allowing new transfers to be initiated.
14	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
13:12	BITO	0x0	RW	<b>Bus Idle Timeout</b> Use to generate a timeout when SCL has been high for a given amount time between a START and STOP condition. When in a bus transaction, i.e. the BUSY flag is set, a timer is started whenever SCL goes high. When the timer reaches the value defined by BITO, it sets the BITO interrupt flag. The BITO interrupt flag will then be set periodically as long as SCL remains high. The bus idle timeout is active as long as BUSY is set. It is thus stopped automatically on a timeout if GIBITO is set. It is also stopped a STOP condition is detected and when the ABORT command is issued. The timeout is activated whenever the bus goes BUSY, i.e. a START condition is detected. The timeout value can be calculated by $\text{timeout} = \text{PCC}/(\text{Fsc} \times (\text{Nlow} + \text{Nhigh}))$
	Value	Mode		Description
	0	OFF		Timeout disabled
	1	I2C40PCC		Timeout after 40 prescaled clock cycles. In standard mode at 100 kHz, this results in a 50us timeout.
	2	I2C80PCC		Timeout after 80 prescaled clock cycles. In standard mode at 100 kHz, this results in a 100us timeout.
	3	I2C160PCC		Timeout after 160 prescaled clock cycles. In standard mode at 100 kHz, this results in a 200us timeout.
11:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9:8	CLHR	0x0	RW	<b>Clock Low High Ratio</b> Determines the values of (and ratio between) the low and high parts of the clock signal generated on SCL as leader.
	Value	Mode		Description
	0	STANDARD		Nlow=4 and Nhigh=4, and the Nlow:Nhigh ratio is 4:4
	1	ASYMMETRIC		Nlow=6 and Nhigh=3, and the Nlow:Nhigh ratio is 6:3
	2	FAST		Nlow=11 and Nhigh=6, and the Nlow:Nhigh ratio is 11:6
7	TXBIL	0x0	RW	<b>TX Buffer Interrupt Level</b> Determines the interrupt and status level of the transmit buffer.
	Value	Mode		Description
	0	EMPTY		TXBL status and the TXBL interrupt flag are set when the transmit buffer becomes empty. TXBL is cleared when the buffer becomes nonempty.

Bit	Name	Reset	Access	Description
	1	HALF_FULL		TXBL status and the TXBL interrupt flag are set when the transmit buffer goes from full to half-full or empty. TXBL is cleared when the buffer becomes full
6	GCAMEN	0x0	RW	<b>General Call Address Match Enable</b> Set to enable address match on general call in addition to the programmed follower address.
	Value	Mode		Description
	0	DISABLE		General call address will be NACK'ed if it is not included by the follower address and address mask.
	1	ENABLE		When a general call address is received, a software response is required
5	ARBDIS	0x0	RW	<b>Arbitration Disable</b> A leader or follower will not release the bus upon losing arbitration.
	Value	Mode		Description
	0	DISABLE		When a device loses arbitration, the ARBIF interrupt flag is set and the bus is released.
	1	ENABLE		When a device loses arbitration, the ARBIF interrupt flag is set, but communication proceeds.
4	AUTOSN	0x0	RW	<b>Automatic STOP on NACK</b> Write to 1 to make a leader transmitter send a STOP when a NACK is received from a follower.
	Value	Mode		Description
	0	DISABLE		Stop is not automatically sent if a NACK is received from a follower.
	1	ENABLE		The leader automatically sends a STOP if a NACK is received from a follower.
3	AUTOSE	0x0	RW	<b>Automatic STOP when Empty</b> Write to 1 to make a leader transmitter send a STOP when no more data is available for transmission.
	Value	Mode		Description
	0	DISABLE		A stop must be sent manually when no more data is to be transmitted.
	1	ENABLE		The leader automatically sends a STOP when no more data is available for transmission.
2	AUTOACK	0x0	RW	<b>Automatic Acknowledge</b> Set to enable automatic acknowledges.
	Value	Mode		Description
	0	DISABLE		Software must give one ACK command for each ACK transmitted on the I2C bus.
	1	ENABLE		Addresses that are not automatically NACK'ed, and all data is automatically acknowledged.
1	SLAVE	0x0	RW	<b>Addressable as Follower</b>

Bit	Name	Reset	Access	Description
				Set this bit to allow the device to be selected as an I2C follower.
	Value	Mode		Description
	0	DISABLE		All addresses will be responded to with a NACK
	1	ENABLE		Addresses matching the programmed follower address or the general call address (if enabled) require a response from software. Other addresses are automatically responded to with a NACK.
0	CORERST	0x0	RW	<b>Soft Reset the internal state registers</b> Set to reset the I2C_STATE register, and return the I2C module to the IDLE state. Must clear this bit to resume normal operation condition
	Value	Mode		Description
	0	DISABLE		No change to internal state registers
	1	ENABLE		Reset the internal state registers

### 22.5.5 I2C\_STATE - State Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Name</b>																					TXBUFCNT	RXFULL	RXDATAV	TXBL	TXC	PABORT	PCONT	PNACK	PACK	PSTOP	PSTART																						

Bit	Name	Reset	Access	Description
31:12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
11:10	TXBUFCNT	0x0	R	<b>TX Buffer Count</b> Indicates the number of buffers filled with valid data and not transmit to tx shift register
9	RXFULL	0x0	R	<b>RX FIFO Full</b> Set when the receive buffer is full. Cleared when the receive buffer is no longer full. When this bit is set, there is still room for one more frame in the receive shift register.
8	RXDATAV	0x0	R	<b>RX Data Valid</b> Set when data is available in the receive buffer. Cleared when the receive buffer is empty.
7	TXBL	0x1	R	<b>TX Buffer Level</b> Indicates the level of the transmit buffer. if TXBL==0, set when the transmit buffer is empty. if TXBL==1, set when the transmit buffer is half full
6	TXC	0x0	R	<b>TX Complete</b> Set when a transmission has completed and no more data is available in the transmit buffer. Cleared when a new transmission starts.
5	PABORT	0x0	R	<b>Pending abort</b> An abort is pending and will be transmitted as soon as possible.
4	PCONT	0x0	R	<b>Pending continue</b> A continue is pending and will be transmitted as soon as possible.
3	PNACK	0x0	R	<b>Pending NACK</b> A not-acknowledge is pending and will be transmitted as soon as possible.
2	PACK	0x0	R	<b>Pending ACK</b> An acknowledge is pending and will be transmitted as soon as possible.
1	PSTOP	0x0	R	<b>Pending STOP</b> A stop condition is pending and will be transmitted as soon as possible.
0	PSTART	0x0	R	<b>Pending START</b> A start condition is pending and will be transmitted as soon as possible.

## 22.5.7 I2C\_CLKDIV - Clock Division Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									RW							
<b>Name</b>																									DIV							

Bit	Name	Reset	Access	Description
31:9	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
8:0	DIV	0x0	RW	<b>Clock Divider</b> Specifies the clock divider for the I2C. Note that DIV must be 1 or higher when follower is enabled.

## 22.5.8 I2C\_SADDR - Follower Address Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									RW							
<b>Name</b>																									ADDR							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:1	ADDR	0x0	RW	<b>Follower address</b> Specifies the follower address of the device.
0	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		

### 22.5.9 I2C\_SADDRMASK - Follower Address Mask Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									RW							
<b>Name</b>																									SADDRMASK							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:1	SADDRMASK	0x0	RW	<b>Follower Address Mask</b>  Specifies the significant bits of the follower address. Setting the mask to 0x00 will match all addresses, while setting it to 0x7F will only match the exact address specified by ADDR.
0	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		

### 22.5.10 I2C\_RXDATA - Receive Buffer Data Register

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									R							
<b>Name</b>																									RXDATA							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	RXDATA	0x0	R	<b>RX Data</b>  Use this register to read from the receive buffer. Buffer is emptied on read access.

## 22.5.11 I2C\_RXDOUBLE - Receive Buffer Double Data Register

Offset	Bit Position																															
0x028	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0								0x0							
<b>Access</b>																	R								R							
<b>Name</b>																	RXDATA1								RXDATA0							

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15:8	RXDATA1	0x0	R	<b>RX Data 1</b> Second byte read from buffer. Buffer is emptied on read access.
7:0	RXDATA0	0x0	R	<b>RX Data 0</b> First byte read from buffer. Buffer is emptied on read access.

## 22.5.12 I2C\_RXDATAP - Receive Buffer Data Peek Register

Offset	Bit Position																															
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									R							
<b>Name</b>																									RXDATAP							

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:0	RXDATAP	0x0	R	<b>RX Data Peek</b> Use this register to read from the receive buffer. Buffer is not emptied on read access.

## 22.5.13 I2C\_RXDOUBLEP - Receive Buffer Double Data Peek Register

Offset	Bit Position																															
0x030	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0								0x0							
<b>Access</b>																	R								R							
<b>Name</b>																	RXDATAP1								RXDATAPO							

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15:8	RXDATAP1	0x0	R	<b>RX Data 1 Peek</b> Second byte read from buffer. Buffer is not emptied on read access.
7:0	RXDATAPO	0x0	R	<b>RX Data 0 Peek</b> First byte read from buffer. Buffer is not emptied on read access.

## 22.5.14 I2C\_TXDATA - Transmit Buffer Data Register

Offset	Bit Position																															
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									W(nB)							
<b>Name</b>																									TXDATA							

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:0	TXDATA	0x0	W(nB)	<b>TX Data</b> Use this register to write a byte to the transmit buffer.

22.5.15 I2C\_TXDOUBLE - Transmit Buffer Double Data Register

Offset	Bit Position																															
0x038	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0								0x0							
<b>Access</b>																	W(nB)								W(nB)							
<b>Name</b>																	TXDATA1								TXDATA0							

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15:8	TXDATA1 Second byte to write to buffer.	0x0	W(nB)	<b>TX Data</b>
7:0	TXDATA0 First byte to write to buffer.	0x0	W(nB)	<b>TX Data</b>

## 22.5.16 I2C\_IF - Interrupt Flag Register

Offset	Bit Position																																														
0x03C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0															
<b>Reset</b>												0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0				
<b>Access</b>												RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW			
<b>Name</b>												SDAERR	SCLERR	CLERR	RXFULL	SSTOP	CLTO	BITO	RXUF	TXOF	BUSHOLD	BUSERR	ARBLOST	MSTOP	NACK	ACK	RXDATAV	TXBL	TXC	ADDR	RSTART	START															

Bit	Name	Reset	Access	Description
31:21	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in 1.2 Conventions</i>		
20	SDAERR	0x0	RW	<b>SDA Error Interrupt Flag</b> Set when the SDA at loopback path is not equal to SDA output
19	SCLERR	0x0	RW	<b>SCL Error Interrupt Flag</b> Set when the SCL at loopback path is not equal to SCL output
18	CLERR	0x0	RW	<b>Clock Low Error Interrupt Flag</b> Set when the clock is pulled low before a START or a STOP condition could be transmitted.
17	RXFULL	0x0	RW	<b>Receive Buffer Full Interrupt Flag</b> Set when the receive buffer becomes full.
16	SSTOP	0x0	RW	<b>Follower STOP condition Interrupt Flag</b> Set when a STOP condition has been received. Will be set regardless of the follower being involved in the transaction or not.
15	CLTO	0x0	RW	<b>Clock Low Timeout Interrupt Flag</b> Set on each clock low timeout. The timeout value can be set in CLTO bit field in the I2Cn_CTRL register.
14	BITO	0x0	RW	<b>Bus Idle Timeout Interrupt Flag</b> Set on each bus idle timeout. The timeout value can be set in the BITO bit field in the I2Cn_CTRL register.
13	RXUF	0x0	RW	<b>Receive Buffer Underflow Interrupt Flag</b> Set when data is read from the receive buffer through the I2Cn_RXDATA register while the receive buffer is empty. It is also set when data is read through the I2Cn_RXDOUBLE while the buffer is not full.
12	TXOF	0x0	RW	<b>Transmit Buffer Overflow Interrupt Flag</b> Set when data is written to the transmit buffer while the transmit buffer is full.
11	BUSHOLD	0x0	RW	<b>Bus Held Interrupt Flag</b> Set when the bus becomes held by the I2C module.
10	BUSERR	0x0	RW	<b>Bus Error Interrupt Flag</b> Set when a bus error is detected. The bus error is resolved automatically, but the current transfer is aborted.
9	ARBLOST	0x0	RW	<b>Arbitration Lost Interrupt Flag</b> Set when arbitration is lost.
8	MSTOP	0x0	RW	<b>Leader STOP Condition Interrupt Flag</b>

Bit	Name	Reset	Access	Description
				Set when a STOP condition has been successfully transmitted. If arbitration is lost during the transmission of the STOP condition, then the MSTOP interrupt flag is not set.
7	NACK	0x0	RW	<b>Not Acknowledge Received Interrupt Flag</b> Set when a NACK has been received.
6	ACK	0x0	RW	<b>Acknowledge Received Interrupt Flag</b> Set when an ACK has been received.
5	RXDATAV	0x0	RW	<b>Receive Data Valid Interrupt Flag</b> Set when received data is half full
4	TXBL	0x0	RW	<b>Transmit Buffer Level Interrupt Flag</b> if TXBIL==0, set when the transmit buffer is empty. if TXBIL==1, set when the transmit is half full
3	TXC	0x0	RW	<b>Transfer Completed Interrupt Flag</b> Set when the transmit shift register becomes empty and there is no more data in the transmit buffer.
2	ADDR	0x0	RW	<b>Address Interrupt Flag</b> Set when incoming address is accepted, i.e. own address or general call address is received.
1	RSTART	0x0	RW	<b>Repeated START condition Interrupt Flag</b> Set when a repeated start condition is detected.
0	START	0x0	RW	<b>START condition Interrupt Flag</b> Set when a start condition is successfully transmitted.

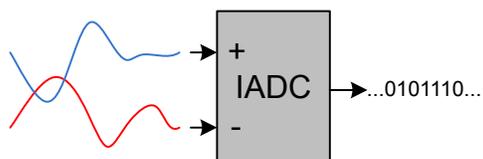

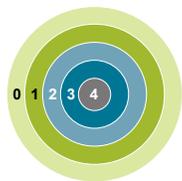

## 22.5.17 I2C\_IEN - Interrupt Enable Register

Offset	Bit Position																																														
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

31:21	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in 1.2 Conventions</i>		
20	SDAERR	0x0	RW	<b>SDA Error Interrupt Flag</b> Set when SDA at loopback path is not equal to SDA output
19	SCLERR	0x0	RW	<b>SCL Error Interrupt Flag</b> Set when SCL at loopback path is not equal to SCL output
18	CLERR	0x0	RW	<b>Clock Low Error Interrupt Flag</b> Set when the clock is pulled low before a START or a STOP condition could be transmitted.
17	RXFULL	0x0	RW	<b>Receive Buffer Full Interrupt Flag</b> Set when the receive buffer becomes full.
16	SSTOP	0x0	RW	<b>Follower STOP condition Interrupt Flag</b> Set when a STOP condition has been received. Will be set regardless of the follower being involved in the transaction or not.
15	CLTO	0x0	RW	<b>Clock Low Timeout Interrupt Flag</b> Set on each clock low timeout. The timeout value can be set in CLTO bit field in the I2Cn_CTRL register.
14	BITO	0x0	RW	<b>Bus Idle Timeout Interrupt Flag</b> Set on each bus idle timeout. The timeout value can be set in the BITO bit field in the I2Cn_CTRL register.
13	RXUF	0x0	RW	<b>Receive Buffer Underflow Interrupt Flag</b> Set when data is read from the receive buffer through the I2Cn_RXDATA register while the receive buffer is empty. It is also set when data is read through the I2Cn_RXDOUBLE while the buffer is not full.
12	TXOF	0x0	RW	<b>Transmit Buffer Overflow Interrupt Flag</b> Set when data is written to the transmit buffer while the transmit buffer is full.
11	BUSHOLD	0x0	RW	<b>Bus Held Interrupt Flag</b> Set when the bus becomes held by the I2C module.
10	BUSERR	0x0	RW	<b>Bus Error Interrupt Flag</b> Set when a bus error is detected. The bus error is resolved automatically, but the current transfer is aborted.
9	ARBLOST	0x0	RW	<b>Arbitration Lost Interrupt Flag</b> Set when arbitration is lost.
8	MSTOP	0x0	RW	<b>Leader STOP Condition Interrupt Flag</b>

Bit	Name	Reset	Access	Description
				Set when a STOP condition has been successfully transmitted. If arbitration is lost during the transmission of the STOP condition, then the MSTOP interrupt flag is not set.
7	NACK	0x0	RW	<b>Not Acknowledge Received Interrupt Flag</b> Set when a NACK has been received.
6	ACK	0x0	RW	<b>Acknowledge Received Interrupt Flag</b> Set when an ACK has been received.
5	RXDATAV	0x0	RW	<b>Receive Data Valid Interrupt Flag</b> Set when data is available in the receive buffer. Cleared automatically when the receive buffer is read.
4	TXBL	0x0	RW	<b>Transmit Buffer Level Interrupt Flag</b> Set when the transmit buffer becomes empty. Cleared automatically when new data is written to the transmit buffer.
3	TXC	0x0	RW	<b>Transfer Completed Interrupt Flag</b> Set when the transmit shift register becomes empty and there is no more data in the transmit buffer.
2	ADDR	0x0	RW	<b>Address Interrupt Flag</b> Set when incoming address is accepted, i.e. own address or general call address is received.
1	RSTART	0x0	RW	<b>Repeated START condition Interrupt Flag</b> Set when a repeated start condition is detected.
0	START	0x0	RW	<b>START condition Interrupt Flag</b> Set when a start condition is successfully transmitted.

## 23. IADC - Incremental Analog to Digital Converter

### Quick Facts

#### What?

The IADC is used to convert analog voltages into a digital representation and features high-speed, low-power operation.

#### Why?

In many applications there is a need to measure analog signals and record them in a digital representation, without exhausting the energy source.

#### How?

The low power IADC samples one or more input channels in a programmable sequence. With the help of PRS and DMA, the IADC can operate without CPU intervention in EM2 and EM3, minimizing the number of powered up resources. The IADC can be automatically shut down between conversions to further reduce the energy consumption.

### 23.1 Introduction

The IADC uses an Incremental Analog to Digital architecture, with a resolution of 12 bits when operating at one million samples per second (1 Msps). The flexible incremental architecture uses oversampling to allow applications to trade speed for higher resolution. An integrated input multiplexer can select from external I/Os and several internal signals.

## 23.2 Features

- Flexible oversampled architecture allows for tradeoffs between speed and resolution.
  - 1 Msps with oversampling ratio = 2
  - 555 ksps with oversampling ratio = 4
  - 76.9 ksps with oversampling ratio = 32
- Digital post-averaging
- Internal and external conversion trigger sources
  - Immediate (software triggered)
  - Local IADC timer
  - External TIMER module (synchronous with output / PWM generation)
  - General PRS hardware signal
- Integrated prescaler for conversion clock generation
- Can be run during EM2 and EM3, waking up the system on interrupts as needed
- Selectable reference sources
  - 1.21 V internal reference
  - External precision reference
  - Analog supply
- Support for offset and gain calibration
- Programmable input gain: 0.5x, 1x, 2x, 3x, or 4x
- Flexible output formatting
  - Unipolar or 2's complement bipolar data
  - Results can be saved in 12 bit, 16 bit, or 20 bit format
  - Programmable left or right justification
  - Optional channel ID tag
- Digital window comparison function detects when results are inside/outside a programmable window
- Two independent groups of configuration registers for setting IADC mode, clock prescaler, reference selection, oversample rate, unipolar/bipolar output formatting, and analog gain
- Programmable single channel conversion
  - Can use either configuration group
  - Triggered by any conversion trigger source
  - Can be tailgated after a scan sequence
  - One shot or continuous mode
  - Local FIFO for immediate data storage
  - Programmable watermark level to generate interrupt or initiate DMA transfer
  - Supports overflow and underflow interrupt generation
  - Supports window compare function
- Autonomous multi-channel scan
  - Up to 16 configurable slots in scan sequence
  - Each slot allows independent selection of configuration group, channel selection, and window compare enable
  - Triggered by any conversion trigger source
  - One shot or continuous mode
  - Local FIFO for immediate data storage
  - Programmable watermark level to generate interrupt or initiate DMA transfer
  - Supports overflow and underflow interrupt generation
  - Conversion tailgating support for predictable periodic scans

- Available interrupt sources:
  - Single FIFO has DVL (data valid level) entries available (also generates DMA request)
  - Scan FIFO has DVL (data valid level) entries available (also generates DMA request)
  - Single FIFO result compared true for digital compare window
  - Scan FIFO result compared true for digital compare window
  - Single queue conversion has completed
  - Scan queue entry conversion has completed
  - Scan queue table conversion has completed
  - Single FIFO overflow or underflow
  - Scan FIFO overflow or underflow
  - Polarity Error interrupt
  - Port Allocation Error interrupt
  - EM23 clock configuration error

### 23.3 Functional Description

The incremental ADC module block diagram is shown in [Figure 23.1 IADC Overview on page 738](#).

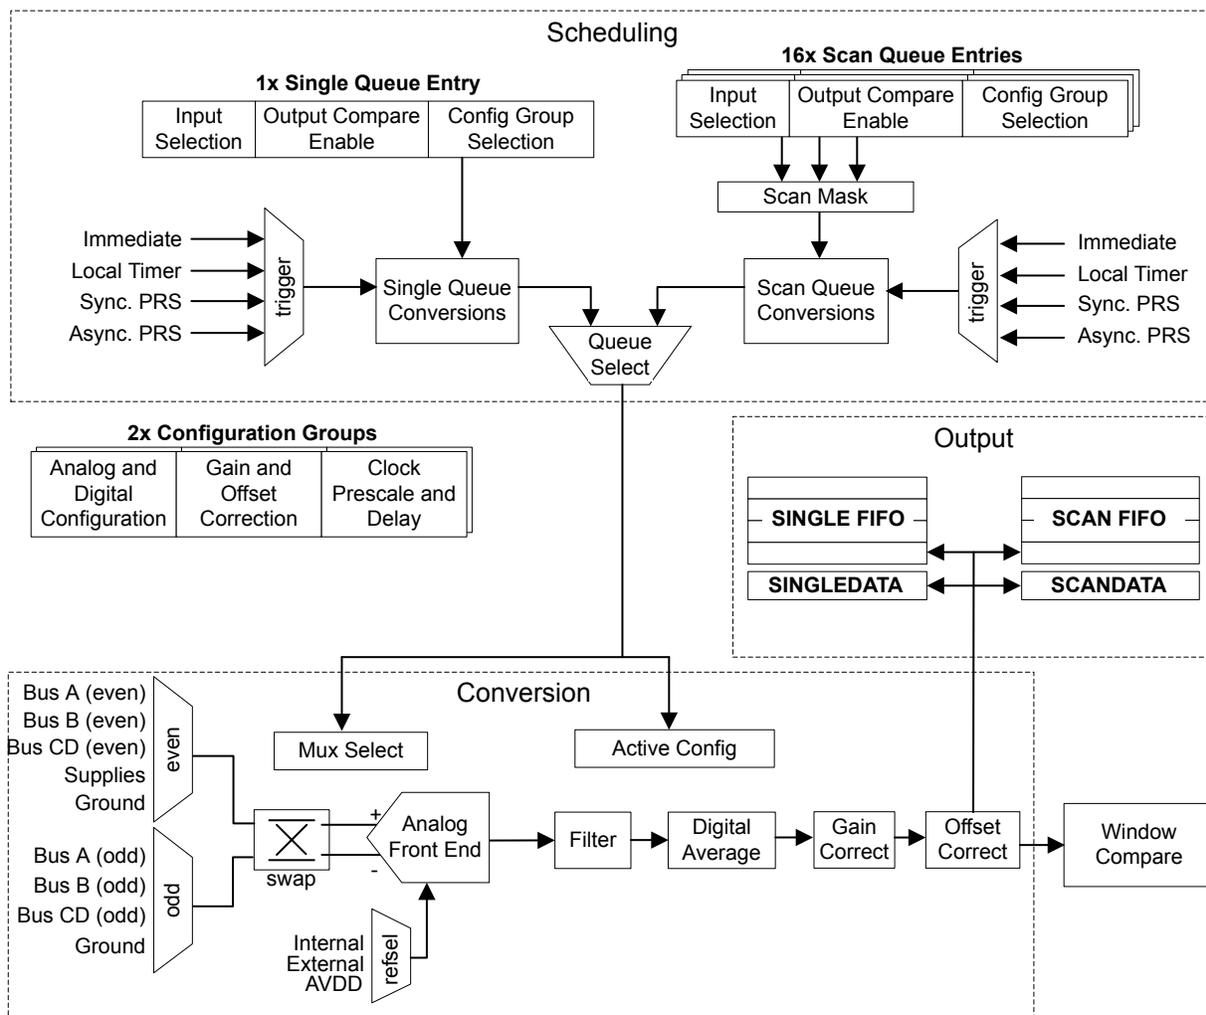

Figure 23.1. IADC Overview

### 23.3.1 Register Access

Many of the IADC module's configuration registers can only be written while the module is disabled (`IADC_EN_EN = 0`). These are `IADC_CTRL`, `IADC_TIMER`, `IADC_CMPTHR`, `IADC_TRIGGER`, `IADC_CFGx`, `IADC_SCALEx`, `IADC_SCHEx`, and `IADC_SCANx`. A typical setup sequence for the IADC module is:

1. With the IADC disabled (`IADC_EN_EN = 0`), program all configuration registers listed above.
2. Enable the IADC by setting `EN` in `IADC_EN` to 1.
3. Program the remaining configuration registers.
4. Enable the single or scan queue.
5. The IADC is ready for use.

### 23.3.2 Clocking

The IADC logic is partitioned into two clock domains: CLK\_BUS (APBIF) and CLK\_SRC\_ADC (CORE). The APBIF domain contains the IADC registers and FIFO read logic. The rest of the IADC is clocked mainly by CLK\_SRC\_ADC and ADC\_CLK, both of which are derived from CLK\_CMU\_ADC, as shown in [Figure 23.2 Clocking on page 740](#).

CLK\_CMU\_ADC is the incoming clock routed to the ADC by the CMU, and may be up to 80 MHz. It is selected within the CMU module. If the ADC is to be used synchronously with an external TIMER module, the clock should be configured to derive from the group A clock. If configuring for operation in EM2 or EM3, a clock source available in EM2 and EM3 must be used directly, as the group A clock multiplexer will be shut down in EM2 and EM3.

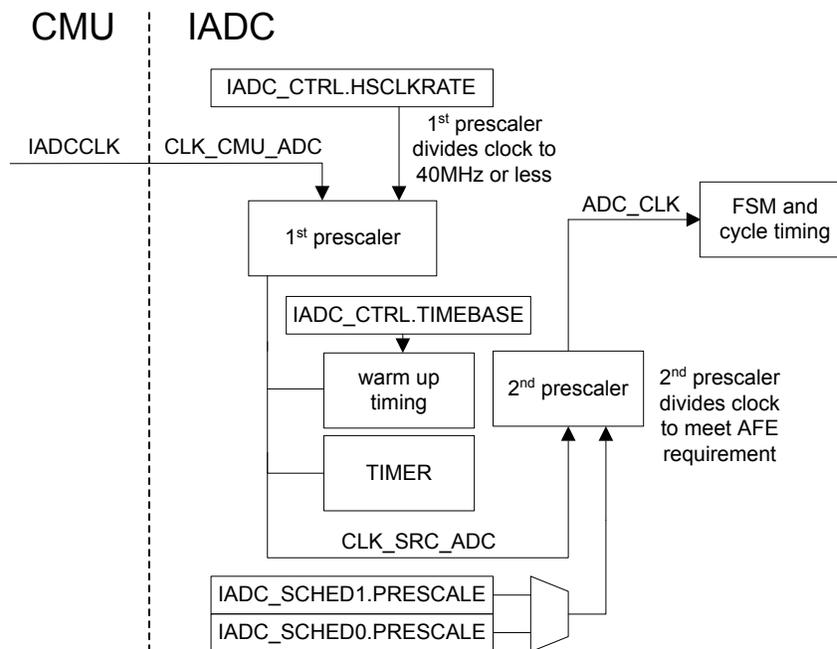

CLK\_SRC\_ADC is derived from CLK\_CMU\_ADC, and must be no faster than 40 MHz. The HSCLKRATE field in IADC\_CTRL sets the prescaler to divide CLK\_CMU\_ADC. If CLK\_CMU\_ADC is already 40 MHz or slower, HSCLKRATE can be set to 0x0 to pass the clock through to CLK\_SRC\_ADC without dividing it. CLK\_SRC\_ADC is the clock source used for the TIMEBASE prescaler as well as the local IADC timer.

ADC\_CLK is used to drive the ADC front-end and state machine logic. Another prescaler is used to reduce CLK\_SRC\_ADC to a suitable frequency for the ADC operating mode. Because the operational mode may be different for single vs. scan conversions, or even for different conversions within a scan, each configuration group has a PRESCALE bit field in the IADC\_SCHEx register. PRESCALE must be set to limit ADC\_CLK to no faster than 10 MHz in normal mode for 0.5x and 1x analog gain settings. For analog gain of 2x, 3x, and 4x, the maximum ADC\_CLK is 5 MHz, 2.5 MHz, or 2.5 MHz respectively. It is recommended to run ADC\_CLK no slower than 100 kHz.

**Note:** If HSCLKRATE is configured to divide CLK\_CMU\_ADC by more than 1 (HSCLKRATE != 0), then PRESCALE must not be set to divide by 1 (PRESCALE = 0). When this condition is detected, a PRESCALE value of 1 (divide by 2) will be automatically be used instead of the programmed PRESCALE value.

The suspend mode fields IADC\_CTRL\_ADCCLKSUSPEND0 (for scan conversions) or IADC\_CTRL\_ADCCLKSUSPEND1 (for single conversions) can be used to shut down the clock between conversions and save power. The ADC logic will wake up the clock before starting IADC warmup and performing a conversion. If the suspend mode is set, the clock will shut down again once the conversion is complete.

When IADC\_TRIGGER\_SCANTRIGSEL or IADC\_TRIGGER\_SINGLETRIGSEL is set to IMMEDIATE, IADC\_CTRL\_ADCCLKSUSPENDn will force the clock to only be running when one of the queues is enabled.

**Figure 23.2. Clocking**

### 23.3.3 Conversion Timing

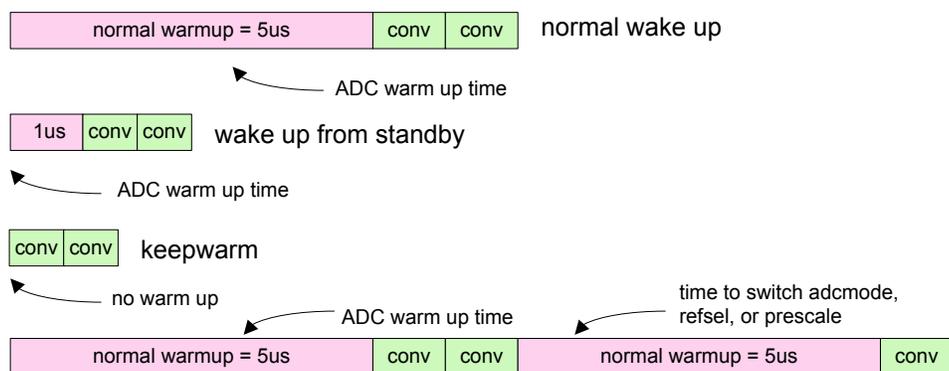

The IADC takes multiple samples of the analog signal to produce each output. The number of input samples contributing to an output word is determined by the oversampling ratio (OSR). Higher OSR settings will improve the ADC's INL and DNL, and reduce system-level noise, but require more time for each conversion. Different OSRs may be specified for each configuration group. It is important to note that oversampling is an analog process which provides more input samples to the digital filter. The OSR is configured with the OSRHS bit field in the IADC\_CFGx register.

During a conversion, the effective front-end sampling frequency ( $F_{\text{sample}}$ ) in normal mode is equal to  $\text{ADC\_CLK} / 4$ .

#### 23.3.3.1 Warmup Time

To save energy, the IADC can be configured to power down completely or enter a standby state between conversions, if full speed operation is not required for the application. The required ADC warm up time from a full powered-down state is 5  $\mu\text{s}$ . Warmup from a standby state requires 1  $\mu\text{s}$ . Warmup is automatically timed by the ADC logic when it is required, but software must configure the TIMEBASE field in IADC\_CTRL for a minimum 1  $\mu\text{s}$  interval. Note that the TIMEBASE counter receives CLK\_SRC\_ADC, and should be programmed based on that frequency. For example, if CLK\_SRC\_ADC is 40 MHz, TIMEBASE should be set to at least 0x27 (39) to produce the minimum 1  $\mu\text{s}$  interval. When transitioning from a powered-down state, the IADC will use five TIMEBASE intervals. When in standby the IADC will use one TIMEBASE interval.

The WARMUPMODE field in the IADC\_CTRL register defines whether the IADC is powered down between conversions (WARMUPMODE = NORMAL), in standby between conversions (WARMUPMODE = KEEPINSTANDBY), or remains powered up (WARMUPMODE = KEEPWARM). The resulting start-up time is shown in [Figure 23.3 Start-up Timing on page 741](#). Note that even in WARMUPMODE = KEEPWARM or KEEPINSTANDBY, the ADC will implement 5 TIMEBASE intervals of warmup on initial power up, or any configuration change affecting PRESCALE, ADCMODE, or REFSEL. IADC\_STATUS\_ADCWARM reflects the current warmup status of the IADC.

Each change in ADCMODE, REFSEL, or PRESCALE require a 5 $\mu\text{s}$  warm up period

**Figure 23.3. Start-up Timing**

### 23.3.3.2 Conversion Pipeline

The IADC uses a pipelined architecture to perform different stages of the ADC conversion in parallel.

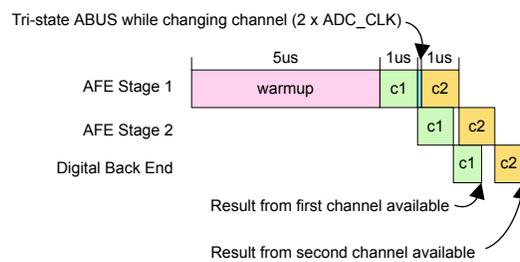

The conversion time for a single sample can be determined from the OSR and the pre-scaled ADC\_CLK frequency ( $f_{ADC\_CLK}$ ) as:

$$\text{Conversion Time} = ((4 * \text{OSR}) + 2) / f_{ADC\_CLK}$$

The minimum OSR is 2, meaning that the fastest possible conversion lasts 10 ADC\_CLK clock cycles.

The IADC will automatically insert 2 additional cycles in the pipeline when changing channels to a new GPIO. This allows for hold timing on the previous conversion and allows for time to tristate the ABUS analog buses before connecting the next GPIO to the analog bus. Therefore the maximum sampling rate while continuously sampling on one channel (with ADC\_CLK = 10 MHz) is 1 Msps, and the maximum sampling rate while switching channels is 833 ksps. Figure 23.4 Normal ADC Mode Pipeline on page 742 shows both single-channel and channel-switching scenarios powering up from a shutdown state with WARMUPMODE = NORMAL. The 5 us warmup is shown in pink, a first conversion pipeline in green, and a second conversion in orange. The blue area in the top diagram represents the extra time to tristate while changing channels.

Normal mode switching channel between conversions

Normal mode converting same channel twice

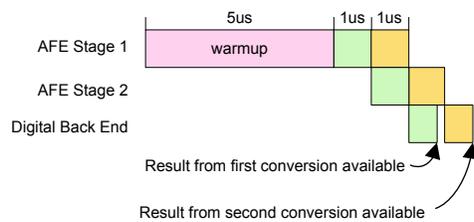

Figure 23.4. Normal ADC Mode Pipeline

### 23.3.3.3 Scheduling and Triggers

The IADC has several triggering options available for both the Single queue and the Scan queue. When a conversion trigger occurs and there are no other conversions active or pending, the request is serviced immediately. If both the single and scan queues are being used in an application, it is possible to serve the conversion requests as needed, and specify their priority.

Conversion triggering is configured using bit fields in the IADC\_TRIGGER register. The SINGLETRIGSEL and SCANTRIGSEL fields specify the trigger source for Single and Scan conversion queues, respectively. The options for trigger source are:

- IMMEDIATE - Trigger from software. This is useful for triggering conversions on-demand from software with no specific sampling frequency requirements, or initiating continuous conversions at full speed.
- TIMER - Use the IADC local timer to trigger conversions. This is useful for triggering conversions at precise intervals.
- PRSCLKGRP - Use a synchronous PRS channel to trigger from an external peripheral in the same clock group domain (i.e. clock group A). This is useful for synchronizing conversions precisely with external TIMER events or PWM outputs.

**Note:** It is recommended to configure the PRS consumer registers prior to enabling synchronous PRS triggers to avoid false triggers.

- PRSPOS - Use a positive edge of an asynchronous PRS channel to trigger conversions. The trigger source will require 1-2 CLK\_SRC\_ADC cycles to synchronize. This is useful for triggering conversions as needed from asynchronous peripheral sources such as GPIO inputs, SYSRTC events, etc.
- PRSNEG - Use a negative edge of an asynchronous PRS channel to trigger conversions. This is the same as PRSPOS, but operates on negative edges of the selected input.
- LESENSE (SCAN Only) - Use signalling from the LESENSE peripheral to trigger conversions. When using this mode, only one entry in the SCAN table (specified by the LESENSE channel) is converted per conversion request, and the SCAN queue is unavailable for normal operation.

Both the single and scan trigger sources can be configured to generate one request per trigger, or begin continuous conversions. Setting SINGLETRIGACTION to ONCE will make one conversion request each time the selected single trigger occurs, and a single ADC output will be converted. Setting SINGLETRIGACTION to CONTINUOUS allows the single trigger to begin the first conversion, and when a conversion completes a new one will be requested immediately without requiring a new trigger. Channel selections and configuration should not be changed while SINGLETRIGACTION is set to CONTINUOUS. Doing so can produce conversion errors. The scan queue should be used if channel or configuration switching is required.

The SCANTRIGACTION field works to request conversion scans in a similar manner. Setting SCANTRIGACTION to ONCE will make one request each time the selected scan trigger occurs, and the IADC will perform all conversions specified in the scan once before stopping. Setting SCANTRIGACTION to CONTINUOUS allows the scan trigger to initiate continuous scans. When a scan cycle completes, a new one will be requested immediately without requiring a new trigger.

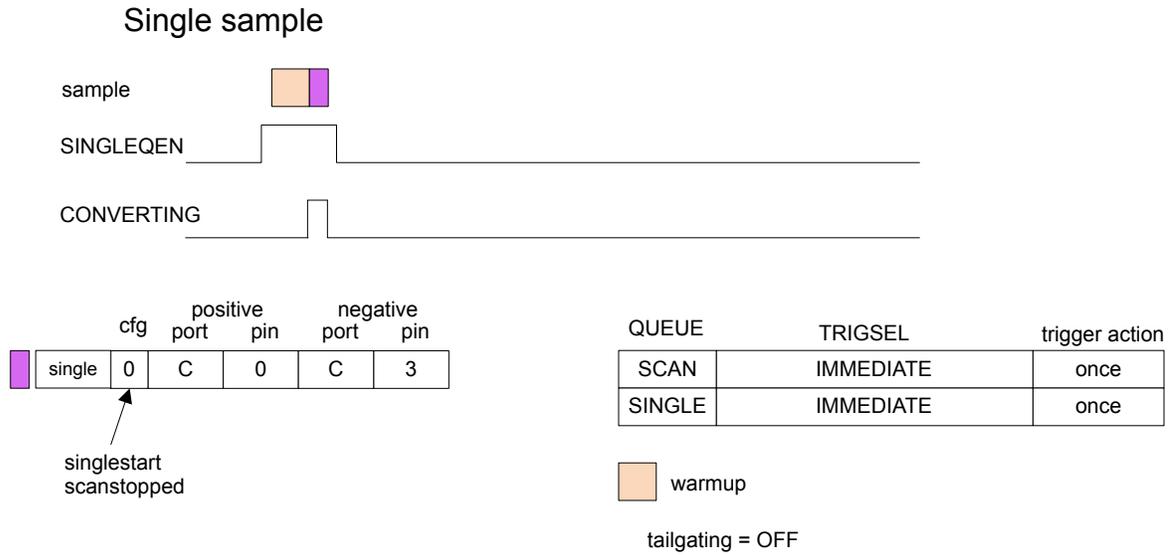

Conversion priority can be adjusted using the SINGLETAILGATE bit. By default, SINGLETAILGATE is set to TAILGATEOFF, meaning that conversion triggers are queued in the order they are received. Any conversion trigger for the Single queue or the Scan queue will initiate a conversion as soon as possible. If any conversion is already in progress or pending, the new conversion will be handled after the current operation.

Setting SINGLETAILGATE to TAILGATEON gives ultimate priority to the Scan queue. The IADC will only perform single conversions immediately after completion of a scan. This allows systems to use the scan queue for high-priority conversions with tight timing requirements, and the single queue for low-priority, on-demand conversion events. Note that this setting should only be used when scan conversions are guaranteed to trigger. If no scan sequence is triggered, any single conversion trigger will remain pending indefinitely. It is also important to note that if there is not enough time between scan conversions to service a single conversion, the next scan conversion will be delayed.

### 23.3.3.3.1 Conversion Triggering Examples

#### Scheduling a Single Sample

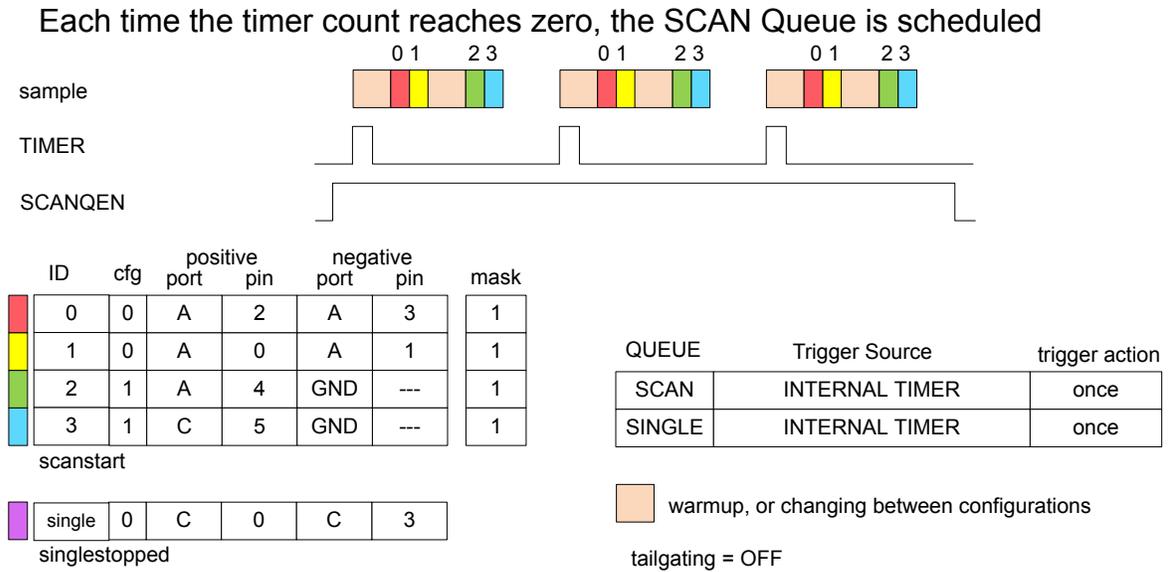

The simplest use case for the IADC is performing one conversion on-demand from the Single queue. [Figure 23.5 Immediate Single Conversion on page 744](#) shows the configuration and timing of this use case. The IADC warmup mode is configured for normal (shuts down between conversions). The single queue trigger is configured for immediate triggering of one conversion, and tailgating is turned off. When the conversion is requested (by setting IADC\_CMD\_SINGLESTART), the IADC block warms up and then begins converting. During the conversion, the CONVERTING bit in IADC\_STATUS is set. When the conversion is complete, the queue is disabled, and SINGLEQEN returns low.

**Figure 23.5. Immediate Single Conversion**

### Periodic Scans

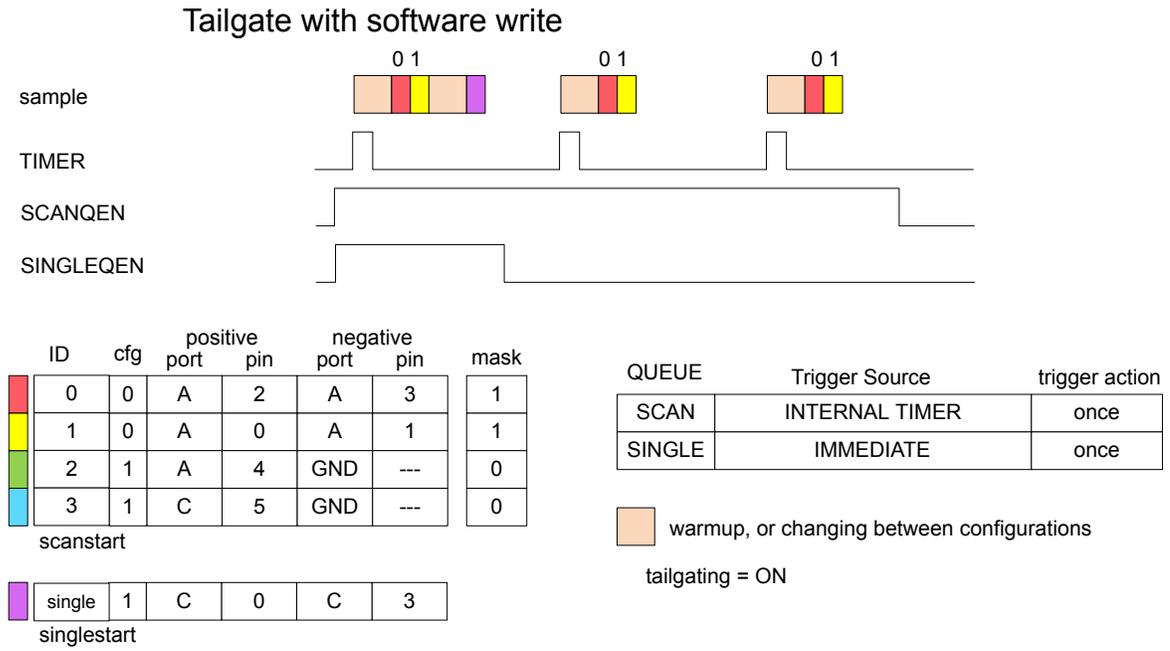

Another common use case is to periodically trigger the IADC to perform a multi-channel scan. [Figure 23.6 Periodic Scan Example on page 745](#) shows the timing of a periodic scan triggered by the IADC's local timer. The scanner is configured to sample four different channels; two using configuration 0 and two using configuration 1. Note that a single TIMER trigger is used to initiate each scan, and all four samples are taken for each trigger. Note also that the IADC inserts another warmup time between conversions 1 and 2, when it switches from configuration 0 to configuration 1. The single queue is disabled and not used in this example.

**Figure 23.6. Periodic Scan Example**

### Tailgating Examples

An example using conversion tailgating is shown in [Figure 23.7 Simple Conversion with Tailgating Enabled on page 746](#). In the example, the Scan queue is configured to trigger a two-channel conversion periodically on the IADC local timer, while the Single queue is configured to trigger on-demand from software. When a single conversion is requested, it waits until after the scan sequence is complete, and then the single conversion is performed. The scan conversions are using configuration 0, and the single conversion is using configuration 1, so a warmup delay is inserted between the end of the scan and the beginning of the single conversion cycle. Note that this example provides plenty of time between IADC scan conversions for the single conversion to occur, and no scan conversions are delayed.

**Figure 23.7. Simple Conversion with Tailgating Enabled**

Another example, shown in [Figure 23.8 Conversions with Tailgating Disabled on page 747](#), demonstrates how requests are handled on the different conversion queues with tailgating disabled.

In this example, the scan queue is being triggered on the internal timer while the single queue is being triggered on a PRS positive edge. Since tailgating is not enabled, the queues will be serviced on a first come first served basis. The first single queue trigger falls between two scan queue triggers and does not interfere with scan queue timing. The second single queue trigger happens just before the scan queue trigger. The IADC will complete this single queue conversion and delay the next scan queue conversions.

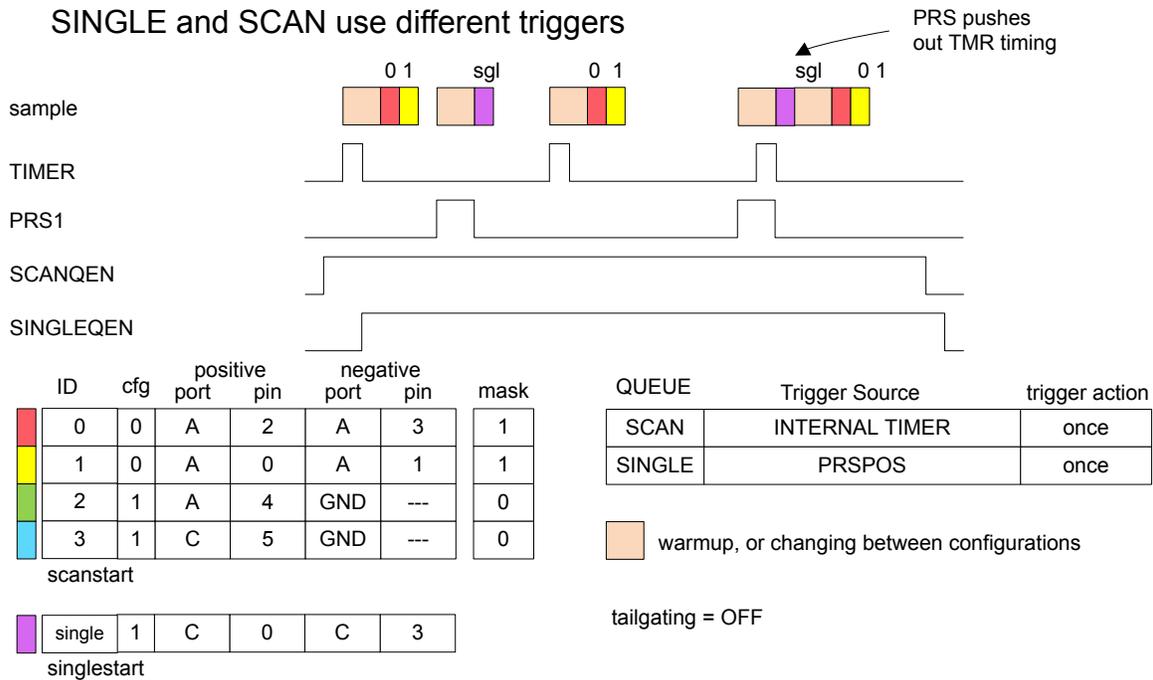

Figure 23.8. Conversions with Tailgating Disabled

### Continuous Conversions

An example of continuous conversions triggered from the scan queue is shown in [Figure 23.9 Continuous Conversions on page 747](#). In this example the SCANTRIGACTION field in IADC\_TRIGGER is set to CONTINUOUS, and the conversion trigger source is software (SCANTRIGSEL = IMMEDIATE). When the scan queue is enabled with IADC\_CMD\_SCANSTART, the ADC warms up and then performs repeated back-to-back scans until software disables the scan queue using IADC\_CMD\_SCANSTOP. While this example shows only one channel converted continuously, it is possible to enable multiple channels for the scan sequence.

### Continuous

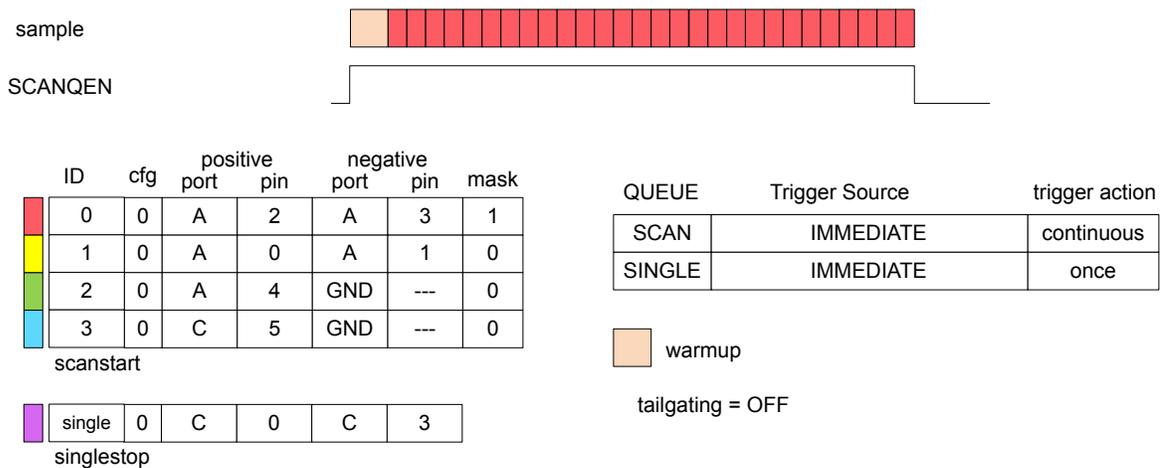

Figure 23.9. Continuous Conversions

### 23.3.4 Reference Selection and Analog Gain

The default IADC reference is to use the internal band gap circuit. The analog power supply voltage can also be used as a voltage reference. The reference voltage is selected using the REFSEL field in IADC\_CFGx.

**Table 23.1. Mode Settings**

Reference	Description	Voltage
VBGR	Internal	1.21V
VDDX	Analog Power Supply	AVDD
VREF	External	1.0V - AVDD (1.25V Nominal)

The IADC also has analog gain selection, controlled via the ANALOGGAIN field in IADC\_CFGx. The analog gain can be set to 0.5x, 1x, 2x, 3x, or 4x. Note that 2x, 3x, and 4x gain modes may require slower ADC\_CLK. The analog gain impacts where the full-scale input reading occurs. For example, with a 1.25 V external reference and ANALOGGAIN set to 2x, the analog input to the IADC is multiplied by a factor of 2, and a full-scale reading occurs at  $1.25 \text{ V} / 2 = 0.625 \text{ V}$ . If ANALOGGAIN is set to 0.5x, the full-scale reading of the ADC will not occur until the input reaches 2.5 V. Note that the ADC is only capable of measuring inputs within the supply rails of the device. If the full scale is configured to be greater than the supply voltage, the maximum input will be limited to the supply.

The sampling capacitance ( $C_{\text{sample}}$ ) is changed according to the analog gain setting.

**Table 23.2. Input Sampling Capacitance vs. Analog Gain**

Analog Gain Setting	Input Sampling Capacitance
0.5x	1 pF
1x	2 pF
2x	4 pF
3x	6 pF
4x	8 pF

Given the sampling capacitance and the front-end sampling rate ( $F_{\text{sample}}$ ), the input impedance of the converter can be calculated as:

$$Z_{\text{in}} = 1 / (C_{\text{sample}} * F_{\text{sample}})$$

Note that the input is not sampled when the converter is inactive between conversions and operating with WARMUPMODE = NORMAL or KEEPINSTANDBY with longer intervals between conversion triggers can increase the effective input impedance of the converter.

### 23.3.5 Input and Configuration Selection

The IADC supports measurement on a number of internal and external signals. External signals are routed to GPIO through shared ABUS resources on the device, or (on some devices) through dedicated analog inputs available to the IADC block.

The single queue and the scan queue have separate registers available to select inputs and configurations. The IADC\_SINGLE register is used to select the input and configuration for the single queue. The IADC\_SCANx registers are used to select the inputs and configurations for each of the scan table entries. In both cases, the register contents and setup are similar. The PORTPOS and PINPOS fields are used to select a signal for the positive ADC input, while PORTNEG and PINNEG are used to select a signal for the negative ADC input. The CFG field selects which of the two configuration sets will be used with the input (i.e. configuration options specified in IADC\_CFGx, IADC\_SCALEx, and IADC\_SCHEx).

To perform single-ended conversions, the PORTNEG field should be set to GND. This indicates that the positive ADC input will be measured with reference to chip ground. PORTPOS and PINPOS should be used to select the desired input signal. The PINNEG field is not used for single-ended conversions.

To perform differential conversions, PORTPOS, PINPOS are used to select the positive input to the ADC, while PORTNEG and PINNEG are used to select the negative input. Note that there are two independent multiplexers in the ADC, and firmware cannot select two signals from the same multiplexer for a differential measurement. The "even" multiplexer consists of all EVEN ABUS selections, Supply voltage options, and GND. The "odd" multiplexer consists of all ODD ABUS selections and GND. One selection from each multiplexer is allowed on the positive and negative input. More detailed examples may be found in [23.3.5.3 ABUS Input Selection Examples](#).

The scan queue has one additional register, IADC\_MASKREQ, to specify which of the 16 possible channel slots will be converted during a scan operation. Each channel in the scan queue is enabled by writing the corresponding bit in the IADC\_MASKREQ register to 1. Enabled channels will be converted in sequence from lowest to highest, during a scan. See [23.3.5.4 Scan Queue](#) for more details on using the scan queue.

#### 23.3.5.1 External GPIO Inputs

GPIO input selections are routed through shared ABUS resources. In order for the IADC to use any GPIO as an input, the IADC must be allocated appropriate analog bus resources in the GPIO\_ABUSALLOC, GPIO\_BBUSALLOC, or GPIO\_CDBUSALLOC registers. For example, if IADC0 will be using both odd and even numbered pins on GPIO port PA, then AEVEN0 and AODD0 in GPIO\_ABUSALLOC could both be set to IADC0. This gives IADC0 access to these two buses. Generally, bus access is set to specific peripherals at configuration time and left alone - it is not normally required to change the bus allocation on the fly. If the IADC requests a pin from a bus that has not been allocated to the IADC, an error will be generated, the PORTALLOCERRIF in IADC\_IF will be set, and any conversion result will be 0. For more details on analog bus structure and capabilities, refer to the GPIO section.

When the appropriate analog buses have been configured to route to the IADC, GPIO selection is a simple matter of programming the desired port and pin into the PORTPOS, PINPOS, PORTNEG, and PINNEG fields. For example, to configure a channel to convert the differential voltage between pins PA5 and PA4, PORTPOS = PORTA, PINPOS = 5, PORTNEG = PORTA, PINNEG = 4. If an invalid selection is made, a polarity error will be generated. More specific examples are described in [23.3.5.3 ABUS Input Selection Examples](#).

### 23.3.5.2 Internal and Dedicated Inputs

Internal signals and dedicated inputs are not routed through the shared ABUS resources. In general, these resources are selected directly by the settings of PORTPOS and PORTNEG, while the PINPOS and PINNEG fields are not used. When PORTPOS is set to SUPPLY, PINPOS is used to select which of the power supplies is connected. To facilitate power supply measurements using internal reference options, higher voltage supplies are attenuated by a factor of 4.

**Table 23.3. Supply Selection (PORTPOS = SUPPLY)**

PINPOS	Supply Connection	Voltage at Positive Input
0	AVDD	AVDD / 4
1	IOVDD	IOVDD / 4
2	VSS	VSS
3	VSS	VSS
4	DVDD	DVDD / 4
7	DECOUPLE	DECOUPLE

If an internal signal is selected for PORTPOS or PORTNEG, selecting GND on the opposite input will instruct the converter to perform a single-ended conversion. In the case where PORTPOS = GND, the IADC logic will automatically swap the direct input selected by PORTNEG to the positive input of the ADC. Otherwise, a differential conversion is performed with PORTPOS selecting the positive and PORTNEG selecting the negative input.

### 23.3.5.3 ABUS Input Selection Examples

When configuring to measure a single-ended signal through the ABUS, the positive input selection should always point to the desired input, and PORTNEG should be programmed to GND.

Correct configuration examples for single-ended conversions are shown in [Figure 23.10 Single-Ended Port/Pin Selection Odd Channel on page 751](#) and [Figure 23.11 Single-Ended Port/Pin Selection Even Channel on page 751](#). Note that the IADC logic will automatically swap the appropriate multiplexer to the positive input of the ADC.

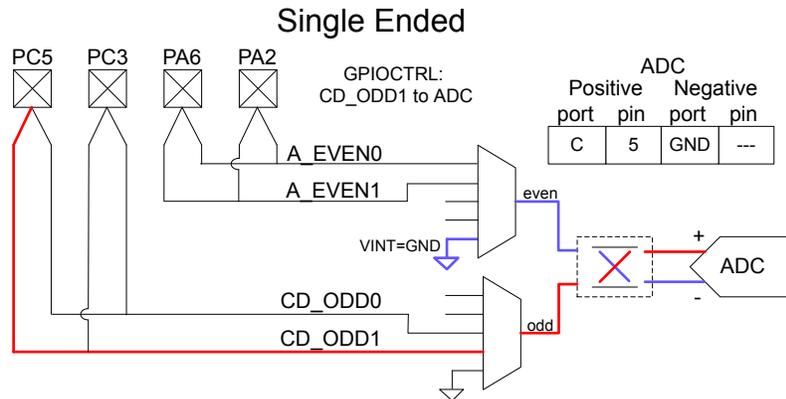

Figure 23.10. Single-Ended Port/Pin Selection Odd Channel

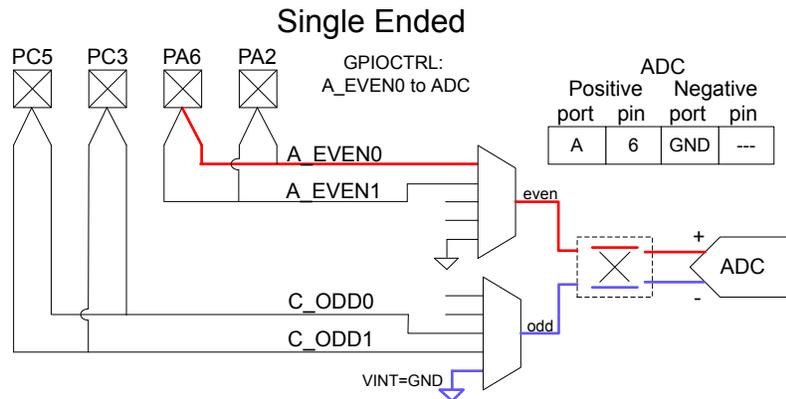

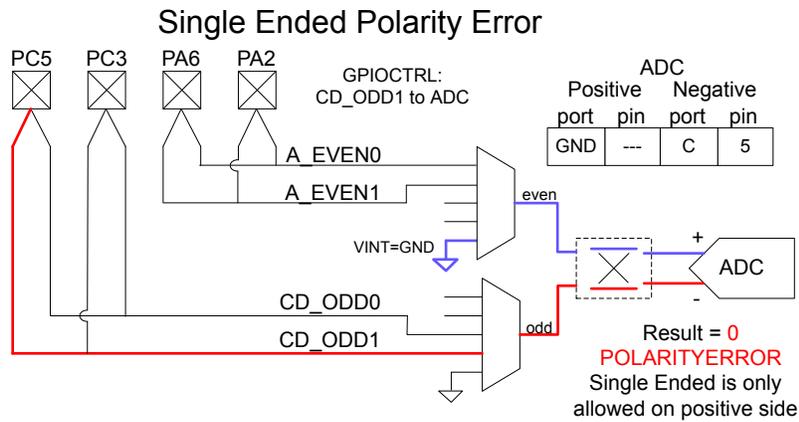

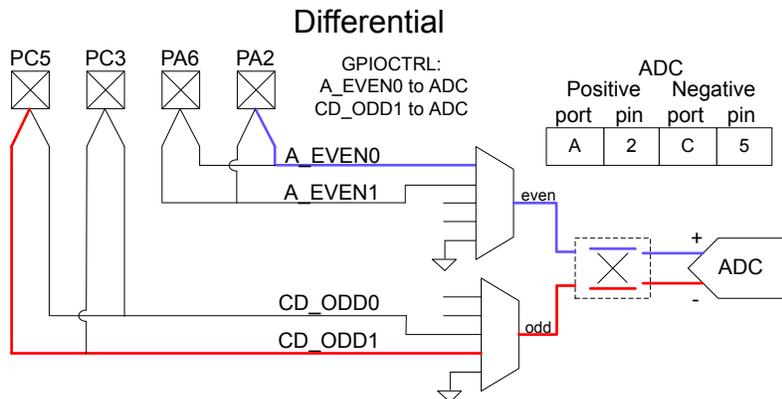

Figure 23.11. Single-Ended Port/Pin Selection Even Channel

[Figure 23.12 Single-Ended Port/Pin Selection Polarity Error on page 752](#) shows an example where the PORTPOS input has been configured to GND, with PORTNEG and PINNEG configured for a GPIO pin. This will result in a polarity error (POLARITYERRIF in IADC\_IF will be set) and any conversion result will be 0.

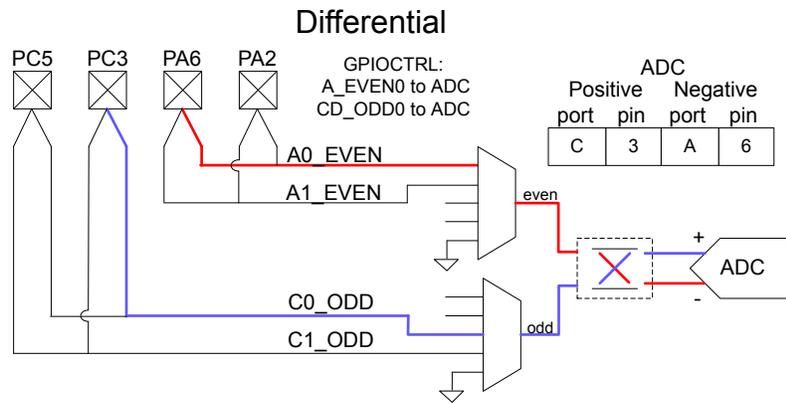

**Figure 23.12. Single-Ended Port/Pin Selection Polarity Error**

Correct configuration examples for differential conversions are shown in [Figure 23.13 Differential Port/Pin Selection without Swap on page 752](#) and [Figure 23.14 Differential Port/Pin Selection with Swap on page 753](#). In both these examples, the inputs were selected from one EVEN multiplexer channel and one ODD multiplexer channel. As with single-ended mode, the IADC logic will automatically swap the multiplexer connections to the IADC input if needed.

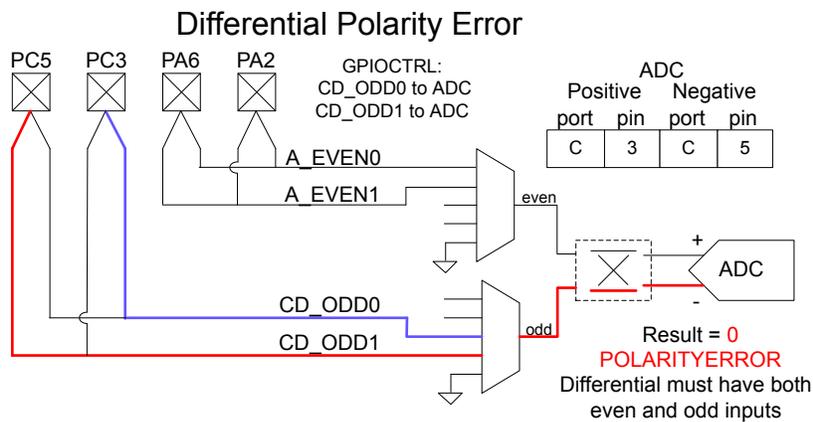

**Figure 23.13. Differential Port/Pin Selection without Swap**

**Figure 23.14. Differential Port/Pin Selection with Swap**

Figure 23.15 Differential Port/Pin Selection Polarity Error on page 753 shows an example where the both the positive and the negative input selections point to ODD buses. Even though the IADC has been allocated both buses, they both route through the ODD input multiplexer and cannot be measured against one another. This will result in a polarity error (POLARITYERRIF in IADC\_IF will be set) and any conversion result will be 0x7FFFF. Likewise, a polarity error will occur if both inputs are selected from EVEN buses.

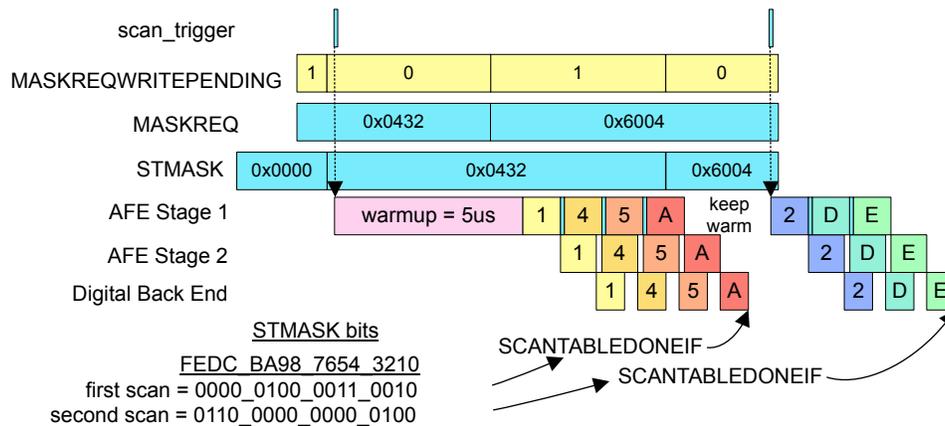

**Figure 23.15. Differential Port/Pin Selection Polarity Error**

### 23.3.5.4 Scan Queue

The scan queue allows the IADC to automatically convert up to 16 channels in sequence without CPU intervention. Input and configuration selection for each channel in the scan table is specified by the IADC\_SCANx register for that channel (channel 0 is configured with IADC\_SCAN0, channel 1 is configured with IADC\_SCAN1, and so on). The IADC\_MASKREQ register allows software to define which of the scan table entries (IADC\_SCANx) to convert during a scan. For example, channels 0, 1, and 7 can be enabled by writing bits 0, 1, and 7 of IADC\_MASKREQ to 1 (IADC\_MASKREQ = 0x0083).

The IADC\_SCANx registers must be configured when the IADC module is disabled (IADC\_EN\_EN = 0). IADC\_MASKREQ can be written while IADC\_EN\_EN is set to 1. If a scan operation is in progress, MASKREQ will be synchronized and held until the current scan operation has completed. Then MASKREQ is copied into the STMASK register for the next scan operation. IADC\_STMASK is the working copy of the MASKREQ used by the IADC during a scan. MASKREQ will only transfer to STMASK when the scan queue is not scanning and converting the scan table. IADC\_STATUS\_MASKWRITEPENDING can be used by software to see when the MASKREQ write has been transferred to STMASK. Writing a new MASKREQ in the middle of a scan will not corrupt the current scan. Software which writes to MASKREQ during a scan operation must ensure IADC\_STATUS\_MASKWRITEPENDING returns to 0 before updating IADC\_MASKREQ again. [Figure 23.16 MASKREQ Updates on page 754](#) shows a time line of when the MASKREQ write is updated.

**Figure 23.16. MASKREQ Updates**

### 23.3.6 Gain and Offset Correction

The IADC has built in gain and offset correction capabilities. Each of the two configuration groups contains its own correction values stored in the IADC\_SCALEx register, allowing the IADC to automatically apply the appropriate correction for the IADC configuration that is being used.

Gain correction is performed through a fixed-point 16-bit value with a range from 0.75x to 1.2499x. The 3 MSBs of the gain value are not directly writeable. The GAIN3MSB bit in IADC\_SCALEx is used to select between 011 and 100 for the 3 MSBs, and the lower 13 bits are programmed directly into IADC\_SCALEx\_GAIN13LSB. Clearing GAIN3MSB to 0 selects the most significant bits of the gain as 011, representing a range from 0.75x to 0.9999x. Setting GAIN3MSB to 1 selects the most significant bits of the gain as 100, representing a range from 1.00x to 1.2499x.

Offset correction is controlled by the OFFSET field in IADC\_SCALEx. It is important to note that the offset correction does not have a direct 1-to-1 relationship with the LSB of the IADC output, and depends on both the OSR and gain correction settings. The offset correction range is +/- 12.5% of full scale. OFFSET is encoded as a 2's complement, 18-bit number with the LSB representing 1 / 2<sup>20</sup> of full scale. Thus, bit 8 of OFFSET aligns with bit 0 of the 12-bit IADC output word.

#### 23.3.6.1 Using Production Calibration Parameters

IADC calibration is performed on every device during Silicon Labs production test and production calibration parameters are stored in the flash DI page. The production calibration values are useful for a wide variety of possible IADC configurations, but do not map directly to the offset and gain correction fields in the IADC\_SCALEx registers. Software must calculate the actual offset and gain correction values from the factory calibration values.

### 23.3.6.1.1 Gain Correction

The IADC gain error is designed to be minimal with the digital gain correction set to 1.0 ( $GAIN3MSB = 1$  and  $GAIN13LSB = 0$ ). Tighter gain error is achieved by adjusting these values in `IADC_SCALEx`. Using this gain correction mechanism will result in a slight increase to the DNL of the converter, which is reduced by higher OSR settings.

Gain error is measured during production test at various settings of `ANALOGGAIN`, and stored in the `DEVINFO_IADC0GAIN0` and `DEVINFO_IADC0GAIN1` locations. The `GAINCANA1` field is used for 0.5x and 1x `ANALOGGAIN` settings, while `GAINCANA2`, `GAINCANA3`, and `GAINCANA4` are used for `ANALOGGAIN` settings of 2x, 3x, and 4x, respectively.

The `GAINCANAn` values are expressed as the full 16-bit fixed-point gain, and must be compressed before writing to the `IADC_SCALEx` register.

To apply a factory-calibrated gain:

1. Read the appropriate `GAINCANAn` field from the `DEVINFO` locations for the selected `ANALOGGAIN`.
2. Write the MSB (bit 15) of `GAINCANAn` to `GAIN3MSB` in `IADC_SCALEx`.
3. Write the 13 LSBs (bits 12-0) of `GAINCANAn` to `GAIN13LSB` in `IADC_SCALEx`.

### 23.3.6.1.2 Offset Correction

Offset is impacted by the selected `ANALOGGAIN` and OSR settings in `IADC_CFGx`, the `GAIN3MSB` and `GAIN13LSB` values in `IADC_SCALEx`, and the voltage reference. Offset is production calibrated for any combination of possibilities, but the `OFFSET` register value must be calculated for the given situation before it can be effectively used.

The production offset calibration consists of four 16-bit terms written to the DEVINFO space: OFFSETANA1NORM, OFFSETANA2NORM, OFFSETANA3NORM, and OFFSETANABASE. The following procedures will determine the setting for the OFFSET register based on production calibration values.

**Step 1:** Determine the offset gain adjustment term (`off_gain`) based on ANALOGGAIN.

For ANALOGGAIN set to 0.5x or 1x:

$$\text{off\_gain} = 0$$

For ANALOGGAIN set to 2x, 3x, or 4x, `off_gain` is calculated as:

$$\text{off\_gain} = \text{OFFSETANA2NORM} * (\text{gain} - 1)$$

The following table summarizes these equations:

**Table 23.4. Offset Gain Adjustment**

ANALOGGAIN Setting	Analog front-end gain	Offset Gain Adjustment Term ( <code>off_gain</code> )
ANAGAIN0P5	0.5 x	0
ANAGAIN1	1 x	0
ANAGAIN2	2 x	OFFSETANA2NORM * 1
ANAGAIN3	3 x	OFFSETANA2NORM * 2
ANAGAIN4	4 x	OFFSETANA2NORM * 3

**Step 2:** Calculate the analog offset adjustment term (`off_ana`) based on OSR and `off_gain`.

For an OSR of 2x (OSRHS = 0):

$$\text{off\_ana} = \text{OFFSETANA1NORM} + \text{off\_gain}$$

For all other OSR settings, 4x - 64x:

$$\text{off\_ana} = \text{OFFSETANABASE} + 2 * (\text{OFFSETANA3NORM} - \text{off\_gain}) / \text{OSR}$$

The following table expresses these equations:

**Table 23.5. Analog Offset Adjustment**

OSRHS Setting	OSR	Analog Offset Adjustment Term ( <code>off_ana</code> )
HISPD2	2 x	OFFSETANA1NORM + <code>off_gain</code>
HISPD4	4 x	OFFSETANABASE + (OFFSETANA3NORM - <code>off_gain</code> )/2
HISPD8	8 x	OFFSETANABASE + (OFFSETANA3NORM - <code>off_gain</code> )/4
HISPD16	16 x	OFFSETANABASE + (OFFSETANA3NORM - <code>off_gain</code> )/8
HISPD32	32 x	OFFSETANABASE + (OFFSETANA3NORM - <code>off_gain</code> )/16
HISPD64	64 x	OFFSETANABASE + (OFFSETANA3NORM - <code>off_gain</code> )/32

**Step 3:** Compensate for reference voltage differences.

The `off_ana` term represents the offset at the input of the ADC, meaning that the reference voltage will have an impact on the magnitude of the offset at the output. Production calibration values are determined with a 1.25 V reference source. If a voltage significantly different than 1.25 V is used for  $V_{REF}$ , adjust the `off_ana` term by a factor of  $1.25 / V_{REF}$ .

$$\text{off\_ana} = \text{off\_ana} * (1.25 / V_{REF})$$

**Step 4:** Calculate total offset by adding the analog offset to the systematic offset.

Systematic offset is a fixed number dependent on OSR, and calculated according to the following equation:

$$\text{off\_sys} = 640 * (256 / \text{OSR})$$

Total uncorrected offset ( $\text{off\_tot}$ ) is calculated by:

$$\text{off\_tot} = (\text{off\_ana} * 4 + \text{off\_sys})$$

**Step 5:** Apply gain error correction, if needed.

Before writing the OFFSET field, the total uncorrected offset must be multiplied by the gain calibration factor. If the gain calibration factor is equal to 1.0 (0x8000 in 16-bit hex, or GAIN3MSB = 1 and GAIN13LSB = 0), this step may be skipped. Otherwise, adjust  $\text{off\_tot}$  according to the following equation:

$$\text{off\_tot} = \text{GAIN\_FACTOR} * (\text{off\_tot} + 0x80000) - 0x80000$$

where  $\text{GAIN\_FACTOR} = \text{GAINCANAn} / 32768$ .

**Step 6:** Write the offset correction value to the OFFSET field.

The OFFSET field holds an 18-bit 2's complement number, which should be the negation of the total offset, or  $-(\text{off\_tot})$ . Before writing to the SCALE register, any leading sign bits should be masked off to avoid corrupting the programmed gain settings.

$$\text{OFFSET} = 0x3FFFF \& (-\text{off\_tot})$$

### 23.3.6.2 Calibration

Calibration can be performed in-system to correct for external errors and provide more accurate measurements. The general calibration procedure is as follows:

1. Configure the ADC to the desired mode, OSR, analog gain settings, reference source, etc.
2. Force the IADC to use bipolar output for the conversion:  $\text{IADC\_CFGx\_TWOSCOMPL} = \text{FORCEBIPOLAR}$ .
3. Set the initial offset to the maximum negative value ( $\text{IADC\_SCALEx\_OFFSET} = 0x20000$ ), and the initial gain to 1.0 (GAIN3MSB = 1, GAIN13LSB = 0x0000). This will prevent output saturation when measuring full scale.
4. Apply a full-scale positive input to the IADC and perform a conversion ( $\text{result\_fullscale}$ ). Multiple conversions can be performed and averaged together to reduce any system-level noise.
5. Apply a zero input to the IADC and perform a conversion ( $\text{result\_zero}$ ). Multiple conversions can be performed and averaged together to reduce any system-level noise.
6. Calculate the gain correction factor: Divide the expected value by the difference in the measured values ( $\text{result\_fullscale} - \text{result\_zero}$ ). Note that the offset adjustment in Step 3 will be canceled out by this calculation.
7. Write the gain correction factor to the IADC using the GAIN3MSB and GAIN13LSB fields in IADC\_SCALEx.
8. Set IADC\_SCALEx\_OFFSET to 0x00000 in preparation for the offset calibration.
9. Apply the desired zero voltage to the IADC input and perform a conversion ( $\text{result\_offset}$ ). Multiple conversions can be performed and averaged together to reduce any system-level noise.
10. Multiply  $\text{result\_offset}$  to convert to a 20-bit value ( $\text{result\_offset\_20}$ ). For example, a 12-bit result should be multiplied by 256.
11. Negate  $\text{result\_offset\_20}$  and write the value to IADC\_SCALEx\_OFFSET.

Note that the IADC\_SCALEx\_OFFSET field is 18 bits. If the result is greater than  $(2^{17} - 1)$  or less than  $(-2^{17})$ , the offset is too large to be corrected.

### 23.3.7 Output Data FIFOs

The single and scan queues each have a eight-word data FIFO. Conversions results are written to the output data FIFO associated with the queue. Single queue results are written to the single FIFO and scan queue results are written to the scan data FIFO. The two queues are identical in operation, but independent.

Conversion results are read from the single FIFO using IADC\_SINGLEFIFODATA. Reading SINGLEFIFODATA will pop the oldest result from the FIFO. It is also possible to read the most recent valid data word using IADC\_SINGLEDATA. Reading SINGLEDATA does not pop a conversion from the FIFO. Similarly, the scan FIFO results are read with IADC\_SCANFIFODATA, which reads the oldest result and pops the FIFO. The most recent scan result can be read using IADC\_SCANDATA.

When the single FIFO has valid data, the SINGLEFIFODV flag in IADC\_STATUS is set to 1. When the scan FIFO has valid data SCANFIFODV in IADC\_STATUS is set to 1. These data valid status bits are cleared automatically whenever the associated FIFO is empty. For more granular FIFO status, the number of data words present in the FIFO is indicated in IADC\_SINGLEFIFOSTAT (for single FIFO) or IADC\_SCANFIFOSTAT (for scan FIFO).

A programmable data level watermark is also available for the FIFOs, allowing hardware to trigger interrupts or DMA operations when a specified number of conversion results are available. The DVL field in register SINGLEFIFOCFG or SCANFIFOCFG sets the watermark level, between 1 and 4 conversions. If the number of valid entries in the FIFO reaches or exceeds the level set in DVL, the SINGLEFIFODVLIF (for single FIFO) or SCANFIFODVLIF (for scan FIFO) flag in the IADC\_IF register will be set to 1. If enabled, an interrupt or DMA request will be triggered when the flag is set.

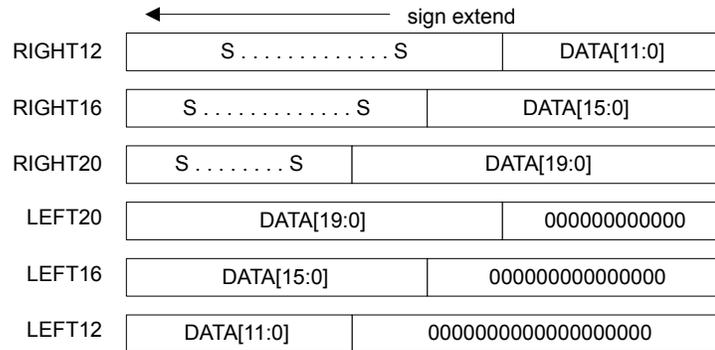

By default, DMA requests are turned off for operation in EM2 or EM3. However, the DMAWUFIFOSINGLE or DMAWUFIFOSCAN bits in SINGLEFIFOCFG or SCANFIFOCFG may be used to enable DMA operations in these lower energy modes.

Overflow and underflow status flags are also available in IADC\_IF. An overflow condition occurs when an IADC conversion completes, but the associated FIFO is already full. In an overflow case the SINGLEFIFOOVFIF or SCANFIFOOVFIF flag will be set. The most recent conversion will still be available in the SINGLEDATA or SCANDATA register, but the FIFO will not be updated with the new data. An underflow condition occurs when software or hardware attempts to read from an empty FIFO. In an underflow case the SINGLEFIFOUFIF or SCANFIFOUFIF flag will be set.

### 23.3.7.1 Data Alignment and Channel ID

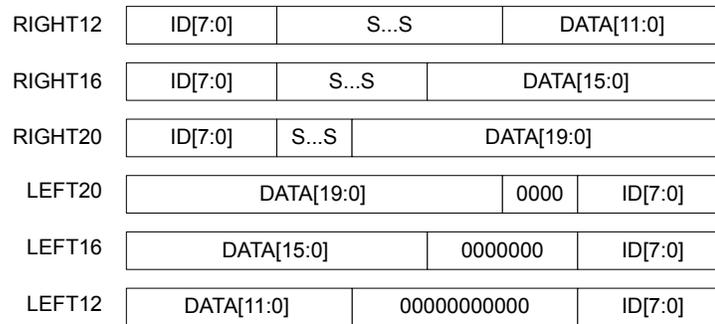

The IADC has data alignment options and the ability to include a channel ID along with the conversion data. For the single queue, alignment and channel ID are configured in the IADC\_SINGLEFIFOCFG register. For the scan queue, alignment and channel ID are configured in the IADC\_SCANFIFOCFG register.

The ALIGNMENT bit field specifies the data justification and the number of data bits as shown in [Figure 23.17 Data Alignment on page 759](#). By default, the converter will produce 12-bit right-justified data, corresponding to ALIGNMENT = RIGHT12.

**Figure 23.17. Data Alignment**

The SHOWID bit controls whether the conversion channel ID is included in the output data word. This option is primarily used with the scan FIFO to help software determine which channel each conversion result came from. If SHOWID is enabled for single conversions, the ID will always be set to 0x20. [Figure 23.18 Data Alignment With ID on page 759](#) shows output data formatting including the ID, when SHOWID = 1.

ID for single queue result is 0x20

**Figure 23.18. Data Alignment With ID**

### 23.3.7.2 Output Polarity

The output polarity of the IADC is controlled by the TWOSCOMPL field in the IADC\_CFGx register. The IADC supports unipolar and bipolar output formatting independent of the input configuration. By default, the TWOSCOMPL field is set to AUTO, meaning that single-ended conversions will produce unipolar output, and differential conversions will produce bipolar output. The polarity can be forced to unipolar or bipolar mode by setting TWOSCOMPL to FORCEUNIPOLAR or FORCEBIPOLAR, respectively.

Unipolar samples are unsigned integers representing zero to positive full-scale. Bipolar samples are two's-complement signed integers, representing negative full-scale to positive full-scale. Using unipolar mode on a differential input signal allows for more dynamic range when the signal is positive, but will saturate to zero when the signal is negative.

**Note:** If bipolar output is used with a single-ended input configuration, it is possible to see negative output values when the input is close to ground. However, the input voltage is still limited by the supply range of the device.

### 23.3.7.3 Digital Accumulation and Averaging

The IADC may optionally accumulate and average several conversion results before posting an output word to the FIFO. Digital averaging is controlled by the DIGAVG field in the IADC\_CFGx register. It can be configured to average 1, 2, 4, 8, or 16 samples. The IADC will collect the number of samples specified by DIGAVG on the selected channel slot back-to-back, and produce only one averaged output word.

### 23.3.7.4 Output Resolution

The usable output resolution of the IADC is a minimum of 12 bits, when the oversampling ratio is set to 2 and no digital averaging is used (DIGAVG = AVG1). An extra bit of output resolution is produced for every power of 2 increase in either of these settings. In other words, the output resolution of the ADC can be determined as:

$$\text{Output Resolution} = 11 + \log_2(\text{OversamplingRatio} \times \text{DigitalAveraging})$$

The MSB is always left-aligned within the DATA field, and the output word will be truncated to 12, 16, or 20 bits, as shown in [Figure 23.17 Data Alignment on page 759](#) and [Figure 23.18 Data Alignment With ID on page 759](#). When using 16 or 20 bit alignment with lower oversampling ratio and digital averaging settings, LSBs of the output can contain residual effects of the offset and gain computation. These residual effects do not represent additional information about the input signal. Any extra LSBs can be masked to 0 by software.

**Table 23.6. Output Resolution Masking Examples**

Alignment Setting	Oversampling Ratio	Digital Averaging	Number of averaged samples	Output Resolution	Recommended Mask for DATA field
16-bit	2x	1x	2	12 bits	0xFFFF0
16-bit	8x	2x	16	15 bits	0xFFFFE
20-bit	2x	1x	2	12 bits	0xFFFF00
20-bit	16x	4x	64	17 bits	0xFFFFF8

### 23.3.7.5 Flushing the FIFOs

Each FIFO has a command bit in the IADC\_CMD register that can be used to trigger a FIFO flush. The FIFO data may be flushed independently for each queue. To flush a FIFO:

1. The IADC must be enabled with the clock running.
2. Disable the queue associated with the FIFO using the SCANSTOP or SINGLESTOP bits in the IADC\_CMD register.
3. Ensure the queue is disabled by reading the associated flag in the IADC\_STATUS register (SINGLEQEN or SCANQEN).
4. Set the command bit to flush the desired FIFO (SINGLEFIFOFLUSH or SCANFIFOFLUSH) in the IADC\_CMD register.
5. Wait for the corresponding status bit (SINGLEFIFOFLUSHING or SCANFIFOFLUSHING) in IADC\_STATUS to go low.

### 23.3.8 Window Compare

The IADC has a window comparison unit that can trigger interrupts conditional on the output data of the converter. The window comparison unit has two thresholds - greater than or equal (ADGT), and less than or equal (ADLT), which are programmable through the IADC\_CMPTHR register. The ADGT and ADLT thresholds always use a 16 bit, left-justified format, regardless of the format specified by the FIFO. The 12-bit conversion result will be compared against the upper 12 bits of the window comparator.

The window comparison unit is active on the ADC output on a conversion-by-conversion basis, and is shared between the two FIFOs. It is not possible to set different window comparison thresholds for different channels or for each FIFO. However, each channel specified in the IADC has a CMP bit field to enable the window comparison on results from that channel. For example, it is possible to only apply the window comparison and associated interrupt to scan channel #3 by setting the CMP field in IADC\_SCAN3 to 1. When the CMP field associated with a channel is 0, the window comparator will not be active for results from that channel.

The window comparator supports conditional triggering on output results which are inside or outside a specified window. When ADLT is greater than or equal to ADGT, the comparator will trigger on an "inside" condition, or when  $DATA \leq ADLT$  and  $DATA \geq ADGT$ . When ADLT is less than ADGT, the comparator will trigger on an "outside" condition, or when  $DATA \leq ADLT$  or  $DATA \geq ADGT$ .

Figure 23.19 Window Comparison Examples on page 761 shows different configurations of the ADLT and ADGT values and the resulting windows. When the window comparator detects that the appropriate conditions are met (shown by the shaded region in the figure), it will generate an interrupt via the SINGLECMPIF flag for conversions on the single queue, or via the SCANCMPIF flag for conversions on the scan queue.

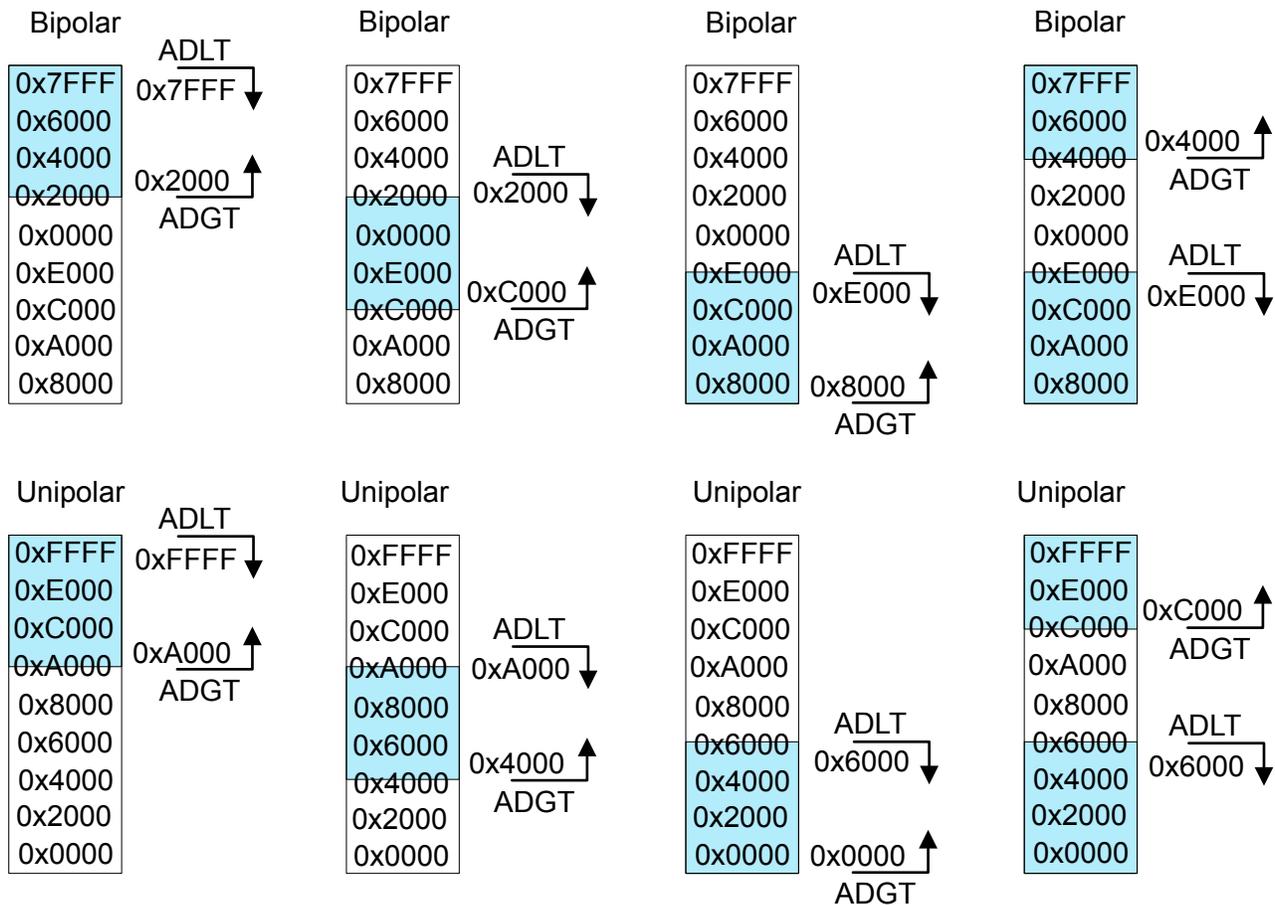

Figure 23.19. Window Comparison Examples

### 23.3.9 Interrupts

Interrupts are enabled in the IADC\_IEN register, allowing interrupts to be generated on several different IADC conditions. Each of the flags in IADC\_IF has a corresponding enable bit in the IADC\_IEN register. A brief overview of the available interrupt sources is shown in the list below; more details can be found in the relevant sections of this chapter.

- SINGLEFIFODVLIF - The single FIFO watermark specified in SINGLEFIFOCFG\_DVL has been reached or exceeded.
- SCANFIFODVLIF - The scan FIFO watermark specified in SCANFIFOCFG\_DVL has been reached or exceeded.
- SINGLECMPIF - A conversion result from the single queue tripped the window comparator.
- SCANCMPIF - A conversion result from the scan queue tripped the window comparator.
- SCANENTRYDONEIF - A scan queue conversion has completed.
- SCANTABLEDONEIF - A scan queue operation has completed (all channels specified in the scan mask have been converted once).
- POLARITYERRIF - A channel polarity selection error has occurred (two channels from the EVEN multiplexer or two channels from the ODD multiplexer were selected for positive and negative inputs).
- PORTALLOCERRIF - A port allocation error has occurred (a pin not allocated to the IADC in the GPIO bus allocation registers was requested).
- SINGLEFIFOOFIF - A single FIFO overflow has occurred.
- SCANFIFOOFIF - A scan FIFO overflow has occurred.
- SINGLEFIFOUFIF - A single FIFO underflow has occurred.
- SCANFIFOUFIF - A scan FIFO underflow has occurred.
- EM23ABORTERRORIF - The system entered EM2 or EM3 while the IADC was converting and using a clock not supported in EM2 or EM3.

Hardware sets the interrupt flags in IADC\_IF, and the flags remain set (sticky) until cleared by software. The interrupt flags should be cleared before enabling the IADC to remove any previous interrupt history. Clearing or setting interrupt bits can be done by writing to IADC\_IF with a set or clear mask.

### 23.3.10 LESENSE Interface

The LESENSE peripheral can be set up to trigger IADC0 conversions and use data from IADC0 to evaluate sensor status. The channel scanner hardware is used by LESENSE in this mode and the IADC SCAN trigger must be set to LESENSE. The SCAN queue can only be used for LESENSE when operated in this mode, but the SINGLE queue may still be used independently.

When an LESENSE channel is active, the OFFSET field in LESENSE\_CHx\_INTERACT field is used to determine which of the ADC's 16 scanner channels is sampled. OFFSET = 0 corresponds to IADC\_SCAN0, OFFSET = 1 corresponds to IADC\_SCAN1, and so on.

The IADC sample is triggered when the sample delay configured in LESENSE\_CHx\_TIMING\_SAMPLEDLY has expired. Results from the conversion are sent to the LESENSE result FIFO for further processing by LESENSE, and are not available in the SCAN FIFO.

## 23.4 IADC Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	IADC_IPVERSION	R	IPVERSION
0x004	IADC_EN	RW ENABLE	Enable
0x008	IADC_CTRL	RW CONFIG	Control
0x00C	IADC_CMD	W SYNC	Command

## 23.5 IADC Register Description

### 23.5.1 IADC\_IPVERSION - IPVERSION

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x2																															
<b>Access</b>	R																															
<b>Name</b>	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x2	R	<b>IP version ID</b>
<p>The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.</p>				

### 23.5.2 IADC\_EN - Enable

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	0x0
<b>Access</b>																															R	RW
<b>Name</b>																															DISABLING	EN

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISABLING	0x0	R	<b>Disablement busy status</b>
<p>When EN is cleared, DISABLING status is set immediately, and cleared when disablement finishes. Disablement resets peripheral cores and not APB registers except hardware updated registers such as INTFLAGS and FIFOs.</p>				
0	EN	0x0	RW	<b>Enable IADC Module</b>
<p>The EN bit enables the module. Software should write to CONFIG type registers before setting the EN bit. Software should write to SYNC type registers only after setting the EN bit.</p>				
Value		Mode		Description
0		DISABLE		Disable
1		ENABLE		Enable

### 23.5.3 IADC\_CTRL - Control

Offset	Bit Position																																				
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

The resulting CLK_SRC_ADC must be 40 MHz or less.</td> </tr> </tbody> </table>	Value	Mode	Description	0	DIV1	Use CMU_CLK_ADC directly. The source clock must be 40 MHz or less.	1	DIV2	Divide CMU_CLK_ADC by 2 before using it. The resulting CLK_SRC_ADC must be 40 MHz or less.	2	DIV3	Divide CMU_CLK_ADC by 3 before using it. The resulting CLK_SRC_ADC must be 40 MHz or less.	3	DIV4	Divide CMU_CLK_ADC by 4 before using it. The resulting CLK_SRC_ADC must be 40 MHz or less.
Value	Mode	Description																	
0	DIV1	Use CMU_CLK_ADC directly. The source clock must be 40 MHz or less.																	
1	DIV2	Divide CMU_CLK_ADC by 2 before using it. The resulting CLK_SRC_ADC must be 40 MHz or less.																	
2	DIV3	Divide CMU_CLK_ADC by 3 before using it. The resulting CLK_SRC_ADC must be 40 MHz or less.																	
3	DIV4	Divide CMU_CLK_ADC by 4 before using it. The resulting CLK_SRC_ADC must be 40 MHz or less.																	
27:23	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>																	
22:16	TIMEBASE	0x0	RW	<b>Time Base</b> ADC clock cycles (TIMEBASE + 1) needed to generate a 1 us interval for warm up and start up timing. Does not allow less than 2 cycles. A setting of 0x0 (1 cycle) is replaced with 0x1 (2 cycles).															
15:6	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>																	
5:4	WARMUPMODE	0x0	RW	<b>Warmup Mode</b> Select the warmup mode for the ADC.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>NORMAL</td> <td>Shut down the IADC after conversions have completed.</td> </tr> <tr> <td>1</td> <td>KEEPINSTANDBY</td> <td>Switch to standby mode after conversions have completed. The next warmup time will require 1us.</td> </tr> <tr> <td>2</td> <td>KEEPWARM</td> <td>Keep IADC fully powered after conversions have completed.</td> </tr> </tbody> </table>	Value	Mode	Description	0	NORMAL	Shut down the IADC after conversions have completed.	1	KEEPINSTANDBY	Switch to standby mode after conversions have completed. The next warmup time will require 1us.	2	KEEPWARM	Keep IADC fully powered after conversions have completed.			
Value	Mode	Description																	
0	NORMAL	Shut down the IADC after conversions have completed.																	
1	KEEPINSTANDBY	Switch to standby mode after conversions have completed. The next warmup time will require 1us.																	
2	KEEPWARM	Keep IADC fully powered after conversions have completed.																	
3	DBGHALT	0x0	RW	<b>Debug Halt</b>															

Bit	Name	Reset	Access	Description
	ADC behavior when halted by debugger.			
	Value	Mode		Description
	0	NORMAL		Continue operation as normal during debug mode
	1	HALT		Complete the current conversion and then halt during debug mode
2	ADCCLKSUSPEND1	0x0	RW	<b>ADC_CLK Suspend - PRS1</b>
	This only functions with single trigger select set to PRSPOS or PRSNEG. In EM0 and EM1, this gates the local clock while clock source remains running. In EM2 and EM3, this disables the clock source until the PRSPOS or PRSNEG event is detected. This bit has no effect if the local IADC timer is running.			
	Value	Mode		Description
	0	PRSWUDIS		Normal mode which does not disable the ADC_CLK.
	1	PRSWUEN		ADCCLKWUEN will gate off ADC_CLK until the trigger is detected provided the internal timer is not selected as the trigger. Once the trigger is detected the ADC_CLK will be started, the band gap will be started, the ADC will be warmed up, and the SCAN Table and the Single entry will be converted. Once the conversions are done, the ADC_CLK will be gated off.
1	ADCCLKSUSPEND0	0x0	RW	<b>ADC_CLK Suspend - PRS0</b>
	This only functions with scan trigger select set to PRSPOS or PRSNEG. In EM0 and EM1, this gates the local clock while clock source remains running. In EM2 and EM3, this disables the clock source until the PRSPOS or PRSNEG event is detected. This bit has no effect if the local IADC timer is running.			
	Value	Mode		Description
	0	PRSWUDIS		Normal mode which does not disable the ADC_CLK.
	1	PRSWUEN		ADCCLKWUEN will gate off ADC_CLK until the trigger is detected provided the internal timer is not selected as the trigger. Once the trigger is detected the ADC_CLK will be started, the band gap will be started, the ADC will be warmed up, and the SCAN Table and the Single entry will be converted. Once the conversions are done, the ADC_CLK will be gated off.
0	EM23WUCONVERT	0x0	RW	<b>EM23 Wakeup on Conversion</b>
	EM23 wake up on conversion			
	Value	Mode		Description
	0	WUDVL		When using suspend mode, conversions performed in EM2 or EM3 should not wake up the DMA until the FIFO's DVL setting is reached. This saves more power for large OSR settings or infrequent sampling.
	1	WUCONVERT		When using suspend mode, conversions performed in EM2 or EM3 will wake up the DMA and keep it awake until the conversions are done, regardless of the DVL setting. This mode burns more power, but it is useful when the conversion rate is faster than the time for the DMA to cycle through wake up and going back to sleep as it converts more than 4 scan table entries. Without using the wake up on conversion mode, the FIFO may overflow while the DMA is going in and out of sleep.

### 23.5.4 IADC\_CMD - Command

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>							0x0	0x0							0x0	0x0											0x0	0x0		0x0	0x0	
<b>Access</b>							W(nB)	W(nB)							W(nB)	W(nB)											W(nB)	W(nB)		W(nB)	W(nB)	
<b>Name</b>							SCANFIFOFLUSH	SINGLEFIFOFLUSH							TIMERDIS	TIMEREN											SCANSTOP	SCANSTART		SINGLESTOP	SINGLESTART	

Bit	Name	Reset	Access	Description
31:26	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
25	SCANFIFOFLUSH	0x0	W(nB)	<b>Flush the Scan FIFO</b>  Flush the Scan FIFO. The IADC must be enabled, not suspended, and the IADC clock must be running. Operation has completed when STATUS.SCANFIFOFLUSHING has gone low. The scan queue should be disabled. Any incoming scan queue data will be discarded during the flush.
24	SINGLEFIFOFLUSH	0x0	W(nB)	<b>Flush the Single FIFO</b>  Flush the Single FIFO. The IADC must be enabled, not suspended, and the IADC clock must be running. Operation has completed when STATUS.SINGLEFIFOFLUSHING has gone low. The Single queue should be disabled. Any incoming single queue data will be discarded during the flush.
23:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
17	TIMERDIS	0x0	W(nB)	<b>Timer Disable</b>  Disable the local timer and reset the counter to timer reload value.
16	TIMEREN	0x0	W(nB)	<b>Timer Enable</b>  Enable the local timer.
15:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	SCANSTOP	0x0	W(nB)	<b>Scan Queue Stop</b>  Stop the Scan queue. Disables Scan triggers and clears pending conversions in the Scan queue. Any conversion that has already started will continue until it is complete. If the scan queue is stopped before all entries of the scan table have completed, the remaining entries will not be converted.
3	SCANSTART	0x0	W(nB)	<b>Scan Queue Start</b>  Start the Scan queue. Enables triggering of the Scan queue.
2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	SINGLESTOP	0x0	W(nB)	<b>Single Queue Stop</b>  Stop the Single queue. Disables Single queue triggers and clears pending conversions in the Single queue. Any conversion that has already started will continue until it is complete.
0	SINGLESTART	0x0	W(nB)	<b>Single Queue Start</b>

Bit	Name	Reset	Access	Description
				Start the Single queue. Enables triggering of the Single queue.

### 23.5.5 IADC\_TIMER - Timer

Offset	Bit Position																																
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																																	0x0
<b>Access</b>																																	RW
<b>Name</b>																																	TIMER

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15:0	TIMER	0x0	RW	<b>Timer Period</b> Number of CLK_SRC_ADC cycles per timer event.

## 23.5.6 IADC\_STATUS - Status

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset		0x0						0x0			0x0	0x0				0x0	0x0	0x0					0x0	0x0		0x0		0x0	0x0		0x0	0x0
Access		R						R			R	R				R	R	R					R	R		R		R	R		R	R
Name		ADCWARM						SYNCBUSY			MASKREQWRITEPENDING	SINGLEWRITEPENDING				TIMERACTIVE	SCANFIFOFLUSHING	SINGLEFIFOFLUSHING					SCANFIFODV	SINGLEFIFODV		CONVERTING		SCANQUEUEPENDING	SCANQEN		SINGLEQUEUEPENDING	SINGLEQEN

Bit	Name	Reset	Access	Description
31	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
30	ADCWARM	0x0	R	<b>ADCWARM</b>  The ADC analog front end and reference require a delay before converting when coming from a powered down or stand-by state. This status bit indicates that the analog front end and reference are ready.
29:25	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
24	SYNCBUSY	0x0	R	<b>SYNCBUSY</b>  Indicates synchronization ongoing
23:22	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
21	MASKREQWRITE-PENDING	0x0	R	<b>MASKREQ write pending</b>  A write to MASKREQ is pending. The ADC converts using a local working mask register, and only transfers MASKREQ to the local working version when the SCAN queue is not converting.
20	SINGLEWRITEPEND-ING	0x0	R	<b>SINGLE write pending</b>  The SINGLE register write is pending. The ADC converts using a local working version of the SINGLE register, and only transfer SINGLE to the local working version when the SINGLE queue is not being converted.
19:17	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
16	TIMERACTIVE	0x0	R	<b>Timer Active</b>  The local timer is running.
15	SCANFIFOFLUSHING	0x0	R	<b>The Scan FIFO is flushing</b>  A scan data FIFO flush operation is in progress.
14	SINGLEFIFOFLUSHING	0x0	R	<b>The Single FIFO is flushing</b>  A single data FIFO flush operation is in progress.

Bit	Name	Reset	Access	Description
13:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9	SCANFIFODV	0x0	R	<b>SCANFIFO Data Valid</b> At least one result in the scan FIFO is ready to read.
8	SINGLEFIFODV	0x0	R	<b>SINGLEFIFO Data Valid</b> At least one result in the single FIFO is ready to read.
7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6	CONVERTING	0x0	R	<b>Converting</b> The ADC is warmed up and in the process of performing a conversion.
5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	SCANQUEUEPENDING	0x0	R	<b>Scan Queue Pending</b> The Scan queue has been triggered and is waiting to start conversion.
3	SCANQEN	0x0	R	<b>Scan Queued Enabled</b> The Scan queue is enabled.
2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	SINGLEQUEUEPEND- ING	0x0	R	<b>Single Queue Pending</b> The Single queue has been triggered and is waiting to start conversion. When tailgating is used, SINGLEQUEUEPEND-ING will remain high until the a scan operation has completed.
0	SINGLEQEN	0x0	R	<b>Single Queue Enabled</b> The Single queue is enabled.

### 23.5.7 IADC\_MASKREQ - Mask Request

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	RW															
<b>Name</b>																	MASKREQ															

Bit	Name	Reset	Access	Description
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
15:0	MASKREQ	0x0	RW	<b>Scan Queue Mask Request</b> Allows software to specify which entries in the Scan table should be converted. For example MASKREQ = 0x8014 means that scan table entries 15, 4, and 2 will be converted. The other entries will not be converted.

## 23.5.8 IADC\_STMASK - Scan Table Mask

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	R															
<b>Name</b>																	STMASK															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	STMASK	0x0	R	<b>Scan Table Mask</b>  This is the active / working copy of the MASKREQ register that the ADC uses. It will only be updated at the end of a scan sequence or when no scan is in progress.

## 23.5.9 IADC\_CMPTHR - Digital Window Comparator Threshold

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																0x0															
<b>Access</b>	RW																RW															
<b>Name</b>	ADGT																ADLT															

Bit	Name	Reset	Access	Description
31:16	ADGT	0x0	RW	<b>ADC Greater Than or Equal to Threshold</b>  Compare threshold value for greater-than or equal to comparison. ADGT should be specified in a left-justified, 16-bit format regardless of the FIFO ALIGNMENT setting. Comparisons with 12-bit formats will ignore the 4 LSBs of the ADGT value. Comparisons with 20-bit formats will ignore the 4 LSBs of the 20-bit result. Unipolar or bipolar mode is considered in the comparison. When ADGT is greater than ADLT, the comparison is true if the result is either greater than ADGT or less than ADLT, but false if the result falls between the values.
15:0	ADLT	0x0	RW	<b>ADC Less Than or Equal to Threshold</b>  Compare threshold value for less-than or equal to comparison. ADLT should be specified in a left-justified, 16-bit format regardless of the FIFO ALIGNMENT setting. Comparisons with 12-bit formats will ignore the 4 LSBs of the ADLT value. Comparisons with 20-bit formats will ignore the 4 LSBs of the 20-bit result. Unipolar or bipolar mode is considered in the comparison. When ADGT is greater than ADLT, the comparison is true if the result is either greater than ADGT or less than ADLT, but false if the result falls between the values.

## 23.5.10 IADC\_IF - Interrupt Flags

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset	0x0												0x0	0x0	0x0	0x0			0x0	0x0			0x0	0x0	0x0				0x0	0x0	0x0	0x0
Access	RW												RW	RW	RW	RW			RW	RW			RW	RW	RW				RW	RW	RW	RW

### 23.5.12 IADC\_TRIGGER - Trigger

Offset	Bit Position																																				
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
<b>Reset</b>																	0x0					0x0						0x0				0x0					
<b>Access</b>																	RW					RW						RW				RW					
<b>Name</b>																	SINGLETAILGATE					SINGLETRIGACTION						SINGLETRIGSEL					SCANTRIGACTION				SCANTRIGSEL

Bit	Name	Reset	Access	Description
31:17	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
16	SINGLETAILGATE	0x0	RW	<b>Single Tailgate Enable</b> Enables tailgating.
	Value	Mode		Description
	0	TAILGATEOFF		The single queue is ready to start warming up and converting once the trigger had been detected.
	1	TAILGATEON		After the single queue's trigger is detected, it must wait until the end of a scan operation before the Single queue can be converted.
15:13	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
12	SINGLETRIGACTION	0x0	RW	<b>Single Trigger Action</b> Selects the trigger action for the single queue.
	Value	Mode		Description
	0	ONCE		For TRIGSEL=IMMEDIATE, converts the single queue once and disables queue. For TRIGSEL = TIMER, PRSCLKGRP, PRSPOS, PRSNEG, converts the single queue once per trigger.
	1	CONTINUOUS		Converts the single queue, then checks for a pending scan queue before converting the single queue again continuously. The queues are first come first serve. If both queues are continuous, the IADC alternates between them.
11	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
10:8	SINGLETRIGSEL	0x0	RW	<b>Single Trigger Select</b> Selects the trigger source for the single queue.
	Value	Mode		Description

Bit	Name	Reset	Access	Description
0		IMMEDIATE		Immediate triggering. The single queue will be disabled once the conversion is complete, unless TRIGGERACTION is set to continuous.
1		TIMER		Triggers when the local timer count reaches zero.
2		PRCLKGRP		Triggers on PRS1 from a timer module that is using the same clock group as the ADC and has been programmed to use the same clock source as the ADC. The prescale may be different between the ADC and the timer module.
3		PRSPPOS		Triggers on asynchronous PRS1 positive edge. Requires PRS1 to go low for 3 ADC_CLKs before another positive edge can be detected. Generates an additional delay of 1 to 2 CLK_SRC_ADC cycles for synchronization.
4		PRSNNEG		Triggers on asynchronous PRS1 negative edge. Requires PRS1 to go high for 3 ADC_CLKs before another negative edge can be detected. Generates an additional delay of 1 to 2 CLK_SRC_ADC cycles for synchronization. PRSNNEG should only be used when the trigger source is from a module that remains powered during EM23. For modules (ie: TIMER) that power down during EM23, PRSPPOS should be used for an asynchronous trigger, and PRCLKGRP should be used for a synchronous trigger.
7:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	SCANTRIGACTION	0x0	RW	<b>Scan Trigger Action</b> Selects the trigger action for the scan queue.
	Value	Mode	Description	
	0	ONCE	For TRIGSEL=IMMEDIATE, goes through the scan table once and disables queue. For TRIGSEL = TIMER, PRCLKGRP, PRSPPOS, PRSNNEG, goes through the scan table once per trigger.	
	1	CONTINUOUS	Goes through the scan table, converts each entry with a mask bit set, and puts it back into the scan queue to repeat again continuously. The queues are first come first serve. If both queues are triggered, the single queue will get to convert after each scan table completes. The scan queue will get to convert after each single conversion completes.	
3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2:0	SCANTRIGSEL	0x0	RW	<b>Scan Trigger Select</b> Selects the trigger source for the scan queue.
	Value	Mode	Description	
	0	IMMEDIATE	Immediate triggering. The scan queue will be disabled once all conversions in the scan table are complete, unless TRIGGERACTION is set to continuous.	
	1	TIMER	Triggers when the local timer count reaches zero.	
	2	PRCLKGRP	Triggers on PRS0 from a timer module that is using the same clock group as the ADC and has been programmed to use the same clock source as the ADC. The prescale may be different between the ADC and the timer module.	

Bit	Name	Reset	Access	Description
3		PRSPOS		Triggers on asynchronous PRS0 positive edge. Requires PRS0 to go low for 3 ADC_CLKs before another positive edge can be detected. Generates an additional delay of 1 to 2 CLK_SRC_ADC cycles for synchronization.
4		PRSNEG		Triggers on asynchronous PRS0 negative edge. Requires PRS0 to go high for 3 ADC_CLKs before another negative edge can be detected. Generates an additional delay of 1 to 2 CLK_SRC_ADC cycles for synchronization. PRSNEG should only be used when the trigger source is from a module that remains powered during EM23. For modules (ie: TIMER) that power down during EM23, PRSPOS should be used for an asynchronous trigger, and PRSCLKGRP should be used for a synchronous trigger.
5		LESENSE		Triggers on LESENSE convert request. When using the LESENSE for the SCAN Table, only one entry is converted per LESENSE convert request.

### 23.5.13 IADC\_CFGx - Configuration

Offset	Bit Position																																
0x048	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Access</b>			RW							RW					RW																RW		RW
<b>Name</b>			TWOSCOMPL							DIGAVG					REFSEL																OSRHS		ADCMODE

Bit	Name	Reset	Access	Description
31:30	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
29:28	TWOSCOMPL	0x0	RW	<b>Two's Complement</b> Selects output word polarity.
	Value	Mode	Description	
	0	AUTO	Automatic: Single ended measurements are reported as unipolar and differential measurements are reported as bipolar.	
	1	FORCEUNIPOLAR	Force all measurements to result in unipolar output. Negative differential numbers will saturate to 0.	
	2	FORCEBIPOLAR	Force all measurements to result in bipolar output. Single ended measurements are half the range, but allow for small negative measurements.	
27:24	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
23:21	DIGAVG	0x0	RW	<b>Digital Averaging</b> Number of output words to convert and average.
	Value	Mode	Description	
	0	AVG1	Collect one output word (no digital averaging).	
	1	AVG2	Collect and average 2 digital output words.	
	2	AVG4	Collect and average 4 digital output words.	
	3	AVG8	Collect and average 8 digital output words.	
	4	AVG16	Collect and average 16 digital output words.	
20:19	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
18:16	REFSEL	0x0	RW	<b>Reference Select</b> Selects voltage reference.
	Value	Mode	Description	
	0	VBGR	Internal 1.21 V reference.	

Bit	Name	Reset	Access	Description
	1	VREF		External Reference. (Calibrated for 1.25V nominal.)
	3	VDDX		AVDD (unbuffered)
	4	VDDX0P8BUF		AVDD (buffered) * 0.8
15	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
14:12	ANALOGGAIN	0x2	RW	<b>Analog Gain</b> Sets analog front end gain.
	Value	Mode	Description	
	1	ANAGAIN0P5	Analog gain of 0.5x.	
	2	ANAGAIN1	Analog gain of 1x.	
	3	ANAGAIN2	Analog gain of 2x.	
	4	ANAGAIN3	Analog gain of 3x.	
	5	ANAGAIN4	Analog gain of 4x.	
11:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4:2	OSRHS	0x0	RW	<b>High Speed OSR</b> Over sampling ratio for high speed conversions.
	Value	Mode	Description	
	0	HISPD2	High speed over sampling of 2x.	
	1	HISPD4	High speed over sampling of 4x.	
	2	HISPD8	High speed over sampling of 8x.	
	3	HISPD16	High speed over sampling of 16x.	
	4	HISPD32	High speed over sampling of 32x.	
	5	HISPD64	High speed over sampling of 64x.	
1:0	ADCMODE	0x0	RW	<b>ADC Mode</b> Selects ADC conversion mode.
	Value	Mode	Description	
	0	NORMAL	High speed mode with a maximum ADC_CLK of 10 MHz.	

## 23.5.14 IADC\_SCALEx - Scaling

Offset	Bit Position

Bit	Name	Reset	Access	Description
31:10	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9:0	PRESCALE	0x0	RW	<b>Prescale</b>  Second level prescaler - divides the CLK_SRC_ADC by (PRESCALE + 1) to generate ADC_CLK. PRESCALE=0 should only be used with HCLKRATE=0. (See text.)

Bit	Name	Reset	Access	Description
7		VALID8		When 8 entries in the single FIFO are valid, set the SINGLEFI-FODVL interrupt and request DMA.
3	SHOWID	0x0	RW	<b>Show ID</b> ID of 0x20 will be applied in the output words.
2:0	ALIGNMENT	0x0	RW	<b>Alignment</b> Alignment of output data written into FIFO.
	Value	Mode		Description
	0	RIGHT12		ID[7:0], SIGN_EXT, DATA[11:0]
	1	RIGHT16		ID[7:0], SIGN_EXT, DATA[15:0]
	2	RIGHT20		ID[7:0], SIGN_EXT, DATA[19:0]
	3	LEFT12		DATA[11:0], 000000000000, ID[7:0]
	4	LEFT16		DATA[15:0], 00000000, ID[7:0]
	5	LEFT20		DATA[19:0], 0000, ID[7:0]

### 23.5.17 IADC\_SINGLEFIFODATA - Single FIFO DATA

Offset	Bit Position																															
0x074	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	R(r)															
<b>Name</b>																	DATA															

Bit	Name	Reset	Access	Description
31:0	DATA	0x0	R(r)	<b>Single FIFO Read Data</b> Reads and pops the oldest value from the single FIFO.

## 23.5.18 IADC\_SINGLEFIFOSTAT - Single FIFO Status

Offset	Bit Position																															
0x078	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																												0x0	0			
<b>Access</b>																												R				
<b>Name</b>																												FIFOREADCNT				

Bit	Name	Reset	Access	Description
31:4	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
3:0	FIFOREADCNT	0x0	R	<b>FIFO Read Count</b> Number of valid entries available to read.

## 23.5.19 IADC\_SINGLEDATA - Single Data

Offset	Bit Position																															
0x07C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																												0x0				
<b>Access</b>																												R				
<b>Name</b>																												DATA				

Bit	Name	Reset	Access	Description
31:0	DATA	0x0	R	<b>Data</b> Reads the most recent data word from the single FIFO, but does not pop a value. Even if the FIFO has overflowed and stopped updating, the most recent conversion will continue to overwrite SINGLEDATA.

### 23.5.20 IADC\_SCANFIFOCFG - Scan FIFO Configuration

Offset	Bit Position																																					
0x080	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Name</b>																								DMAWUFIFOSCAN			DVL		SHOWID		ALIGNMENT							

Bit	Name	Reset	Access	Description
31:9	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
8	DMAWUFIFOSCAN	0x0	RW	<b>Scan FIFO DMA Wakeup</b> Enables scan FIFO to wake DMA in EM2 or EM3.
	Value	Mode		Description
	0	DISABLED		While in EM2 or EM3, the DMA controller will not be requested.
	1	ENABLED		While in EM2 or EM3, the DMA controller will be requested when the scan FIFO reaches its Data Valid Level. [DVL must be set to 0 (VALID1).]
7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6:4	DVL	0x3	RW	<b>Data Valid Level</b> Data valid level before requesting DMA transfer. If the number of words in the FIFO reaches or exceeds DVL+1, DMA requests will be generated.
	Value	Mode		Description
	0	VALID1		When 1 entry in the scan FIFO is valid, set the SCANFIFODVL interrupt and request DMA.
	1	VALID2		When 2 entries in the scan FIFO are valid, set the SCANFIFODVL interrupt and request DMA.
	2	VALID3		When 3 entries in the scan FIFO are valid, set the SCANFIFODVL interrupt and request DMA.
	3	VALID4		When 4 entries in the scan FIFO are valid, set the SCANFIFODVL interrupt and request DMA.
	4	VALID5		When 5 entries in the scan FIFO are valid, set the SCANFIFODVL interrupt and request DMA.
	5	VALID6		When 6 entries in the scan FIFO are valid, set the SCANFIFODVL interrupt and request DMA.
	6	VALID7		When 7 entries in the scan FIFO are valid, set the SCANFIFODVL interrupt and request DMA.

Bit	Name	Reset	Access	Description
7		VALID8		When 8 entries in the scan FIFO are valid, set the SCANFI-FODVL interrupt and request DMA.
3	SHOWID	0x0	RW	<b>Show ID</b> Enable ID in output words.
2:0	ALIGNMENT	0x0	RW	<b>Alignment</b> Alignment of output data written into FIFO.
	Value	Mode		Description
	0	RIGHT12		ID[7:0], SIGN_EXT, DATA[11:0]
	1	RIGHT16		ID[7:0], SIGN_EXT, DATA[15:0]
	2	RIGHT20		ID[7:0], SIGN_EXT, DATA[19:0]
	3	LEFT12		DATA[11:0], 000000000000, ID[7:0]
	4	LEFT16		DATA[15:0], 00000000, ID[7:0]
	5	LEFT20		DATA[19:0], 0000, ID[7:0]

### 23.5.21 IADC\_SCANFIFODATA - Scan FIFO Read Data

Offset	Bit Position																																
0x084	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Name</b>																	CMP	CFG	PORTPOS		PINPOS		PORTNEG		PINNEG							

Bit	Name	Reset	Access	Description
31:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
17	CMP	0x0	RW	<b>Comparison Enable</b> Enable digital window comparison for this entry.
16	CFG	0x0	RW	<b>Configuration Group Select</b> Select which configuration group (CFGx, SCALEx, SCHEDx registers) is used with this entry.
	Value	Mode	Description	
	0	CONFIG0	Use configuration group 0	
	1	CONFIG1	Use configuration group 1	
15:12	PORTPOS	0x0	RW	<b>Positive Port Select</b> Port (A, B, C, D) or special signal assigned to the positive input of the ADC
	Value	Mode	Description	
	0	GND	Ground	
	1	SUPPLY	Supply Pin - Select specific supply using PINPOS	
	2	DAC0	Direct connection to DAC0_CH0	
	8	PORTA	Port A - Select pin number using PINPOS	
	9	PORTB	Port B - Select pin number using PINPOS	
	10	PORTC	Port C - Select pin number using PINPOS	
	11	PORTD	Port D - Select pin number using PINPOS	
11:8	PINPOS	0x0	RW	<b>Positive Pin Select</b> Pin number for the positive input of the ADC.
7:4	PORTNEG	0x0	RW	<b>Negative Port Select</b> Port (A, B, C, D) or special signal assigned to the negative input of the ADC
	Value	Mode	Description	
	0	GND	Ground (single-ended)	
	2	DAC1	Direct connection to DAC0_CH1	
	8	PORTA	Port A - Select pin number using PINNEG	

Bit	Name	Reset	Access	Description
	9	PORTB		Port B - Select pin number using PINNEG
	10	PORTC		Port C - Select pin number using PINNEG
	11	PORTD		Port D - Select pin number using PINNEG
3:0	PINNEG	0x0	RW	<b>Negative Pin Select</b> Pin number for the negative input of the ADC.

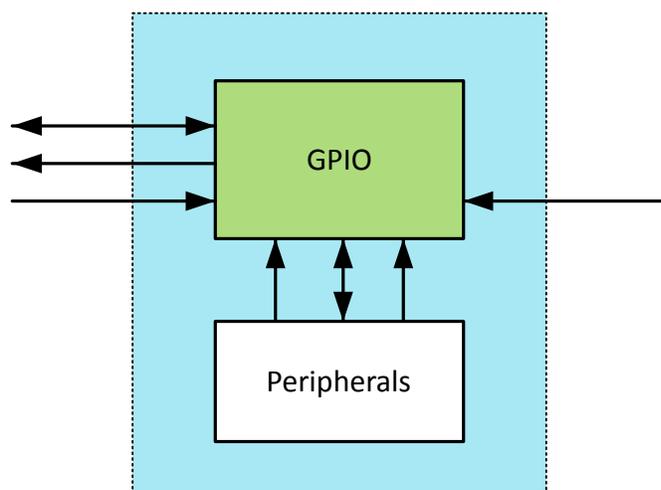

### 23.5.25 IADC\_SCANx - SCAN Entry

Offset	Bit Position																															
0x0A0	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

31:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
17	CMP	0x0	RW	<b>Comparison Enable</b> Enable digital window comparison for this entry.
16	CFG	0x0	RW	<b>Configuration Group Select</b> Select which configuration group (CFGx, SCALEx, SCHEDx registers) is used with this entry.
	Value	Mode	Description	
	0	CONFIG0	Use configuration group 0	
	1	CONFIG1	Use configuration group 1	
15:12	PORTPOS	0x0	RW	<b>Positive Port Select</b> Port (A, B, C, D) or special signal assigned to the positive input of the ADC
	Value	Mode	Description	
	0	GND	Ground	
	1	SUPPLY	Supply Pin - Select specific supply using PINPOS	
	2	DAC0	Direct connection to DAC0_CH0	
	8	PORTA	Port A - Select pin number using PINPOS	
	9	PORTB	Port B - Select pin number using PINPOS	
	10	PORTC	Port C - Select pin number using PINPOS	
	11	PORTD	Port D - Select pin number using PINPOS	
11:8	PINPOS	0x0	RW	<b>Positive Pin Select</b> Pin number for the positive input of the ADC.
7:4	PORTNEG	0x0	RW	<b>Negative Port Select</b> Port (A, B, C, D) or special signal assigned to the negative input of the ADC
	Value	Mode	Description	
	0	GND	Ground (single-ended)	
	2	DAC1	Direct connection to DAC0_CH1	
	8	PORTA	Port A - Select pin number using PINNEG	

Bit	Name	Reset	Access	Description
	9	PORTB		Port B - Select pin number using PINNEG
	10	PORTC		Port C - Select pin number using PINNEG
	11	PORTD		Port D - Select pin number using PINNEG
3:0	PINNEG	0x0	RW	<b>Negative Pin Select</b> Pin number for the negative input of the ADC.

## 24. GPIO - General Purpose Input/Output

### Quick Facts

#### What?

The General Purpose Input/Output (GPIO) is used for pin configurations as well as routing for peripheral pin connections.

#### Why?

Easy to use and highly configurable input/output pins are important to fit many communication protocols as well as minimizing software control overhead. Flexible routing of peripheral functions helps to ease PCB layout.

#### How?

Each pin on the device can be individually configured as either an input or an output with several different drive modes. Also, individual bit manipulation registers minimize control overhead. Peripheral connections to pins can be routed to pins as desired solving congestion and contention issues that may arise with limited routing flexibility. Fully asynchronous interrupts can also be generated from any pin.

### 24.1 Introduction

In the EFR32xG23 devices the General Purpose Input/Output (GPIO) pins are organized into ports with up to 16 pins each. These GPIO pins can be individually configured as either an output or input. More advanced configurations like open-drain, open-source, and glitch filtering can be configured for each individual GPIO pin. Peripheral resources, like Timer PWM outputs or USART RX/TX can be routed to the GPIO pins as desired by the user. Finally, the input value of a pin can be routed through the Peripheral Reflex System to other peripherals or used to trigger an external interrupt.

## 24.2 Features

- Individual configuration for each pin
  - Tristate (reset state)
  - Push-pull
  - Open-drain
  - Pull-up resistor
  - Pull-down resistor
  - Programmable Slewrate Control
- EM4 IO pin retention
  - Output enable
  - Output value
  - Pull enable
  - Pull direction
- EM4 wake-up on selected GPIO pins
- Glitch suppression input filter
- Extremely flexible analog and digital resource routing
- Toggle register for output data
- Dedicated data input register (read-only)
- Interrupts
  - Two independent interrupt vectors
  - All GPIO pins are selectable as interrupts in EM0 and EM1
  - All PA and PB GPIO pins are also selectable as interrupts down to EM2 and EM3
  - All EM4 wake-up pins are also available as interrupts in EM0/1/2/3
  - Separate enable, status, set and clear registers
  - Asynchronous sensing
  - Rising, falling or both edges
- Peripheral Reflex System producer
  - All GPIO pins are selectable

### 24.3 Functional Description

An overview of the GPIO module is shown in [Figure 24.1 Pin Configuration on page 796](#). The GPIO pins are grouped into 16-pin ports. Each individual GPIO pin is called P<sub>xn</sub> where x indicates the port (A, B, C ...) and n indicates the pin number (0,1,...,15). Fewer than 16 pins may be available on some ports depending on the total number of I/O pins on the package. After a reset, both input and output are disabled for all pins on the device, except for the Serial Wire Debug pins.

To use a pin, the Mode Register (GPIO\_P<sub>x</sub>\_MODEL/GPIO\_P<sub>x</sub>\_MODEH) must be configured for the pin to make it an input or output. These registers can also do more advanced configuration, which is covered in [24.3.1 Pin Configuration](#). When the port is configured as an input or an output, the Data In Register (GPIO\_P<sub>x</sub>\_DIN) can be used to read the level of each pin in the port (bit n in the register is connected to pin n on the port). When configured as an output, the value of the Data Out Register (GPIO\_P<sub>x</sub>\_DOUT) will be driven to the pin.

The DOUT value can be changed in 4 different ways:

- Writing to the GPIO\_P<sub>x</sub>\_DOUT register
- Writing the SET address of the GPIO\_P<sub>x</sub>\_DOUT register sets the DOUT bits
- Writing the CLEAR address of the GPIO\_P<sub>x</sub>\_DOUT register clears the DOUT bits
- Writing the GPIO\_P<sub>x</sub>\_DOUTTGL register toggles the corresponding DOUT bits

Reading the GPIO\_P<sub>x</sub>\_DOUT register will return its contents. Reading the GPIO\_P<sub>x</sub>\_DOUTTGL register will return 0.

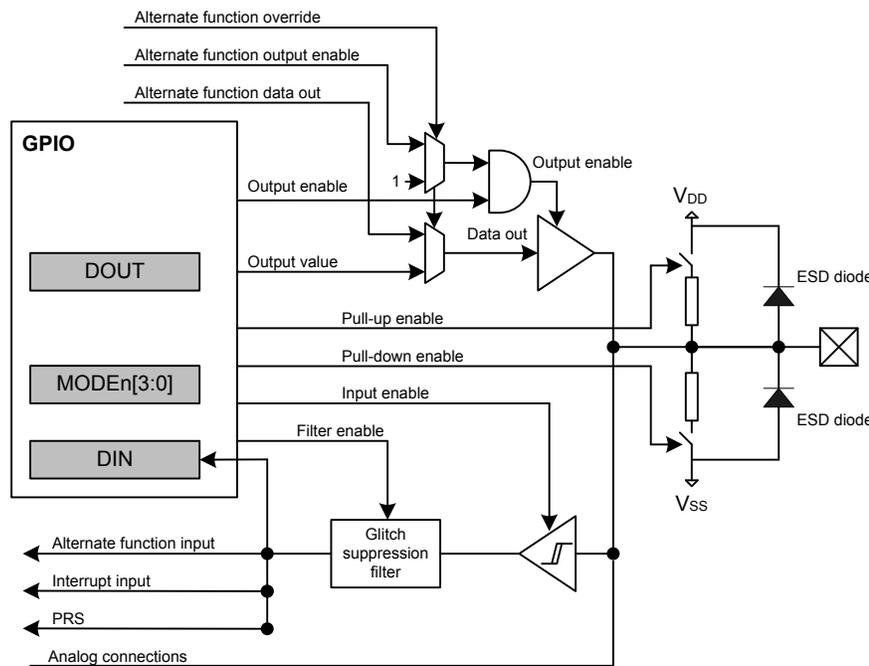

Figure 24.1. Pin Configuration

### 24.3.1 Pin Configuration

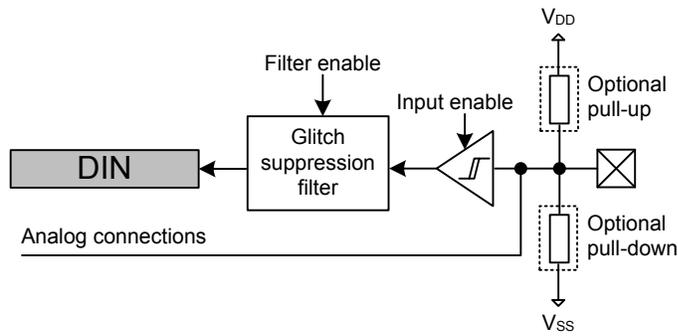

In addition to setting the pins as either outputs or inputs, the GPIO\_Px\_MODEL and GPIO\_Px\_MODEH registers can be used for more advanced configurations. GPIO\_Px\_MODEL contains 8 bit fields named MODEn (n=0,1,..7) which control pins 0-7, while GPIO\_Px\_MODEH contains 8 bit fields named MODEn (n=8,9,..15) which control pins 8-15. In some modes GPIO\_Px\_DOUT is also used for extra configurations like pull-up/down and glitch suppression filter enable. [Table 24.1 Pin Configuration on page 797](#) shows the available configurations.

**Table 24.1. Pin Configuration**

MODEn	Input	Output	DOUT	Pull-down	Pull-up	Alt Port Ctrl	Input Filter	Description
DISABLED	Disabled	Disabled	0					Input disabled
			1		On			Input disabled with pull-up
INPUT	Enabled if not DINDIS		0					Input enabled
			1				On	Input enabled with filter
INPUTPULL		0	On					Input enabled with pull-down
		1		On				Input enabled with pull-up
INPUTPULLFILTER		0	On				On	Input enabled with pull-down and filter
		1		On			On	Input enabled with pull-up and filter
PUSHPULL		Push-pull	x					Push-pull
PUSHPULLALT			x			On		Push-pull with alternate port control values
WIREDOR		Open Source (Wired-OR)	x					Open-source
WIREDORPULLDOWN			x	On				Open-source with pull-down
WIREDAND	Open Drain (Wired-AND)	x						Open-drain
WIREDANDFILTER		x					On	Open-drain with filter
WIREDANDPULLUP		x			On			Open-drain with pull-up
WIREDANDPULLUPFILTER		x			On		On	Open-drain with pull-up and filter
WIREDANDALT		x				On		Open-drain with alternate port control values
WIREDANDALTFILTER		x				On	On	Open-drain with alternate port control values and filter
WIREDANDALTPULLUP		x			On	On		Open-drain with alternate port control values and pull-up
WIREDANDALTPULLUPFILTER		x			On	On	On	Open-drain with alternate port control values, pull-up and filter

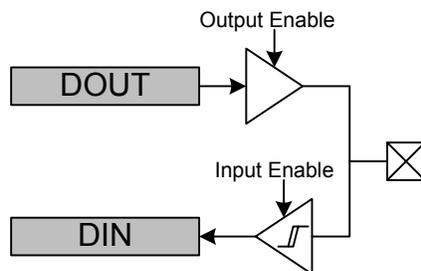

MODEn determines which mode the pin is in at a given time. Setting MODEn to DISABLED disables the pin, reducing power consumption to a minimum. When the output driver and input driver are disabled, the pin can be used as a connection for an analog module. An input is enabled by setting MODEn to any value other than DISABLED while DINDIS for the given port is cleared. Set DINDIS to disable

the input of a GPIO port. The pull-up, pull-down and glitch filter function can optionally be applied to the input, see [Figure 24.2 Tristated Output with Optional Pull-up or Pull-down on page 798](#).

**Figure 24.2. Tristated Output with Optional Pull-up or Pull-down**

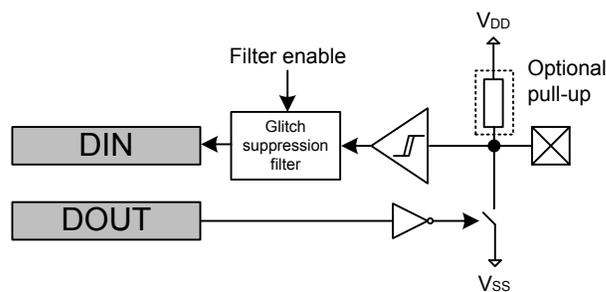

When  $MODEn$  is  $PUSHPULL$  or  $PUSHPULLALT$ , the pin operates in push-pull mode. In this mode, the pin can have alternate port control values and can be driven either high or low, dependent on the value of  $GPIO\_Px\_DOUt$ . The push-pull configuration is shown in [Figure 24.3 Push-Pull Configuration on page 798](#).

**Figure 24.3. Push-Pull Configuration**

When  $MODEn$  is  $WIREDOR$  or  $WIREDORPULLDOWN$ , the pin operates in open-source mode (with a pull-down resistor for  $WIREDORPULLDOWN$ ). When driving a high value in open-source mode, the pull-down is disconnected to save power.

When the mode is prefixed with  $WIREDAND$ , the pin operates in open-drain mode as shown in [Figure 24.4 Open-drain on page 798](#). In open-drain mode, the pin can have an input filter, a pull-up, alternate port control values or any combination of these. When driving a low value in open-drain mode, the pull-up is disconnected to save power.

**Figure 24.4. Open-drain**

### 24.3.2 Alternate Port Control

The Alternate Port Control allows for additional flexibility of port level settings. A user may setup two different port configurations (normal and alternate modes) and select which is applied on a pin by pin bases. For example you may configure half of port A to use the slowest slew rate while the other half uses a faster slew rate.

Alternate port control is enabled when MODEN is set to any of the ALT enumerated modes (i.e., PUSH/PULL/ALT). When MODEN is an alternate mode, the pin uses the alternate port control values specified in the DINDISALT and SLEWRATEALT fields in GPIO\_Px\_CTRL. In all other modes, the port control values are used from the DINDIS and SLEWRATE fields in GPIO\_Px\_CTRL.

### 24.3.3 Slew Rate

The slewrate can be applied to pins on a port-by-port basis. The slew rate applied to pins configured using normal MODEN settings can be controlled using the SLEWRATE fields in GPIO\_Px\_CTRL. The slewrate applied to pins configured using the alternate MODEN settings can be controlled using the SLEWRATEALT field.

The lowest slew rate setting has limited drive strength. That is the current is limited to about 1 mA. This setting provides slow switching and limited drive. A slew rate setting of 1 provides the slowest switching with full drive capability. The maximum recommended setting for most digital I/O is 6. A slew rate setting of 7 should only be used for high-speed clock signals, above 10 MHz. A setting of 7 should not be used on more than one pin per port. Please refer to the datasheet for GPIO rise and fall times.

### 24.3.4 Input Disable

The pin inputs can be disabled on a port-by-port basis. The input of pins configured using the normal MODEN settings can be disabled by setting DINDIS in GPIO\_Px\_CTRL. The input of pins configured using the alternate MODEN settings can be disabled by setting DINDISALT.

### 24.3.5 Configuration Lock

The GPIO configuration registers (GPIO\_Px\_CTRL, PIO\_Px\_MODEL, GPIO\_xBUSALLOC, GPIO\_EXTIPSELL, GPIO\_EXTIPINSEL, GPIO\_x\_yROUTE, and GPIO\_xROUTEEN) can be locked by writing any value other than 0xA534 to GPIO\_LOCK. Writing the value 0xA534 to the GPIOx\_LOCK register unlocks the configuration registers.

### 24.3.6 EM2 Functionality

While all GPIO pins retain their state in EM2, only pins on port A and B remain fully functional in EM2. Digital peripherals which are active in EM2 must have their resources routed to pins on port A or B to function correctly in EM2. Analog peripherals may use any GPIO pin while in EM2 provided that the ABUS was configured prior to entering EM2. However, analog peripherals that are configured to scan multiple pins while in EM2 (such as the ADC) dynamically reconfigure the ABUS while in EM2 and thus must use only pins on port A and B.

### 24.3.7 EM4 Functionality

By default GPIO pins revert back to their reset state when EM4 is entered. The GPIO pins can be configured to retain the settings for output enable, output value, pull enable, and pull direction while in EM4.

EM4 GPIO retention is controlled with the EM4IORETMODE field in the EMU\_EM4CTRL register:

- Setting EM4IORETMODE to EM4EXIT will cause GPIO retention to persist while in EM4. GPIO state will be reset during wakeup.
- Setting EM4IORETMODE to SWUNLATCH will cause the GPIO retention to persist through EM4 and wakeup, until the EM4UNLATCH bit is written by software. When using SWUNLATCH, the GPIO register values are still reset on wakeup. To ensure the GPIO state does not change, software must re-write the GPIO registers before setting EM4UNLATCH and ending EM4 GPIO retention. Note that the GPIO state cannot be retained through an EM4 wakeup due to a reset (e.g., pin reset or POR reset) - only non-reset methods of EM4 wakeup are supported (e.g., EM4WU IRQ or BURTC IRQ).

See the EMU chapter for additional documentation on EM4IORETMODE and the EM4UNLATCH bit.

### 24.3.8 EM4 Wakeup

It is possible to trigger a wake-up from EM4 using any of the selectable EM4WU GPIO pins. The wake-up request can be triggered through the pins by enabling the corresponding bit in the GPIO\_EM4WUEN register. When EM4 wake-up is enabled for the pin, the input filter is enabled during EM4. This is done to avoid false wake-up caused by glitches. In addition, the polarity of the EM4 wake-up request can be selected using the GPIO\_EM4WUPOL register.

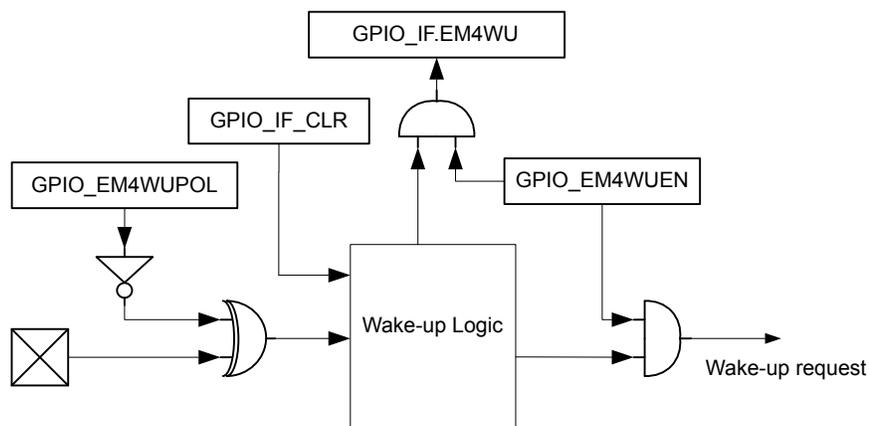

Figure 24.5. EM4 Wake-up Logic

The pins used for EM4 wake-up must be configured as inputs with glitch filters using the GPIO\_Px\_MODEL register. If the input is disabled and the wakeup polarity is low, a false wakeup will occur when entering EM4. If the input is enabled, the glitch filtered is disabled, and the polarity is set low, a glitch will occur when going into EM4 that will cause an immediate wake-up. Before going down to EM4, it is important to clear the wake-up logic by setting the GPIO\_IF\_CLR bits, which clear the wake-up logic, including the GPIO\_IF register. It is possible to determine which pin caused the EM4WU by reading the GPIO\_IF register.

Each EM4WU signal is connected to a fixed pin. Refer to the Alternate Function Table in the device Datasheet for the location of each EM4 wakeup signal.

### 24.3.9 Debug Connections

#### 24.3.9.1 JTAG Debug Connection

The JTAG Debug Port is a fixed location resource connected directly to specific GPIO pins. Refer to the Alternate Function Table in the device Datasheet for the location of the JTAG signals. By default TMS, TCK, TDO, and TDI pin connections are enabled with internal pull up, pull down, no pull, and pull up resistors, respectively. It is possible to disable these pin connections (and disable the pull resistors) by setting the SWDIOTMSPEN, SWCLKTCKPEN, TDOPEN, and TDIPEN bits in GPIO\_DEBUGROUTEPEN to 0.

#### 24.3.9.2 Serial Wire Debug Connection

The SW Debug Port is a fixed location resource connected directly to specific GPIO pins. Refer to the Alternate Function Table in the device Datasheet for the location of the SW Debug port signals. The SWDIO and SWCLK pin connections are enabled by default with internal pull up and pull down resistors, respectively. It is possible to disable these pin connections (and disable the pull resistors) by setting the SWDIOTMSPEN and SWCLKTCKPEN bits in GPIO\_DEBUGROUTEPEN to 0.

The Serial Wire Viewer pin, SWV, can be enabled by setting the SWVPEN bit in GPIO\_TRACEROUTEPEN.

**Note:** The SWV pin is not affected by debug lock, so the SWV pin should not be enabled for production devices.

#### 24.3.9.3 Disabling Debug Connections

When the debug pins are disabled, the device can no longer be accessed by a debugger. A reset will set the debug pins back to their enabled default state. The GPIO\_DBGROUTEPEN register can only be updated when the debugger is disconnected from the system. Any attempts to modify GPIO\_DBGROUTEPEN when the debugger is connected will not occur. If you do disable the debug pins, make sure you have at least a 3 second timeout at the start of your program code before you disable the debug pins. This way the debugger will have time to connect to the device after a reset and before the pins are disabled.

### 24.3.9.4 ETM Trace Connections

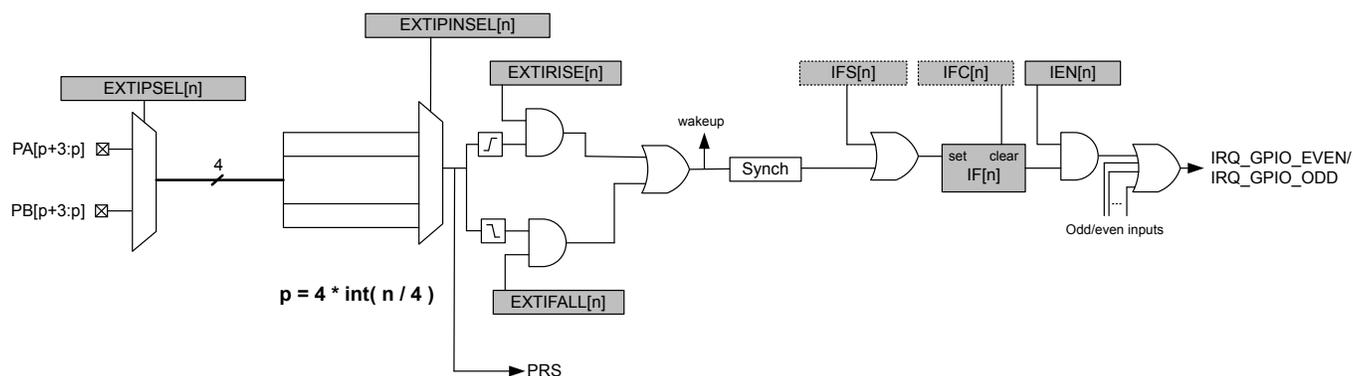

The device includes ETM trace pins. The trace clock can be enabled by setting the TRACECLKPEN bit-field in GPIO\_TRACEROUTEPEN. The data pin(s) can be enabled individually by setting TRACEDATAxPEN in GPIO\_TRACEROUTEPEN. The trace pins are fixed location resources connected to specific pins. Refer to the Alternate Function Table in the device Datasheet for the location of the ETM trace port signals.

### 24.3.10 Interrupt Generation

#### 24.3.10.1 Standard Interrupt Generation

The GPIO can generate an interrupt from any edge of the input of any GPIO pin on the device. The standard interrupts have asynchronous sense capability, enabling wake-up from energy modes as low as EM3, see [Figure 24.6 Pin n Interrupt Generation on page 801](#).

**Note:** In EM2 and EM3, only signals on Port A and Port B are available as standard interrupts. Standard interrupts are available to all pins in EM0 and EM1.

**Figure 24.6. Pin n Interrupt Generation**

The standard external pin interrupts are numbered starting with 0. Each interrupt has a corresponding enable bit in the GPIO\_IEN register and an interrupt flag bit in the GPIO\_IF register. Each interrupt may be used with one of four possible pins on any available port. First select the desired port for each interrupt using the corresponding EXTIPSELx field in the GPIO\_EXTIPSELL register. (Some devices with many pins may also have a GPIO\_EXTIPSELH register.)

Each interrupt can be mapped to one of four possible pins on the selected port. External interrupts EXTI0 through EXTI3 may be mapped to pins 0,1,2, or 3 on any available port. External interrupts EXTI4 through EXTI7 may be mapped to pins 4,5,6 or 7 on any available port.

**Note:** Note that while the EXTIEN field in the GPIO\_IEN register has 15 bits, the number of useful bits is limited by the number of pins available in the widest port. If the widest port is 8 bits wide, only the first 8 external interrupts are useful.

The selected pin for each interrupt is the base plus the offset. The base for EXTI0 through EXTI3 is 0, while the base for interrupts EXTI4 through EXTI7 is 4. The base may be calculated by taking the interrupt number, dividing by four, then using only the integer portion of the quotient. (BASE = Integer(N/4)

The offset is selected using the corresponding field in the GPIO\_EXTIPINSELL register, (Some devices with many pins may also have a GPIO\_EXTIPINSELH register.) Subtract the base from the desired pin number to get the offset. For example, to map EXTI5 to pin 7 of PORTA, the base is 4 and the offset will be 3.

The GPIO\_EXTIRISE[n] and GPIO\_EXTIFALL[n] registers enable sensing of rising and falling edges. By setting the EXT[n] bit in GPIO\_IEN, a high interrupt flag n, will trigger one of two interrupt lines. The even interrupt line is triggered by any enabled even numbered interrupt flag index, while the odd interrupt line is triggered by odd flag indexes. The interrupt flags can be set and cleared by software when writing the GPIO\_IF\_SET and GPIO\_IF\_CLR register locations. Since the external interrupts are asynchronous, they are sensitive to noise. To increase noise tolerance, the MODEx field(s) in the GPIO\_Px\_MODEL register, should be set to include glitch filtering for pins that have external interrupts enabled.

### 24.3.10.2 Interrupt Generation on EM4WU Pins

In addition to being an EM4 wake source, any of the dedicated EM4WU (EM4 wake-up) signals on PA, PB, PC or PD may be used to generate edge-sensitive interrupts in EM0, EM1, EM2, and EM3.

In order to enable an EM4WU pin as an interrupt, set the EM4WUIENn field in the GPIO\_IEN register and the EM4WUENn field in the EM4WUEN register. The EM4WUPOLn field in the GPIO\_EM4WUPOL register is used to set the desired polarity for the interrupt (0 for a falling edge, and 1 for a rising edge).

Upon an interrupt occurring, the corresponding EM4WU index in the GPIO\_IF register will be set along with the odd or even interrupt line depending on the index inside of GPIO\_IF. For example, by setting the EM4WU8 in GPIO\_EM4WUPOL and EM4WU[8] in GPIO\_IEN, the interrupt flag EM4WU[8] in GPIO\_IF will be triggered by a rising edge on pin EM4WU8 and a interrupt request will be sent on IRQ\_GPIO\_EVEN.

The wake-up granularity of the EM4WU interrupts is based on the settings of the EM4WU field in the GPIO\_IEN register and the EM4WUEN field in the GPIO\_EM4WUEN register (see [Table 24.2 EM4WU Interrupt Energy Mode Wakeup on page 802](#)).

**Table 24.2. EM4WU Interrupt Energy Mode Wakeup**

EM4WUIENn in GPIO_IEN	EM4WUENn in GPIO_EM4WUEN	Energy Mode Wakeup	Interrupt
x	0	No Wake	No Interrupt
0	1	Wake from EM4	No Interrupt
1	1	Wake from EM1, EM2, EM3, or EM4	Interrupt from EM0, EM1, EM2, or EM3

For example, to configure the device to wake up and generate an interrupt when PD02 (EM4WU9) sees a falling edge:

1. Set bit 9 of EM4WUEN in the GPIO\_EM4WUEN register to '1'. This enables the asynchronous wake logic.
2. Set bit 9 of EM4WUIEN in the GPIO\_IEN register to '1'. This enables routing of the wake signal to the GPIO\_ODD IRQ.
3. Clear bit 9 of EM4WUPOL in the GPIO\_EM4WUPOL register to '0'. This indicates that the interrupt should occur when a falling edge is detected at the pin.
4. Enable the GPIO.ODD IRQ. The ODD interrupt is used because the bit index of EM4WUIF in GPIO\_IF is odd.

### 24.3.11 Output to PRS

All pins within a group of four(0-3,4-7,8-11,12-15) from all ports are grouped together to form one PRS producer which outputs to the PRS. The pin from which the output should be taken is selected in the same fashion as the edge interrupts.

PRS output is not affected by the interrupt edge detection logic or gated by the IEN bits. See [24.3.10 Interrupt Generation](#) for an illustration of where the PRS output signal is generated.

### 24.3.12 Peripheral Resource Routing

Most peripherals have resources that need to be connected to GPIO pins to function. For example, the I2C has SDA and SCL which need to be connected to pins for the I2C to communicate with other ICs. Resources come in three types. Fixed resources are hard-wired to a pin and can only be accessed in that location. For example the LFXO LFXTAL\_I and LFXTAL\_O resources are only available on one pin each. Digital route-able resources are connected to pins through the [24.3.12.1 Digital Bus \(DBUS\)](#) which allows for extremely flexible resource placement. Analog route-able resources are connected to pins through the [24.3.12.2 Analog Bus \(ABUS\)](#) which provides extremely flexible resource placement.

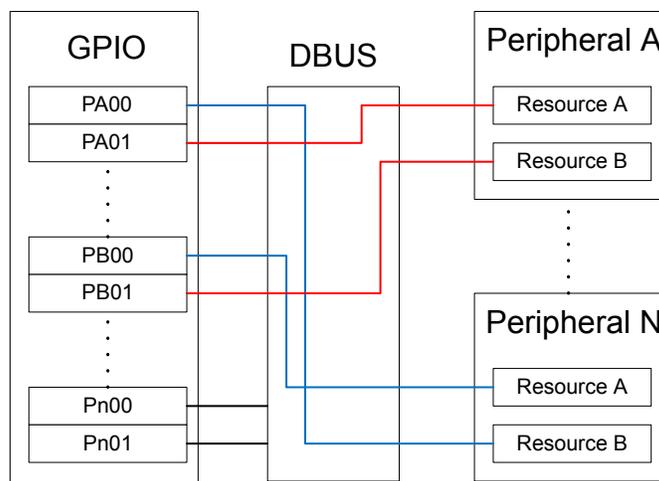

The locations of fixed resources and the limitations of ABUS and DBUS on each device can be found in the device data sheet.

### 24.3.12.1 Digital Bus (DBUS)

The Digital Bus (DBUS) is an any-to-any switch matrix between peripheral resources and GPIO pins as shown in [Figure 24.7 Digital Bus Interconnect on page 803](#). There are two DBUSes on the EFR32xG23 - DBUSAB serves ports A and B, while DBUSCD serves ports C and D. Not all peripherals have access to both DBUSes.

To connect a resource to a pin, first select the desired PORT and PIN in the GPIO\_x\_yROUTE register, where x is the peripheral name and y is the resource name. The PORT field is encoded as PA = 0, PB = 1, PC = 2, etc. Once the pin is selected, the resource must be enabled by setting its enable bit in the appropriate GPIO\_x\_ROUTEEN register. For example, to route the SDA resource of I2C0 to PB03, set PORT to 0x1 and PIN to 0x3 in GPIO\_I2C0\_SDAROUTE. Then set the GPIO\_I2C0\_ROUTEN.SDAPEN bit.

Any pin connected to a digital resource should be properly configured for that resource (refer to [24.3.1 Pin Configuration](#)). For example, an I2C SDA should be configured as open-drain, a USART (or EUSART) TX should be configured as push-pull, and a USART (or EUSART) RX should be configured as an input.

**Figure 24.7. Digital Bus Interconnect**

### 24.3.12.2 Analog Bus (ABUS)

Analog peripherals may be connected to any pins on port A, B, C, or D via the Analog Bus. There are three analog buses on the EFR32xG23: one dedicated to Port A (ABUSA), one dedicated to port B (ABUSB), and one that serves both ports C and D (ABUSCD). The specific pin and port selection for analog resources are configured in the analog peripherals. Refer to the respective analog peripheral chapter for this information. However, the GPIO block must be configured to grant the peripheral access to an ABUS before any connection can be made.

**Note:** The analog signals on ABUSes will be voltage limited by the lowest supply voltage of IOVDD and AVDD.

Up to two analog peripherals may be given access to an ABUS at any one time and the even/odd pins of each bus are configured independently. This means that a single bus may have up to four different analog peripherals connected to it: two on the even pins and two on the odd pins. The GPIO\_ABUSxALLOC register, where x is the port, determines which peripherals have access to the bus. To grant a peripheral access to the bus even pins select it in either the EVEN0 or EVEN1 field. To grant a peripheral access to the bus odd pins select it in either the ODD0 or ODD1 fields.

When a differential connection is being used, positive inputs are restricted to the EVEN pins and negative inputs are restricted to the ODD pins. When a single ended connection is being used, the positive input is available on all pins.

Peripherals may be given access to as many buses as desired. For example the ADC may be given access to ABUSA, ABUSB, and ABUSCD allowing it to select any pin on ports A-D. If two peripherals select the same port and pin the ABUS will make both connections simultaneously, effectively connecting the two peripherals together.

Any pin connected to an analog resource should be configured to input DISABLED as described in [24.3.1 Pin Configuration](#)

The process for configuring an analog peripheral to access a pin through the ABUS is as follows:

- Configure the desired analog port pins to input DISABLED mode in the corresponding GPIO\_PORTx\_MODEL/H register.
- Configure the corresponding GPIO\_xBUSALLOC field to grant access to the desired peripheral on the desired ABUS.
- Configure the analog peripheral to select the desired port and channel as described in the peripheral chapter.

### 24.3.12.3 Pin Function Tables

This section details the functions and GPIO pins available on the most fully-featured devices in the EFR32xG23 family. Availability of GPIO and signals varies. Refer to the device datasheet for specific peripheral and GPIO availability. Fixed-pin peripheral resources are shown in [Table 24.3 GPIO Alternate Function Table on page 805](#), ABUS routing options are listed in [Table 24.4 ABUS Routing Table on page 807](#), and DBUS routing options are listed in [Table 24.5 DBUS Routing Table on page 808](#)

#### 24.4 Synchronization

To avoid metastability in synchronous logic connected to the pins, all inputs are synchronized with double flip-flops. The flip-flops for the input data run on the selected APB clock for the GPIO module (PCLK). Consequently, when a pin changes state, the change will propagate to GPIO\_Px\_DIN after two 2 PCLK cycles. Synchronization (also running on the PCLK) is also added for interrupt input. To save power when the external interrupts are not used, the synchronization flip-flops for these can be turned off by clearing the EXTINT field in the GPIO\_IEN register.

## 24.5 GPIO Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	GPIO_IPVERSION	R	Main
0x030	GPIO_PORTA_CTRL	RW	Port Control
0x034	GPIO_PORTA_MODEL	RW	Mode Low
0x03C	GPIO_PORTA_MODEH	RW	Mode High
0x040	GPIO_PORTA_DOUT	RW	Data Out

## 24.6 GPIO Register Description

### 24.6.1 GPIO\_IPVERSION - Main

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x2																															
<b>Access</b>	R																															
<b>Name</b>	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION IPVERSION ID	0x2	R	<b>ip version id</b>

## 24.6.2 GPIO\_PORTA\_CTRL - Port Control

Offset	Bit Position																																		
0x030	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
<b>Reset</b>				0x0								0x4												0x0								0x4			
<b>Access</b>				RW								RW												RW								RW			
<b>Name</b>				DINDISALT								SLEWRATEALT												DINDIS								SLEWRATE			

Bit	Name	Reset	Access	Description
31:29	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
28	DINDISALT	0x0	RW	<b>Data In Disable Alt</b> Data input disable for port pins using alternate modes.
27:23	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
22:20	SLEWRATEALT	0x4	RW	<b>Slew Rate Alt</b> Slewrates limit for port pins using alternate modes. Higher values represent faster slewrates.
19:13	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
12	DINDIS	0x0	RW	<b>Data In Disable</b> Data input disable for port pins not using alternate modes.
11:7	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
6:4	SLEWRATE	0x4	RW	<b>Slew Rate</b> Slewrates limit for port pins using not alternate modes. Higher values represent faster slewrates.
3:0	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>

## 24.6.3 GPIO\_PORTA\_MODEL - Mode Low

Offset	Bit Position																															
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0			0x0			0x0			0x0			0x0			0x0			0x0			0x0										
<b>Access</b>	RW			RW			RW			RW			RW			RW			RW													
<b>Name</b>	MODE7			MODE6			MODE5			MODE4			MODE3			MODE2			MODE1			MODE0										

Bit	Name	Reset	Access	Description
31:28	MODE7	0x0	RW	<b>MODE n</b>
	MODE n			
	Value	Mode		Description
	0	DISABLED		Input disabled. Pullup if DOUT is set.
	1	INPUT		Input enabled. Filter if DOUT is set.
	2	INPUTPULL		Input enabled. DOUT determines pull direction.
	3	INPUTPULLFILTER		Input enabled with filter. DOUT determines pull direction.
	4	PUSHPULL		Push-pull output.
	5	PUSHPULLALT		Push-pull using alternate control.
	6	WIREDOR		Wired-or output.
	7	WIREDORPULLDOWN		Wired-or output with pull-down.
	8	WIREDAND		Open-drain output.
	9	WIREDANDFILTER		Open-drain output with filter.
	10	WIREDANDPULLUP		Open-drain output with pullup.
	11	WIREDANDPULLUPFILTER		Open-drain output with filter and pullup.
	12	WIREDANDALT		Open-drain output using alternate control.
	13	WIREDANDALTFILTER		Open-drain output using alternate control with filter.
	14	WIREDANDALTPULLUP		Open-drain output using alternate control with pullup.
	15	WIREDANDALTPULLUPFILTER		Open-drain output using alternate control with filter and pullup.
27:24	MODE6	0x0	RW	<b>MODE n</b>
	MODE n			
	Value	Mode		Description
	0	DISABLED		Input disabled. Pullup if DOUT is set.
	1	INPUT		Input enabled. Filter if DOUT is set.
	2	INPUTPULL		Input enabled. DOUT determines pull direction.
	3	INPUTPULLFILTER		Input enabled with filter. DOUT determines pull direction.

Bit	Name	Reset	Access	Description
	4	PUSHPULL		Push-pull output.
	5	PUSHPULLALT		Push-pull using alternate control.
	6	WIREDOR		Wired-or output.
	7	WIREDORPULLDOWN		Wired-or output with pull-down.
	8	WIREDAND		Open-drain output.
	9	WIREDANDFILTER		Open-drain output with filter.
	10	WIREDANDPULLUP		Open-drain output with pullup.

## 24.6.19 GPIO\_PORTD\_DIN - Data in

Offset	Bit Position																															
0x0D4	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0					
<b>Access</b>																											R					
<b>Name</b>																											DIN					

Bit	Name	Reset	Access	Description
31:6	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
5:0	DIN	0x0	R	<b>Data input</b>
	Data input			

## 24.6.20 GPIO\_LOCK - Lock Register

Offset	Bit Position																															
0x300	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0xA534					
<b>Access</b>																											W					
<b>Name</b>																											LOCKKEY					

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	LOCKKEY	0xA534	W	<b>Configuration Lock Key</b>
	Write any other value than the unlock code to lock configuration registers. Write the unlock code to unlock (See text for detailed list of configuration registers.)			
	Value	Mode	Description	
	42292	UNLOCK	Unlock code	

## 24.6.21 GPIO\_GPIOLockSTATUS - Lock Status

Offset	Bit Position																															
0x310	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0
<b>Access</b>																																R
<b>Name</b>																																LOCK

Bit	Name	Reset	Access	Description
31:1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	LOCK	0x0	R	<b>GPIO LOCK status</b> Indicates current lock status of GPIO registers
	Value	Mode		Description
	0	UNLOCKED		Registers are unlocked
	1	LOCKED		Registers are locked

## 24.6.22 GPIO\_ABUSALLOC - A Bus Allocation

Offset	Bit Position																															
0x320	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>					0x0								0x0								0x0											
<b>Access</b>					RW								RW								RW											
<b>Name</b>					AODD1								AODD0								AEVEN1								AEVEN0			

Bit	Name	Reset	Access	Description
31:28	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
27:24	AODD1	0x0	RW	<b>A Bus Odd 1</b> peripheral allocation to A Bus Odd 1
	Value	Mode	Description	
	0	TRISTATE	The bus is not allocated	
	1	ADC0	The bus is allocated to ADC0	
	2	ACMP0	The bus is allocated to ACMP0	
	3	ACMP1	The bus is allocated to ACMP1	
	4	VDAC0CH1	The bus is allocated to VDAC0 CH1	
23:20	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	AODD0	0x0	RW	<b>A Bus Odd 0</b> peripheral allocation to A Bus Odd 0
	Value	Mode	Description	
	0	TRISTATE	The bus is not allocated	
	1	ADC0	The bus is allocated to ADC0	
	2	ACMP0	The bus is allocated to ACMP0	
	3	ACMP1	The bus is allocated to ACMP1	
	4	VDAC0CH0	The bus is allocated to VDAC0 CH0	
15:12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
11:8	AEVEN1	0x0	RW	<b>A Bus Even 1</b> peripheral allocation to A Bus Even 1
	Value	Mode	Description	
	0	TRISTATE	The bus is not allocated	
	1	ADC0	The bus is allocated to ADC0	
	2	ACMP0	The bus is allocated to ACMP0	

Bit	Name	Reset	Access	Description
	3	ACMP1		The bus is allocated to ACMP1
	4	VDAC0CH1		The bus is allocated to VDAC0 CH1
7:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
3:0	AEVEN0	0x0	RW	<b>A Bus Even 0</b> peripheral allocation to A Bus Even 0
	Value	Mode	Description	
	0	TRISTATE	The bus is not allocated	
	1	ADC0	The bus is allocated to ADC0	
	2	ACMP0	The bus is allocated to ACMP0	
	3	ACMP1	The bus is allocated to ACMP1	
	4	VDAC0CH0	The bus is allocated to VDAC0 CH0	

## 24.6.23 GPIO\_BBUSALLOC - B Bus Allocation

Offset	Bit Position																															
0x324	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>					0x0								0x0								0x0											
<b>Access</b>					RW								RW								RW											
<b>Name</b>					BODD1								BODD0								BEVEN1								BEVEN0			

Bit	Name	Reset	Access	Description
31:28	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
27:24	BODD1	0x0	RW	<b>B Bus Odd 1</b> peripheral allocation to B Bus Odd 1
	Value	Mode	Description	
	0	TRISTATE	The bus is not allocated	
	1	ADC0	The bus is allocated to ADC0	
	2	ACMP0	The bus is allocated to ACMP0	
	3	ACMP1	The bus is allocated to ACMP1	
	4	VDAC0CH1	The bus is allocated to VDAC0 CH1	
23:20	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	BODD0	0x0	RW	<b>B Bus Odd 0</b> peripheral allocation to B Bus Odd 0
	Value	Mode	Description	
	0	TRISTATE	The bus is not allocated	
	1	ADC0	The bus is allocated to ADC0	
	2	ACMP0	The bus is allocated to ACMP0	
	3	ACMP1	The bus is allocated to ACMP1	
	4	VDAC0CH0	The bus is allocated to VDAC0 CH0	
15:12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
11:8	BEVEN1	0x0	RW	<b>B Bus Even 1</b> peripheral allocation to B Bus Even 1
	Value	Mode	Description	
	0	TRISTATE	The bus is not allocated	
	1	ADC0	The bus is allocated to ADC0	
	2	ACMP0	The bus is allocated to ACMP0	

Bit	Name	Reset	Access	Description
	3	ACMP1		The bus is allocated to ACMP1
	4	VDAC0CH1		The bus is allocated to VDAC0 CH1
7:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
3:0	BEVEN0	0x0	RW	<b>B Bus Even 0</b> peripheral allocation to B Bus Even 0
	Value	Mode	Description	
	0	TRISTATE	The bus is not allocated	
	1	ADC0	The bus is allocated to ADC0	
	2	ACMP0	The bus is allocated to ACMP0	
	3	ACMP1	The bus is allocated to ACMP1	
	4	VDAC0CH0	The bus is allocated to VDAC0 CH0	

## 24.6.24 GPIO\_CDBUSALLOC - CD Bus Allocation

Offset	Bit Position																															
0x328	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## 24.6.51 GPIO\_EUSART0\_RTSTRUTE - RTS Port/Pin Select

Offset	Bit Position																															
0x4D0	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0																0x0			
<b>Access</b>													RW																RW			
<b>Name</b>													PIN																PORT			

Bit	Name	Reset	Access	Description
31:20	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
19:16	PIN RTS pin select register	0x0	RW	<b>RTS pin select register</b>
15:2	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
1:0	PORT RTS port select register	0x0	RW	<b>RTS port select register</b>

## 24.6.52 GPIO\_EUSART0\_RXROUTE - RX Port/Pin Select

Offset	Bit Position																															
0x4D4	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0																0x0			
<b>Access</b>													RW																RW			
<b>Name</b>													PIN																PORT			

Bit	Name	Reset	Access	Description
31:20	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
19:16	PIN RX pin select register	0x0	RW	<b>RX pin select register</b>
15:2	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
1:0	PORT RX port select register	0x0	RW	<b>RX port select register</b>

## 24.6.53 GPIO\_EUSART0\_SCLKROUTE - SCLK Port/Pin Select

Offset	Bit Position																															
0x4D8	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0																0x0			
<b>Access</b>													RW																RW			
<b>Name</b>													PIN																PORT			

Bit	Name	Reset	Access	Description
31:20	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	PIN SCLK pin select register	0x0	RW	<b>SCLK pin select register</b>
15:2	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	PORT SCLK port select register	0x0	RW	<b>SCLK port select register</b>

## 24.6.54 GPIO\_EUSART0\_TXROUTE - TX Port/Pin Select

Offset	Bit Position																															
0x4DC	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0																0x0			
<b>Access</b>													RW																RW			
<b>Name</b>													PIN																PORT			

Bit	Name	Reset	Access	Description
31:20	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	PIN TX pin select register	0x0	RW	<b>TX pin select register</b>
15:2	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	PORT TX port select register	0x0	RW	<b>TX port select register</b>

## 24.6.56 GPIO\_EUSART1\_CSROUTE - CS Port/Pin Select

Offset	Bit Position																															
0x4E8	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0																0x0			
<b>Access</b>													RW																RW			
<b>Name</b>													PIN																PORT			

Bit	Name	Reset	Access	Description
31:20	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
19:16	PIN CS pin select register	0x0	RW	<b>CS pin select register</b>
15:2	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
1:0	PORT CS port select register	0x0	RW	<b>CS port select register</b>

## 24.6.57 GPIO\_EUSART1\_CTSROUTE - CTS Port/Pin Select

Offset	Bit Position																															
0x4EC	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0																0x0			
<b>Access</b>													RW																RW			
<b>Name</b>													PIN																PORT			

Bit	Name	Reset	Access	Description
31:20	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
19:16	PIN CTS pin select register	0x0	RW	<b>CTS pin select register</b>
15:2	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
1:0	PORT CTS port select register	0x0	RW	<b>CTS port select register</b>

## 24.6.58 GPIO\_EUSART1\_RTSTRUTE - RTS Port/Pin Select

Offset	Bit Position																															
0x4F0	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>														0x0																0x0		
<b>Access</b>														RW																RW		
<b>Name</b>														PIN																PORT		

Bit	Name	Reset	Access	Description
31:20	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	PIN RTS pin select register	0x0	RW	<b>RTS pin select register</b>
15:2	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	PORT RTS port select register	0x0	RW	<b>RTS port select register</b>

## 24.6.59 GPIO\_EUSART1\_RXROUTE - RX Port/Pin Select

Offset	Bit Position																															
0x4F4	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>														0x0																0x0		
<b>Access</b>														RW																RW		
<b>Name</b>														PIN																PORT		

Bit	Name	Reset	Access	Description
31:20	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	PIN RX pin select register	0x0	RW	<b>RX pin select register</b>
15:2	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	PORT RX port select register	0x0	RW	<b>RX port select register</b>

## 24.6.60 GPIO\_EUSART1\_SCLKROUTE - SCLK Port/Pin Select

Offset	Bit Position																															
0x4F8	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0																0x0			
<b>Access</b>													RW																RW			
<b>Name</b>													PIN																PORT			

Bit	Name	Reset	Access	Description
31:20	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	PIN SCLK pin select register	0x0	RW	<b>SCLK pin select register</b>
15:2	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	PORT SCLK port select register	0x0	RW	<b>SCLK port select register</b>

## 24.6.61 GPIO\_EUSART1\_TXROUTE - TX Port/Pin Select

Offset	Bit Position																															
0x4FC	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0																0x0			
<b>Access</b>													RW																RW			
<b>Name</b>													PIN																PORT			

Bit	Name	Reset	Access	Description
31:20	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	PIN TX pin select register	0x0	RW	<b>TX pin select register</b>
15:2	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	PORT TX port select register	0x0	RW	<b>TX port select register</b>

## 24.6.63 GPIO\_EUSART2\_CSROUTE - CS Port/Pin Select

Offset	Bit Position																															
0x508	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0																0x0			
<b>Access</b>													RW																RW			
<b>Name</b>													PIN																PORT			

Bit	Name	Reset	Access	Description
31:20	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	PIN CS pin select register	0x0	RW	<b>CS pin select register</b>
15:2	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	PORT CS port select register	0x0	RW	<b>CS port select register</b>

## 24.6.64 GPIO\_EUSART2\_CTSROUTE - CTS Port/Pin Select

Offset	Bit Position																															
0x50C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0																0x0			
<b>Access</b>													RW																RW			
<b>Name</b>													PIN																PORT			

Bit	Name	Reset	Access	Description
31:20	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	PIN CTS pin select register	0x0	RW	<b>CTS pin select register</b>
15:2	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	PORT CTS port select register	0x0	RW	<b>CTS port select register</b>

## 24.6.65 GPIO\_EUSART2\_RTSTRUTE - RTS Port/Pin Select

Offset	Bit Position																															
0x510	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>													0x0																0x0			
<b>Access</b>													RW																RW			
<b>Name</b>													PIN																PORT			

Bit	Name	Reset	Access	Description
31:20	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	PIN RTS pin select register	0x0	RW	<b>RTS pin select register</b>

## 25. LDMA - Linked DMA

### 25.1 Introduction

The Linked Direct Memory Access (LDMA) controller performs memory transfer operations independently of the CPU. This has the benefit of reducing the energy consumption and the workload of the CPU, and enables the system to stay in low energy modes while still routing data to memory and peripherals. For example, moving data from the ADC to memory.

#### Quick Facts

##### What?

The LDMA controller can move data without CPU intervention, effectively reducing the energy consumption for a data transfer.

##### Why?

The LDMA can perform data transfers more energy efficiently than the CPU and allows autonomous operation in low energy modes.

##### How?

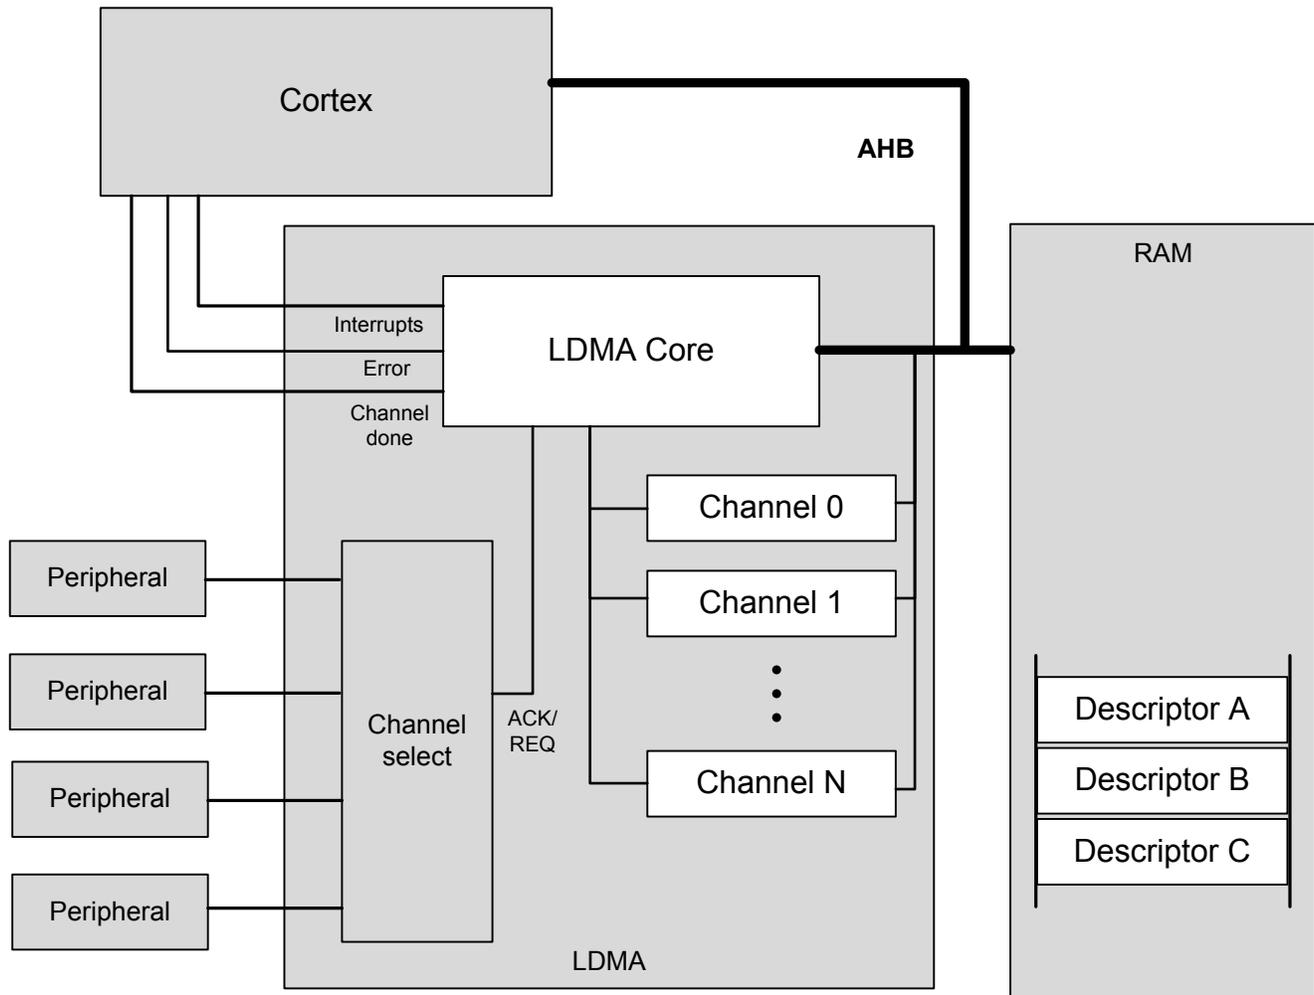

The LDMA controller has multiple highly configurable, prioritized DMA channels. A linked list of flexible descriptors makes it possible to tailor the controller to the specific needs of an application.

### 25.1.1 Features

- Flexible Source and Destination transfers
  - Memory-to-memory
  - Memory-to-peripheral
  - Peripheral-to-memory
  - Peripheral-to-peripheral
- DMA transfers triggered by peripherals, software, or linked list
- Single or multiple data transfers for each peripheral or software request
- Inter-channel and hardware event synchronization via trigger and wait functions
- Supports single or multiple descriptors
  - Single descriptor
  - Linked list of descriptors
  - Circular and ping-pong buffers
  - Scatter-Gather
  - Looping
  - Pause and restart triggered by other channels
  - Sophisticated flow control which can function without CPU interaction
- Channel arbitration includes:
  - Fixed priority
  - Simple round robin
  - Round robin with programmable multiple interleaved entries for higher priority requesters
- Programmable data size and source and destination address strides
- Programmable interrupt generation at the end of each DMA descriptor execution
- Little-endian/big-endian conversion
- DMA write-immediate function

## 25.2 Block Diagram

An overview of the LDMA and the modules it interacts with is shown in [Figure 25.1 LDMA Block Diagram on page 985](#).

**Figure 25.1. LDMA Block Diagram**

The Linked DMA Controller consists of three main parts

- A DMA core that executes transfers and communicates status to the core
- A channel select block that routes peripheral DMA requests and acknowledge signals to the DMA
- A set of internal channel configuration registers for tracking the progress of each DMA channel

The DMA has access to all system memory through the AHB bus and the AHB->APB bridge. It can load channel descriptors from memory with no CPU intervention.

## 25.3 Functional Description

The Linked DMA Controller is highly flexible. It is capable of transferring data between peripherals and memory without involvement from the processor core. This can be used to increase system performance by off-loading the processor from copying large amounts of data or avoiding frequent interrupts to service peripherals needing more data or having available data. It can also be used to reduce the system energy consumption by making the LDMA work autonomously with some EM2/3 peripherals for data transfer without having to wake up the processor core from sleep.

The Linked DMA Controller has 8 independent channels. Each of these channels can be connected to any of the available peripheral DMA transfer request input sources by writing to the channel configuration registers, see [25.3.2 Channel Configuration](#). In addition, each channel can also be triggered directly by software, which is useful for memory-to-memory transfers.

The channel descriptors determine what the Linked DMA Controller will do when it receives DMA transfer request. The initial descriptor is written directly to the LDMA's channel registers. If desired, the initial descriptor can link to additional linked descriptors stored in memory (RAM or Flash). Alternatively, software may also load the initial descriptor by writing the descriptor address to the LDMA\_CHx\_LINK register and then setting the corresponding bit the LDMA\_LINKLOAD register.

Before enabling a channel, the software must take care to properly configure the channel registers including the link address and any linked descriptors. When a channel is triggered, the Linked DMA Controller will perform the memory transfers as specified by the descriptors. A descriptor contains the memory address to read from, the memory address to write to, link address of the next descriptor, the number of bytes to be transferred, etc. The channel descriptor is described in detail in [25.3.7 Channel Descriptor Data Structure](#).

The Linked DMA Controller supports both fixed priority and round robin arbitration. The number of fixed and round robin channels is programmable. For round robin channels, the number of arbitration slots requested for each channel is programmable. Using this scheme, it is possible to ensure that timing-critical transfers are serviced on time.

DMA transfers take place by reading a block of data at a time from the source, storing it in the LDMA's local FIFO, then writing the block out to the destination from the FIFO. Interrupts may optionally be signaled to the CPU's interrupt controller at the end of any DMA transfer or at the completion of a descriptor if the DONEIFSEN bit is set. An AHB error will always generate an interrupt.

### 25.3.1 Channel Descriptor

Each DMA channel has descriptor registers. A transfer can be initialized by software writing to the registers or by the DMA itself copying a descriptor from RAM to memory. When using a linked list of descriptors the first descriptor should be initialized by the CPU. The DMA itself will then copy linked descriptors to its descriptor registers as required. In addition to manually initializing the first transfer, software may also cause the LDMA to load the initial descriptor by writing the descriptor address to the LDMA\_CHx\_LINK register and then setting the corresponding bit the LDMA\_LINKLOAD register.

The contents of the descriptor registers are dynamically updated during the DMA transfer. The contents of descriptors in memory are not edited by the controller.

Some descriptor field values are only used for linked descriptors. For example, the SRCMODE and DSTMODE bits of the LDMA\_CHx\_CTRL registers determine if a linked descriptor is using relative or absolute addressing. Software writes to the address registers will always use absolute addressing and never set these bits. Therefore, these bits are read only.

#### 25.3.1.1 DMA Transfer Size

A DMA transfer is the smallest unit of data that can be transferred by the LDMA. The LDMA supports byte, half-word and word sized transfers. The SIZE field in the LDMA\_CHx\_CTRL register specifies the data width of one DMA transfer.

#### 25.3.1.2 Source/Destination Increments

The SRCINC and DSTINC in the LDMA\_CHx\_CTRL register determines the increment between DMA transfers. The increment is in units of DMA transfers and using an increment size of 1 will transfer contiguous bytes, half-words, or words depending on the value of the SIZE field. Multiple unit increments are useful for transferring or packing/unpacking aligned data. For example using an increment of 4 with a size of BYTE will transfer word aligned bytes. An increment of 2 units with a size of HALFWORD is suitable for the transfer of word aligned half-word data. The LDMA can also pack or unpack data by using a different increment size for source and destination. For example - to convert from word aligned byte data (unpacked) to contiguous byte data (packed), set the SIZE to BYTE, SRCINC to 4, and DSTINC to 1.

SIZE may also be set to NONE which will cause the LDMA to read or write the same location for every DMA transfer. This is useful for accessing peripheral FIFO or data registers.

### 25.3.1.3 Block Size

The block size defines the amount of data transferred in one arbitration. It consists of one or more DMA transfers. See [25.3.6.1 Arbitration Priority](#) for more details.

### 25.3.1.4 Transfer Count

The descriptor transfer count defines how many DMA transfers to perform. The number of bytes transferred by the descriptor will depend on both the transfer count XFERCNT and the SIZE field settings.  $TOTAL\_BYTES = XFERCNT * SIZE$

### 25.3.1.5 Descriptor List

A descriptor list consists of one or more descriptors which are executed serially. This list may be a simple sequence of descriptors, a loop of descriptors, or a combination of the two.

Each descriptor in the list can be one of several types.

- Single Transfer descriptor: Transfers TOTAL\_BYTES of data and then stops.
- Linked Transfer descriptor: Transfers TOTAL\_BYTES of data and then loads the next linked descriptor.
- Loop Transfer descriptor: Transfers TOTAL\_BYTES of data and performs loop control (see [25.3.2.2 Loop Counter](#)).
- Sync descriptor: Handle synchronization of the list with other entities (see [25.3.7.2 SYNC Descriptor Structure](#)).
- WRI descriptor: Writes a value to a location in memory (see [25.3.7.3 WRI Descriptor Structure](#)).

### 25.3.1.6 Addresses

Before initiating a transfer, software should write the source address, destination address, and if applicable the link address to the descriptor registers. Alternatively, software may load a descriptor from memory by writing the descriptor address to the LDMA\_CHx\_LINK register and setting the corresponding bit in the LDMA\_LINKLOAD register.

During a DMA transfer, the DMA source and destination address registers are pointers to the next transfer address. The LDMA will update the SRC and DST addresses after each transfer. If software halts a DMA transfer by clearing the enable bit, the SRC and DST addresses will indicate the next transfer address.

When a descriptor is finished the DMA will either halt or load the next (linked) descriptor depending on the value of the LINK field in the LDMA\_Chx\_LINK register. After loading a linked descriptor, the descriptor registers will reflect the content of the loaded descriptor. Note that the linked descriptor must be word aligned in memory. The two least significant bits of the LDMA\_CHx\_LINK register are used by the LINK and LINKMODE bits. The two least significant bits of the link address are always zero.

### 25.3.1.7 Addressing Modes

The DMA descriptors support absolute addressing or relative addressing. When using relative addressing, the offset is relative to the current contents of the respective address registers. Regardless of the descriptor addressing modes, the address registers always indicate the absolute address. For example, when loading a descriptor using relative SRC addressing, the LDMA will add the descriptor source address (offset) to the contents of the SRCADDR register (base address). After loading, the SRCADDR register will indicate the absolute address of the loaded descriptor.

The initial descriptor must use absolute addressing. The LDMA will ignore the DSTMODE, SRCMODE, and LINKMODE bits for the initial descriptor and interpret the addresses as an absolute addresses.

Relative addressing is most useful for the link address. The initial descriptor will indicate the absolute address of the linked descriptors in memory. The linked descriptors might be an array of structures. In this case the offset between descriptors is constant and is always 4 words or 16 bytes (each descriptor has 4 words). The LINK address is not incremented or decremented after each transfer. Thus, a relative offset of 0x10 may be used for all linked descriptors.

The source and destination addresses also support relative addressing. When using relative addressing with the source or destination address registers, the LDMA adds the relative offset to the current contents of the respective address register. Since the source and destination addresses are normally incremented after each transfer, the final address will point to one unit past the last transfer. Thus, an offset of zero will give the next sequential data address.

See the example [25.4.6 2D Copy](#) for an common use of relative addressing.

### 25.3.1.8 Byte Swap

Enabling byte swap reverses the endianness of the incoming source data read into the LDMA's FIFO. Byte swap is only valid for transfer sizes of word and half-word. Note that linked structure reads are not byte swapped.

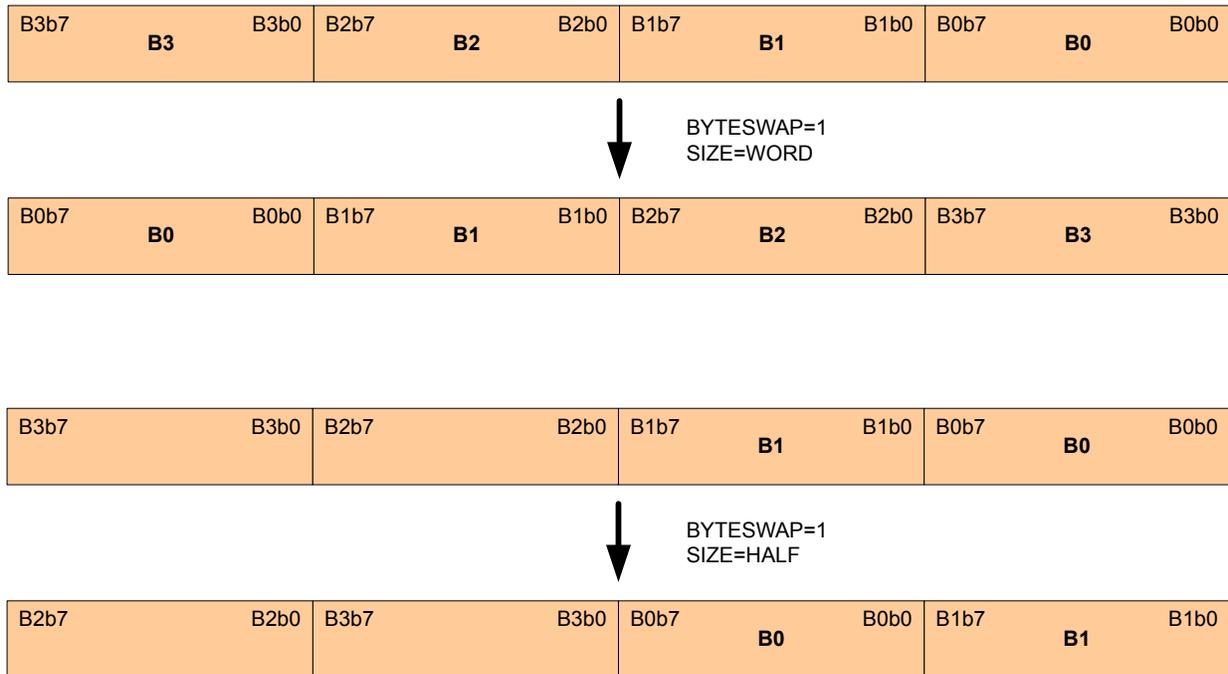

Figure 25.2. Word and Half-Word Endian Byte Swap Examples

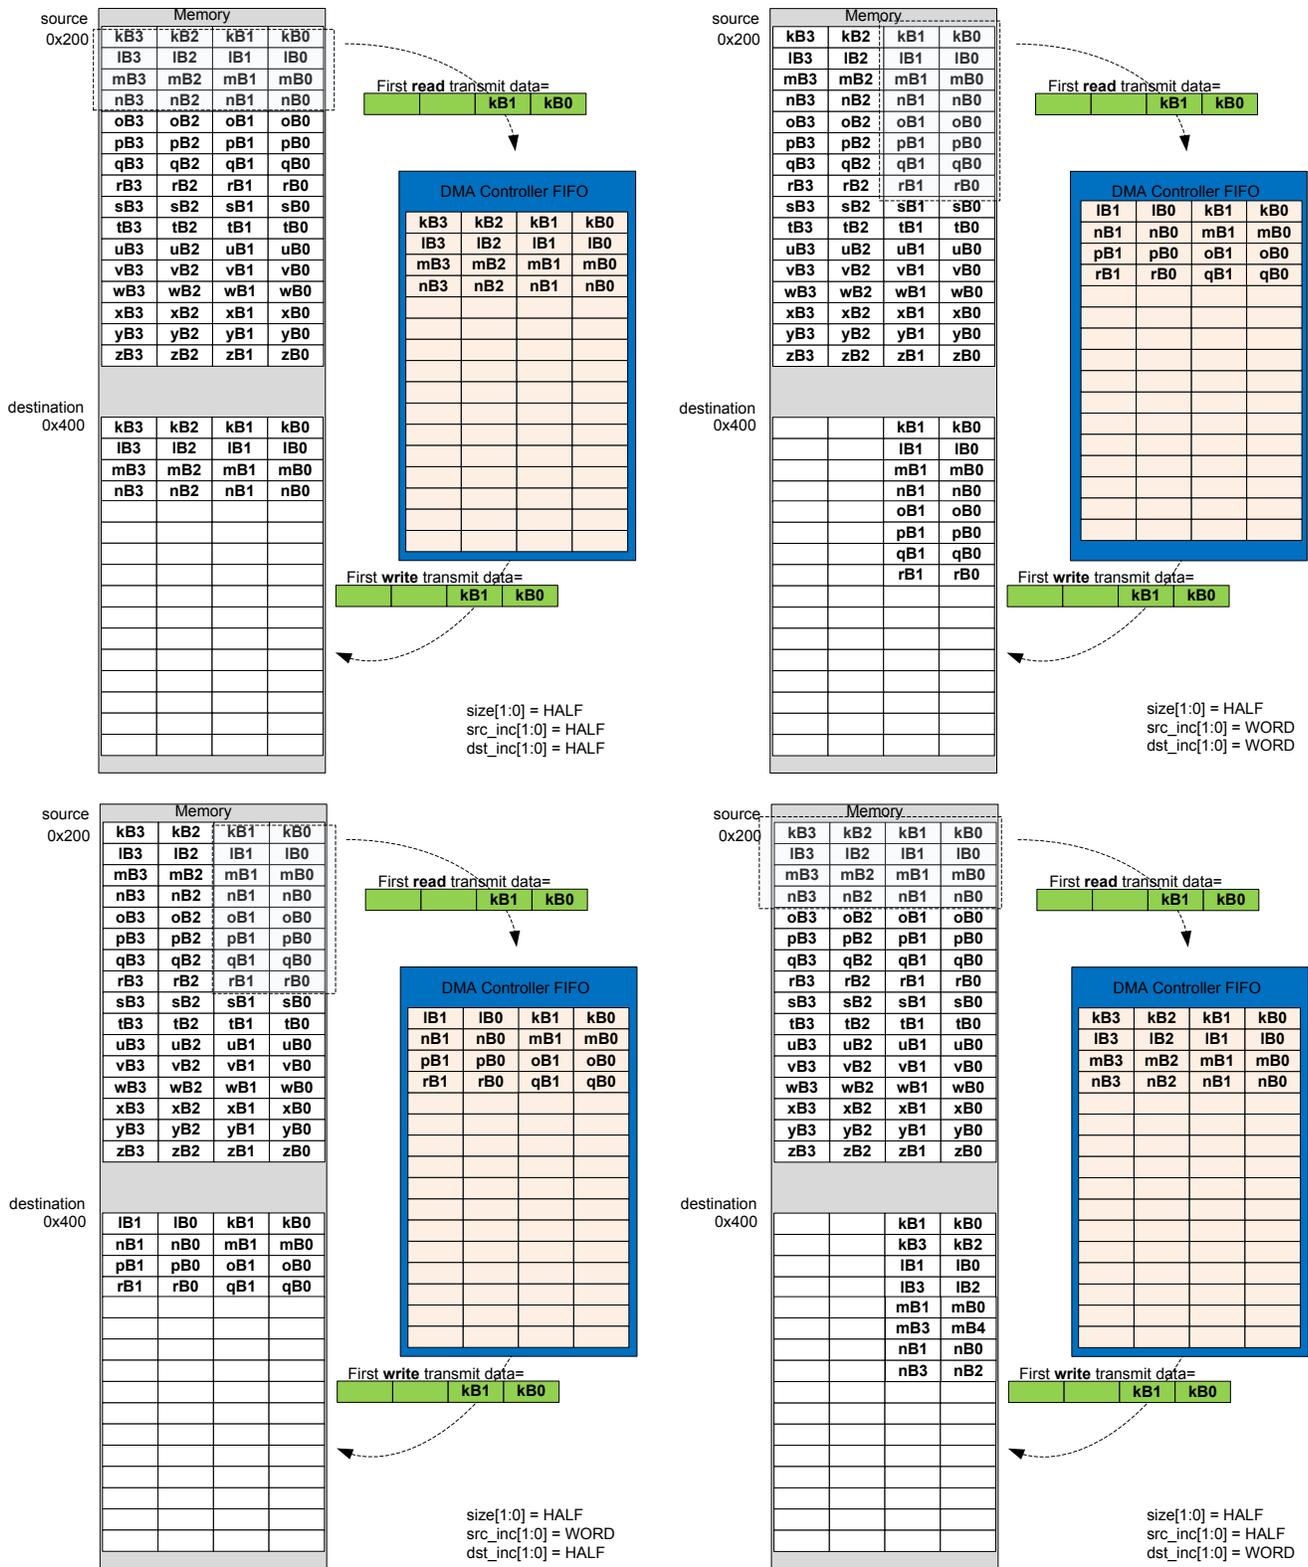

Figure 25.4. Memory-to-Memory Transfer HALF Size Examples

Fields SRCINCSIGN and DSTINCSIGN allow for address decrement. These can be used to mirror an image, for example, in the pixel copy application.

### 25.3.2 Channel Configuration

Each DMA channel has associated configuration and loop counter registers for controlling direction of address increment, arbitration slots, and descriptor looping.

#### 25.3.2.1 Address Increment/Decrement

Normally DMA transfers increment the source and destination addresses after each DMA transfer. Each channel is also capable of decrementing the source and/or destination addresses after each DMA transfer. This may be useful for flipping an array or copying data from tail to head. For example, a data packet might be prepared as an array of data with increasing addresses and then transmitted from the highest address to the lowest address, from tail to head.

After reset the SRCINCSIGN and DSTINCSIGN bits in the LDMA\_CHx\_CFG register are cleared causing the source and destination addresses to increment after each transfer. If the SRCINCSIGN bit is set, the DMA will decrement the source address after each transfer. If the DSTINCSIGN bit in the LDMA\_CHx\_CFG register is set, the DMA will decrement the destination address after each transfer. Setting only one of these bits will flip the data. Setting both bits will copy from tail to head, but will not flip the data.

The SRCINCSIGN and DSTINCSIGN bits apply to all descriptors used by that channel. Software should take care to set the starting source and/or destination address to the highest data address when decrementing.

#### 25.3.2.2 Loop Counter

Each channel has a LDMA\_CHx\_LOOP register that includes a loop counter field. To use looping, software should initialize the loop counter with the desired number of repetitions before enabling the transfer. A descriptor with the DECLOOPCNT bit set to TRUE will repeat the loop and decrement the loop counter until LOOPCNT = 0.

For a looping descriptor, with DECLOOPCNT=1, the LINK address in the LDMA\_CHx\_LINK register is used as the loop address. While LOOPCNT is greater than zero, the descriptor will execute and then the LDMA will load the next descriptor using the address specified in the LDMA\_CHx\_LINK register. This feature enables looping of multiple descriptors. To repeat a single descriptor, the LINK address of the descriptor should point to itself.

After LOOPCNT reaches zero, if the LINK bit in the descriptor LINK word is clear the transfer stops. If the LINK bit is set, the LDMA will load the next sequential descriptor located immediately following the looping descriptor. The behavior of the LINK bit is different for a looping descriptor. This is necessary because the LINK address is re-purposed as the loop address for a looping descriptor.

Note that LOOPCNT sets the number of repeats, not the number of iterations. The total number of loop iterations will be LOOPCNT plus 1. Normally, the LOOPCNT should be set to one or more repeats.

Also note that because there is only one LOOPCNT per channel, software intervention is required to update the LOOPCNT if a sequence of transfers contains multiple loops. It is also possible to use a write immediate DMA data transfer to update the LDMA\_CHx\_LOOP register.

### 25.3.3 Channel Select Configuration

The channel select block determines which peripheral request signal connects to each DMA channel.

This configuration is done by software through the SOURCESEL and SIGSEL fields of the LDMA\_CHn\_REQSEL register. SOURCESEL selects the peripheral and SIGSEL picks which DMA request signals to use from the selected peripheral. Please refer to [25.5 LDMA Source Selection Details](#) for more information.

### 25.3.4 Starting a Transfer

A transfer may be started by software, a peripheral request, or a descriptor load.

Software may initiate a transfer by setting the bit for the desired channel in the LDMA\_SWREQ register. In this case the channel should set SOURCESEL to NONE to prevent unintentional triggering of the channel by a peripheral.

A peripheral may trigger the channel by configuring the peripheral source and signal as described in [25.3.3 Channel Select Configuration](#)

The LDMA may also be configured to begin a transfer immediately after a new descriptor is loaded by setting the STRUCTREQ field of the LDMA\_CHx\_CTRL register or descriptor word.

This configuration is done by software through the SOURCESEL and SIGSEL fields of the LDMA\_CHn\_REQSEL register. SOURCESEL selects the peripheral and SIGSEL picks which DMA request signals to use from the selected peripheral.

### 25.3.4.1 Peripheral Transfer Requests

By default peripherals issue a Single Request (SREQ) when any data is present. For peripherals with a data buffer or FIFO this occurs any time the FIFO is not empty. Upon receiving an SREQ the LDMA will perform one DMA transfer and stop till another request is made.

It is generally more efficient to wait for a peripheral to accumulate data and transfer in a burst. This both reduces overhead of the DMA engine and allows EM2 peripherals to save power by using the LDMA less often. To enable this, set the IGNORESREQ bit in the LDMA\_CHx\_CTRL register (or descriptor) which will cause the LDMA to ignore SREQs and wait for a full Request (REQ) signal before any data is transferred. For most peripherals with a FIFO the REQ signal is set when the FIFO is full, or a predetermined threshold has been reached. See the individual peripheral chapters for more information.

### 25.3.5 Managing Transfer Errors

LDMA transfer errors are normally managed using interrupts. Software should clear the ERROR flag in the bit in the LDMA\_IF register and enable error interrupts by setting the ERROR bit in the LDMA\_IEN register before initiating a DMA transfer.

The LDMA interrupt handler should check the ERROR flag bit in the LDMA\_IF register. If the ERROR flag bit is set, it should then read the CHERROR field in the LDMA\_STATUS register to determine the errant channel. The interrupt handler should reset the channel and clear the ERROR flag bit in the LDMA\_IF register before returning.

### 25.3.6 Arbitration

While multiple channels are configured simultaneously the LDMA engine can only be actively copying data for one channel at a time. Arbitration determines which channel is being serviced at any point in time. The LDMA will choose a channel through arbitration, transfer BLOCK\_SIZE elements of that channel and then arbitrate again choosing another channel to service. This allows high priority channels to be serviced while lower priority channels are in the middle of a transfer.

#### 25.3.6.1 Arbitration Priority

There are two modes in determining priority when the controller arbitrates: fixed priority and round robin priority.

In fixed priority mode, channel 0 has the highest priority. As the channel number increases, the priority decreases. When the LDMA controller is idle or when a transfer completes, the highest priority channel with an active request is granted the transfer. This mode guarantees smallest latency for the highest priority requesters. It is best suited for systems where peak bandwidth is well below LDMA controller's maximum ability to serve. The drawback of this mode is the possibility of starvation for lowest priority requesters.

In the round robin priority mode, each active requesting channel is serviced in the order of priority. A late arriving request on a higher priority channel will not get serviced until the next round. This mode minimizes the risk of starving low-priority latency-tolerant requesters. The drawback of this mode is higher risk of starving low-latency requesters.

The NUMFIXED field in the LDMA\_CTRL register determines which channels are fixed priority and which are round robin. Channels lower than NUMFIXED are fixed priority while those above it are round robin. A value of 0x0 implies all channels are round robin. A value of 0x4 implies channels 0 through 3 are fixed priority and 4 through 7 are round robin. A value of 7 implies that channels 0 through 6 are fixed and channel 7 is round robin. This is functionally equivalent to having 8 fixed priority channels.

Fixed priority channels always take priority over round robin. As long as NUMFIXED is greater than 0, there is a possibility that a higher priority channel can starve the remaining channels.

To address the drawbacks of using fixed priority or round robin priority the LDMA implements the concept of arbitration slots. This allows for channels to have high bandwidth and low latency while preventing starvation of latency tolerant low priority channels.

Each channel has a two bit ARBSLOT field in its LDM\_CHx\_CFG register. This field only applies to channels marked as round robin (determined by NUMFIXED). The channels in the same arbitration slot are treated equally with round robin scheduling. Channels marked with a higher arbitration slot will get serviced more frequently. By default all channels are placed in arbitration slot 1.

Every time the channels in slot 1 get serviced the channels in slot 2 get serviced twice, those in slot 4 get serviced 4 times, and those in slot 8 get serviced 7 times. The specific arbitration allocation can be seen by the following table. The highest arbitration slot is serviced every other arbitration cycle, allowing for low latency response. If there are no requests from channels in arbitration slot then that slot is immediately skipped.

**Table 25.1. Arbitration Slot Order**

Arbslot order	8	4	8	2	8	4	8	1	8	4	8	2	8	4
Arbslot1								1						
Arbslot2				1								1		
Arbslot4		1				1				1				1
Arbslot8	1		1		1		1		1		1		1	

The top row shows the order at which the arbitration slots are executed. The remaining part of the table shows a more visual interpretation of the arbitration order.

For example, if we have one low latency channel (CHNL0) and two latency tolerant channels (CHNL1 and CHNL2). We could use the following settings.

LDMA\_CTRL.NUMFIXED = 0; set round robin for all channels.

CHNL0\_CFG.ARBSLOTS = TWO;

CHNL1\_CFG.ARBSLOTS = ONE;

CHNL2\_CFG.ARBSLOTS = ONE;

If all channels are constantly requesting transfers, then the arbitration order is: CHNL0, CHNL1, CHNL0, CHNL2, CHNL0, CHNL1, CHNL0, CHNL2, CHNL0, etc

Note, there are no channels assigned to arbitration slot four or eight in this example, so those slots are skipped and the final sequence is ARBSLOT2, ARBSLOT1, ARBSLOT2, ARBSLOT1, etc...

Channel 1 and Channel 2 are selected in round robin order when arbitration slot 1 is executed.

If we replace the ARBSLOTS value for channel 0 with EIGHT, then the sequence would look like the following:

CHNL0, CHNL0, CHNL0, CHNL0, CHNL1, CHNL0, CHNL0, CHNL0, CHNL0, CHNL2, CHNL0, CHNL0, CHNL0, CHNL0, CHNL1, etc.

### 25.3.6.2 DMA Transfer Arbitration

In addition to the inter channel arbitration, software can configure when the controller arbitrates during a DMA transfer. This provides reduced latency to higher priority channels when configuring low priority transfers with more arbitration cycles.

The LDMA provides four bits that configure how many DMA transfers occur before it re-arbitrates. These bits are known as the BLOCKSIZE bits and they map to the arbitration rate as shown below. For example, if BLOCKSIZE = 4 then the arbitration rate is 6, that is, the controller arbitrates every 6 DMA transfers.

Table 25.2 AHB Bus Transfer Arbitration Interval on page 994 lists the arbitration rates.

**Table 25.2. AHB Bus Transfer Arbitration Interval**

BLOCKSIZE	Arbitrate After x DMA transfers
0	x = 1
1	x = 2
2	x = 3
3	x = 4
4	x = 6
5	x = 8
6	x = 12
7	x = 16
8	x = 24
9	x = 32
10	x = 64
11	x = 128
12	x = 256
13	x = 512
14	x = 1024
15	x = lock

**Note:** Software must take care not to assign a low-priority channel with a large BLOCKSIZE because this prevents the controller from servicing high-priority requests, until it re-arbitrates.

The number of DMA transfers that need to be done is specified by the user in XFERCNT. When XFERCNT > BLOCKSIZE and is not an integer multiple of BLOCKSIZE then the controller always performs sequences of BLOCKSIZE transfers until XFERCNT < BLOCKSIZE remain to be transferred. The controller performs the remaining XFERCNT transfers at the end of the DMA cycle.

Software must store the value of the BLOCKSIZE bits in the channel control data structure. See 25.3.7.1 XFER Descriptor Structure for more information about the location of the BLOCKSIZE bits in the data structure.

### 25.3.7 Channel Descriptor Data Structure

Each channel descriptor consists of four 32-bit words:

- CTRL - control word contains information like transfer count and block size.
- SRC - source address points to where to copy data from
- DST - destination address points to where to copy data to
- LINK - link address points to where to load the next linked descriptor

These words map directly to the LDMA\_CHx\_CTRL, LDMA\_CHx\_SRC, LDMA\_CHx\_DST, and LDMA\_CHx\_LINK registers. The usage of the SRC and DST fields may differ depending on the structure type

There are three different types of descriptor data structures: **XFER**, **SYNC**, and **WRI**

### 25.3.7.1 XFER Descriptor Structure

This descriptor defines a typical data transfer which may be a Normal, Link, or Loop transfer.

Only this structure type can be written directly into LDMA's registers by the CPU. All descriptors may be linked to. Please refer to the register descriptions for additional information.

For specifying XFER structure type, set STRUCTTYPE to 0. Please see the peripheral register descriptions for information on the fields in this structure.

Name		Bit Position

### 25.3.7.2 SYNC Descriptor Structure

This descriptor defines an intra-channel synchronizing structure. It allows the channel to wait for some external stimulus before continuing on to the next descriptor. This structure is also used to provide stimulus to another channel to indicate that it may continue.

For example channel 1 may be configured to transfer a header into a buffer while channel 2 is simultaneously transferring data into the same structure. When channel 1 has completed it can wait for a sync signal from channel 2 before transferring the now complete buffer to a peripheral.

Sync descriptors do nothing until a condition is met. The condition is formed by the SYNCTRIG field in the LDMA\_SYNC register and the MATCHEN and MATCHVAL fields of the descriptor. When  $(\text{SYNCTRIG} \& \text{MATCHEN}) == (\text{MATCHVAL} \& \text{MATCHEN})$  the next descriptor is loaded. In addition to waiting for the condition a Link descriptor can set or clear bits in SYNCTRIG to meet the conditions of another channel and cause it to continue. The CPU also has the ability to set and clear the SYNCTRIG bits from software.

This structure type can only be linked in from memory.

For specifying SYNC structure type, set STRUCTTYPE to 1.

Name	Bit Position																															
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CTRL												DONEIFSEN																	STRUCTTYPE			
													SYNCCLR								SYNCSET											
DST SRC												MATCHEN								MATCHVAL												
LINK	LINKADDR																												LINK	LINKMODE		

Bit	Name	Description
1:0	STRUCTTYPE	<b>Descriptor Type</b> This field indicates which type of descriptor this is. It must be 1 for a SYNC descriptor.
20	DONEIFSEN	<b>Done if Set indicator</b> If set the interrupt flag will be set when descriptor completes.
15:8	SYNCCLR	<b>Sync Trigger Clear</b> This bit-field is used to clear corresponding bits within the SYNCTRIG field of the SYNC LDMA_SYNC register. To clear a given bit, a one should be loaded to the corresponding bit. Set is given priority over clear if both corresponding bits are loaded with a one. The sync trigger clear function can only be used when loaded from a linked structure. Alternately, the user can directly write the SYNCTRIG bit-field if required.
7:0	SYNCSET	<b>Sync Trigger Set</b> This bit-field is used to set corresponding bits within the SYNCTRIG bit-field. To set a given bit, a one should be loaded to the corresponding bit. Set is given priority over clear if both corresponding bits are loaded with a one. The sync trigger set function can only be used when loaded from a linked structure. Alternately, the user can directly write the SYNCTRIG bit-field if required.
15:8	MATCHEN	<b>Sync Trigger Match Enable</b> This bit-field serves as the SYNCTRIG match enable. A sync match triggers the load of the next linked DMA structure as specified by link_mode, when: $(\text{SYNCTRIG} \& \text{MATCHEN}) == (\text{MATCHVAL} \& \text{MATCHEN})$ .
7:0	MATCHVAL	<b>Sync Trigger Match Value</b>

Bit	Name	Description
		This bit-field serves as the SYNCTRIG match value. A sync match triggers the load of the next linked DMA structure as specified by link_mode, when: (SYNCTRIG & MATCHEN) == (MATCHVAL & MATCHEN).

### 25.3.7.3 WRI Descriptor Structure

This descriptor defines a write-immediate structure. This allows a list of descriptors to write a value to a register or memory location. For example, if a channel wishes to perform two loops in a descriptor sequence a WRI may be used to program the loop count for the second loop.

This structure type can only be linked in from memory.

For specifying WRI structure type, set STRUCTTYPE to 2.

Name	Bit Position																															
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CTRL												DONEIFSEN																	STRUCTTYPE			
SRC	IMMVAL																															
DST	DSTADDR																															
LINK	LINKADDR																												LINK		LINKMODE	

Bit	Name	Description
1:0	STRUCTTYPE	<b>Descriptor Type</b> This field indicates which type of descriptor this is. It must be 2 for a WRI descriptor.
20	DONEIFSEN	<b>Done if Set indicator</b> If set the interrupt flag will be set when descriptor completes.
31:0	IMMVAL	<b>Immediate Value for Write</b> This bit-field specifies the immediate data value that is to be written to the address pointed to by DSTADDR. Only one write occurs for WRI structures.
31:0	DSTADDR	<b>Address to write</b> This bit-field specifies the address the immediate data should be written to.

### 25.3.8 Interaction with the EMU

The LDMA interacts with the Energy Management Unit (EMU) to allow transfers from a low energy peripheral while in EM2.

When using the ADC in EM2 or EM3 the EMU can wake up the LDMA as needed to allow data transfers to occur.

### 25.3.9 Interrupts

The LDMA\_IF Interrupt flag register contains one DONE bit for each channel and one combined ERROR bit. When enabled, these interrupts are available as interrupts to the M33 core. They are combined into one interrupt vector, DMA\_INT. If the interrupt for the DMA is enabled in the ARM M33 core, an interrupt will be made if one or more of the interrupt flags in LDMA\_IF and their corresponding bits in LDMA\_IEN are set.

When a descriptor finishes execution the interrupt flag for that channel will be set if the DONEIFSEN field of the LDMA\_CHx\_LOOP register is set. If LINK and DONEIFSEN are both set when the descriptor completes the interrupt and the linked descriptor will be immediately loaded. When the final descriptor in a linked list (LINK = 0) is finished the interrupt flag is always set regardless of the state of DONEIFSEN.

### 25.3.10 Debugging

For a peripheral request DMA transfer, if software sets a bit for a channel in the LDMA\_DBGHALT register then the DMA will halt during a debug halt and the SRC and DST registers in the debug window will show the transfer in progress. Otherwise, during debug halt the DMA will continue to run and complete the entire transfer causing the descriptor registers to indicate the transfer has completed.

## 25.4 Examples

This section provides examples of common LDMA usage. All examples assume the LDMA is in the reset state with the channel being configured disabled and LDMA\_CHx\_CFG, LDMA\_CHx\_LOOP, and LDMA\_CHx\_LINK cleared.

### 25.4.1 Single Direct Register DMA Transfer

This simple example uses only the Channel Descriptor registers directly and does not use linking. Software writes directly to the LDMA channel registers. This example does not use a memory based descriptor list.

This example is suitable for most simple transfers that are limited to transferring one block of data. It supports anything that can be done using a single descriptor. This includes endian conversion and packing/unpacking data. Channel 0 is used for this example.

The LDMA will be used to copy 127 contiguous half words (254 bytes) from 0x0 to 0x1000. It will allow arbitration every 4 transfers and is triggered by a CPU write to the LDMA\_SWREQ register. The CH0 interrupt flag will be set when the transfer completes since the descriptor does not link to another descriptor.

- Configure LDMA\_CH0\_CTRL
  - DSTMODE = 0 (absolute)
  - SRCMODE = 0 (absolute)
  - SIZE = HALFWORD (16 bits)
  - DSTINC = 0 (1 half-word)
  - SRCINC = 0 (1 half-word)
  - DECLOOPCNT=0 (unused)
  - REQMODE = 1 (one request transfers all data)
  - BLOCKSIZE = 3 (4 transfers)
  - BYTESWAP=0 (no byte swap)
  - XFERCNT=127 (transfer 127 half words)
  - STRUCTTPYE=0 (TRANSFER)
- Write source address to LDMA\_CH0\_SRC register
- Write destination address to LDMA\_CH0\_DST register
- Configure the LDMA\_CH0REQSEL register for the desired peripheral or select none for a memory-to-memory transfer
- Clear and enable interrupts.
  - Write a 1 to bit 0 of the LDMA\_IFC register to clear the CH0 DONE flag
  - Write a 1 to bit 0 of the LDMA\_IEN register to enable the CH0 interrupt
- Write a 1 to bit 0 of the LDMA\_CHEN register to enable CH0

The REQMODE field is normally cleared to zero for a peripheral request transfer and will transfer the specified block size for each peripheral request. The REQMODE may be set to 1 for a memory-to-memory transfer or any time it is desired for a single DMA request to initiate complete transfer.

## 25.4.2 Descriptor Linked List

This example shows how to use a Linked List of descriptors. Each descriptor has a link address which points to the next descriptor in the list. A descriptor may be removed from the Linked list by altering the Link address of the one before it to point to the one after it. Descriptor Linked lists are useful when handling an array of buffers for communication data. For example, a bad packet can be removed from a receiver queue by simply removing the descriptor from the linked list.

Software loads the first descriptor into the DMA by writing the descriptor address to LDMA\_CHx\_LINK and setting the bit for that channel in the LDMA\_LINKLOAD register. This method is preferred when using a linked list in memory since it treats the first descriptor just like all the others. However, it is also allowed for software to write the first descriptor directly to the LDMA registers.

In this example 4 descriptors are executed in series. the interrupt flag is set after the 2nd and 4th (last) descriptors have completed.

- Prepare a list of descriptors using the XFER structure type in RAM
- Initialize the CTRL, SRC, and DST members as desired
  - Setting STRUCTREQ in the CTRL word for descriptors 2-4 will cause them to begin transferring data as soon as they are loaded.
- Write 0x00000013 to the LINK member of all but the last descriptor
  - LINKMODE = 1 (relative addressing)
  - LINK = 1 (Link to the next descriptor)
  - LINKADDR = 0x00000010 (size of descriptor)
- Set the DONEIFSEN bit in the CTRL member of the 2nd structure so that the interrupt flag will be set when it completes
- Write 0x00000000 to the LINK member of the last descriptor
  - LINK = 0 (Do not link to the next descriptor)
  - LINKMODE = 0 (don't care)
  - LINKADDR = 0x00000000 (don't care)

Each descriptor now points to the start of the next descriptor as shown on the left in [Figure 25.5 Descriptor Linked List on page 999](#). To remove a descriptor from the linked list modify the LINK address of the descriptor of the one before to point to the one after. For example to remove the third descriptor, add 0x00000010 to the LINK register of the second descriptor. The second descriptor will now point to the forth descriptor and skip over the third descriptor as shown on the right in [Figure 25.5 Descriptor Linked List on page 999](#).

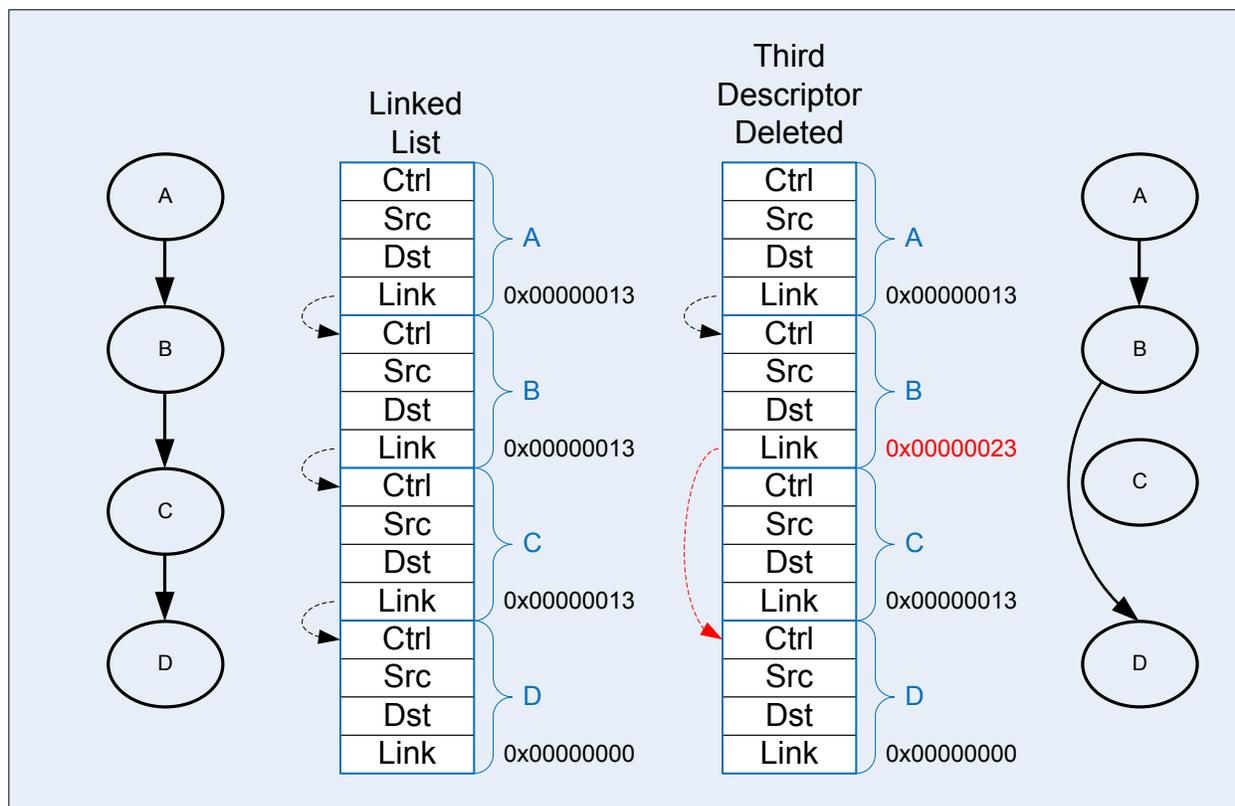

Figure 25.5. Descriptor Linked List

To start execution of the linked list of descriptors:

- Write the absolute address of the first descriptor to the LINKADR field of the LDMA\_CH0\_LINK register
- Set the LINK bit of LDMA\_CH0\_LINK register.
- Configure the LDMA\_CH0REQSEL register for the desired peripheral or select none for memory-to-memory
- Clear and enable interrupts as desired
- Set bit 0 in the LDMA\_LINKLOAD register to initiate loading and execution of the first descriptor

Alternatively, software can manually copy the first descriptor contents to the LDMA\_CH0\_CTRL, LDMA\_CH0\_SRC, LDMA\_CH0\_DST, and LDMA\_CH0\_LINK registers and then enable the channel in the LDMA\_CHEN register.

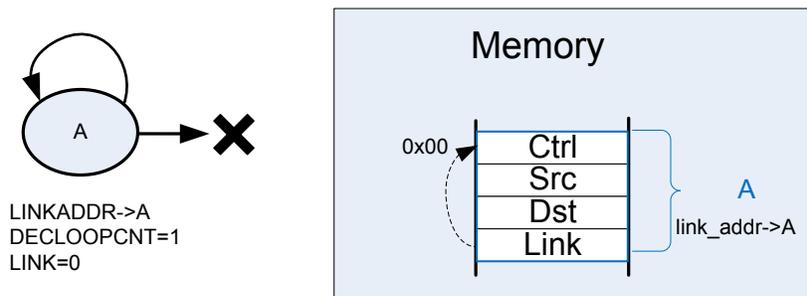

### 25.4.3 Single Descriptor Looped Transfer

This example demonstrates how to use looping using a single descriptor. This method allows a single DMA transfer to be repeated a specified number of times. The looping descriptor is stored in memory and reloaded by hardware. After a specified number of iterations, the transfer stops.

CH0 is setup to copy 4 words from the ADC FIFO into a 15 word buffer at 0x1000. It repeats 4 times to fill the entire 16 word buffer. An interrupt will fire when the entire 16 words have been transferred.

Initialize the Linked descriptor in memory as follows:

- Configure CTRL member
  - DSTMODE = 0 (absolute)
  - SRCMODE = 0 (absolute)
  - SIZE = WORD
  - DSTINC = 0 (1 WORD)
  - SRCINC = 3 (0 WORDS)
  - DECLOOPCNT=1 (decrement loop count)
  - REQMODE=1 (Use XFERCNT)
  - BLOCKSIZE = 4 (4 words)
  - BYTESWAP=0 (no swap)
  - XFERCNT= 4 (4 words)
  - STRUCTTYPE=0 (TRANSFER)
  - IGNORESREQ=1 (ignore single requests)
- Write the address ADC0\_SINGLEDATA register to the SRC member
- Write 0x1000 address to DST member
- Configure the LINK member
  - LINK = 0 (stop after loop)
  - MODE = 1 (relative link address)
  - LINKADDR = 0 (point to ourself)
- Configure the Channel
  - Write the desired number of repeats to the LDMA\_CH0\_LOOP register
  - SOURCESEL in LDMA\_CH0REQSEL = ADC0 (select the ADC)
  - SIG in LDMA\_CH0REQSEL = ADC0SCAN (select the scan conversion request)
- Clear and enable interrupts
- Load the descriptor using LINKLOAD as described in [25.4.2 Descriptor Linked List](#)

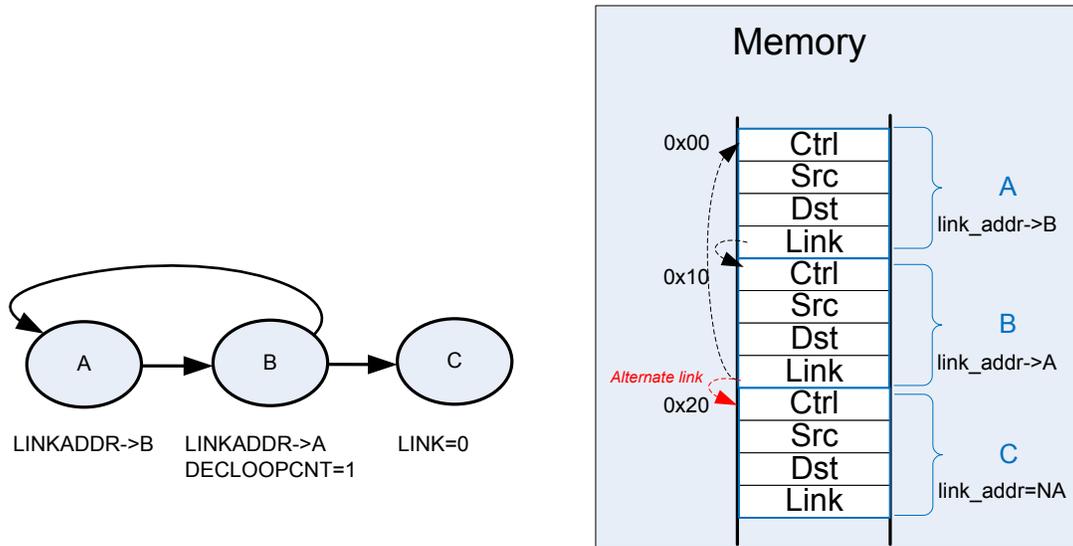

**Figure 25.6. Single Descriptor Looped Transfer**

Note that the looping descriptor must be stored in memory, because it must load itself from the link address in memory on each iteration.

### 25.4.4 Descriptor List with Looping

This example uses a descriptor list in memory with looping over multiple descriptors. This example also uses the looping feature and continues on with the next sequential descriptor after looping completes.

The descriptor list in memory is shown in figure [Figure 25.7 Descriptor List with Looping on page 1002](#). Descriptor A links to descriptor B. Descriptor B has the DECLOOPCNT bit enabled and loops back to the start of descriptor A. The LINK address of descriptor B is used for the loop address. The LINK bit is set to indicate that execution will continue after completion of looping. Once the LOOPCNT reaches zero, the LDMA will load descriptor C. Descriptor C must be located immediately following descriptor B.

**Figure 25.7. Descriptor List with Looping**

Initialization is similar to the single looping descriptor with the following modifications.

- Set the LINK bit in descriptors A and B
- write the address of descriptor A into the LIKADDRESS of descriptor B
- write the address of descriptor B into the LIKADDRESS of descriptor A
- Descriptor C must be located immediately after descriptor B in memory

### 25.4.5 Simple Inter-Channel Synchronization

The LDMA controller features synchronization structures which allow differing channels and/or hardware events to pause a DMA sequence, and wait for a synchronizing event to restart it.

In this example DMA channel 0 and 1 are tasked with the transfer of different sets of data. Channel 0 has two transfer structures, and channel 1 just one, but channel 0 must wait until channel 1 has completed its transfer before it starts its second transfer structure.

Pausing channel 0 is accomplished by inserting a sync wait structure between the two transfer structures. This sync structure waits on SYNCTRIG[7] to be set by a sync set/clear structure which is controlled by channel 1. Sync structures do not transfer data, they can only set, clear, or wait to match the SYNCTRIG[7:0] bits. Note that sync structures cannot decrement loop counter.

```
LDMA_SYNC
  SYNCTRIG=0x0 (at time 0)

LDMA_CH0

  Structure A @ 0x00          Structure B @ 0x10          Structure C @ 0x20
  CTRL                      CTRL                      CTRL
  STRUCTTYPE=XFER          STRUCTTYPE=SYNC          STRUCTTYPE=XFER
  LINK                      LINK                      LINK
  LINKADDR[29:0]=0x00000004 LINKADDR[29:0]=0x00000008 LINKADDR[29:0]=NA
  LINK=1                   LINK=1                   LINK=0

                                DST
                                MATCHEN=0x80
                                MATCHVAL=0x80 (waits for SYNCTRIG[7]=1)

LDMA_CH1

  Structure Y @ 0x30          Structure Z @ 0x40
  CTRL                      CTRL
  STRUCTTYPE=XFER          STRUCTTYPE=SYNC
  LINK                      LINK
  LINKADDR[29:0]=0x00000010 LINKADDR=NA
  LINK=1                   LINK=0

                                SRC
                                SRCCLR=0x0
                                SRCSET=0x80 (sets SYNCTRIG[7])
```

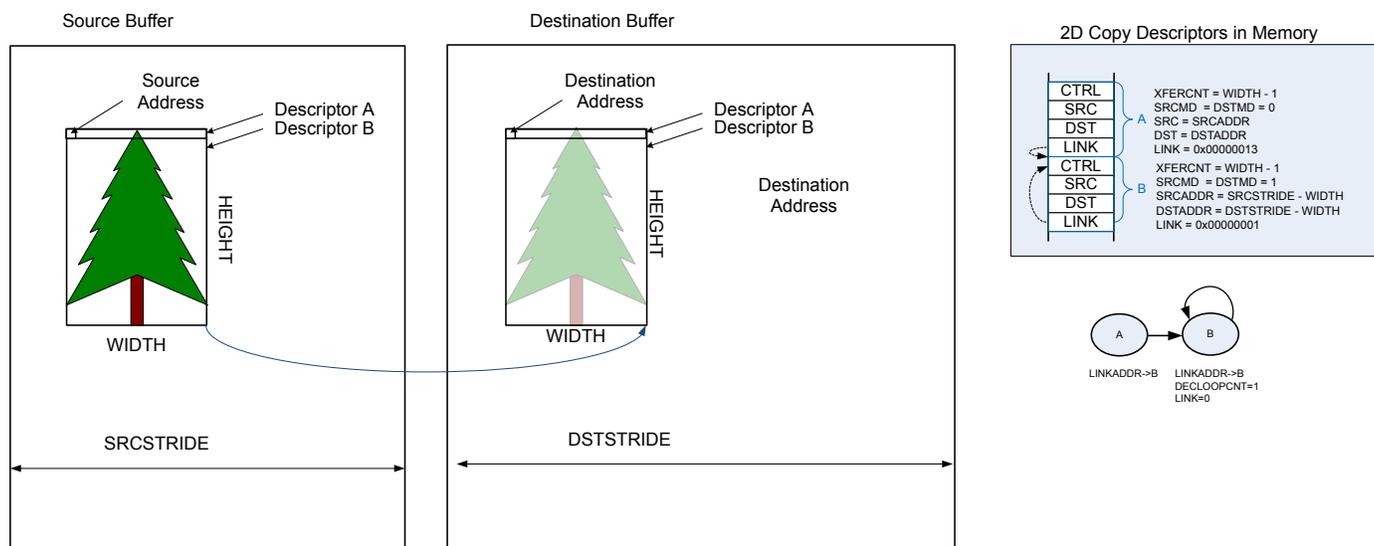

**Figure 25.8. Simple Intra-channel Synchronization Example**

Both A and Y effectively start at the same time. A finishes earlier, then it links to B, which waits for the SYNC[7] bit to be set before loading C. Y finishes after B is loaded, and it links to sync structure Z, which sets the SYNC[7] bit. Channel 0 responds to the trigger set by loading C for the final data transfer.

## 25.4.6 2D Copy

The LDMA can easily perform a 2D copy using a descriptor list with looping. This set up is visualized in [Figure 25.9 2D Copy on page 1005](#).

For an application working with graphics, this would mean the ability to copy a rectangle of a given width and height from one picture to another.

**Figure 25.9. 2D Copy**

The first descriptor will use absolute addressing mode and the source and destination addresses should point to the desired target addresses. The first descriptor will copy only the first row. The XFERCNT of the first descriptor is set to the desired width minus one.

- CTRL
  - XFERCNT = WIDTH - 1
  - SRCMD = 0 (absolute)
  - DSTMD = 0 (absolute)
- SRCADDR = target source address
- DSTADDR = target destination address
- LINK = 0x00000013
  - LINK=1
  - LINKMD=1
  - LINKADDR=0x00000010 (point to next descriptor)

The second descriptor will use relative addressing and the source and destination addresses are set to the desired offset. After the completion of the first descriptor, the address registers will point to the last address transferred. Thus, the width must be subtracted from the stride to get the offset. The second descriptor uses looping and the link register has not offset.

- CTRL
  - XFERCNT = WIDTH - 1
  - SRCMD = 1 (relative)
  - DSTMD = 1 (relative)
  - DECLOOPCNT = 1
- SRCADDR = desired source offset (SRCSTRIDE-WIDTH)
- DSTADDR = desired destination offset (DSTSTRIDE-WIDTH)
- LINK = 0x00000001
  - LINK=0
  - LINKMD=1 (relative)
  - LINKADDR=0x00000000 (no offset)

---

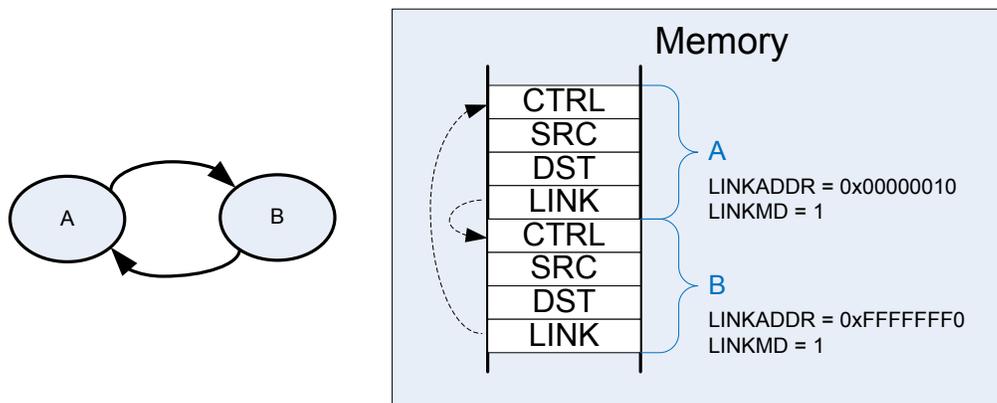

Because the first descriptor already transferred one row, the number of looping repeats should be the desired height minus two. Therefore, LOOPCNT should be set to HEIGHT minus two before initiating the transfer.

This same method is easily extended to copy multiple rectangles by linking descriptors together. To initialize the LDMA\_CHx\_LOOP register, precede each descriptor pair described above with a write immediate descriptor which writes the desired value to the LOOPCNT field of the LDMA\_CHx\_LOOP register.

### 25.4.7 Ping-Pong

Communication peripherals often use ping-pong buffers. Ping-pong buffers allow the CPU to process data in one buffer while a peripheral transmits or receives data in the other buffer.

Both transmit and receive ping-pong buffers are easily implemented using the LDMA. In either case, this requires two descriptors as shown in [Figure 25.10 Infinite Ping-Pong Example on page 1007](#). The LINKADDR field of the LINK member should point to the other descriptor. Using two adjacent descriptors and relative link addressing ensures the descriptors are easily reloadable.

**Figure 25.10. Infinite Ping-Pong Example**

A **receiver** ping-pong buffer controller consists of two buffers and two descriptors stored in memory that point to the two buffers. Once initialized, as the peripheral receives data, it will fill the first buffer. Once the first buffer is full, it will link automatically to the second buffer and generate an interrupt. Software will then process the data in the first buffer while the LDMA is transferring data to the second buffer. For a receiver ping-pong buffer each descriptor should link to the other descriptor. The link bit should be set to provide infinite ping pong between the two buffers. The DONIFS bit in each descriptor should be set to generate an interrupt on the completion of each descriptor.

- Descriptor A
  - CTRL
    - DONEIFS = 1
    - other settings as desired
  - SRCADDR = peripheral source address
  - DSTADDR = memory destination address
  - LINK = 0x00000013
    - LINKADDR = 0x00000010 (next descriptor)
    - LINK = 1 (link to next descriptor)
    - LINKMD = 1 (relative addressing)
- Descriptor B
  - CTRL
    - DONEIFS = 1
    - other settings as desired
  - SRCADDR = peripheral source address
  - DSTADDR = memory destination address
  - LINK = 0xFFFFFFFF3
    - LINKADDR = 0xFFFFFFFF0 (previous descriptor)
    - LINK = 1 (link to previous descriptor)
    - LINKMD = 1 (relative addressing)

For **transmitter** ping-pong buffer, software will fill the first buffer and then initiate the DMA transfer. The LDMA will transmit the first buffer data while software is filling the second buffer. In this case, the two descriptors should point to each other, but not automatically

continue to the second buffer. The LINK bit should be cleared to zero. Once software has loaded the first buffer, it will use the LINK-LOAD bit to load the first descriptor and transmit the data. The DONEIFS need not be set in each descriptor. The DMA will stop and then generate an interrupt at the completion of each descriptor.

- Descriptor A
  - CTRL
    - DONEIFS = 0
    - other settings as desired
  - SRCADDR = memory source address
  - DSTADDR = peripheral destination address
  - LINK = 0x00000013
    - LINKADDR = 0x00000010 (next descriptor)
    - LINK = 0 (link to next descriptor)
    - LINKMD = 1 (relative addressing)
- Descriptor B
  - CTRL
    - DONEIFS = 0
    - other settings as desired
  - SRCADDR = memory source address
  - DSTADDR = peripheral destination address
  - LINK = 0xFFFFFFFF3
    - LINKADDR = 0xFFFFFFFF0 (previous descriptor)
    - LINK = 0 (link to previous descriptor)
    - LINKMD = 1 (relative addressing)

#### 25.4.8 Scatter-Gather

Scatter-Gather in general refers to a process that copies data from multiple locations scattered in memory and gathers the data to a single location in memory, or vice versa. A simple descriptor list allows data gathering. For example, data from a discontinuous list of buffers might be copied to a contiguous sequential array of buffers. The inverse is also possible when a sequential array of buffers is scattered to a discontinuous list of available buffers. See section [25.4.2 Descriptor Linked List](#).

Some DMAs which only have two descriptors implement scatter-gather by using one descriptor to modify the other descriptor. While it is possible to implement this same behavior using the LDMA, it is much more straight-forward to just use a simple descriptor list.

#### 25.5 LDMA Source Selection Details

## 25.5.1 LDMA Source Selection Details

Table 25.3. LDMA Source Selection Details

SOURCESEL	Source Name	SIGSEL	Request Signal Name
0x1	LDMAXBAR	0x0	LDMAXBARPRSREQ0
		0x1	LDMAXBARPRSREQ1

## 25.7 LDMA Register Description

### 25.7.1 LDMA\_IPVERSION - IP Version

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									R							
<b>Name</b>																									IPVERSION							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	IPVERSION	0x0	R	<b>IPVERSION</b> The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.

### 25.7.2 LDMA\_EN - DMA Module Enable Disable Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																																0x0
<b>Access</b>																																RW
<b>Name</b>																																EN

Bit	Name	Reset	Access	Description
31:1	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
0	EN	0x0	RW	<b>LDMA module enable and disable register</b> The ENABLE bit enables the module. Software should write to CONFIG type registers before setting the ENABLE bit. Software should write to SYNC type registers only after setting the ENABLE bit.

## 25.7.3 LDMA\_CTRL - DMA Control Register

Offset	Bit Position																																
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>	0x0					0x1E																											
<b>Access</b>	RW					RW																											
<b>Name</b>	CORERST					NUMFIXED																											

Bit	Name	Reset	Access	Description
31	CORERST	0x0	RW	<b>Reset DMA controller</b> Trigger a reset of the LDMA controller core without losing register configuration
30:29	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
28:24	NUMFIXED	0x1E	RW	<b>Number of Fixed Priority Channels</b> This field defines the number of Fixed Priority Arbitration channels. Channels CH0 through CH(n-1) are fixed, and channels CH(n) through CH7 are round robin, where n is the field value. The reset value will give all fixed channels.
23:0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

## 25.7.4 LDMA\_STATUS - DMA Status Register

Offset	Bit Position																																																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																																
<b>Reset</b>									0x8								0x10								0x0								0x0								0x0								0x0															
<b>Access</b>									R								R								R								R								R								R															
<b>Name</b>									CHNUM								FIFOLEVEL								CHERROR								CHGRANT																ANYREQ								ANYBUSY							

Bit	Name	Reset	Access	Description
31:29	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
28:24	CHNUM	0x8	R	<b>Number of Channels</b> The value of CHNUM always reads the total number of channels present for this instance of the DMA controller module.
23:21	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
20:16	FIFOLEVEL	0x10	R	<b>FIFO Level</b> The value of FIFOLEVEL indicates the number of entries currently in the FIFO. (Note when all channels are disabled, this register will read the total number of entries in the FIFO.)
15:13	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
12:8	CHERROR	0x0	R	<b>Errant Channel Number</b> When the ERROR flag is set in the LDMA_IF register, the CHERROR field will indicate the most recent channel to have a transfer error.
7:3	CHGRANT	0x0	R	<b>Granted Channel Number</b> The value of this field indicates the currently active channel or last active channel. Note that the reset value for this field is zero.
2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	ANYREQ	0x0	R	<b>Any DMA Channel Request Pending</b> The value of this bit will be TRUE (1) if any requests are pending
0	ANYBUSY	0x0	R	<b>Any DMA Channel Busy</b> The value of this bit will be TRUE (1) if one or more DMA channels are actively transferring data

## 25.7.5 LDMA\_SYNCSET - DMA Sync Trig Sw Set Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									W							
<b>Name</b>																									SYNCSET							

Bit	Name	Reset	Access	Description
31:8	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
7:0	SYNCSET	0x0	W	<b>DMA SYNC Software Trigger Set</b> Sets the corresponding bit in the SYNCSTATUS.SYNCTRIG field to value 1.

## 25.7.6 LDMA\_SYNCCLR - DMA Sync Trig Sw Clear Register

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									W							
<b>Name</b>																									SYNCCLR							

Bit	Name	Reset	Access	Description
31:8	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
7:0	SYNCCLR	0x0	W	<b>DMA SYNC Software Trigger Clear</b> Clears the corresponding bit in the SYNCSTATUS.SYNCTRIG field to value 0.

## 25.7.7 LDMA\_SYNCWEN - DMA Sync HW Trigger Enable Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>									0x0																0x0							
<b>Access</b>									RW																RW							
<b>Name</b>									SYNCCLREN																SYNCSETEN							

Bit	Name	Reset	Access	Description
31:24	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
23:16	SYNCCLREN	0x0	RW	<b>Hardware Sync Trigger Clear Enable</b> Enables the corresponding bit in the SYNCSTATUS.SYNCTRIG field to be cleared by PRS channel 7-0, mapping to bits [23:16].
15:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:0	SYNCSETEN	0x0	RW	<b>Hardware Sync Trigger Set Enable</b> Enables the corresponding bit in the SYNCSTATUS.SYNCTRIG field to be set by PRS channel 7-0, mapping to bits [7:0].

### 25.7.8 LDMA\_SYNCHWSEL - DMA Sync HW Trigger Selection Register

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>									0x0																0x0							
<b>Access</b>									RW																RW							
<b>Name</b>									SYNCCLREGE																SYNCSETEGE							

Bit	Name	Reset	Access	Description
31:24	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
23:16	SYNCCLREGE	0x0	RW	<b>Hardware Sync Trigger Clear Edge Select</b> Select rising or falling edge detection on PRS to clear trigger.
	Value	Mode	Description	
	0	RISE	Use rising edge detection	
	1	FALL	Use falling edge detection	
15:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:0	SYNCSETEGE	0x0	RW	<b>Hardware Sync Trigger Set Edge Select</b> Select rising or falling edge detection on PRS to set trigger.
	Value	Mode	Description	
	0	RISE	Use rising edge detection	
	1	FALL	Use falling edge detection	

## 25.7.9 LDMA\_SYNCSTATUS - DMA Sync Trigger Status Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									R							
<b>Name</b>																									SYNCTRIG							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	SYNCTRIG	0x0	R	<b>sync trig status</b>  Reflects the status of setting and clearing by software (SYNCSWSET/SYNCSWCLR), hardware (PRS), and loading SYNC structures. Setting a bit always takes precedence over clearing.

## 25.7.10 LDMA\_CHEN - DMA Channel Enable Register

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									W							
<b>Name</b>																									CHEN							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	CHEN	0x0	W	<b>Channel Enables</b>  Setting one of these bits will enable the respective DMA channel, writing zeros has no effect

## 25.7.11 LDMA\_CHDIS - DMA Channel Disable Register

Offset	Bit Position																															
0x028	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									W							
<b>Name</b>																									CHDIS							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	CHDIS	0x0	W	<b>DMA Channel disable</b>  Setting one of these bits will disable respective DMA channel, writing zeros has no effect. If set while a transfer is in progress, the current transfer block will complete. The remaining blocks will pause until resumed later by setting corresponding CHEN bit.

## 25.7.12 LDMA\_CHSTATUS - DMA Channel Status Register

Offset	Bit Position																															
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									R							
<b>Name</b>																									CHSTATUS							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	CHSTATUS	0x0	R	<b>DMA Channel Status</b>  The value of this bit will be TRUE (1) if one or more DMA channels are enabled

### 25.7.13 LDMA\_CHBUSY - DMA Channel Busy Register

Offset	Bit Position																															
0x030	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									R							
<b>Name</b>																									BUSY							

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	BUSY	0x0	R	<b>Channels Busy</b> The bits of this field read 1 when the corresponding channel is busy.

## 25.7.14 LDMA\_CHDONE - DMA Channel Linking Done Register

Offset	Bit Position																																																						
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																							
<b>Reset</b>																									0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0								
<b>Access</b>																									RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW							
<b>Name</b>																									CHDONE7	CHDONE6	CHDONE5	CHDONE4	CHDONE3	CHDONE2	CHDONE1	CHDONE0																							

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7	CHDONE7	0x0	RW	<b>DMA Channel Link done intr flag</b>  Each DMA channel sets the corresponding bit in this register when the entire linked transfer is done. The interrupt service routine should clear these bits. For non-link structures this will be set once the structure is done.
6	CHDONE6	0x0	RW	<b>DMA Channel Link done intr flag</b>  Each DMA channel sets the corresponding bit in this register when the entire linked transfer is done. The interrupt service routine should clear these bits. For non-link structures this will be set once the structure is done.
5	CHDONE5	0x0	RW	<b>DMA Channel Link done intr flag</b>  Each DMA channel sets the corresponding bit in this register when the entire linked transfer is done. The interrupt service routine should clear these bits. For non-link structures this will be set once the structure is done.
4	CHDONE4	0x0	RW	<b>DMA Channel Link done intr flag</b>  Each DMA channel sets the corresponding bit in this register when the entire linked transfer is done. The interrupt service routine should clear these bits. For non-link structures this will be set once the structure is done.
3	CHDONE3	0x0	RW	<b>DMA Channel Link done intr flag</b>  Each DMA channel sets the corresponding bit in this register when the entire linked transfer is done. The interrupt service routine should clear these bits. For non-link structures this will be set once the structure is done.
2	CHDONE2	0x0	RW	<b>DMA Channel Link done intr flag</b>  Each DMA channel sets the corresponding bit in this register when the entire linked transfer is done. The interrupt service routine should clear these bits. For non-link structures this will be set once the structure is done.
1	CHDONE1	0x0	RW	<b>DMA Channel Link done intr flag</b>  Each DMA channel sets the corresponding bit in this register when the entire linked transfer is done. The interrupt service routine should clear these bits. For non-link structures this will be set once the structure is done.
0	CHDONE0	0x0	RW	<b>DMA Channel Link done intr flag</b>  Each DMA channel sets the corresponding bit in this register when the entire linked transfer is done. The interrupt service routine should clear these bits. For non-link structures this will be set once the structure is done.

## 25.7.15 LDMA\_DBGHALT - DMA Channel Debug Halt Register

Offset	Bit Position																															
0x038	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									RW							
<b>Name</b>																									DBGHALT							

Bit	Name	Reset	Access	Description
31:8	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
7:0	DBGHALT	0x0	RW	<b>DMA Debug Halt</b>  Setting one of these bits will mask the corresponding DMA channel's peripheral request when debugging and the CPU is halted. This may be useful for debugging DMA software.

## 25.7.16 LDMA\_SWREQ - DMA Channel Software Transfer Request

Offset	Bit Position																															
0x03C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									W							
<b>Name</b>																									SWREQ							

Bit	Name	Reset	Access	Description
31:8	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
7:0	SWREQ	0x0	W	<b>Software Transfer Requests</b>  Setting one of these bits will trigger a DMA transfer for the corresponding channel. Writing zeros has no effect.

## 25.7.17 LDMA\_REQDIS - DMA Channel Request Disable Register

Offset	Bit Position																															
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									RW							
<b>Name</b>																									REQDIS							

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:0	REQDIS	0x0	RW	<b>DMA Request Disables</b>
Setting one of these bits will disable peripheral requests for the corresponding channel. When cleared any pending peripheral requests will be serviced.				

## 25.7.18 LDMA\_REQPEND - DMA Channel Requests Pending Register

Offset	Bit Position																															
0x044	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									R							
<b>Name</b>																									REQPEND							

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:0	REQPEND	0x0	R	<b>DMA Requests Pending</b>
When a DMA channel has a pending peripheral request the corresponding REQPEND bit will read 1.				

## 25.7.19 LDMA\_LINKLOAD - DMA Channel Link Load Register

Offset	Bit Position																															
0x048	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									W							
<b>Name</b>																									LINKLOAD							

Bit	Name	Reset	Access	Description
31:8	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
7:0	LINKLOAD	0x0	W	<b>DMA Link Loads</b>
Setting one of these bits will force the corresponding DMA channel to load the next DMA structure and enable the channel. This empowers software to step through a sequence of descriptors.				

## 25.7.20 LDMA\_REQCLEAR - DMA Channel Request Clear Register

Offset	Bit Position																															
0x04C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									W							
<b>Name</b>																									REQCLEAR							

Bit	Name	Reset	Access	Description
31:8	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
7:0	REQCLEAR	0x0	W	<b>DMA Request Clear</b>
Setting one of these bits will clear any internally registered transfer requests for the corresponding channel.				

## 25.7.21 LDMA\_IF - Interrupt Flag Register

Offset	Bit Position																																																					
0x050	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																						
Reset	0x0																									0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0							
Access	RW																									RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW							
Name	ERROR																									DONE7	DONE6	DONE5	DONE4	DONE3	DONE2	DONE1	DONE0																					

Bit	Name	Reset	Access	Description
31	ERROR	0x0	RW	<b>Error Flag</b> Set to 1 on an Error
30:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7	DONE7	0x0	RW	<b>DMA Structure Operation Done</b> When a channel completes a transfer or sync operation, the corresponding DONE bit is set the LDMA_IF register.
6	DONE6	0x0	RW	<b>DMA Structure Operation Done</b> When a channel completes a transfer or sync operation, the corresponding DONE bit is set the LDMA_IF register.
5	DONE5	0x0	RW	<b>DMA Structure Operation Done</b> When a channel completes a transfer or sync operation, the corresponding DONE bit is set the LDMA_IF register.
4	DONE4	0x0	RW	<b>DMA Structure Operation Done</b> When a channel completes a transfer or sync operation, the corresponding DONE bit is set the LDMA_IF register.
3	DONE3	0x0	RW	<b>DMA Structure Operation Done</b> When a channel completes a transfer or sync operation, the corresponding DONE bit is set the LDMA_IF register.
2	DONE2	0x0	RW	<b>DMA Structure Operation Done</b> When a channel completes a transfer or sync operation, the corresponding DONE bit is set the LDMA_IF register.
1	DONE1	0x0	RW	<b>DMA Structure Operation Done</b> When a channel completes a transfer or sync operation, the corresponding DONE bit is set the LDMA_IF register.
0	DONE0	0x0	RW	<b>DMA Structure Operation Done</b> When a channel completes a transfer or sync operation, the corresponding DONE bit is set the LDMA_IF register.

### 25.7.22 LDMA\_IEN - Interrupt Enable Register

Offset	Bit Position																															
0x054	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																									0x0						
<b>Access</b>	RW																									RW						
<b>Name</b>	ERROR																									CHDONE						

Bit	Name	Reset	Access	Description
31	ERROR	0x0	RW	<b>Enable or disable the error interrupt</b> Enables the AHB bus error interrupt
30:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:0	CHDONE	0x0	RW	<b>Enable or disable the done interrupt</b> Enables done interrupts

## 25.7.23 LDMA\_CHx\_CFG - Channel Configuration Register

Offset	Bit Position																																	
0x05C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
<b>Reset</b>												0x0	0x0					0x0																
<b>Access</b>												RW	RW					RW																
<b>Name</b>												DSTINCSIGN	SRCINCSIGN					ARBSLOTS																

Bit	Name	Reset	Access	Description
31:22	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
21	DSTINCSIGN	0x0	RW	<b>Destination Address Increment Sign</b> 0: Increment destination address, 1: Decrement destination address
	Value	Mode		Description
	0	POSITIVE		Increment destination address
	1	NEGATIVE		Decrement destination address
20	SRCINCSIGN	0x0	RW	<b>Source Address Increment Sign</b> 0: Increment source address, 1: Decrement source address
	Value	Mode		Description
	0	POSITIVE		Increment source address
	1	NEGATIVE		Decrement source address
19:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
17:16	ARBSLOTS	0x0	RW	<b>Arbitration Slot Number Select</b> For channels using round robin arbitration, this bit-field is used to select the number of slots in the round robin queue.
	Value	Mode		Description
	0	ONE		One arbitration slot selected
	1	TWO		Two arbitration slots selected
	2	FOUR		Four arbitration slots selected
	3	EIGHT		Eight arbitration slots selected
15:0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

### 25.7.24 LDMA\_CHx\_LOOP - Channel Loop Counter Register

Offset	Bit Position																															
0x060	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0			
<b>Access</b>																													RW			
<b>Name</b>																													LOOPCNT			

Bit	Name	Reset	Access	Description
31:8	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:0	LOOPCNT	0x0	RW	<p><b>Linked Structure Sequence Loop Counter</b></p> <p>This bit-field specifies the number of iterations when using looping descriptors. Software should write to LOOPCNT before using a looping descriptor.</p>

## 25.7.25 LDMA\_CHx\_CTRL - Channel Descriptor Control Word Register

Offset	Bit Position																																
0x064	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>	0x0	0x0	0x0		0x0		0x0		0x0	0x0	0x0	0x0			0x0		0x0							0x0						0x0			0x0
<b>Access</b>	R	R	RW		RW		RW		RW	RW	RW	RW			RW		RW							RW						R			RW
<b>Name</b>	DSTMODE	SRCMODE	DSTINC		SIZE		SRCINC		IGNORESREQ	DELOOPCNT	REQMODE	DONEIEN			BLOCKSIZE		BYTESWAP													STRUCTREQ			STRUCTTYPE

Bit	Name	Reset	Access	Description															
31	DSTMODE	0x0	R	<b>Destination Addressing Mode</b>  This field specifies the destination addressing mode of linked descriptors. After loading a linked descriptor, reading this field will indicate the destination addressing mode of the linked descriptor. Note that the first descriptor always uses absolute addressing mode.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>ABSOLUTE</td> <td>The DSTADDR field of LDMA_CHx_DST contains the absolute address of the destination data.</td> </tr> <tr> <td>1</td> <td>RELATIVE</td> <td>The DSTADDR field of LDMA_CHx_DST contains the relative offset of the destination data.</td> </tr> </tbody> </table>	Value	Mode	Description	0	ABSOLUTE	The DSTADDR field of LDMA_CHx_DST contains the absolute address of the destination data.	1	RELATIVE	The DSTADDR field of LDMA_CHx_DST contains the relative offset of the destination data.						
Value	Mode	Description																	
0	ABSOLUTE	The DSTADDR field of LDMA_CHx_DST contains the absolute address of the destination data.																	
1	RELATIVE	The DSTADDR field of LDMA_CHx_DST contains the relative offset of the destination data.																	
30	SRCMODE	0x0	R	<b>Source Addressing Mode</b>  This field specifies the source addressing mode of linked descriptors. After loading a linked descriptor, reading this field will indicate the source addressing mode of the linked descriptor. Note that the first descriptor always uses absolute addressing mode.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>ABSOLUTE</td> <td>The SRCADDR field of LDMA_CHx_SRC contains the absolute address of the source data.</td> </tr> <tr> <td>1</td> <td>RELATIVE</td> <td>The SRCADDR field of LDMA_CHx_SRC contains the relative offset of the source data.</td> </tr> </tbody> </table>	Value	Mode	Description	0	ABSOLUTE	The SRCADDR field of LDMA_CHx_SRC contains the absolute address of the source data.	1	RELATIVE	The SRCADDR field of LDMA_CHx_SRC contains the relative offset of the source data.						
Value	Mode	Description																	
0	ABSOLUTE	The SRCADDR field of LDMA_CHx_SRC contains the absolute address of the source data.																	
1	RELATIVE	The SRCADDR field of LDMA_CHx_SRC contains the relative offset of the source data.																	
29:28	DSTINC	0x0	RW	<b>Destination Address Increment Size</b>  This bit-field specifies the stride or number of unit data addresses to increment the destination address after each unit of data is transferred. The unit data width is controlled by the SIZE bit-field and can be a byte, half-word or word.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>ONE</td> <td>Increment destination address by one unit data size after each write</td> </tr> <tr> <td>1</td> <td>TWO</td> <td>Increment destination address by two unit data sizes after each write</td> </tr> <tr> <td>2</td> <td>FOUR</td> <td>Increment destination address by four unit data sizes after each write</td> </tr> <tr> <td>3</td> <td>NONE</td> <td>Do not increment the destination address. Writes are made to a fixed destination address, for example writing to a FIFO.</td> </tr> </tbody> </table>	Value	Mode	Description	0	ONE	Increment destination address by one unit data size after each write	1	TWO	Increment destination address by two unit data sizes after each write	2	FOUR	Increment destination address by four unit data sizes after each write	3	NONE	Do not increment the destination address. Writes are made to a fixed destination address, for example writing to a FIFO.
Value	Mode	Description																	
0	ONE	Increment destination address by one unit data size after each write																	
1	TWO	Increment destination address by two unit data sizes after each write																	
2	FOUR	Increment destination address by four unit data sizes after each write																	
3	NONE	Do not increment the destination address. Writes are made to a fixed destination address, for example writing to a FIFO.																	

Bit	Name	Reset	Access	Description
27:26	SIZE	0x0	RW	<b>Unit Data Transfer Size</b> This field specifies the size of data transferred.
	Value	Mode		Description
	0	BYTE		Each unit transfer is a byte
	1	HALFWORD		Each unit transfer is a half-word
	2	WORD		Each unit transfer is a word
25:24	SRCINC	0x0	RW	<b>Source Address Increment Size</b> This bit-field specifies the stride or number of unit data addresses to increment the source address after each unit of data is transferred. The unit data width is controlled by the SIZE bit-field and can be a byte, half-word or word.
	Value	Mode		Description
	0	ONE		Increment source address by one unit data size after each read
	1	TWO		Increment source address by two unit data sizes after each read
	2	FOUR		Increment source address by four unit data sizes after each read
	3	NONE		Do not increment the source address. In this mode reads are made from a fixed source address, for example reading FIFO.
23	IGNORESREQ	0x0	RW	<b>Ignore Sreq</b> The channel arbiter will ignore single requests (SREQ) and only respond to multiple requests (REQ) when this bit is set.
22	DECLOOPCNT	0x0	RW	<b>Decrement Loop Count</b> When using looping, setting this bit will decrement the LOOPCNT field in the LDMA_CHx_LOOP register after each descriptor execution.
21	REQMODE	0x0	RW	<b>DMA Request Transfer Mode Select</b> Selects the DMA Request Transfer mode.
	Value	Mode		Description
	0	BLOCK		The LDMA transfers one BLOCKSIZE per transfer request.
	1	ALL		One transfer request transfers all units as defined by the XFRCNT field.
20	DONEIEN	0x0	RW	<b>DMA Operation Done Interrupt Flag Set En</b> Setting this bit will set the interrupt flag when the transfer is done, or linked in the case where the LINK bit is set, or synchronized in the case of a SYNC transfer.
19:16	BLOCKSIZE	0x0	RW	<b>Block Transfer Size</b> This bit-field controls the number of unit data transfers per arbitration cycle
	Value	Mode		Description
	0	UNIT1		One unit transfer per arbitration
	1	UNIT2		Two unit transfers per arbitration
	2	UNIT3		Three unit transfers per arbitration
	3	UNIT4		Four unit transfers per arbitration

Bit	Name	Reset	Access	Description
4		UNIT6		Six unit transfers per arbitration
5		UNIT8		Eight unit transfers per arbitration
7		UNIT16		Sixteen unit transfers per arbitration
9		UNIT32		32 unit transfers per arbitration
10		UNIT64		64 unit transfers per arbitration
11		UNIT128		128 unit transfers per arbitration
12		UNIT256		256 unit transfers per arbitration
13		UNIT512		512 unit transfers per arbitration
14		UNIT1024		1024 unit transfers per arbitration
15		ALL		Transfer all units as specified by the XFRCNT field
15	BYTESWAP	0x0	RW	<b>Endian Byte Swap</b> For word and half-word transfers, setting this bit will swap all bytes of each word or half-word.
14:4	XFRCNT	0x0	RW	<b>DMA Unit Data Transfer Count</b> Specifies number of unit data (words, half-words, or bytes) to transfer, as determined by the SIZE field. The value written should be one less than the desired transfer count.
3	STRUCTREQ	0x0	R	<b>Structure DMA Transfer Request</b> Structure Transfer Request
2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	STRUCTTYPE	0x0	RW	<b>DMA Structure Type</b> DMA Structure type
	Value	Mode	Description	
	0	TRANSFER	DMA transfer structure type selected.	
	1	SYNCHRONIZE	Synchronization structure type selected.	
	2	WRITE	Write immediate value structure type selected.	

## 25.7.26 LDMA\_CHx\_SRC - Channel Descriptor Source Address

Offset	Bit Position																															
0x068	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	RW																															
<b>Name</b>	SRCADDR																															

Bit	Name	Reset	Access	Description
31:0	SRCADDR	0x0	RW	<b>Source Data Address</b>
Writing to this register sets the source address. Reading from this register during a DMA transfer will indicate the next source read address. The value of this register is incremented or decremented with each source read.				

## 25.7.27 LDMA\_CHx\_DST - Channel Descriptor Destination Address

Offset	Bit Position																															
0x06C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																															
<b>Access</b>	RW																															
<b>Name</b>	DSTADDR																															

Bit	Name	Reset	Access	Description
31:0	DSTADDR	0x0	RW	<b>Destination Data Address</b>
Writing to this register sets the destination address. Reading from this register during a DMA transfer will indicate the next destination write address. This value of this register is incremented or decremented with each destination write.				

## 25.7.28 LDMA\_CHx\_LINK - Channel Descriptor Link Address

Offset	Bit Position																															
0x070	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																										0x0	0x0				
<b>Access</b>	RW																										RW	R				
<b>Name</b>	LINKADDR																										LINK	LINKMODE				

Bit	Name	Reset	Access	Description
31:2	LINKADDR	0x0	RW	<b>Link Structure Address</b>  To use linking, write the address of the the first linked descriptor to this register. When a linked descriptor is loaded, it may also be linked to another descriptor. Reading this register will reflect the address of the next linked descriptor.
1	LINK	0x0	RW	<b>Link Next Structure</b>  After completing the initial transfer, if this bit is set, the DMA will load the next linked descriptor. If the next linked descriptor also has this bit set, the DMA will load the next linked descriptor.
0	LINKMODE	0x0	R	<b>Link Structure Addressing Mode</b>  This field specifies the addressing mode of linked descriptors. After loading a linked descriptor, reading this field will indicate the addressing mode of the loaded linked descriptor. Note that the first descriptor always uses absolute addressing mode.
	Value	Mode	Description	
	0	ABSOLUTE	The LINKADDR field of LDMA_CHx_LINK contains the absolute address of the linked descriptor.	
	1	RELATIVE	The LINKADDR field of LDMA_CHx_LINK contains the relative offset of the linked descriptor.	

## 25.8 LDMAXBAR Register Map

The offset register address is relative to the registers base address.

3:0	SIGSEL	0x0	RW	<b>Signal Select</b> Select input signal to DMA channel.

## 26. WDOG - Watch Dog Timer

### Quick Facts

#### What?

The WDOG (Watchdog Timer) resets the system in case of a fault condition, and can be enabled in all energy modes as long as the low frequency clock source is available.

#### Why?

If a software failure or external event renders the MCU unresponsive, a Watchdog timeout will reset the system to a known, safe state.

#### How?

An enabled Watchdog Timer implements a configurable timeout period. If the CPU fails to re-start the Watchdog Timer before it times out, a full system reset will be triggered. The Watchdog consumes insignificant power, and allows the device to remain safely in low energy modes for up to 256 seconds at a time.

### 26.1 Introduction

The purpose of the watchdog timer is to generate a reset in case of a system failure to increase application reliability. The failure can be caused by a variety of events, such as an ESD pulse or a software failure.

### 26.2 Features

- Clock input from selectable oscillators
  - Internal 32 kHz LFRCO oscillator
  - Internal 1 kHz ULFRCO oscillator
  - External 32.768 kHz LFXO XTAL oscillator
  - HCLK divided by 1024
- Configurable timeout period from 9 to 256k watchdog clock cycles
- Individual selection to keep running or freeze when entering EM1 Sleep, EM2 DeepSleep, or EM3 Stop
- Selection to keep running or freeze when entering debug mode
- Selection to block the CPU from entering Energy Mode 4
- Configurable warning interrupt at 25%, 50%, or 75% of the timeout period
- Configurable window interrupt at 12.5%, 25%, 37.5%, 50%, 62.5%, 75%, 87.5% of the timeout period
- Timeout interrupt
- PRS as a watchdog clear
- Interrupt for the event where a PRS rising edge is absent before a software reset

## 26.3 Functional Description

The watchdog is enabled by setting the EN bit in WDOGn\_EN. When enabled, the watchdog counts up to the period value configured through the PERSEL field in WDOGn\_CFG. If the watchdog timer is not cleared to 0 (by writing a 1 to the CLEAR bit in WDOGn\_CMD) before the period is reached, the chip is reset. If a timely clear command is issued, the timer starts counting up from 0 again. The watchdog can optionally be locked by writing anything other than UNLOCK code in WDOGn\_LOCK. Once locked, it cannot be disabled or reconfigured by software.

**Note:** If the WDOG is configured to halt during EM1, EM2, or EM3 and EM1/EM2/EM3 is entered on the clock cycle before the specified timeout, a timeout event will occur upon the EM1/EM2/EM3 wake event.

When the EN bit in WDOGn\_EN is cleared to 0, the watchdog counter is reset. Any pending interrupt flags will remain active until cleared.

### 26.3.1 Clock Source

Four clock sources are available for use with the watchdog, through the CLKSEL field in CMU\_WDOGn\_CFG. The selected oscillator source automatically starts when the watchdog is enabled. To prevent accidental change of the clock selection, CMU\_WDOGLOCK can be written anything other than UNLOCK code. Also, respective oscillator has locks to prevent accidental disabling of oscillators. The PERSEL field in WDOGn\_CFG is used to divide the selected watchdog clock, and the timeout for the watchdog timer can be calculated with the formula:

$$T_{\text{TIMEOUT}} = [2^{(\text{PERSEL}+3)} + 1] / f$$

where f is the frequency of the selected clock.

Users must clear EM2RUN and EM3RUN when the selected clock source is HCLKDIV1024.

### 26.3.2 Debug Functionality

The watchdog timer can either keep running or be frozen when the device is halted by a debugger. This configuration is done through the DEBUGRUN bit in WDOGn\_CFG. When code execution is resumed, the watchdog will continue counting where it left off.

### 26.3.3 Energy Mode Handling

The watchdog timer can be configured to either keep on running or freeze when entering EM1 Sleep, EM2 DeepSleep, or EM3 Stop. The configuration is done individually for each energy mode in the EM1RUN, EM2RUN, and EM3RUN bits in WDOGn\_CFG. When the watchdog has been frozen and is re-entering an energy mode where it is running, the watchdog timer will continue counting where it left off. The watchdog does not run in EM4. If EM4BLOCK in WDOGn\_CFG is set, the CPU will be prevented from entering EM4 by software request.

### 26.3.4 Warning Interrupt

The watchdog implements a warning interrupt which can be configured to occur at approximately 25%, 50%, or 75% of the timeout period through the WARNSEL field of the WDOGn\_CFG register. This interrupt can be used to wake up the cpu for clearing the watchdog. The warning point for the watchdog timer can be calculated with the formula:

$$T_{\text{WARNING}} = [2^{(\text{PERSEL}+3)} + 1] * \text{WARNSEL} / 4 / f$$

where f is the frequency of the selected clock.

When the watchdog is enabled, it is recommended to clear the watchdog before changing WARNSEL.

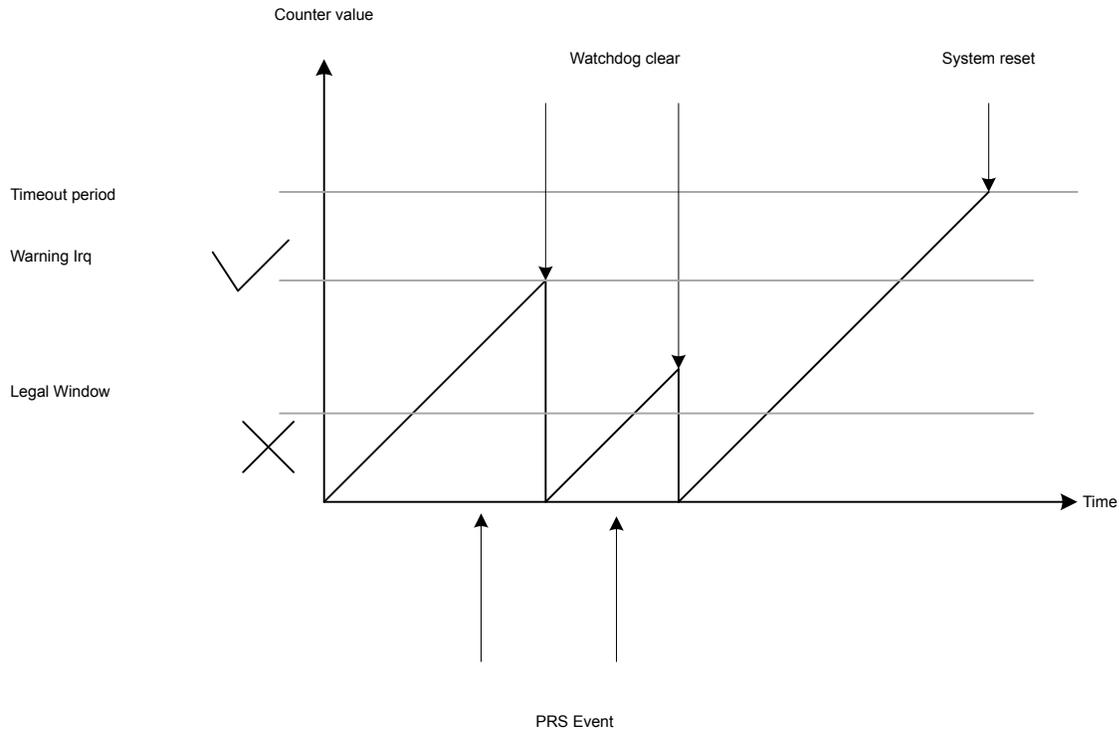

### 26.3.5 Window Interrupt

This interrupt occurs when the watchdog is cleared below a certain threshold. This threshold is given by the formula:

$$T_{\text{WINDOW}} = [2^{(\text{PERSEL}+3)} + 1] * \text{WARNSEL} / 8 / f$$

where f is the frequency of the selected clock.

This value will be approximately 12.5%, 25%, 37.5%, 50%, 62.5%, 75%, or 87.5% of the timeout value based on the WINSEL field of the WDOGn\_CFG. [Figure 26.1 WDOG Warning, Window, and Timeout on page 1039](#) illustrates the warning, the window, and the timeout interrupts. Also, it shows where the PRS rising edge needs to happen. The PRS edge detection feature is discussed later.

**Figure 26.1. WDOG Warning, Window, and Timeout**

### 26.3.6 PRS as Watchdog Clear

A PRS channel (selected by register PRS\_CONSUMER\_WDOGn\_SRC0) can be used to clear the watchdog counter. To enable this feature, CLRSRC must be set to 1. [Figure 26.2 PRS Clearing WDOG on page 1040](#) shows how the PRS channel takes over the WDOG clear function. Clearing the WDOG with the PRS is mutually exclusive of clearing the WDT by software.

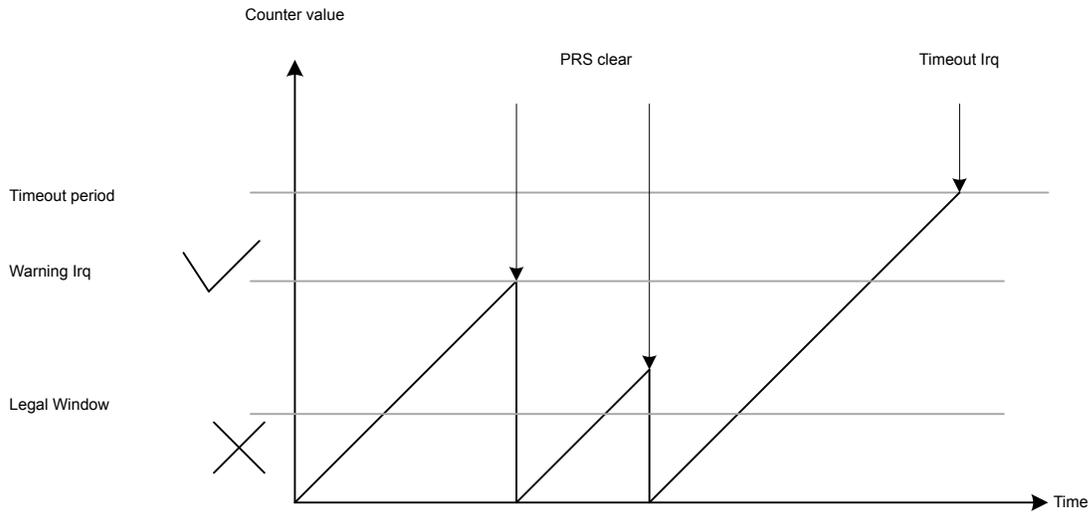

Figure 26.2. PRS Clearing WDOG

### 26.3.7 PRS Rising Edge Monitoring

PRS channels can be used to monitor multiple processes. The first and second channel are selected by PRS\_CONSUMER\_WDOGn\_SRC0 and PRS\_CONSUMER\_WDOGn\_SRC1, respectively. If enabled, every time the watch dog timer is cleared the PRS channels are checked and any channel which has not seen an event can trigger an interrupt.

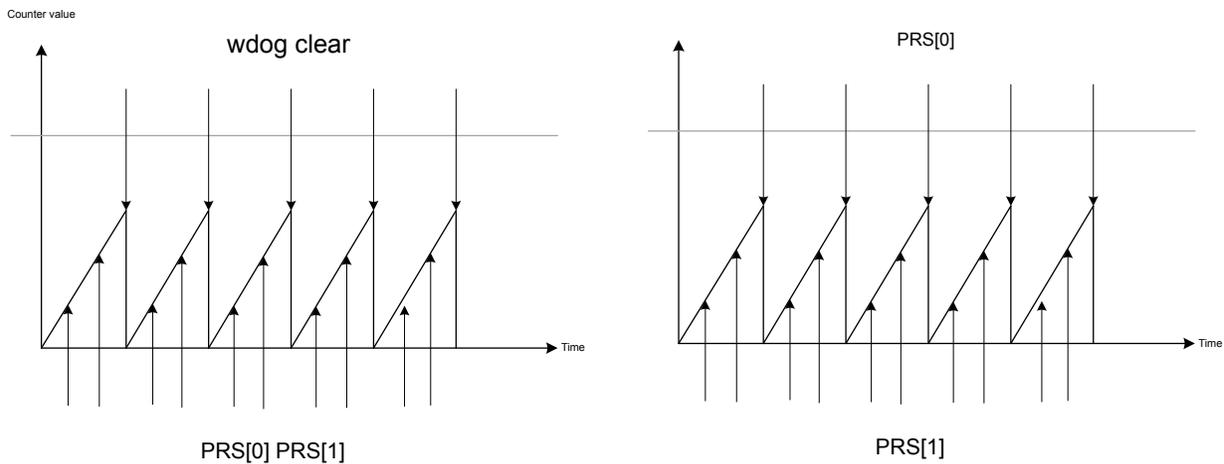

Figure 26.3. PRS Edge Monitoring in WDOG

## 26.4 WDOG Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description

## 27. LCD - Liquid Crystal Display Driver

### Quick Facts

#### What?

The LCD driver can drive LCD displays of up to 4x20 segments. The animation feature makes it possible to have active animations without CPU intervention.

#### Why?

Segmented LCD displays are a common way to display information. The extreme low-power LCD driver enables a lot of applications to utilize an LCD display even in energy critical systems.

#### How?

The low frequency clock signal, low-power waveform, animation and blink capabilities enable the LCD driver to run autonomously in EM2 for long periods. Adding the flexible frame rate setting, contrast control, and different multiplexing modes make the EFR32xG23 the optimal choice for battery-driven systems with LCD panels.

### 27.1 Introduction

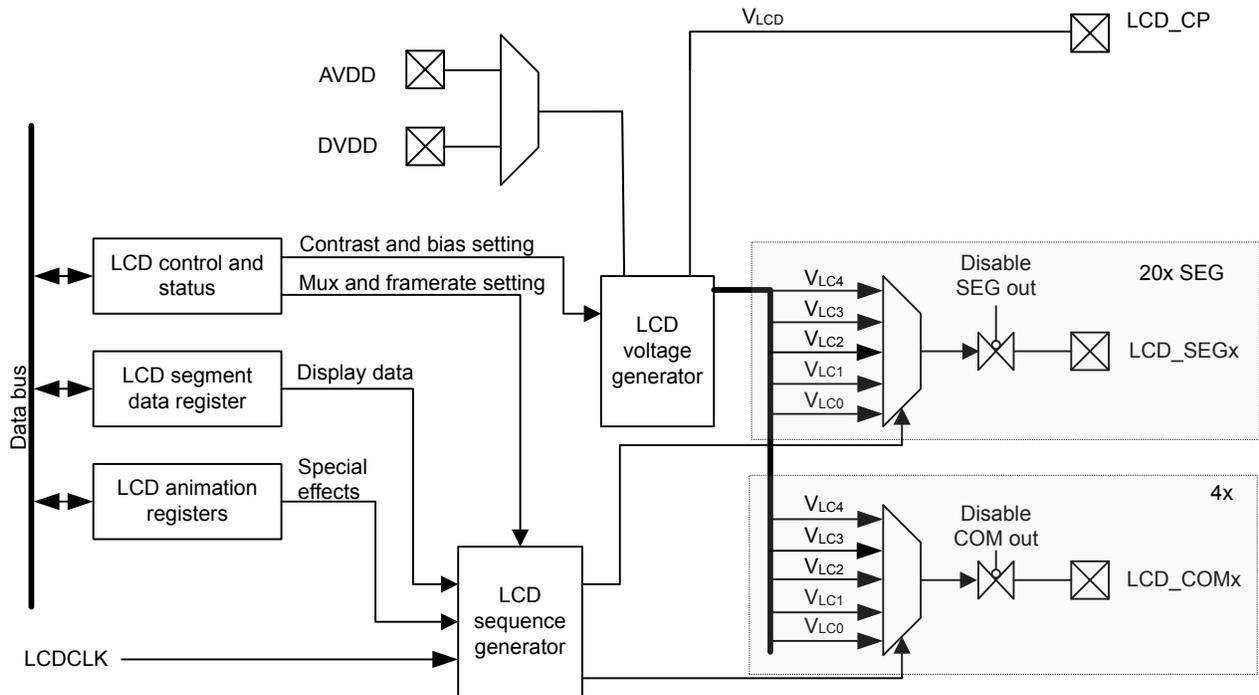

The LCD driver is capable of driving a segmented LCD display in combinations of up to 4 x 20 segments. A charge pump function enables it to provide the LCD display with higher voltage than the supply voltage for the device. In addition, an animation feature can run custom animations on the LCD display without any CPU intervention. The LCD driver can also remain active even in Energy Mode 2 and provides a Frame Counter interrupt or a Display Counter interrupt that can wake-up the device on a regular basis for updating data.

### 27.2 Features

- Up to 4x20 segments.
- Configurable multiplexing (1, 2, 3, 4)
- Supports COM/SEG combinations of: 1x20, 2x20, 3x20 and 4x20
- Configurable bias/voltage levels settings
- Configurable clock source prescaler
- Configurable Frame rate
- Segment lines can be enabled or disabled individually
- Blink capabilities
- Integrated animation functionality
  - Available on SEG0-SEG7 or SEG8-SEG15
- Charge Redistribution
- Charge pump capabilities
- Possible to run on external power
- Programmable contrast
- Frame Counter
- LCD frame interrupt
- Display Counter
- Display Counter interrupt
- Synchronization Done interrupt
- Direct segment control

### 27.3 Functional Description

An overview of the LCD module is shown in [Figure 27.1 LCD Block Diagram on page 1051](#). In its simplest form, an LCD driver would apply a voltage above a certain threshold voltage in order to darken a segment and a voltage below threshold to make a segment clear. However, the LCD display segment will degrade if the applied voltage has a DC-component. To avoid this, the applied waveforms are arranged such that the differential voltage seen by each segment has an average value of zero, and such that the RMS voltage (or differential sum of the two waveforms for fast response LCDs) is below the segment threshold voltage if the segment shall be transparent, and above the segment threshold voltage when the segment shall be dark. The segment lines to support up to 80 different LCD segments using 4 common lines by 20 segment lines. The common lines and segment lines can be enabled or disabled individually to prevent the LCD driver from occupying more I/O resources than required.

**Figure 27.1. LCD Block Diagram**

The LCD peripheral clock, LCDCLK, is selected in the CMU. Within this chapter it may be referred to as LCDCLK or by the more generic name CLK\_PER (peripheral clock). The register interface is clocked by the selected bus clock, referred to as either PCLK or CLK\_BUS.

Setting the EN bit in LCD\_EN enables the LCD driver. The MUX bit-field in LCD\_DISPCTRL determines which COM lines are driven by the LCD driver. By default, LCD.COM0 is driven whenever the LCD driver is enabled.

Refer to the GPIO module to enable GPIOs for individual segment and common lines.

Each LCD segment pin can also be individually disabled by setting the pin to any other state than DISABLED in the GPIO pin configuration.

### 27.3.1 LCD Frame Rates

LCD Frame rates are usually set between 30 to 100 frames per second (FPS). The LCD peripheral clock LCDCLK can be prescaled which reduces power by slowing down the internal LCD logic clocking. Charge redistribution can also be used to reduce power by briefly connecting LCD pins to the same mid-voltage driver before switching each LCD pin to its next voltage driver.

The 32.768 kHz clock should remain stable during LCD usage. If the clock is switched between LFXO and LFRCO, the LCD should first be disabled before switching the clock.

Each multiplexed line will have two phase periods per frame. For example, a static mux configuration (one COM line) will have two phase periods per frame, while a Quadruplex mux configuration (four COM lines) will have 8 phase periods per frame. CHGRDST in LCD\_DISPCTRL is used to select the number of prescaled LCDCLK cycles used for charge redistribution. FRDIV in LCD\_FRAMERATE is used to provide an additional increase of the phase period. The actual frame rate divider is  $FRDIV + 1$ . The charge redistribution cycle percentage (CHGRDST PERCENT) should generally be 5% or less to keep the reduction in LCD pad RMS voltage to a minimum. If charge redistribution is not used, a larger prescaling value is recommended to reduce power. Charge redistribution is on by default, but it can be disabled by setting CHGRDST to disable. in LCD\_DISPCTRL. [Table 27.1 LCD Frame Rate on page 1052](#) shows several example settings and the resulting percentage of time that charge redistribution is on.

**Table 27.1. LCD Frame Rate**

MUX	CHGRDST	Prescale	Actual FR Divider	FPS	CHGRDST PERCENT
Static	4	1	512	32.0	0.8%
Static	4	1	163	100.5	2.5%
Static	1	16	32	32.0	3.1%
Static	1	8	20	102.4	5.0%
Static	0	128	4	32.0	0.0%
Static	0	32	5	102.4	0.0
Quadruplex	4	1	136	30.1	2.9%
Quadruplex	2	1	40	102.4	5.0%
Quadruplex	1	4	34	30.1	2.9%
Quadruplex	1	2	20	102.4	5.0%
Quadruplex	0	16	8	32.0	0.0%
Quadruplex	0	4	10	102.4	0.0%

### 27.3.2 LCD Multiplexing, Bias, and Wave Settings

The LCD driver supports different multiplexing and bias settings, and these can be set individually in the LCD\_DISPCTRL.MUX and LCD\_DISPCTRL.BIAS respectively, see [Table 27.2 LCD Mux Settings on page 1053](#) and [Table 27.3 LCD BIAS Settings on page 1053](#).

The MUX setting determines the number of LCD COM lines that are enabled, beginning with COM0. When static multiplexing is selected, LCD output is enabled on LCD.COM0, when duplex multiplexing is used, LCD.COM0-LCD.COM1 are used, when triplex multiplexing is selected, LCD.COM0-LCD.COM2 are used, and when quadruplex multiplexing is selected, LCD.COM0-LCD.COM3 are used.

The waveforms generated by the LCD controller can be generated in two different versions, type A and type B. The type B waveforms have a lower switching frequency than the type A waveforms, and thus consume less power. LCD\_DISPCTRL.WAVE decides which waveforms to generate. An example of a type A waveform is shown in [Figure 27.2 LCD Type A Waveform for LCD.COM0 in Quadruplex Multiplex Mode, 1/3 Bias on page 1054](#), and an example of a type B waveform is shown in [Figure 27.3 LCD Type B Waveform for LCD.COM0 in Quadruplex Multiplex Mode, 1/3 Bias on page 1054](#). For COM waveforms, a green dotted lines indicates where the SEG waveform would be for an 'on' level while the red dotted lines indicate where the SEG waveform would be for an 'off' level.

**Table 27.2. LCD Mux Settings**

MUX	Mode	Multiplexing
00	Static	Static (segments can be multiplexed with LCD_COM[0])
01	Duplex	Duplex (segments can be multiplexed with LCD_COM[1:0])
10	Triplex	Triplex (segments can be multiplexed with LCD_COM[2:0])
11	Quadruplex	Quadruplex (segments can be multiplexed with LCD_COM[3:0])

**Table 27.3. LCD BIAS Settings**

BIAS	Mode	Bias setting
00	Static	Static (2 levels)
01	Half Bias	1/2 Bias (3 levels)
10	Third Bias	1/3 Bias (4 levels)
11	Fourth Bias	1/4 Bias (5 levels)

**Table 27.4. LCD Wave Settings**

WAVE	Mode	Wave mode
0	Type B	Low power optimized waveform output
1	Type A	Regular waveform output

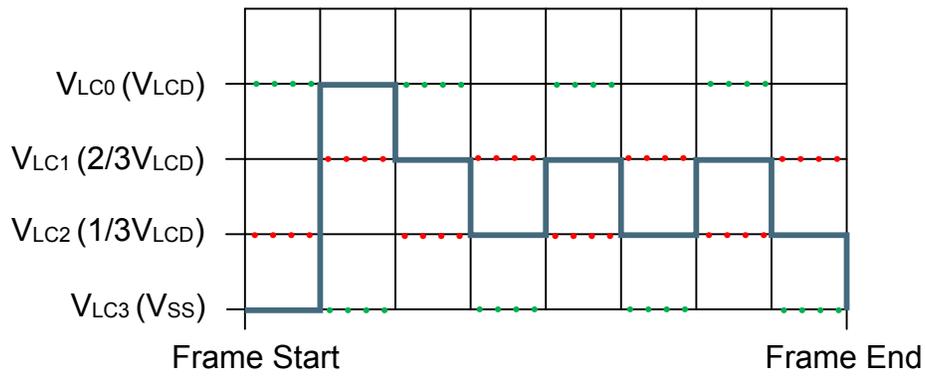

Figure 27.2. LCD Type A Waveform for LCD.COM0 in Quadruplex Multiplex Mode, 1/3 Bias

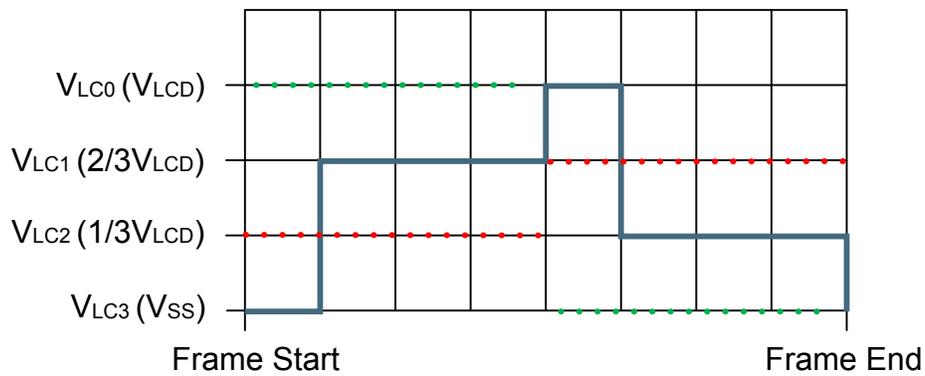

Figure 27.3. LCD Type B Waveform for LCD.COM0 in Quadruplex Multiplex Mode, 1/3 Bias

### 27.3.3 LCD Waveform Examples

The numbers on the illustration's y-axes in the following sections only indicate different voltage levels. All examples are shown with low-power waveforms.

### 27.3.3.1 Waveforms with Static Bias and Multiplexing

- With static bias and multiplexing, each segment line can be connected to LCD.COM0. When the segment line has the same waveform as LCD.COM0, the LCD panel pixel is turned off, while when the segment line has the opposite waveform, the LCD panel pixel is turned on.
- DC voltage = 0 (over one frame)
- $V_{RMS} (on) = V_{LCD}$
- $V_{RMS} (off) = 0 (V_{SS})$

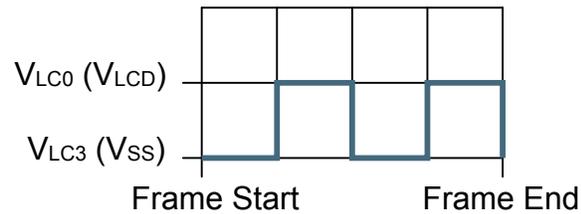

Figure 27.4. LCD Static Bias and Multiplexing - LCD.COM0

### 27.3.3.2 Waveforms with 1/2 Bias and Duplex Multiplexing

In this mode, each frame is divided into 4 periods. LCD\_COM[1:0] lines can be multiplexed with all segment lines. Figure 27.5 LCD 1/2 Bias and Duplex Multiplexing - LCD.COM0 on page 1056 and Figure 27.6 LCD 1/2 Bias and Duplex Multiplexing - LCD.COM1 on page 1056 show 1/2 bias and duplex multiplexing (waveforms show two frames)

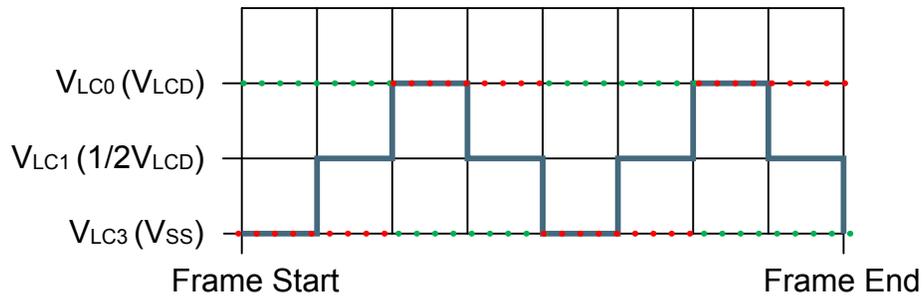

Figure 27.5. LCD 1/2 Bias and Duplex Multiplexing - LCD.COM0

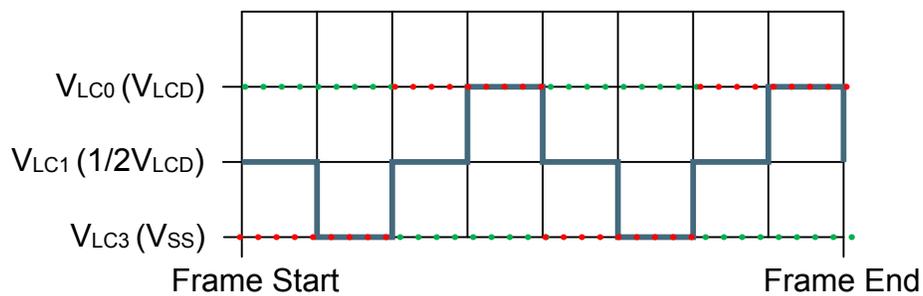

Figure 27.6. LCD 1/2 Bias and Duplex Multiplexing - LCD.COM1

#### 1/2 bias and duplex multiplexing - LCD.SEG0

Figure 27.7 LCD 1/2 Bias and Duplex Multiplexing - LCD.SEG0 on page 1057 is an example to illustrate how different segment waveforms can be multiplexed with the LCD\_COM lines in order to turn on and off LCD pixels. As illustrated in Figure 27.9 LCD 1/2 Bias and Duplex Multiplexing - LCD.SEG0-LCD.COM0 on page 1057 and Figure 27.10 LCD 1/2 Bias and Duplex Multiplexing - LCD.SEG0-LCD.COM1 on page 1058, this waveform will turn ON pixels connected to LCD.COM0, while pixels connected to LCD.COM1 will be turned OFF.

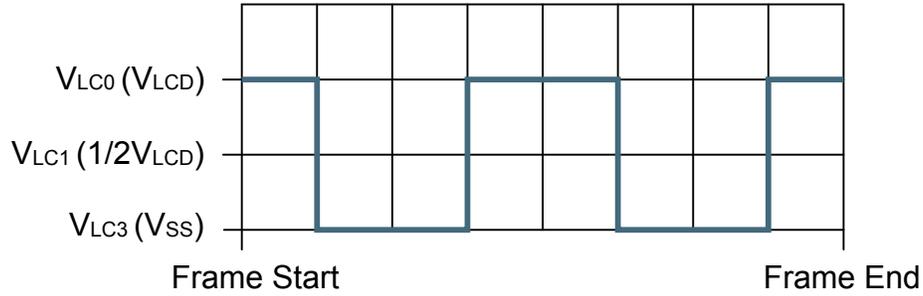

Figure 27.7. LCD 1/2 Bias and Duplex Multiplexing - LCD.SEG0

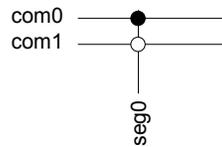

Figure 27.8. LCD 1/2 Bias and Duplex Multiplexing - LCD.SEG0 Connection

**1/2 bias and duplex multiplexing - LCD.SEG0-LCD.COM0**

- DC voltage = 0 (over one frame)
- $V_{RMS} = 0.79 \times V_{LCD}$
- The LCD display pixel that is connected to LCD.SEG0 and LCD.COM0 will be ON with this waveform.

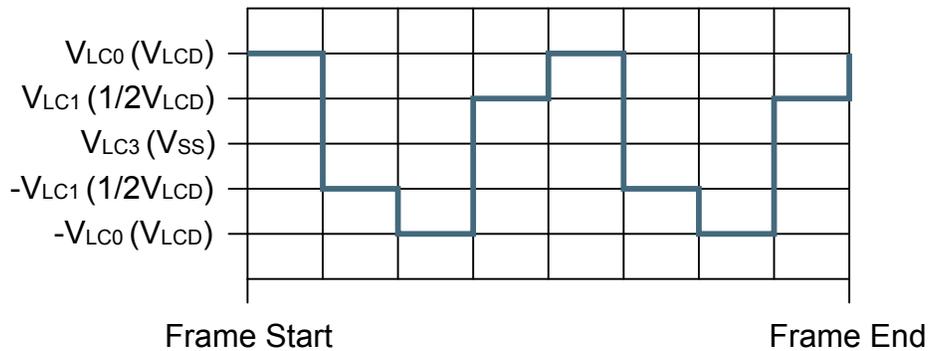

Figure 27.9. LCD 1/2 Bias and Duplex Multiplexing - LCD.SEG0-LCD.COM0

**1/2 bias and duplex multiplexing - LCD.SEG0-LCD.COM1**

- DC voltage = 0 (over one frame)
- $V_{RMS} = 0.35 \times V_{LCD}$
- The LCD display pixel that is connected to LCD.SEG0 and LCD.COM0 will be OFF with this waveform.

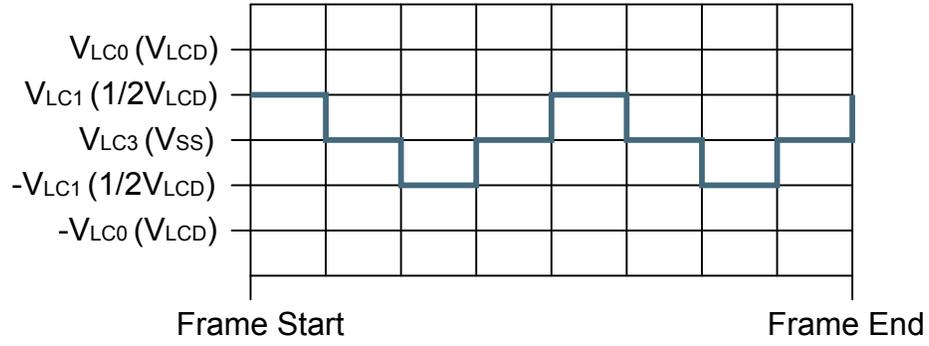

Figure 27.10. LCD 1/2 Bias and Duplex Multiplexing - LCD.SEG0-LCD.COM1

### 27.3.3.3 Waveforms with 1/3 Bias and Duplex Multiplexing

In this mode, each frame is divided into 4 periods. LCD\_COM[1:0] lines can be multiplexed with all segment lines. Figure 27.11 LCD 1/3 Bias and Duplex Multiplexing - LCD.COM0 on page 1059 and Figure 27.12 LCD 1/3 Bias and Duplex Multiplexing - LCD.COM1 on page 1059 show 1/3 bias and duplex multiplexing (waveforms show two frames).

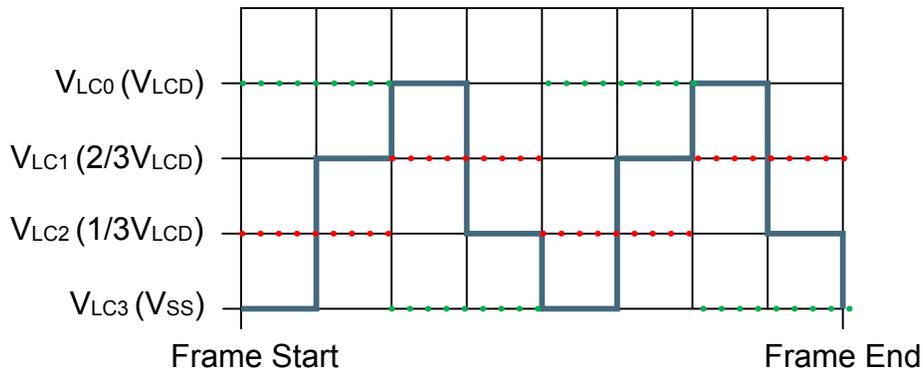

Figure 27.11. LCD 1/3 Bias and Duplex Multiplexing - LCD.COM0

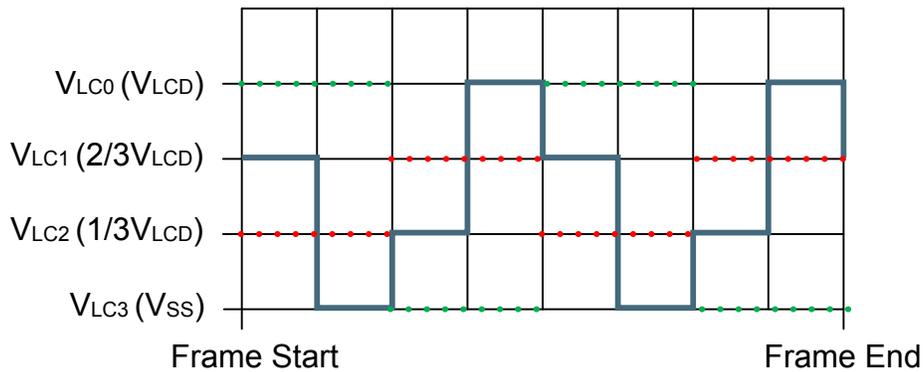

Figure 27.12. LCD 1/3 Bias and Duplex Multiplexing - LCD.COM1

#### 1/3 bias and duplex multiplexing - LCD.SEG0

Figure 27.13 LCD 1/3 Bias and Duplex Multiplexing - LCD.SEG0 on page 1060 is just an example to illustrate how different segment waveforms can be multiplexed with the COM lines in order to turn on and off LCD pixels. As illustrated in Figure 27.15 LCD 1/3 Bias and Duplex Multiplexing - LCD.SEG0-LCD.COM0 on page 1060 and Figure 27.16 LCD 1/3 Bias and Duplex Multiplexing - LCD.SEG0-LCD.COM1 on page 1061, this waveform will turn ON pixels connected to LCD.COM0, while pixels connected to LCD.COM1 will be turned OFF.

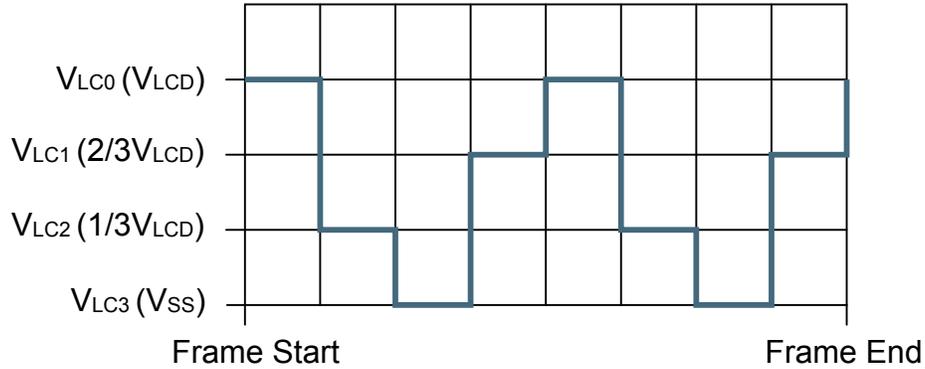

Figure 27.13. LCD 1/3 Bias and Duplex Multiplexing - LCD.SEG0

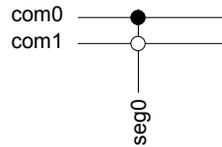

Figure 27.14. LCD 1/3 Bias and Duplex Multiplexing - LCD.SEG0 Connection

**1/3 bias and duplex multiplexing - LCD.SEG0-LCD.COM0**

- DC voltage = 0 (over one frame)
- $V_{RMS} = 0.75 \times V_{LCD}$
- The LCD display pixel that is connected to LCD.SEG0 and LCD.COM0 will be ON with this waveform.

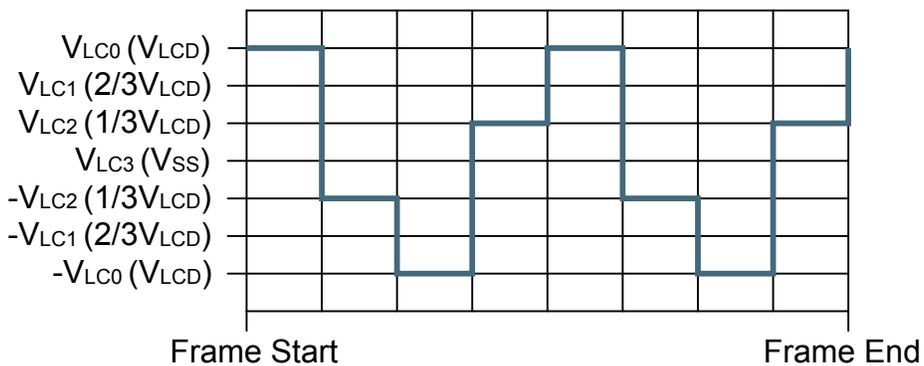

Figure 27.15. LCD 1/3 Bias and Duplex Multiplexing - LCD.SEG0-LCD.COM0

**1/3 bias and duplex multiplexing - LCD.SEG0-LCD.COM0**

- DC voltage = 0 (over one frame)
- $V_{RMS} = 0.33 \times V_{LCD}$

- The LCD display pixel that is connected to LCD.SEG0 and LCD.COM1 will be OFF with this waveform.

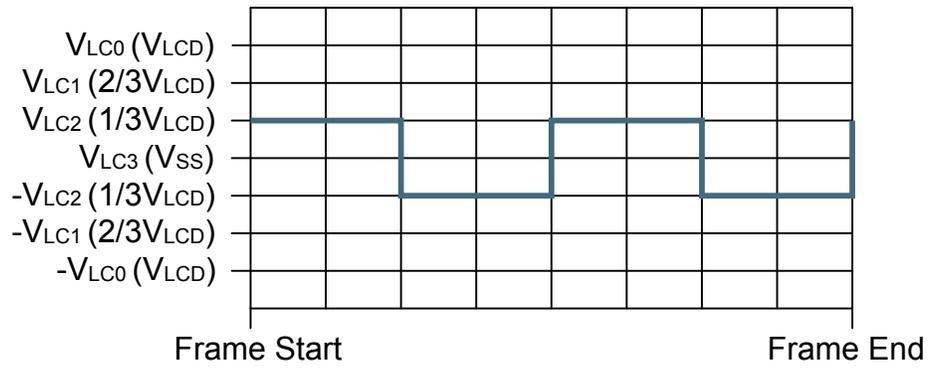

Figure 27.16. LCD 1/3 Bias and Duplex Multiplexing - LCD.SEG0-LCD.COM1

### 27.3.3.4 Waveforms with 1/2 Bias and Triplex Multiplexing

In this mode, each frame is divided into 6 periods. LCD\_COM[2:0] lines can be multiplexed with all segment lines. Figure 27.17 LCD 1/2 Bias and Triplex Multiplexing - LCD.COM0 on page 1062 through Figure 27.19 LCD 1/2 Bias and Triplex Multiplexing - LCD.COM2 on page 1062 show 1/2 bias and triplex multiplexing (waveforms show two frames).

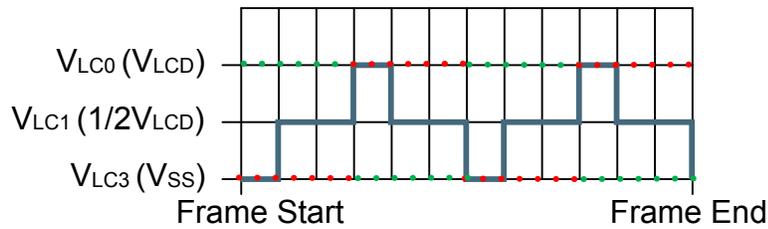

Figure 27.17. LCD 1/2 Bias and Triplex Multiplexing - LCD.COM0

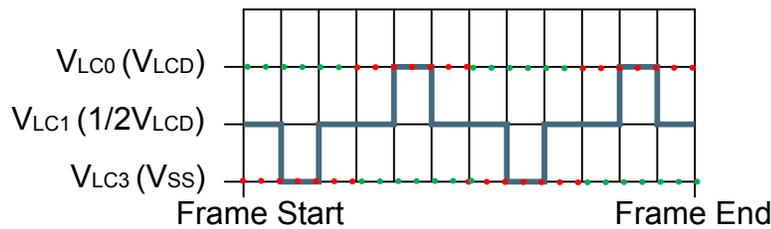

Figure 27.18. LCD 1/2 Bias and Triplex Multiplexing - LCD.COM1

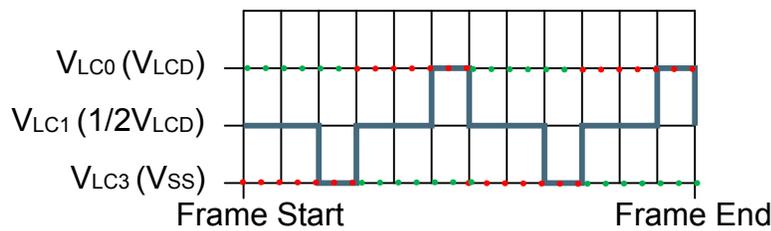

Figure 27.19. LCD 1/2 Bias and Triplex Multiplexing - LCD.COM2

#### 1/2 bias and triplex multiplexing - LCD.SEG0

Figure 27.20 LCD 1/2 Bias and Triplex Multiplexing - LCD.SEG0 on page 1063 is just an example to illustrate how different segment waveforms can be multiplexed with the COM lines in order to turn on and off LCD pixels. As illustrated in Figure 27.22 LCD 1/2 Bias and Triplex Multiplexing - LCD.SEG0-LCD.COM0 on page 1063 through Figure 27.24 LCD 1/2 Bias and Triplex Multiplexing - LCD.SEG0-LCD.COM2 on page 1064, this waveform will turn ON pixels connected to LCD.COM1, while pixels connected to LCD.COM0 and LCD.COM2 will be turned OFF.

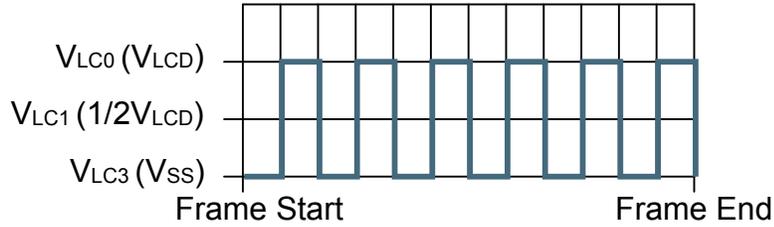

Figure 27.20. LCD 1/2 Bias and Triplex Multiplexing - LCD.SEG0

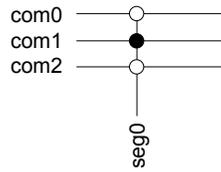

Figure 27.21. LCD 1/2 Bias and Triplex Multiplexing - LCD.SEG0 Connection

**1/2 bias and triplex multiplexing - LCD.SEG0-LCD.COM0**

- DC voltage = 0 (over one frame)
- $V_{RMS} = 0.4 \times V_{LCD}$
- The LCD display pixel that is connected to LCD.SEG0 and LCD.COM0 will be OFF with this waveform.

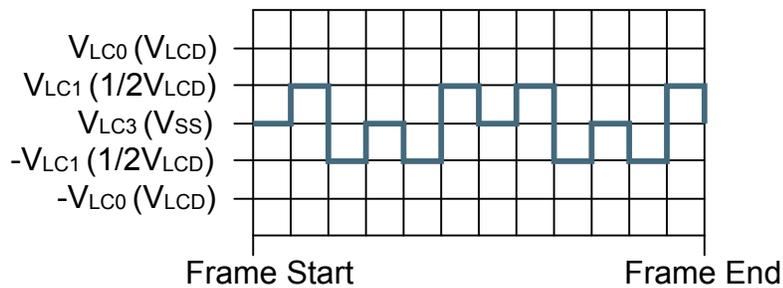

Figure 27.22. LCD 1/2 Bias and Triplex Multiplexing - LCD.SEG0-LCD.COM0

**1/2 bias and triplex multiplexing - LCD.SEG0-LCD.COM1**

- DC voltage = 0 (over one frame)
- $V_{RMS} = 0.7 V_{LCD}$
- The LCD display pixel that is connected to LCD.SEG0 and LCD.COM1 will be ON with this waveform.

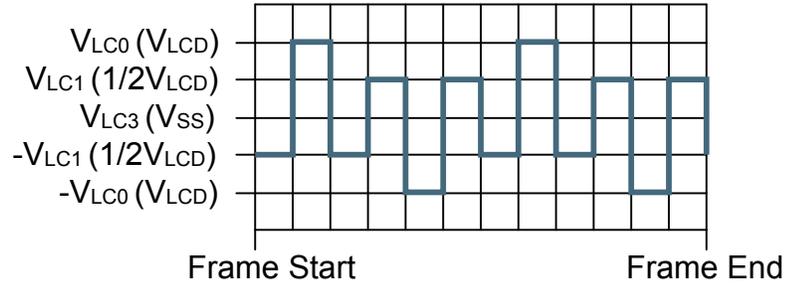

Figure 27.23. LCD 1/2 Bias and Triplex Multiplexing - LCD.SEG0-LCD.COM1

**1/2 bias and triplex multiplexing - LCD.SEG0-LCD.COM2**

- DC voltage = 0 (over one frame)
- $V_{RMS} = 0.4 \times V_{LCD}$
- The LCD display pixel that is connected to LCD.SEG0 and LCD.COM2 will be OFF with this waveform.

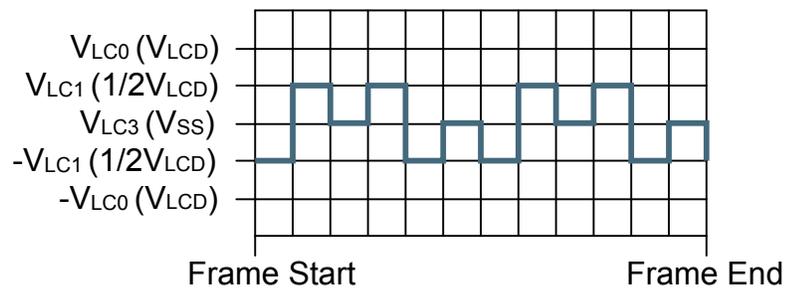

Figure 27.24. LCD 1/2 Bias and Triplex Multiplexing - LCD.SEG0-LCD.COM2

### 27.3.3.5 Waveforms with 1/3 Bias and Triplex Multiplexing

In this mode, each frame is divided into 6 periods. LCD\_COM[2:0] lines can be multiplexed with all segment lines. Figure 27.25 LCD 1/3 Bias and Triplex Multiplexing - LCD.COM0 on page 1065 through Figure 27.27 LCD 1/3 Bias and Triplex Multiplexing - LCD.COM2 on page 1065 show 1/3 bias and triplex multiplexing (waveforms show two frames).

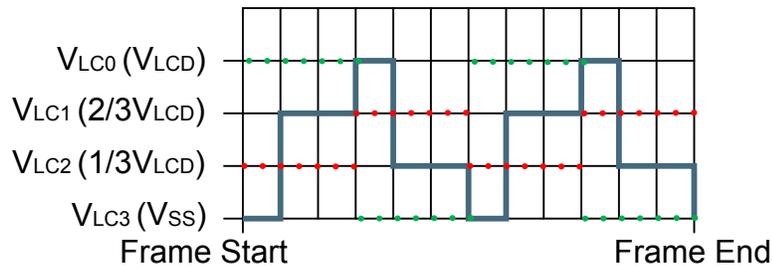

Figure 27.25. LCD 1/3 Bias and Triplex Multiplexing - LCD.COM0

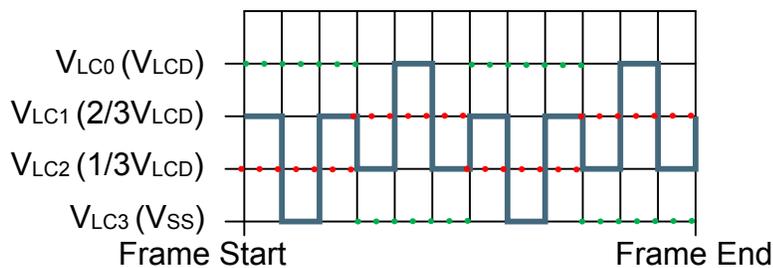

Figure 27.26. LCD 1/3 Bias and Triplex Multiplexing - LCD.COM1

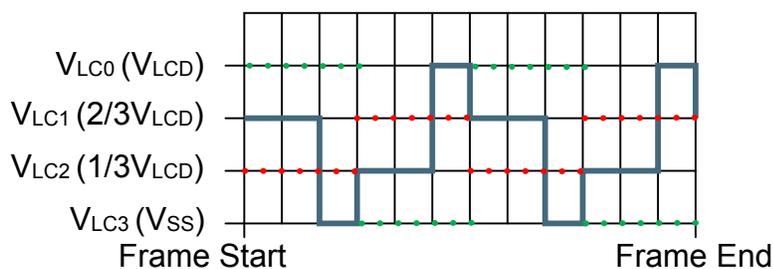

Figure 27.27. LCD 1/3 Bias and Triplex Multiplexing - LCD.COM2

#### 1/3 bias and triplex multiplexing - LCD.SEG0

Figure 27.28 LCD 1/3 Bias and Triplex Multiplexing - LCD.SEG0 on page 1066 illustrates how different segment waveforms can be multiplexed with the COM lines in order to turn on and off LCD pixels. As illustrated in Figure 27.30 LCD 1/3 Bias and Triplex Multiplexing - LCD.SEG0-LCD.COM0 on page 1066 through Figure 27.32 LCD 1/3 Bias and Triplex Multiplexing - LCD.SEG0-LCD.COM2 on page 1066

page 1067, this waveform will turn ON pixels connected to LCD.COM1, while pixels connected to LCD.COM0 and LCD.COM2 will be turned OFF.

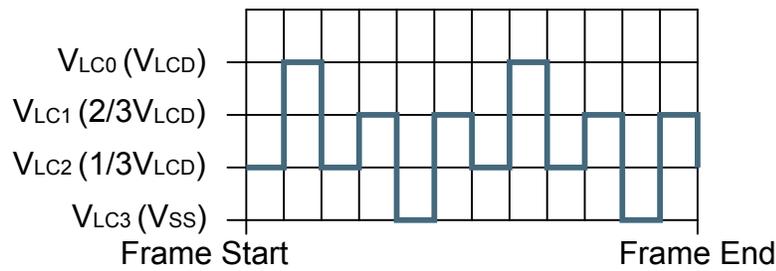

Figure 27.28. LCD 1/3 Bias and Triplex Multiplexing - LCD.SEG0

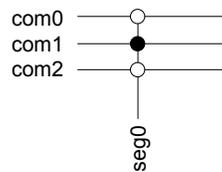

Figure 27.29. LCD 1/3 Bias and Triplex Multiplexing - LCD.SEG0 Connection

**1/3 bias and triplex multiplexing - LCD.SEG0-LCD.COM0**

- DC voltage = 0 (over one frame)
- $V_{RMS} = 0.33 V_{LCD}$
- The LCD display pixel that is connected to LCD.SEG0 and LCD.COM0 will be OFF with this waveform

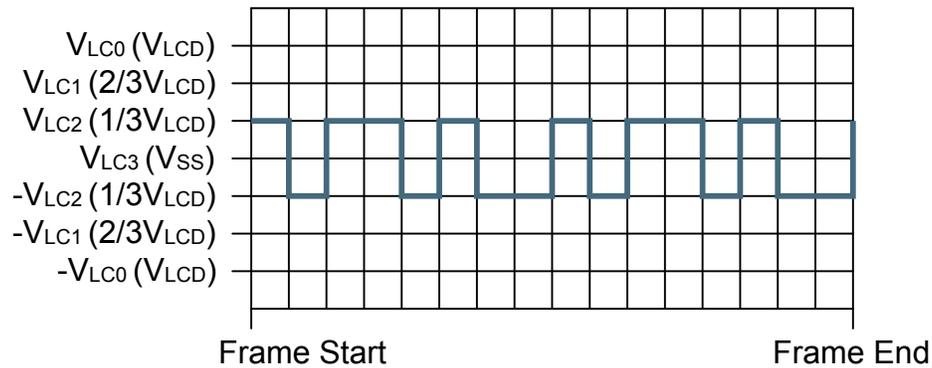

Figure 27.42. LCD 1/3 Bias and Quadruplex Multiplexing - LCD.SEG0-LCD.COM3

**27.3.4 Type A Waveforms with Charge Redistribution**

Charge redistribution can be used to save power by briefly connecting common lines and segment lines to a common connection between each phase of the waveform. Instead of driving some lines from high to low and other lines from low to high, the lines are briefly sharing charge to get to a mid voltage level before each waveform drives to its new voltage level.

The data sequence is monitored for each segment line, and charge redistribution is not used on specific segments at times that the data does not change. If a specific segment line at that specific point went from a previous data value of 0x1 to a new data value of 0x1, there is no reason to charge redistribute that segment line from a high voltage to a mid value voltage and back to high voltage again. Type A waveforms will always use charge redistribution on the segment lines while type B waveforms will look at the data sequence to turn off charge redistribution when the data does not change.

### 27.3.4.1 Type A Half Bias Triplex Waveform with Charge Redistribution

With charge redistribution between 1 to 4 LCDCLK cycles are selected with CHGRDST in LCD\_DISPCTRL to short LCD pads to an intermediate voltage temporarily before each LCD pad transitions to its next voltage level. Due to the power savings charge redistribution is on by default. To switch off charge redistribution use CHGRDST in LCD\_DISPCTRL. The logic looks at both the data per segment and the phase change to determine when to apply charge redistribution.

This example assumes a 32.768 kHz clock prescaled by 2 and a frame rate divider (LCD\_FRAMERATE.FRDIV) of 90 which gives 30 frames per second. The charge redistribution is 1% of each phase. The normal power waveform is shown with segment 0 data of {1,1,0}.

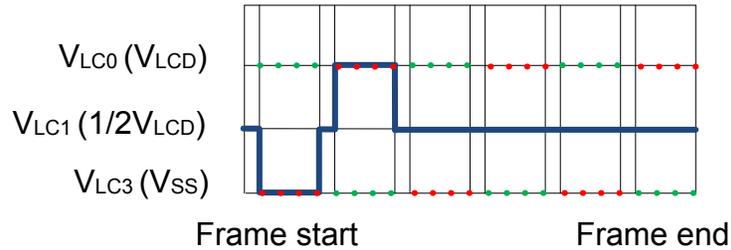

Figure 27.43. LCD Charge Redist - 1/2 Bias and Triplex Multiplexing - LCD.COM0

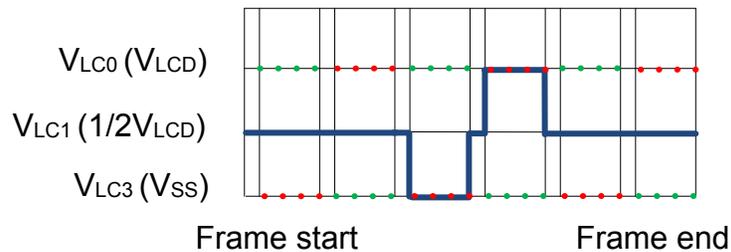

Figure 27.44. LCD Charge Redist - 1/2 Bias and Triplex Multiplexing - LCD.COM1

- $V_{RMS} = 0.40 \times V_{LCD}$
- The LCD display pixel that is connected to LCD.SEG0 and LCD.COM2 will be OFF with this waveform

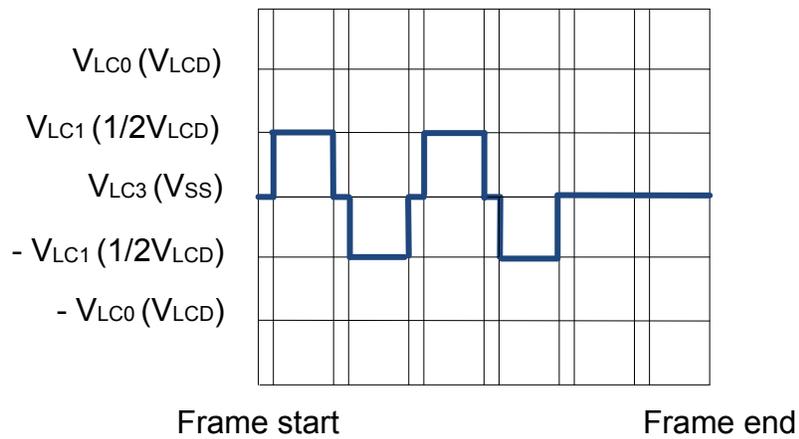

Figure 27.49. LCD Charge Redist - 1/2 Bias and Triplex Multiplexing - LCD.SEG0-LCD.COM2

### 27.3.4.2 Type B Half Bias Quadruplex Waveforms with Charge Redistribution

For type B waveforms there is no charge redistribution on the segment lines when the data does not change. The length of time spent in charge redistribution is exaggerated in the waveform to make it more visible. Typically much less than 5% of the waveform is for charge redistribution.

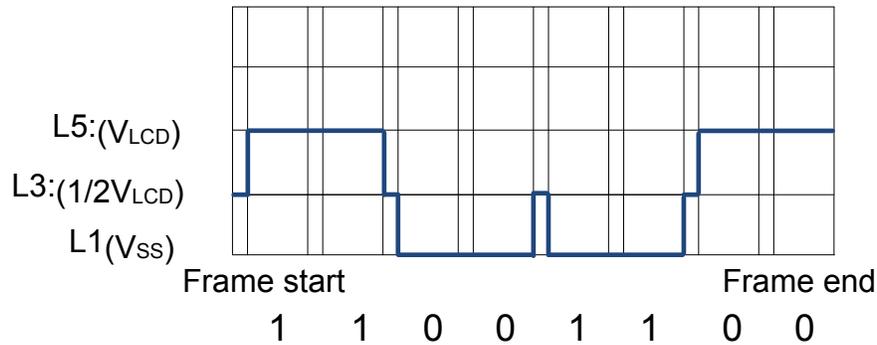

Figure 27.50. LCD Charge Redist - 1/2 Bias and Quadruplex Multiplexing - LCD.SEG0

- $V_{RMS} = 0.54 \times V_{LCD}$
- The LCD display pixel that is connected to LCD.SEG0 and LCD.COM0 will be ON with this waveform

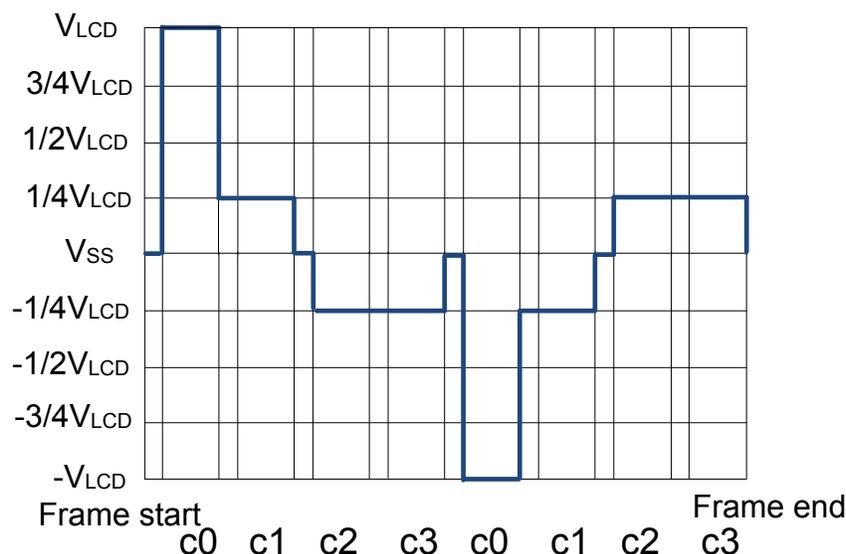

Figure 27.58. LCD Charge Redist - 1/4 Bias and Quadruplex Multiplexing - LCD.SEG0-LCD.COM0

### 27.3.5 LCD Contrast

Different LCD panels have different characteristics and also temperature may affect the characteristics of the LCD panels. To compensate for such variations, the LCD driver has a programmable contrast that adjusts the  $V_{LCD}$ . The contrast is set by LCD\_BIASCTRL.VLCD, and can be adjusted relative to  $V_{DD}$  ( $V_{LCD}$ ).

Table 27.5. LCD Contrast

Mode	Equation for vo44
step down and charge pump	$2.25V + 50\text{ mV} * VLCD[4:0]$

**Note:** Reset value is maximum contrast. vo34, vo24, and vo14 are equally spaced such as  $vo44 * 3/4$ ,  $vo44 * 2/4$ , and  $vo44 * 1/4$ .

### 27.3.6 Voltage Levels and Mode Selection

The number of LCD bias levels is controlled by LCD\_DISPCTRL.BIAS.

Voltage scaling of vo34, vo24, and vo14 are generated off of vo44 such as 3/4, 1/2, 1/4, and Vss for a BIAS setting of ONEFOURTH. For a BIAS setting of ONETHIRD, the scaled settings would be 2/3, 1/3, and Vss. For a BIAS setting of ONEHALF, the scaled settings would be 1/2 and Vss. For a BIAS setting of STATIC, the voltage are only vo44 and Vss.

Two modes are available for setting LCD voltage bias levels: step down mode or charge pump mode.

For the step down mode an external capacitor is regulated using an LCD comparator to maintain a vo44 voltage that is not greater than supply voltage.

For the charge pump mode, a voltage of up to twice the supply voltage is generated internally and maintained on an external capacitor. A second internal capacitor is used to pump up the external capacitor which maintains the vo44 voltage.

Pins assigned to LCD common or segment lines are capable of driving above the IOVDD supply to achieve the desired voltages.

## V<sub>LCD</sub> Selection

By default, the LCD driver runs in step down mode which is set with LCD\_BIASCTRL.MODE or charge pump mode may be selected. Charge pump mode will boost V<sub>LCD</sub> to a maximum value of approximately  $1.95 * V_{DD}$ . Using V<sub>DD</sub> = 1.8 V and setting VLCD register to its maximum value would charge up to about 3.5V. The charge pump is guaranteed to charge to the range of 2.4 V – 3.6 V by configuring LCD\_BIASCTRL.VLCD to the appropriate code. Due to process variations the VLCD codes allow for a range slightly bigger than 2.4V - 3.6V. Any code that would have charged to a voltage greater than 3.6 V will be reduced to 3.6 V. Note that the charge pump circuit is not designed to operate with the selected charge pump voltage, V<sub>LCD</sub>, smaller than V<sub>DD</sub>.

The LCD\_CP pin must be connected through a 4.7 uF capacitor to VSS.

### 27.3.7 Data Update

The LCD Driver logic that controls the output waveforms is clocked on the prescaled LCDCLK. The LCD data and Control Registers are clocked on the PCLK. To avoid metastability and unpredictable behavior, the data in the Segment Data (SEGDn) registers must be synchronized to the LCD driver logic. Also, it is important that data is updated at the beginning of an LCD frame since the segment waveform depends on the segment data and a change in the middle of a frame may lead to a DC-component in that frame. The LCD driver has dedicated functionality to synchronize data transfer to the LCD frames. The synchronization logic is applied to all data that need to be updated at the beginning of the LCD frames:

- LCD\_SEGDn
- LCD\_AREGA
- LCD\_AREGB
- LCD\_BACTRL
- LCD\_UPDATECTRL

The different methods to update data are controlled by LCD\_CTRL.UDCTRL.

**Table 27.6. LCD Update Data Control (UDCTRL) Bits**

UDCTRL	Mode	Description
00	REGULAR	The data transfer is controlled by SW and data synchronization is initiated by writing data to the buffers. Data is transferred as soon as possible, possibly creating a frame with a DC component on the LCD.
01	FCEVENT	The data transfer is done at the next event triggered by the Frame Counter (FC). See <a href="#">27.3.7 Data Update</a> for details on how to configure the Frame Counter. Optionally, the Frame Counter can also generate an interrupt at every event.
10	FRAMESTART	The data transfer is done at frame-start.
11	DISPLAYEVENT	The data transfer is done at a display event.

### 27.3.8 Direct Segment Control (DSC)

It is possible to gain direct control over the bias levels for each SEG/COM line by setting DSC in LCD\_CTRL, overwriting the BIAS settings in LCD\_DISPCTRL. The SEG lines bias levels can be set in SEGD0-SEGD3, while the COM line bias levels can be set in SEGD4. To represent the different bias levels, 4-bits per SEG lines are needed. For example, SEG0's bias levels can be set using SEGD0[3:0], and SEG1 can be controlled through SEGD1[3:0] etc. Bias level encoding is shown in [Table 27.7 DSC BIAS Encoding on page 1081](#), and segment/common locations are shown in [Table 27.8 DSC Segment and Common mapping on page 1081](#).

**Table 27.7. DSC BIAS Encoding**

SEGD	Bias setting
0000	tristate
0001	VSS
0010	1/3 or 1/4 $V_{LCD}$
0011	1/2 $V_{LCD}$
0100	2/3 or 3/4 $V_{LCD}$
0101	$V_{LCD}$

**Table 27.8. DSC Segment and Common mapping**

Register	L[31:28]	L[27:24]	L[23:20]	L[19:16]	L[15:12]	L[11:8]	L[7:4]	L[3:0]
SEGD0				seg16	seg12	seg8	seg4	seg0
SEGD1				seg17	seg13	seg9	seg5	seg1
SEGD2				seg18	seg14	seg10	seg6	seg2
SEGD3				seg19	seg15	seg11	seg7	seg3
AREGA							com2	com0
AREGB							com3	com1

### 27.3.9 Frame Counter (FC)

The Frame Counter is synchronized to the LCD frame start and will generate an event after a programmable number of frames. An FC event can trigger:

- LCD ready interrupt
- Blink (controlling the blink frequency)
- Next state in the Animation State Machine
- Data update if LCD\_CTRL.UDCTRL = 01
- DMA transfer if LCD\_BIASCTRL.DMAMODE = 01

The Frame Counter is a down counter. It is enabled by writing FCEN in LCD\_BACTRL. Optionally, the Frame Counter can be prescaled so that the Frame Counter is decremented at:

- Every frame
- Every second frame
- Every fourth frame
- Every eighth frame

This is controlled by the FCPRESC in LCD\_BACFG, see [Table 27.9 FCPRESC on page 1082](#)

**Table 27.9. FCPRESC**

FCPRESC	Mode	Description	General equation
00	Div1	$CLK_{FRAME}/1$	$CLK_{FC} = CLK_{FRAME}/2^{FCPRESC}$
01	Div2	$CLK_{FRAME}/2$	
10	Div4	$CLK_{FRAME}/4$	
11	Div8	$CLK_{FRAME}/8$	

The top value for the Frame Counter is set by FCTOP in LCD\_BACTRL. Every time the frame counter reaches zero, it is reloaded with the top value, and at the same time an event, which can cause an interrupt, data update, blink, or an animation state transition is triggered.

$$CLK_{EVENT} = CLK_{FC}/(1 + FCTOP[5:0]) \text{ Hz}$$

**Figure 27.59. LCD Event Frequency Equation**

[Figure 27.59 LCD Event Frequency Equation on page 1082](#) shows how to set-up the LCD event frequency. As an example, if the frame rate is 64 Hz, in order to have an LCD event frequency of 0.5 Hz, the following parameters should be set:

- Write FCPRESC to 3 =>  $CLK_{FC} = 8 \text{ Hz}$  (0.125 seconds)
- Write FCTOP to 15 =>  $CLK_{EVENT} = 0.5 \text{ Hz}$  (2 seconds)

If higher resolution is required, configure a lower prescaler value and increase FCPRESC in LCD\_BACFG accordingly (e.g. FCPRESC = 2, FCTOP = 31).

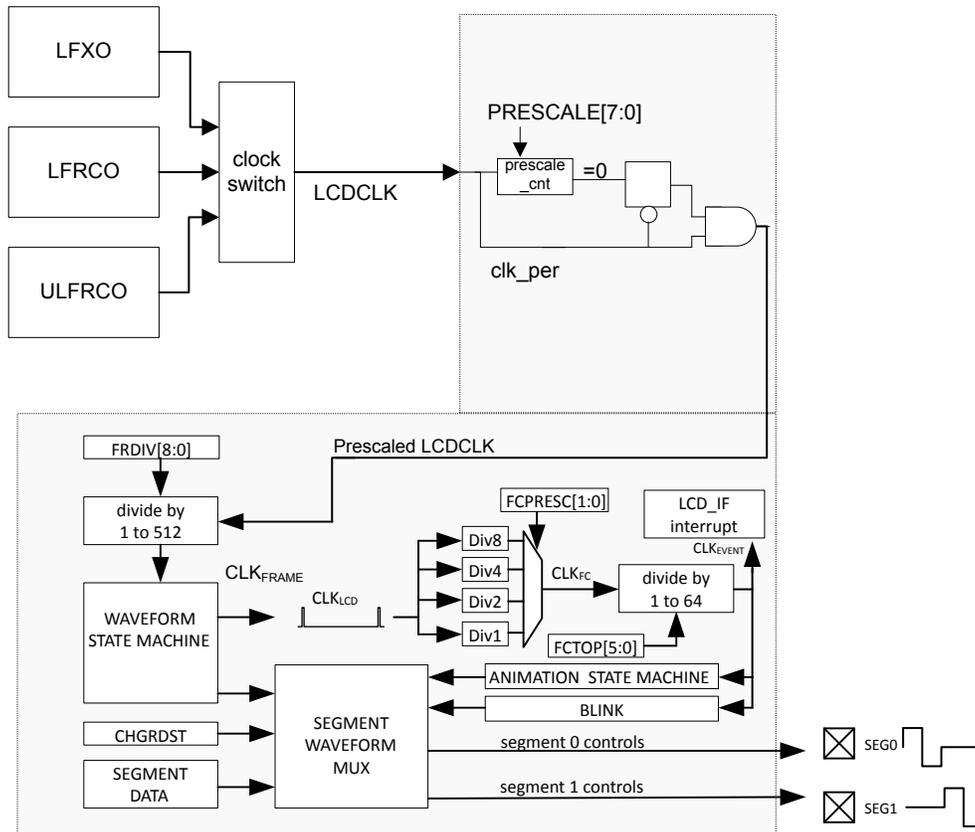

Figure 27.60. LCD Clock System in LCD Driver

### 27.3.10 Display Counter

The Display Counter is counting a number of frame counter events and can be used to interrupt or cause a DMA transfer at a slower rate than the frame counter. A Display counter event can trigger:

- Display counter interrupt
- Data update if LCD\_CTRL.UDCTRL = 11
- DMA transfer if LCD\_BIASCTRL.DMAMODE = 10

### 27.3.11 LCD Interrupt

The LCD interrupt can be used to synchronize data update. The FC interrupt flag is set at every LCD Frame Counter Event, which must be set-up separately. The interrupt is enabled by setting LCD\_IEN.FC bit. The frame counter is enabled with LCD\_BACTRL.FCEN.

There is also a display counter interrupt (LCD\_IF.DISPLAY) that can be used to indicate when when the display count reaches zero. The interrupt is enabled with LCD\_IEN.DISPLAY, and the display counter is enabled with LCD\_BACTRL.DISPLAYCNTEN.

### 27.3.12 LCD DMA Transfer

The display counter can be used to have the LDMA transfer new segment data to the LCD when the display counter reaches 0x0 by setting LCD\_BIASCTRL.DMAMODE to DMADISPLAY.

The LDMA transfer can be done with the frame counter by setting LCD\_BIASCTRL.DMAMODE to DMAFC.

**Note:** An LDMA transfer typically is used to update segment data. After the LDMA writes new information to the LCD registers, the LCD peripheral must perform a hardware synchronization. See 27.3.15 LCD Synchronization. Subsequent LDMA requests will not be triggered by the LCD peripheral until hardware synchronization has completed.

## 27.3.13 Blink, Blank, and Animation Features

### 27.3.13.1 Blink

The LCD driver can be configured to blink, alternating all enabled segments between on and off. The blink frequency is given by the  $CLK_{EVENT}$  frequency, see [27.3.9 Frame Counter \(FC\)](#). See [27.3.7 Data Update](#) for details regarding synchronization of the blink feature. The FC must be on for blink to work.

### 27.3.13.2 Blank

Setting BLANK in LCD\_BACTRL will output the “OFF” waveform on all enabled segments, effectively blanking the entire display. Writing the BLANK bit to zero disables the blanking and segment data will be output as normal.

### 27.3.13.3 Animation State Machine

The Animation State Machine makes it possible to enable different animations without updating the data registers, allowing specialized patterns running on the LCD panel while the microcontroller remains in Low Energy Mode and thus saving power consumption. The animation feature is available on segment 0 to 7 multiplexed with LCD.COM0. The animation is implemented as two programmable 8 bits registers that are shifted left or right every other Animation state for a total of 16 states. The animation feature is available on 8 segments multiplexed with LCD.COM0. The 8 segments can be either segments 0 to 7 or 8 to 15, depending on ALOC in LCD\_BACTRL.

The shift operations applied to the shift registers are controlled by AREGASC and AREGBSC in LCD\_BACTRL as shown in [Table 27.10 LCD Animation Shift Register on page 1085](#). Note also that the FC must be on for animation to work, as it is the FC event that drives the animation state machine.

The BACFG.ASTATETOP can also be used to set the number of segments to values other than 8. Setting astatetop = 7 will give 8 segments, setting astate = 1 will give 2 segments. If the astatetop is set to 3, that will give 4 segments based on AREGA[3:0]. Setting AREGA[3:0] = 0001 and left shifting without using AREGB would give {0001, 0010, 0100, 1000, 0001, ...}.

**Table 27.10. LCD Animation Shift Register**

AREGnSC, n = A or B	Mode	Description
00	NOSHIFT	No Shift operation
01	SHIFTLEFT	Animation register is shifted left (LCD_AREGA is shifted every odd state, LCD_AREGB is shifted every even state)
10	SHIFTRIGHT	Animation register is shifted right (LCD_AREGA is shifted every odd state, LCD_AREGB is shifted every even state)
11	Reserved	Reserved

The two registers are either OR'ed or AND'ed to achieve the displayed animation pattern. This allows some segments to always be on while other segments appear to be moving. This is controlled by ALOGSEL in LCD\_BACTRL as shown in [Table 27.11 LCD Animation Pattern on page 1085](#). In addition, the regular segment data SEG0[7:0] is OR'ed with the animation pattern to generate the resulting output.

**Table 27.11. LCD Animation Pattern**

ALOGSEL	Mode	Description
0	AND	LCD_AREGA and LCD_AREGB are AND'ed together
1	OR	LCD_AREGA and LCD_AREGB are OR'ed together

Each state is displayed one CLK<sub>EVENT</sub> period, see [27.3.13.3 Animation State Machine](#). By reading ASTATE in LCD\_STATUS, software can identify which state that is currently active in the state sequence. Note that the shifting operation is performed on internal registers that are not accessible in SW (when reading LCD\_AREGA and LCD\_AREGB, the data that was original written will also be read back). The SW must utilize the knowledge about the current state (ASTATE) to calculate what is currently output. ASTATE is cleared when LCD\_AREGA or LCD\_AREGB are updated with new values. See [Table 27.12 LCD Animation Example on page 1085](#) for an example.

**Table 27.12. LCD Animation Example**

ASTATE	LCD_AREGA	LCD_AREGB	Resulting Data
0	11000000	11000000	11000000
1	01100000	11000000	11100000
2	01100000	01100000	01100000
3	00110000	01100000	01110000
4	00110000	00110000	00110000
5	00011000	00110000	00111000

ASTATE	LCD_AREGA	LCD_AREGB	Resulting Data
6	00011000	00011000	00011000
7	00001100	00011000	00011100
8	00001100	00001100	00001100
9	00000110	00001100	00001110
10	00000110	00000110	00000110
11	00000011	00000110	00000111
12	00000011	00000011	00000011
13	10000001	00000011	10000011
14	10000001	10000001	10000001
15	11000000	10000001	11000001

In the table, AREGASC = 10, AREGBSC = 10, ALOGSEL = 1 and the resulting data is to be displayed on segment lines 7-0 multiplexed with LCD.COM0.

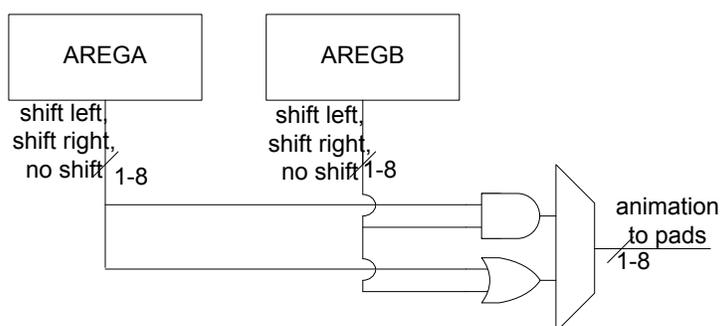

Figure 27.61. LCD Block Diagram of the Animation Circuit

#### Animation Example

- Write data into the animation registers LCD\_AREGA, LCD\_AREGB
- Enable the correct shift direction (if any)
- Decide which logical function to perform on the registers
  - ALOGSEL = 0: Data\_out = LCD\_AREGA & LCD\_AREGB
  - ALOGSEL = 1: Data\_out = LCD\_AREGA | LCD\_AREGB
- Configure the right animation period (CLK<sub>EVENT</sub>)
- Enable the animation pattern and frame counter (AEN = 1, FCEN = 1)

For updating data in the LCD while it is running an animation, and the new animation data depends on the pattern visible on the LCD, see the following example.

- Enable the LCD interrupt (the interrupt will be triggered simultaneously as the Animation State machine changes state)
- In the interrupt handler, read back the current state (ASTATE)
- Knowing the current state of the Animation State Machine makes it possible to calculate what data that is currently output
- Modify data as required (Data will be updated at the next Frame Counter Event). It is important that new data is written before the next Frame Counter Event.

### 27.3.14 LCD in Low Energy Modes

As long as the LCDCLK is running, the LCD controller continues to output LCD waveforms according to the data that is currently synchronized to the LCD Driver logic. In addition, the following features are still active if enabled:

- Animation State Machine
- Blink
- LCD Event Interrupt

### 27.3.15 LCD Synchronization

Writes to the registers (BACTRL, AREGA, AREGB, and SEGDn) require a hardware synchronization sequence. This sequence can be started with either a LCD\_CMD.LOAD pulse or with a LCD\_UPDATECTRL.LOADADDR matching the most recent register address. Once the sequence starts, any writes to the (BACTRL, AREGA, AREGB, or SEGDn) registers will be blocked and cause a bus fault. To prevent a bus fault, first check that LCD\_STATUS.LOADBUSHY is not set (0x1). Then write as many of the registers (BACTRL, AREGA, AREGB, and SEGDn) as needed. Then start the sequence. Do not write to these registers again until LCD\_STATUS.LOADBUSHY has cleared.

Once the sequence is started during EM0, the energy mode can switch to EM2 if desired. The rest of the synchronization does not require EM0. The data synchronizes on a UDCTRL event boundary, so it may take a very long time before synchronization has completed. If a register change is desired before the synchronization completes, use the LCD\_CMD.CLEAR pulse to clear out the synchronization and stop the write from going through to the LCDCLK domain. Check the LCD\_STATUS.LOADBUSHY to see when the synchronization has cleared out, or use the LCD\_IF.SYNCBUSYDONE interrupt to indicate that the previous synchronization is cleared.

## 27.4 LCD Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	LCD_IPVERSION	R	IPVERSION
0x004	LCD_EN	RW ENABLE	Enable

## 27.5 LCD Register Description

### 27.5.1 LCD\_IPVERSION - IPVERSION

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x1																															
<b>Access</b>	R																															
<b>Name</b>	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x1	R	<b>IPVERSION</b>
	IPVERSION			

### 27.5.2 LCD\_EN - Enable

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	0x0
<b>Access</b>																															R	RW
<b>Name</b>																															DISABLING	EN

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISABLING Disablement status	0x0	R	<b>Disablement busy status</b>
0	EN Enable	0x0	RW	<b>Enable</b>
	Value	Mode		Description
	0	DISABLE		Disable
	1	ENABLE		Enable

### 27.5.3 LCD\_SWRST - Software Reset

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	0x0
<b>Access</b>																															R	W
<b>Name</b>																															RESETTING	SWRST

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	RESETTING Status of Reset	0x0	R	<b>Software reset busy status</b>
0	SWRST Software reset command	0x0	W	<b>Software reset command</b>

## 27.5.4 LCD\_CTRL - Control Register

Offset	Bit Position																															
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>					0x0							0x4			0x0															0x0		
<b>Access</b>					RW							RW			RW															RW		
<b>Name</b>					PRESCALE							WARMUPDLY			DSC															UDCTRL		

Bit	Name	Reset	Access	Description
31	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
30:24	PRESCALE	0x0	RW	<b>Presclae</b> Prescales the LCDCLK from CMU
23:21	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
20:18	WARMUPDLY	0x4	RW	<b>Warmup Delay</b> Keep LCD pad tristated until warm up delay. The default value of 275ms is assuming a 4.7uF external capacitor.
	Value	Mode	Description	
	0	WARMUP1	1mswarm up	
	1	WARMUP31	31ms warm up	
	2	WARMUP63	62ms warm up	
	3	WARMUP125	125ms warm up	
	4	WARMUP250	250ms warm up	
	5	WARMUP500	500ms warm up	
	6	WARMUP1000	1000ms warm up	
	7	WARMUP2000	2000ms warm up	
17	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
16	DSC	0x0	RW	<b>Direct Segment Control</b> This bit enables direct control over bias levels for each SEG/COM line.
	Value	Mode	Description	
	0	DISABLE	DSC disable	
	1	ENABLE	DSC enable	
15:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2:1	UDCTRL	0x0	RW	<b>Update Data Control</b>

Bit	Name	Reset	Access	Description
These bits control how data from the SEGDn registers are transferred to the LCD driver.				
	Value	Mode		Description
	0	REGULAR		The data transfer is controlled by SW. Transfer is performed as soon as possible on the next CTRL.PRESCALE clock. This is primarily available for debug only since only some of the new SEGMENT data may be ready by the time of the UPDATE. This should not be used with interrupts since partially updating SEGMENT data may have indeterminant results.
	1	FRAMESTART		Data is loaded continuously at every frame start
	2	FCEVENT		The data transfer is done at the next Frame Counter event
	3	DISPLAYEVENT		The data transfer is done at the next Display Counter event
0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

### 27.5.5 LCD\_CMD - Command Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0	0x0		
<b>Access</b>																													W(nB)	W(nB)		
<b>Name</b>																													CLEAR	LOAD		

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	CLEAR	0x0	W(nB)	<b>Clear command</b>  This command clears the LOAD command so that new register values can be written instead of waiting for the next UDCTRL before LOAD will complete.
0	LOAD	0x0	W(nB)	<b>Load command</b>  Load command begins synchronization to transfer HV registers to CLK_PER domain. This may take a considerable amount of time to complete depending on the LCD_UPDATECTRL.UDCTRL setting.

Bit	Name	Reset	Access	Description
1		TYPEA		Type A waveform
3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2:0	MUX	0x0	RW	<b>Mux Configuration</b> These bits set the multiplexing mode for the LCD Driver.
	Value	Mode		Description
	0	STATIC		Static
	1	DUPLEX		Duplex
	2	TRIPLEX		Triplex
	3	QUADRUPLEX		Quadruplex

### 27.5.7 LCD\_BACFG - Blink and Animation Config Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>											0x0					0x0					0x7											
<b>Access</b>											RW					RW					RW											
<b>Name</b>											FCTOP					FCPRESC					ASTATETOP											

Bit	Name	Reset	Access	Description
31:24	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
23:18	FCTOP	0x0	RW	<b>Frame Counter Top</b> These bits contain the Top Value for the Frame Counter: $CLK\_EVENT = CLK\_FC / (1 + FCTOP[5:0])$ .
17:16	FCPRESC	0x0	RW	<b>Frame Counter Prescaler</b> These bits controls the prescaling value for the Frame Counter input clock.
	Value	Mode		Description
	0	DIV1		every frame clock
	1	DIV2		every 2nd frame clock
	2	DIV4		every 4th frame clock
	3	DIV8		every 8th frame clock
15:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2:0	ASTATETOP	0x7	RW	<b>ASTATE top cnt</b> Reload astate once the astatetop is reached

### 27.5.8 LCD\_BACTRL - Blink and Animation Control Register

Offset	Bit Position																																							
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0								
<b>Reset</b>				0x0																		0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0	0x0

<b>Name</b>				ALOC																		DISPLAYCNTEN	FCEN	ALOGSEL	AREGBSC	AREGASC	AEN	BLANK	BLINKEN											

Bit	Name	Reset	Access	Description									
31:29	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											
28	ALOC	0x0	RW	<b>Animation Location</b> Set the LCD segments which animation applies to  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>SEG0TO7</td> <td>Animation appears on segments 0 to 7</td> </tr> <tr> <td>1</td> <td>SEG8TO15</td> <td>Animation appears on segments 8 to 15</td> </tr> </tbody> </table>	Value	Mode	Description	0	SEG0TO7	Animation appears on segments 0 to 7	1	SEG8TO15	Animation appears on segments 8 to 15
Value	Mode	Description											
0	SEG0TO7	Animation appears on segments 0 to 7											
1	SEG8TO15	Animation appears on segments 8 to 15											
27:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											
9	DISPLAYCNTEN	0x0	RW	<b>Display Counter Enable</b> Enable display counter for use with creating an interrupt or a DMA transfer to update the display  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>DISABLE</td> <td>Disable the display counter</td> </tr> <tr> <td>1</td> <td>ENABLE</td> <td>Enable the display counter</td> </tr> </tbody> </table>	Value	Mode	Description	0	DISABLE	Disable the display counter	1	ENABLE	Enable the display counter
Value	Mode	Description											
0	DISABLE	Disable the display counter											
1	ENABLE	Enable the display counter											
8	FCEN	0x0	RW	<b>Frame Counter Enable</b> When this bit is set, the frame counter is enabled.									
7	ALOGSEL	0x0	RW	<b>Animate Logic Function Select</b> When this bit is set, the animation registers are AND'ed together. When this bit is cleared, the animation registers are OR'ed together.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>AND</td> <td>AREGA and AREGB AND'ed</td> </tr> <tr> <td>1</td> <td>OR</td> <td>AREGA and AREGB OR'ed</td> </tr> </tbody> </table>	Value	Mode	Description	0	AND	AREGA and AREGB AND'ed	1	OR	AREGA and AREGB OR'ed
Value	Mode	Description											
0	AND	AREGA and AREGB AND'ed											
1	OR	AREGA and AREGB OR'ed											
6:5	AREGBSC	0x0	RW	<b>Animate Register B Shift Control</b> These bits controls the shift operation that is performed on Animation register B.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>NOSHIFT</td> <td>No Shift operation on Animation Register B</td> </tr> </tbody> </table>	Value	Mode	Description	0	NOSHIFT	No Shift operation on Animation Register B			
Value	Mode	Description											
0	NOSHIFT	No Shift operation on Animation Register B											

Bit	Name	Reset	Access	Description
	1	SHIFTLEFT		Animation Register B is shifted left
	2	SHIFTRIGHT		Animation Register B is shifted right
4:3	AREGASC	0x0	RW	<b>Animate Register A Shift Control</b> These bits controls the shift operation that is performed on Animation register A.
	Value	Mode		Description
	0	NOSHIFT		No Shift operation on Animation Register A
	1	SHIFTLEFT		Animation Register A is shifted left
	2	SHIFTRIGHT		Animation Register A is shifted right
2	AEN	0x0	RW	<b>Animation Enable</b> When this bit is set, the animate function is enabled.
1	BLANK	0x0	RW	<b>Blank Display</b> When this bit is set, all segment output waveforms are configured to blank the LCD display. The Segment Data Registers are not affected when writing this bit.
	Value	Mode		Description
	0	DISABLE		Display is not "blanked"
	1	ENABLE		Display is "blanked"
0	BLINKEN	0x0	RW	<b>Blink Enable</b> When this bit is set, the Blink function is enabled. Every "ON" segment will alternate between on and off at every Frame Counter Event.

### 27.5.9 LCD\_STATUS - Status Register

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>												0x0			0x0						0x0											
<b>Access</b>												R			R						R											
<b>Name</b>												LOADBUSY			BLINK						ASTATE											

Bit	Name	Reset	Access	Description
31:12	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
11	LOADBUSY	0x0	R	<b>Load Synchronization is busy</b> Load synchronization is busy. Doing any writes to HV registers will not go through and will cause a bus fault
10:9	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
8	BLINK	0x0	R	<b>Blink State</b> This bits indicates the blink status. If this bit is 1, all segments are off. If this bit is 0, the segments(LCD_SEGDxn) which are set to 1 are on.
7:4	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
3:0	ASTATE	0x0	R	<b>Current Animation State</b> Contains the current animation state (0-15).

### 27.5.10 LCD\_AREGA - Animation Register a

Offset	Bit Position																															
0x024	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																							0x0									
<b>Access</b>																							RW									
<b>Name</b>																							AREGA									

Bit	Name	Reset	Access	Description
31:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	AREGA	0x0	RW	<b>Animation Register A Data</b> This register contains the A data for generating animation pattern.

## 27.5.11 LCD\_AREGB - Animation Register B

Offset	Bit Position																															
0x028	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0							
<b>Access</b>																									RW							
<b>Name</b>																									AREGB							

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:0	AREGB	0x0	RW	<b>Animation Register B Data</b> This register contains the B data for generating animation pattern.

## 27.5.12 LCD\_IF - Interrupt Enable Register

Offset	Bit Position																															
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																									0x0	0x0	0x0					
<b>Access</b>																									RW	RW	RW					
<b>Name</b>																									SYNCBUSYDONE	DISPLAY	FC					

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	SYNCBUSYDONE	0x0	RW	<b>Synchronization is Done</b> HV register load synchronization has completed
1	DISPLAY	0x0	RW	<b>Display Update Event</b> Display Update Event
0	FC	0x0	RW	<b>Frame Counter</b> Frame Counter qualified with CTRL.UDCTRL

### 27.5.13 LCD\_IEN - Interrupt Enable

Offset	Bit Position																															
0x030	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																											0x0	0x0	0x0			
<b>Access</b>																											RW	RW	RW			
<b>Name</b>																											SYNCBUSYDONE	DISPLAY	FC			

Bit	Name	Reset	Access	Description
31:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	SYNCBUSYDONE	0x0	RW	<b>Sync Busy Done</b> Load Synchronization of HV registers has completed
1	DISPLAY	0x0	RW	<b>Display Update Event</b> Display Update Event
0	FC	0x0	RW	<b>Frame Counter</b> Frame Counter

### 27.5.14 LCD\_BIASCTRL - Analog BIAS Control

Offset	Bit Position																																				
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
<b>Reset</b>	0x0					0x0					0x0					0x1F					0x0					0x0					0x0						
<b>Access</b>	RW					RW					RW					RW					RW					RW					RW						
<b>Name</b>	DMAMODE					LCDGATE					VDDXSEL					VLCD					MODE					BUFBIAS					BUFDRV					RESISTOR	

Bit	Name	Reset	Access	Description
31:30	DMAMODE DMA mode	0x0	RW	<b>DMA Mode</b>
	Value	Mode		Description
	0	DMADISABLE		No DMA requests are generated
	1	DMAFC		DMA request on frame counter event. This will also start a DMA transfer during EM23.
	2	DMADISPLAY		DMA request on display counter event. This will also start a DMA transfer during EM23.
29:27	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
26	LCDGATE Tristate the LCD pins. The gating or un-gating occurs on Frame boundaries.	0x0	RW	<b>LCD Gate</b>
	Value	Mode		Description
	0	UNGATE		LCD BIAS voltages driven onto pins.
	1	GATE		LCD BIAS MUX tristated at the pins.
25:23	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
22	VDDXSEL VDDX select	0x0	RW	<b>VDDX select</b>
	Value	Mode		Description
	0	DVDD		Connect charge pump to digital DVDD supply
	1	AVDD		Connect charge pump to analog AVDD supply
21	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
20:16	VLCD This controls the VLCD supply voltage.	0x1F	RW	<b>VLCD voltage level</b>
15:13	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

Bit	Name	Reset	Access	Description
12	MODE	0x0	RW	<b>Mode Setting</b>  This field determines the LCD mode of operation.
	Value	Mode		Description
	0	STEPPDOWN		Use step down control with VLCD less than VDDX. Use VLCD[4:0] to control VLCD level, and use SPEED to adjust VLCD drive strength.
	1	CHARGE PUMP		Use the charge pump to pump VLCD above VDDX.
11:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9:8	BUFBIAS	0x0	RW	<b>Buffer Bias Setting</b>  Operating bias current for the buffers.
7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6:4	BUFDRV	0x0	RW	<b>Buffer Drive Strength</b>  Buffer driver strength.
3:0	RESISTOR	0x0	RW	<b>Resistor strength</b>  Adjust the resistor strength for warmup drive of the external capacitor and for step down mode

### 27.5.15 LCD\_DISPCTRLX - Display Control Extended

Offset	Bit Position																															
0x038	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	RW															
<b>Name</b>																	DISPLAYDIV															

Bit	Name	Reset	Access	Description
31:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9:0	DISPLAYDIV	0x0	RW	<b>Display Divider</b>  Creates an interrupt for every DISPLAYDIV+1 number of frame events. This can be used to wakeup and have the DMA load in new SEGMENT registers values

## 27.5.16 LCD\_SEGD0 - Segment Data Register 0

Offset	Bit Position																															
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																				0x0												
<b>Access</b>																				RW												
<b>Name</b>																				SEG00												

Bit	Name	Reset	Access	Description
31:20	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
19:0	SEG00	0x0	RW	<b>COM0 Segment Data Low</b> This register contains segment data for segment lines 0-19 for COM0.

## 27.5.17 LCD\_SEGD1 - Segment Data Register 1

Offset	Bit Position																															
0x048	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																				0x0												
<b>Access</b>																				RW												
<b>Name</b>																				SEG01												

Bit	Name	Reset	Access	Description
31:20	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
19:0	SEG01	0x0	RW	<b>COM1 Segment Data Low</b> This register contains segment data for segment lines 0-19 for COM1.

## 27.5.18 LCD\_SEGD2 - Segment Data Register 2

Offset	Bit Position																															
0x050	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																				0x0												
<b>Access</b>																				RW												
<b>Name</b>																				SEG2												

Bit	Name	Reset	Access	Description
31:20	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
19:0	SEG2	0x0	RW	<b>COM2 Segment Data Low</b>

This register contains segment data for segment lines 0-19 for COM2.

## 27.5.19 LCD\_SEGD3 - Segment Data Register 3

Offset	Bit Position																															
0x058	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

8:0	FRDIV	0x0	RW	<b>Frame Rate Divider</b> Determines number of prescaled clocks per phase. Static has 2 phases, and octaplex has sixteen phases per frame.

## 28. PCNT - Pulse Counter

### Quick Facts

#### What?

The Pulse Counter (PCNT) decodes incoming pulses. The module has a quadrature mode which may be used to decode the speed and direction of a mechanical shaft. PCNT can operate in EM0 down to EM3.

#### Why?

The PCNT generates an interrupt after a specific number of pulses (or rotations), eliminating the need for timing or I/O interrupts and CPU processing to measure pulse widths, etc.

#### How?

PCNT uses the EM23GRPACLK or may be externally clocked from a pin. The module incorporates a 16-bit up/down-counter to keep track of incoming pulses or rotations.

### 28.1 Introduction

The Pulse Counter (PCNT) can be used for counting incoming pulses on a single input or to decode quadrature encoded inputs in EM0 down to EM3. It can run from the internal EM23GRPACLK clock source while counting pulses on the PCNTn\_S0IN pin. Alternatively, the PCNTn\_S0IN pin or a PRS signal may be used as an external clock source that runs the PCNT counter and register access.

### 28.2 Features

- 16-bit counter with reload register
- Auxiliary counter for counting a single direction
- Single input oversampling up/down counter mode
- Externally clocked single input pulse up/down counter mode
- Quadrature decoder modes
  - Externally clocked quadrature decoder 1X mode
  - Oversampling quadrature decoder 1X, 2X and 4X modes
- Interrupt on counter underflow and overflow
- Interrupt when a direction change is detected (quadrature decoder mode only)
- Optional pulse width filter
- Optional input inversion/edge detect select
- Optional inputs from PRS

## 28.3 Functional Description

An overview of the PCNT module is shown in [Figure 28.1 PCNT Overview](#) on page 1108.

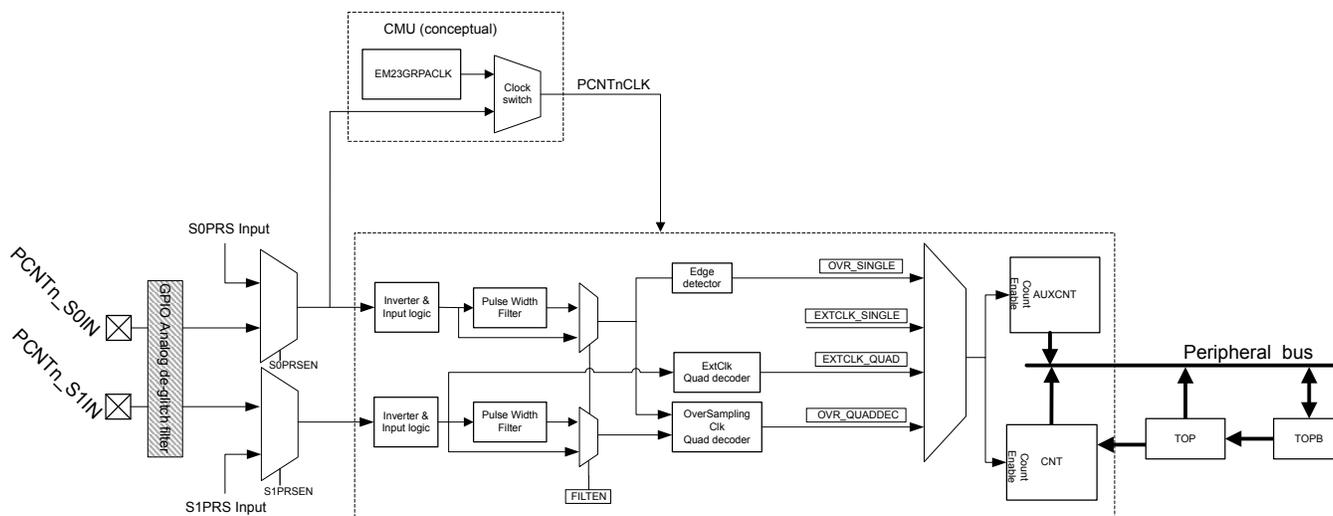

Figure 28.1. PCNT Overview

### 28.3.1 Pulse Counter Modes

The pulse counter can operate in single input oversampling mode (OVSSINGLE), externally clocked single input counter mode (EXTCLKSINGLE), externally clocked quadrature decoder mode (EXTCLKQUAD) and oversampling quadrature decoder modes (OVSQUAD1X, OVSQUAD2X and OVSQUAD4X). The following sections describe operation of each of these modes and how they are enabled.

#### 28.3.1.1 Single Input Oversampling Mode

This mode is selected by writing OVSSINGLE to the MODE field in the PCNTn\_CFG register. The STARTCNT bit in PCNTn\_CMD is used to start the counter, and STOPCNT can be used to stop the counter. The EM23GRPACLK clock source to the pulse counter is selected by setting CLKSEL in the CMU\_PCNT0CLKCTRL register to EM23GRPACLK. In this mode the maximum input toggle frequency should be 2 times slower than the frequency of the selected EM23GRPACLK clock source.

The optional pulse width filter is enabled by setting the FILTEN bit in the PCNTn\_CFG register. Additionally, the PCNTn\_S0IN input may be inverted, so that falling edges are counted, by setting the EDGE bit in the PCNTn\_CTRL register.

If S1CDIR in the PCNTn\_CTRL register is cleared, PCNTn\_S0IN is the only observed input in this mode. The PCNTn\_S0IN input is sampled by the PCNTnCLK and the number of detected positive or negative edges on PCNTn\_S0IN appears in PCNTn\_CNT. By default the counter will count up, but the counter may be configured to count down by setting the CNTDIR bit in PCNTn\_CTRL.

The counting direction can also be controlled externally in this mode, by setting S1CDIR. This will make the input value on PCNTn\_S1IN decide the direction counted for each PCNTn\_S0IN edge. When PCNTn\_S1IN is high, the count is done according to CNTDIR in PCNTn\_CTRL. When PCNTn\_S1IN is low, the count direction is opposite.

#### 28.3.1.2 Externally Clocked Single Input Counter Mode

This mode is enabled by writing EXTCLKSINGLE to the MODE field in the PCNTn\_CFG register. The STARTCNT bit in PCNTn\_CMD is used to start the counter, and STOPCNT can be used to stop the counter. The external pin clock source is selected by setting CLKSEL in the CMU\_PCNT0CLKCTRL register to PCNTS0.

Positive edges on PCNTn\_S0IN are used to clock the counter. Similar to the oversampled mode, PCNTn\_S1IN is used to determine the count direction if S1CDIR is set. If not, CNTDIR in PCNTn\_CTRL solely defines count direction.

The digital pulse width filter is not available in this mode. The analog de-glitch filter in the GPIO pads is capable of removing some unwanted noise. However, this mode may be susceptible to spikes and unintended pulses from devices such as mechanical switches, and is therefore most suited to take input from electronic sensors etc. that generate single wire pulses.

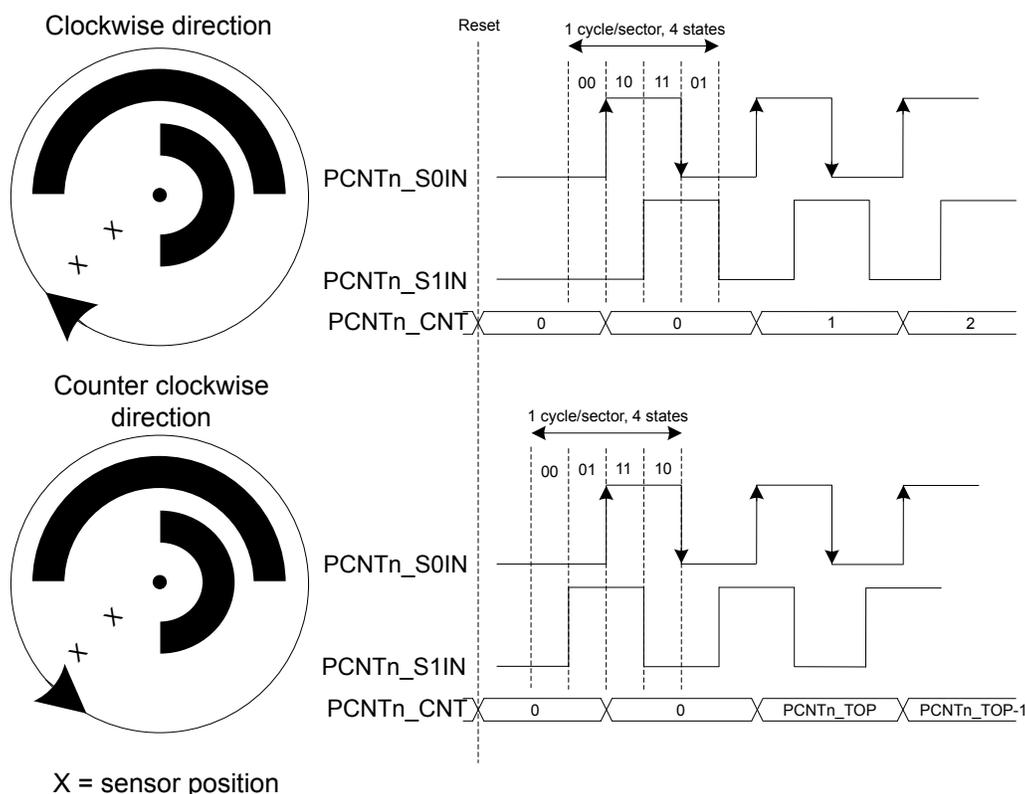

### 28.3.1.3 Quadrature Decoder Modes

Two different types of quadrature decoding are supported in the pulse counter: the externally clocked (Asynchronous) quadrature decoding and the oversampling (Synchronous) quadrature decoding. The externally clocked mode supports 1X quadrature decoding whereas the oversampling mode supports 1X, 2X and 4X quadrature decoding. These modes are described in detail in [28.3.1.4 Externally Clocked Quadrature Decoder Mode](#) and [28.3.1.5 Oversampling Quadrature Decoder Mode](#) .

### 28.3.1.4 Externally Clocked Quadrature Decoder Mode

This mode is enabled by writing EXTCLKQUAD to the MODE field in PCNTn\_CFG. The STARTCNT bit in PCNTn\_CMD is used to start the counter, and STOPCNT can be used to stop the counter. The external pin clock source is selected by setting CLKSEL in the CMU\_PCNT0CLKCTRL register to PCNTS0.

In this mode, both edges on PCNTn\_S0IN pin are used to sample the PCNTn\_S1IN pin, in order to decode the quadrature code. A quadrature coded signal contains information about the relative speed and direction of a rotating shaft as illustrated by [Figure 28.2 PCNT Quadrature Coding on page 1110](#), hence the direction of the counter register PCNTn\_CNT is controlled automatically.

**Figure 28.2. PCNT Quadrature Coding**

If PCNTn\_S0IN leads PCNTn\_S1IN in phase, the direction is clockwise, and if it lags in phase the direction is counter-clockwise. Default behavior is illustrated by [Figure 28.2 PCNT Quadrature Coding on page 1110](#).

The counter direction may be read from the DIR bit in the PCNTn\_STATUS register. Additionally, the DIRCNG interrupt in the PCNTn\_IF register is generated when a direction change is detected. When a change is detected, the DIR bit in the PCNTn\_STATUS register must be read to determine the current new direction.

**Note:** The sector disc illustrated in the figure may be finer grained in some systems. Typically, they may generate 2-4 PCNTn\_S0IN wave periods per 360° rotation.

The direction of the quadrature code and control of the counter is generated by the simple binary function outlined by [Table 28.1 PCNT QUAD Mode Counter Control Function on page 1110](#). Note that this function also filters some invalid inputs that may occur when the shaft changes direction or temporarily toggles direction.

**Table 28.1. PCNT QUAD Mode Counter Control Function**

Inputs		Control/Status	
S1IN posedge	S1IN negedge	Count Enable	CNTDIR status bit
0	0	0	0

Inputs		Control/Status	
S1IN posedge	S1IN negedge	Count Enable	CNTDIR status bit
0	1	1	0
1	0	1	1
1	1	0	0

**Note:** PCNTn\_S1IN is sampled on both edges of PCNTn\_S0IN.

### 28.3.1.5 Oversampling Quadrature Decoder Mode

There are three Oversampling Quadrature Decoder Modes supported: 1X , 2X and 4X. These modes are enabled by writing OVSQUAD1X, OVSQUAD2X and OVSQUAD4X, respectively, to the MODE field in PCNTn\_CFG. The STARTCNT bit in PCNTn\_CMD is used to start the counter, and STOPCNT can be used to stop the counter. The EM23GRPACLK clock source to the pulse counter must be selected by setting CLKSEL in the CMU\_PCNT0CLKCTRL register to EM23GRPACLK.

The optional pulse width filter is enabled by setting the FILTEN bit in the PCNTn\_CFG register. The filter applies to both inputs PCNTn\_S0IN and PCNTn\_S1IN. The filter length is configured by FILTLEN in PCNTn\_OVSCTRL register.

Based on the modes selected, the decoder updates the counter on different events. In the OVSQUAD1X mode, the counter is updated on the rising edge of the PCNTn\_S0IN input when counting up, and on the negeedge of the PCNTn\_S0IN input when counting down. In the OVSQUAD2X mode, the counter is updated on both edges of PCNTn\_S0IN input. In the OVSQUAD4X mode the counter is updated on both edges of both inputs PCNTn\_S0IN and PCNTn\_S1IN. [Table 28.2 PCNT OVSQUAD 1X, 2X and 4X Mode Counter Control Function on page 1112](#) outlines the increment or decrement of the counter based on the Quadrature Mode selected.

**Note:** The decoding behavior of OVSQUAD1X mode is slightly different compared to EXTCLKQUAD mode(also 1X mode). In the EXTCLKQUAD mode, the counter is updated only on the posedge of S0IN input. However, in the OVSQUAD1X mode, the counter is updated on the posedge of S0IN when counting up and on the negeedge of S0IN when counting down.

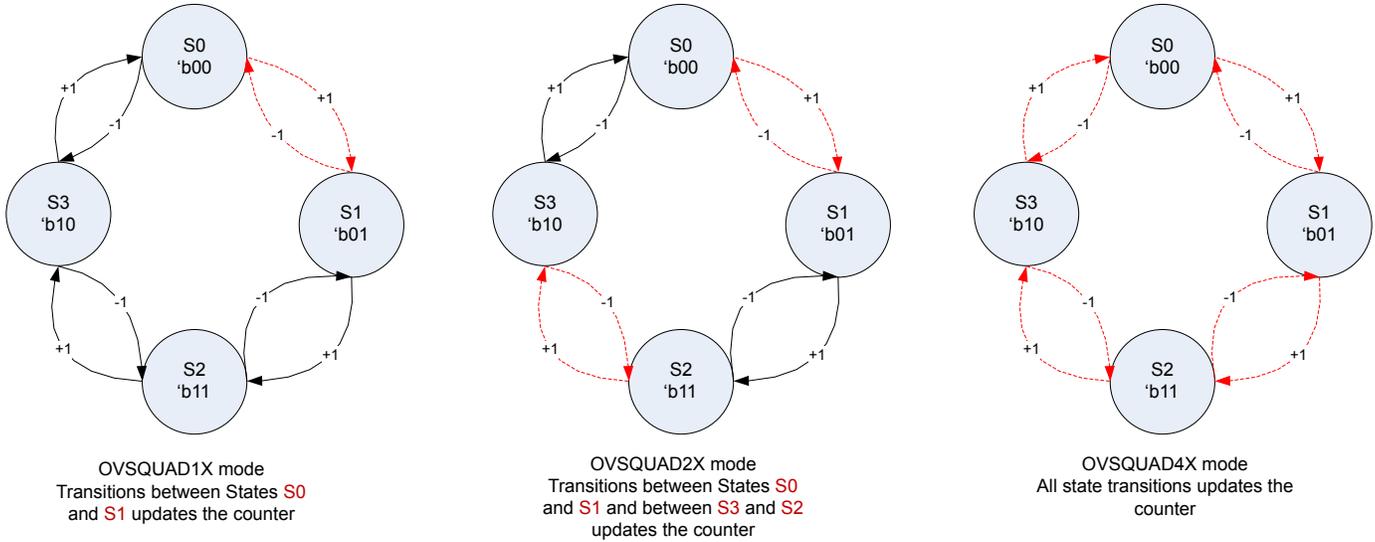

**Table 28.2. PCNT OVSQUAD 1X, 2X and 4X Mode Counter Control Function**

Direction	Previous State		Next State		OVSQUAD MODE		
	S1IN	S0IN	S1IN	S0IN	1X	2X	4X
Clockwise	0	0	0	1	+1	+1	+1
	0	1	1	1			+1
	1	1	1	0		+1	+1
	1	0	0	0			+1
Counter Clockwise	1	0	1	1		-1	-1
	1	1	0	1			-1
	0	1	0	0	-1	-1	-1
	0	0	1	0			-1

[Figure 28.3 PCNT State Transitions for Different Oversampling Quadrature Decoder Modes on page 1113](#) illustrates the different states of the quadrature input and the state transitions that updates the counter for the different modes. Each cycle of the input states results in 1 update, 2 updates and 4 updates of the counter for OVSQUAD1X, OVSQUAD2X and OVSQUAD4X modes respectively.

Relationship between inputs and its state

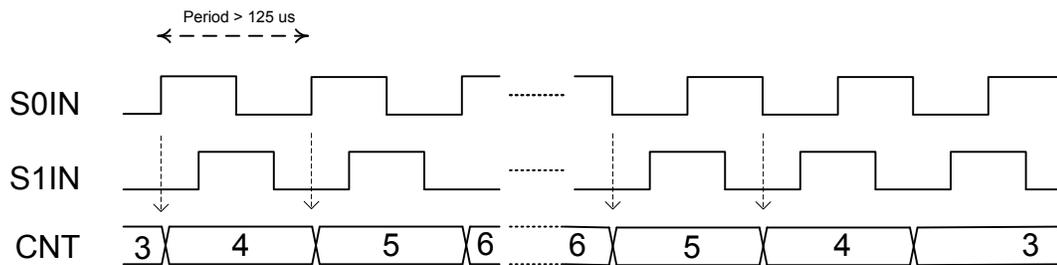

STATE	S1IN	S0IN
S0	0	0
S1	0	1
S2	1	1
S3	1	0

**Figure 28.3. PCNT State Transitions for Different Oversampling Quadrature Decoder Modes**

The counter direction can be read from the DIR bit in PCNTn\_STATUS register. Additionally, the DIRCNG interrupt in the PCNTn\_IF is generated when the direction change is detected. When a change is detected, the DIR bit in the PCNTn\_STATUS register must be read to determine the new direction.

In the oversampling quadrature decoder modes, the maximum input toggle frequency supported is PCNTnCLK / 4. For frequencies above PCNTnCLK / 4, incorrect decoding occurs. The different decoding modes and the counter updates are further illustrated by Figure 28.4 PCNT Oversampling Quadrature Decoder 1X Mode on page 1113, Figure 28.5 PCNT Oversampling Quadrature Decoder 2X Mode on page 1114 and Figure 28.6 PCNT Oversampling Quadrature Decoder 4X Mode on page 1114.

**Figure 28.4. PCNT Oversampling Quadrature Decoder 1X Mode**

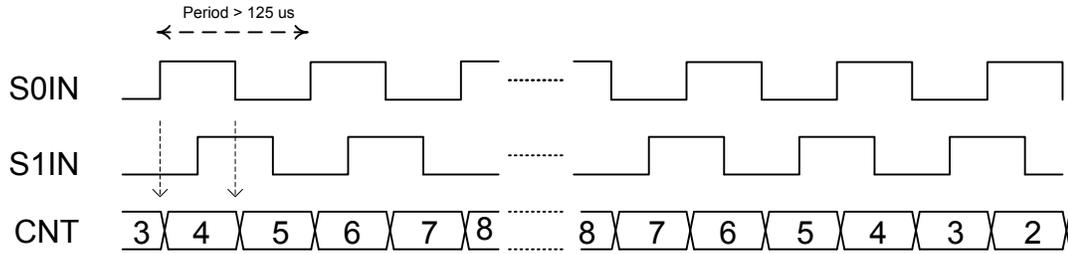

Figure 28.5. PCNT Oversampling Quadrature Decoder 2X Mode

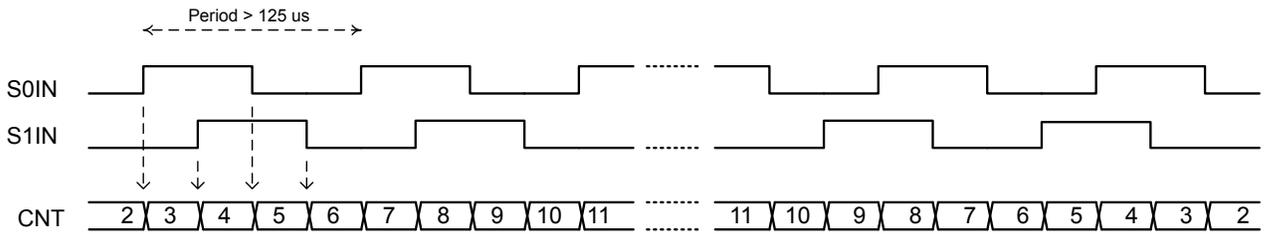

Figure 28.6. PCNT Oversampling Quadrature Decoder 4X Mode

The above modes, by default, are prone to flutter effects in the inputs PCNTn\_S0IN and PCNTn\_S1IN. When this occurs, the counter changes directions rapidly causing DIRCNG interrupts and unnecessarily waking the core. To prevent this, set FLUTERRM in the PCNTn\_OVSCTRL register. When enabled, flutter is removed, thus preventing unnecessary wakeup of the core. The flutter removal logic works by preventing update of the counter value if the wheel keeps changing direction as a result of flutter. The counter is only updated if the current and previous state transition of the rotation are in the same direction. These state transitions are quadrature decoder mode specific. The highlighted state transitions in [Figure 28.3 PCNT State Transitions for Different Oversampling Quadrature Decoder Modes on page 1113](#) are the ones considered for the different quadrature decoder modes. [Figure 28.7 PCNT Oversampling Quadrature Decoder with Flutter Removal on page 1114](#) shows how the counter is updated for the different quadrature decoder modes with flutter removal FLUTERRM enabled in PCNTn\_OVSCTRL.

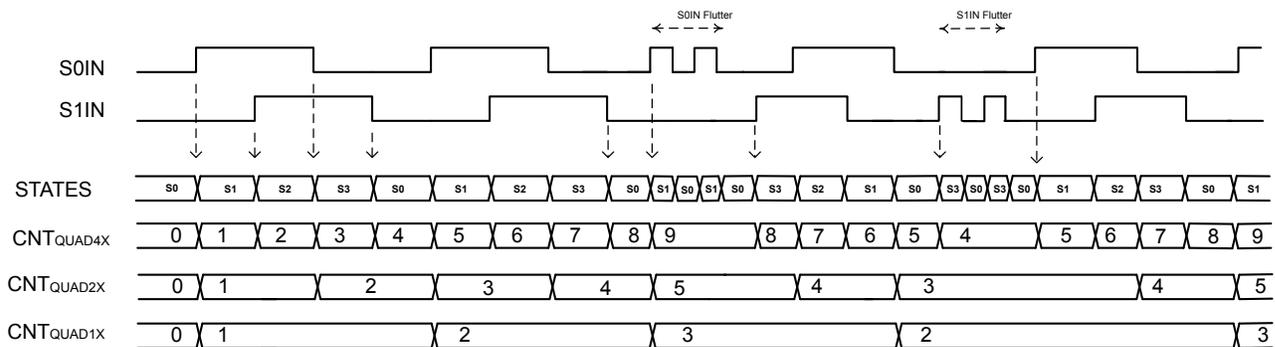

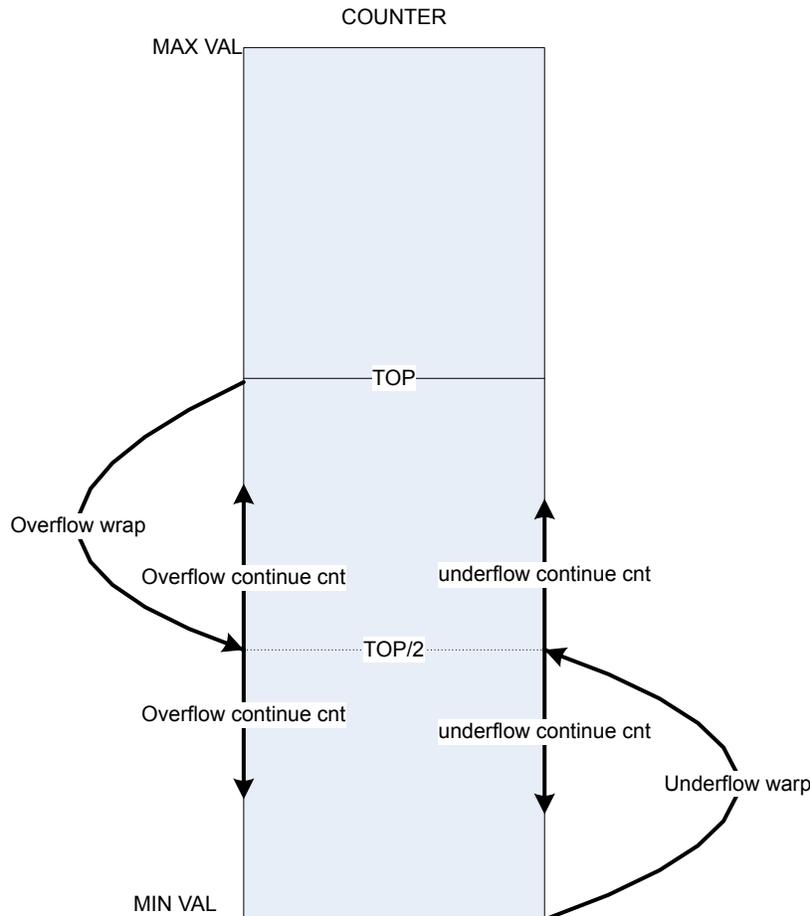

Figure 28.7. PCNT Oversampling Quadrature Decoder with Flutter Removal

### 28.3.2 Hysteresis

By default the pulse counter wraps to 0 when passing the configured top value, and wraps to the top value when counting down from 0. On these events, a system will likely want to wake up to store and track the overflow count. This is fine if the pulse counter is tracking a monotonic value or a value that does not change directions frequently. In the latter scenario, if the counter changes directions around the overflow/underflow point, the system will have to wake up frequently to keep track of the rotations, resulting in higher current consumption.

To solve this, the pulse counter has a way of introducing hysteresis to the counter. When HYST in PCNT<sub>n</sub>\_CFG is set, the pulse counter will always wrap to TOP/2 on underflows and overflows. This takes the counter away from the area where it might overflow or underflow, removing the problem. [Figure 28.8 PCNT Hysteresis behavior of Counter on page 1115](#) illustrates the hysteresis behavior.

**Figure 28.8. PCNT Hysteresis behavior of Counter**

Given a starting value of 0 for the counter, the absolute count value when hysteresis is enabled can be calculated with the equations [Figure 28.9 Absolute Position With Hysteresis and Even TOP Value on page 1115](#) or [Figure 28.10 Absolute Position With Hysteresis and Odd TOP Value on page 1115](#), depending on whether the TOP value is even or odd.

$$CNT_{abs} = CNT - UF_{CNT} \times (TOP/2+1) + OF_{CNT} \times (TOP/2+1)$$

**Figure 28.9. Absolute Position With Hysteresis and Even TOP Value**

$$CNT_{abs} = CNT - UF_{CNT} \times (TOP/2+1) + OF_{CNT} \times (TOP/2+2)$$

**Figure 28.10. Absolute Position With Hysteresis and Odd TOP Value**

### 28.3.3 Auxiliary Counter

To be able to keep explicit track of counting in one direction in addition to the regular counter which counts both up and down, the auxiliary counter can be used. The pulse counter can, for instance, be configured to keep track of the absolute rotation of the wheel, while at the same time the auxiliary counter can keep track of how much the wheel has reversed.

The auxiliary counter is enabled by configuring AUXCNTEV in PCNTn\_CTRL. It will always count up, but it can be configured whether it should count up on up-events, down-events or both, keeping track of rotation either way or general movement. The value of the auxiliary counter can be read from the PCNTn\_AUXCNT register.

Overflows on the auxiliary counter happen when the auxiliary counter passes the top value of the pulse counter, configured in PCNTn\_TOP. In that event, the AUXOF interrupt flag is set, and the auxiliary counter wraps to 0.

The auxiliary counter is started and stopped in a similar way to the main counter, using commands in the PCNTn\_CMD register. The STARTAUXCNT bit in PCNTn\_CMD is used to start the auxiliary counter, and STOPAUXCNT can be used to stop the auxiliary counter.

As the auxiliary counter, the main counter can be configured to count only on certain events. This is done through CNTEV in PCNTn\_CTRL, and it is possible like for the auxiliary counter, to make the main counter count on only up and down events. The difference between the counters is that where the auxiliary counter will only count up, the main counter will count up or down depending on the direction of the count event.

### 28.3.4 Register Access

The counter-clock domain may be clocked externally. To update the counter-clock domain registers from software in this mode, 2-3 clock pulses on the external clock are needed to synchronize accesses to the externally clocked domain. Clock source switching is controlled from the registers in the CMU.

When the CORERST bit in the PCNTn\_CMD register is set by software, the PCNT clock domain is synchronously reset and released two PCNT clock edges later. This synchronous reset restores the reset values in PCNTn\_TOP, PCNTn\_CNT and other core registers in the PCNT clock domain.

CNTRST works in a similar manner as CORERST, but only resets the counter, CNT. Note that the counter is also reset by CORERST.

AUXCNTRST works in a similar manner as CORERST, but only resets the auxiliary counter, PCNTn\_AUXCNT. Note that the auxiliary counter is also reset by CORERST.

**Note:** PCNTn\_CNT is a read-only register. When writing to PCNTn\_TOP, make sure that the counter value, PCNTn\_CNT, can not exceed the value written to PCNTn\_TOP within two clock cycles.

**Note:** To ensure reset during SWRST, if the counter-clock domain is clocked externally, it is advisable to switch the counter-clock to the internal clock before performing the software reset. The clock pulses from an external source cannot be relied upon. By switching to an internal clock the software reset operation completion will be guaranteed.

### 28.3.5 Clock Sources

The pulse counter may be clocked from two possible clock sources: EM23GRPACLK or an external clock. The clock selection is configured by setting the CLKSEL field in the CMU\_PCNTnCLKCTRL register. The default clock source is the EM23GRPACLK.

This PCNT module may also use PCNTn\_S0IN as an external clock to clock the counter (EXTCLKSINGLE mode) and to sample PCNTn\_S1IN (EXTCLKQUAD mode). Setup, hold and max frequency constraints for PCNTn\_S0IN and PCNTn\_S1IN for these modes are specified in the device data sheet.

**Note:** If changing PCNT to an external clock source, either through the PCNTn\_S0IN or S0PRS input, the CMU clock switch will need at least 2 external clocks to sync over to that new clock source. Register will not load and counting will not begin until there are few external clocks.

**Note:** Switching external clock source to the S0PRS input can cause a clock glitch. So S0PRSEN in PCNTn\_CFG should be configured before configuring the CLKSEL field in CMU\_PCNTnCLKCTRL.

### 28.3.6 Input Filter

An optional pulse width filter is available in OVSSINGLE and OVSQUAD modes, when EM23GRPACLK is selected as a clock source for the Pulse Counter. The filter is enabled by writing 1 to the FILTEN bit in the PCNTn\_CTRL register. When enabled, the high and low periods of PCNTn\_S0IN and PCNTn\_S1IN must be stable for a programmable number of consecutive clock cycles before the edge is passed to the edge detector. The filter length should be programmed in FILTLEN field of the PCNTn\_OVSCTRL register.

The filter length is given by [Figure 28.11 PCNT Input Filter Length Equation on page 1117](#):

$$\text{Filter length} = (\text{FILTLEN} + 5) \text{ EM23GRPACLK cycles}$$

**Figure 28.11. PCNT Input Filter Length Equation**

The maximum filter length configured is 260 EM23GRPACLK cycles.

In EXTCLKSINGLE and EXTCLKQUAD mode, there is no digital pulse width filter available.

### 28.3.7 Edge Polarity

The edge polarity can be set by configuring the EDGE bit in the PCNTn\_CTRL register. When this bit is cleared, the pulse counter counts positive edges of PCNTn\_S0IN input. When this bit is set, the pulse counter counts negative edges in OVSSINGLE mode. Also, when the EDGE bit is set in the OVSSINGLE and EXTCLKSINGLE modes, the PCNTn\_S1IN input is inverted. In OVSQUAD 1X-4X modes the EDGE bit inverts both inputs.

**Note:** The EDGE bit in PCNTn\_CTRL has no effect in EXTCLKQUAD mode.

### 28.3.8 PRS and PCNTn\_S0IN,PCNTn\_S1IN Inputs

It is possible to receive input from a PRS signal on both PCNTn\_S0IN (or PCNTn\_S1IN) by setting S0PRSEN (or S1PRSEN) in PCNTn\_CFG. Routing of PRS channels to the inputs is performed using the PRS\_CONSUMER\_PCNTn\_S0IN and PRS\_CONSUMER\_PCNTn\_S1IN registers.

In the Oversampling quadrature decoder modes, the input frequency should be less than 4 times slower than the sampling clock PCNTnCLK to ensure correct functionality.

In the Single Input Oversampling Mode, the input toggle frequency should be 2 times slower than the sampling clock PCNTnCLK to ensure correct functionality.

In the externally clocked modes (where S0IN or S0PRS is used as PCNTnCLK clock source), the input frequency should be less than 1 MHz to ensure correct functionality.

The PCNT module generates two PRS signals, the PCNTn UFOF signal and the PCNTn DIR signal. The PCNTn UFOF signal is generated when the counter overflows or underflows. The PCNTn DIR signal is a level, and indicates the current direction of count of counter CNT.

### 28.3.9 Interrupts

The interrupt generated by PCNT uses the PCNTn\_INT interrupt vector. Software must read the PCNTn\_IF register to determine which module interrupt that generated the vector invocation.

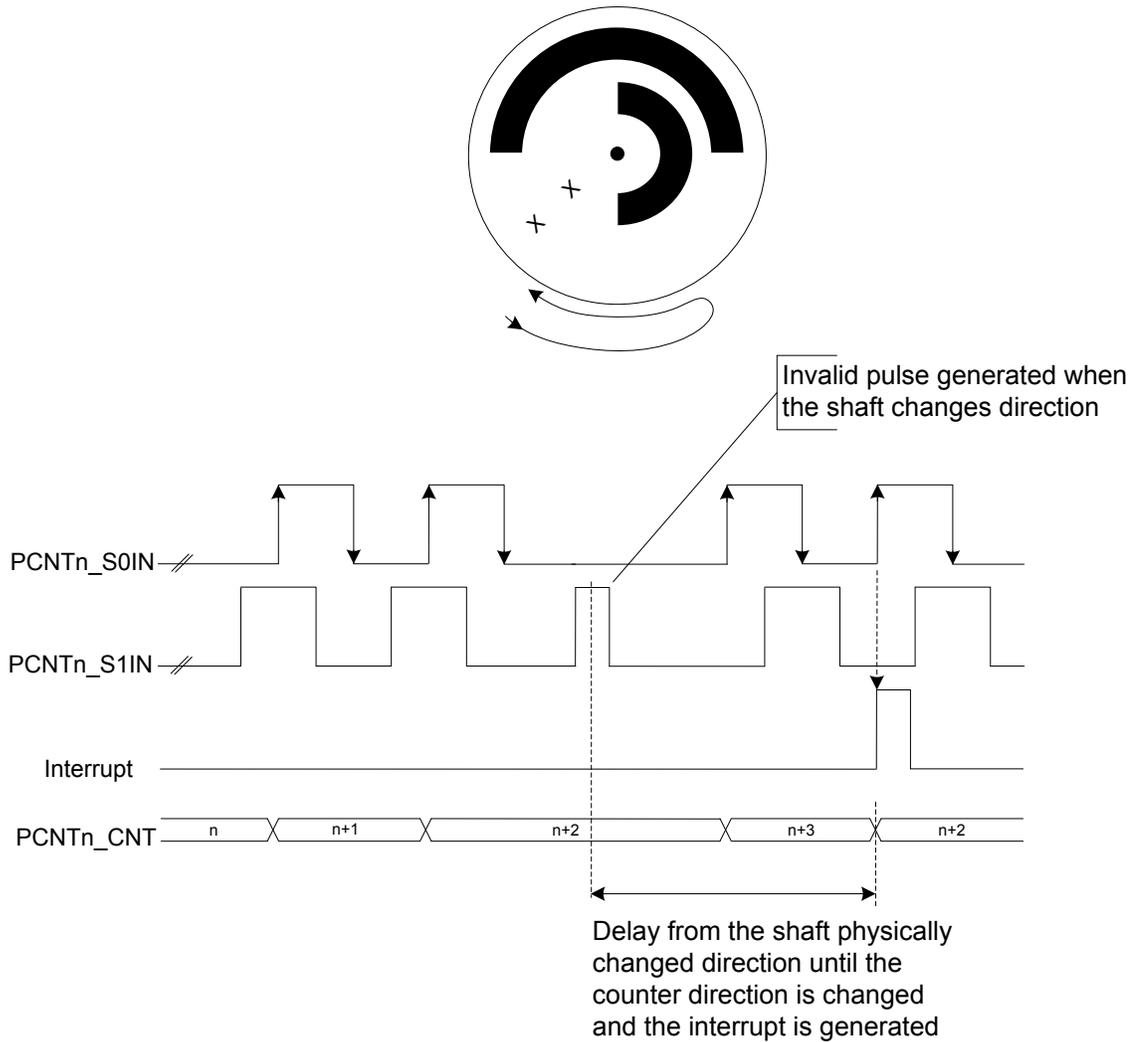

#### 28.3.9.1 Underflow and Overflow Interrupts

The underflow interrupt flag (UF) is set when the counter counts down from 0 (i.e. when the value of the counter is 0 and a new pulse is received). The PCNTn\_CNT register is loaded with the PCNTn\_TOP value after this event.

The overflow interrupt flag (OF) is set when the counter counts up from the PCNTn\_TOP (reload) value (i.e. if PCNTn\_CNT = PCNTn\_TOP and a new pulse is received). The PCNTn\_CNT register is loaded with the value 0 after this event.

### 28.3.9.2 Direction Change Interrupt

The PCNTn\_PCNT module sets the DIRCNG interrupt flag (PCNTn\_IF register) for EXTCLKQUAD and OVSQUAD1X-4X modes when the direction of the quadrature code changes. The behavior of this interrupt in the EXTCLKQUAD mode is illustrated by [Figure 28.12 PCNT Direction Change Interrupt \(DIRCNG\) Generation](#) on page 1118.

**Figure 28.12. PCNT Direction Change Interrupt (DIRCNG) Generation**

## 28.4 PCNT Register Map

The offset register address is relative to the registers base address.

## 28.5 PCNT Register Description

### 28.5.1 PCNT\_IPVERSION - IP Version ID

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset	0x1																															
Access	R																															
Name	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x1	R	<b>IP VERSION</b> Gives access to the IP VERSION of PCNT

### 28.5.2 PCNT\_EN - Module Enable Register

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																															0x0	0x0
Access																															R	RW
Name																															DISABLING	EN

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISABLING	0x0	R	<b>Disablement busy status</b> When EN is cleared, DISABLING status is set immediately, and cleared when disablement finishes. Disablement resets peripheral cores and not APB registers except the INTFLAG register.
0	EN	0x0	RW	<b>PCNT Module Enable</b> Enable the PCNT module. When EN is cleared(disablement), it halts module operation immediately, and initialize the core domain such that when the is re-enabled, it starts cleanly.

## 28.5.3 PCNT\_SWRST - Software Reset Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0	0x0		
<b>Access</b>																													R	W		
<b>Name</b>																													RESETTING	SWRST		

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	RESETTING	0x0	R	<b>Software reset busy status</b>  When SWRST command is issued, resetting logic sets RESETTING status immediately, and later it is cleared when reset process finishes.
0	SWRST	0x0	W	<b>Software reset command</b>  A software reset command field resets the module back to the initial condition, similar to a power on reset condition

## 28.5.4 PCNT\_CFG - Configuration Register

Offset	Bit Position																																																					
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																						
<b>Reset</b>																							0x0	0x0		0x0	0x0	0x0																										
<b>Access</b>																							RW	RW		RW	RW	RW																										
<b>Name</b>																							S1PRSEN	S0PRSEN		HYST	FILTEN	DEBUGHALT																										MODE

Bit	Name	Reset	Access	Description
31:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9	S1PRSEN	0x0	RW	<b>S1IN PRS Enable</b> When set, the PRS channel is selected as input to S1IN.
8	S0PRSEN	0x0	RW	<b>S0IN PRS Enable</b> When set, the PRS channel is selected as input to S0IN.
7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6	HYST	0x0	RW	<b>Enable Hysteresis</b> When hysteresis is enabled, the PCNT will always overflow and underflow to TOP/2.
5	FILTEN	0x0	RW	<b>Enable Digital Pulse Width Filter</b> The filter passes all high and low periods that are at least (FILTLEN+5) clock cycles wide. This filter is only available in OVSSINGLE,OVSQUAD1X-4X modes.
4	DEBUGHALT	0x0	RW	<b>Debug Mode Halt Enable</b> Set to halt the PCNT in debug mode only in OVSSINGLE and OVSQUAD modes. When in EXTCLKSINGLE or EXTCLKQUAD modes, DEBUGHALT does not halt the Pulse Counter.
	Value	Mode		Description
	0	DISABLE		PCNT is running in debug mode.
	1	ENABLE		PCNT is frozen in debug mode.
3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2:0	MODE	0x0	RW	<b>Mode Select</b> Selects the mode of operation. The corresponding clock source must be selected from the CMU.
	Value	Mode		Description
	0	OVSSINGLE		Single input EM23GRPACLK oversampling mode (available in EM0-EM3).
	1	EXTCLKSINGLE		Externally clocked single input counter mode (available in EM0-EM3).
	2	EXTCLKQUAD		Externally clocked quadrature decoder mode (available in EM0-EM3).

Bit	Name	Reset	Access	Description
3		OVSQUAD1X		EM23GRPACLK oversampling quadrature decoder 1X mode (available in EM0-EM3).
4		OVSQUAD2X		EM23GRPACLK oversampling quadrature decoder 2X mode (available in EM0-EM3).
5		OVSQUAD4X		EM23GRPACLK oversampling quadrature decoder 4X mode (available in EM0-EM3).

## 28.5.5 PCNT\_CTRL - Control Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0	0x0		0x0	0x0	0x0										
<b>Access</b>																	RW	RW		RW	RW	RW										
<b>Name</b>																	AUXCNTEV	CNTEV		EDGE	CNTDIR	S1CDIR										

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7:6	AUXCNTEV	0x0	RW	<b>Controls When the Aux Counter Counts</b> Selects whether the auxiliary counter responds to up-count events, down-count events or both
	Value	Mode	Description	
	0	BOTH	Counts up on both up-count and down-count events.	
	1	UP	Counts up on up-count events.	
	2	DOWN	Counts up on down-count events.	
5:4	CNTEV	0x0	RW	<b>Controls When the Counter Counts</b> Selects whether the regular counter responds to up-count events, down-count events or both
	Value	Mode	Description	
	0	BOTH	Counts up on up-count and down on down-count events.	
	1	UP	Only counts up on up-count events.	
	2	DOWN	Only counts down on down-count events.	
3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	EDGE	0x0	RW	<b>Edge Select</b> Determines the polarity of the incoming edges. This bit used only in OVSSINGLE, EXTCLKSINGLE and OVS-QUAD1X-4X modes.
	Value	Mode	Description	
	0	POS	Positive edges on the PCNTn_S0IN inputs are counted in OVSSINGLE mode. Does not invert PCNTn_S1IN input in OVSSINGLE and EXTCLKSINGLE modes	
	1	NEG	Negative edges on the PCNTn_S0IN inputs are counted in OVSSINGLE mode. Inverts the PCNTn_S1IN input in OVSSINGLE and EXTCLKSINGLE modes	
1	CNTDIR	0x0	RW	<b>Non-Quadrature Mode Counter Direction Co</b> The direction of the counter must be set in the OVSSINGLE and EXTCLKSINGLE modes. This bit is ignored in EXTCLKQUAD mode as the direction is automatically detected.

Bit	Name	Reset	Access	Description
	Value	Mode		Description
	0	UP		Up counter mode.
	1	DOWN		Down counter mode.
0	S1CDIR	0x0	RW	<b>Count Direction Determined By S1</b> Allows S1 give the direction of counting when in the OVSSINGLE or EXTCLKSINGLE modes. When S1 is high, the count direction is given by CNTDIR. When S1 is low, the count direction is the opposite given by CNTDIR

## 28.5.6 PCNT\_CMD - Command Register

Offset	Bit Position																																										
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0											
<b>Reset</b>																					0x0	0x0	0x0	0x0													0x0			0x0	0x0	0x0	0x0
<b>Access</b>																					W	W	W	W													W(nB)			W(nB)	W(nB)	W(nB)	W(nB)
<b>Name</b>																					STOPAUXCNT	STOPCNT	STARTAUXCNT	STARTCNT													LCNTIM			AUXCNTRST	CNTRST	CORERST	

Bit	Name	Reset	Access	Description
31:12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
11	STOPAUXCNT	0x0	W	<b>Stop Aux Counter</b> Write a 1 to stop the aux counter
10	STOPCNT	0x0	W	<b>Stop Main Counter</b> Write a 1 to stop the main counter
9	STARTAUXCNT	0x0	W	<b>Start Aux Counter</b> Write a 1 to start the aux counter
8	STARTCNT	0x0	W	<b>Start Main Counter</b> Write a 1 to start the main counter
7:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	LCNTIM	0x0	W(nB)	<b>Load CNT Immediately</b> Load PCNTn_TOP into PCNTn_CNT on the next counter clock cycle.
3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	AUXCNTRST	0x0	W(nB)	<b>AUXCNT Reset</b> The auxiliary counter, AUXCNT, is synchronously reset when this bit is set. This action clears the auxiliary counter to its reset value
1	CNTRST	0x0	W(nB)	<b>CNT Reset</b> The counter, CNT, is synchronously reset when this bit is set. This action clears the counter to its reset value
0	CORERST	0x0	W(nB)	<b>PCNT Clock Domain Reset</b> The PCNT clock domain logic is synchronously reset when this bit is set. This action clears the all the PCNT logic and registers to their reset value

## 28.5.7 PCNT\_STATUS - Status Register

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																												0x0	0x0	0x0	0x0	0x0
<b>Access</b>																												R	R	R	R	R
<b>Name</b>																												AUXCNTRUNNING	CNTRUNNING	PCNTLOCKSTATUS	TOPBV	DIR

Bit	Name	Reset	Access	Description									
31:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											
4	AUXCNTRUNNING	0x0	R	<b>Aux Counter running status</b>  Indicates the current status of PCNT auxiliary counter running. The counter status will continue to indicate as Running even when it is halted during debug assertion.									
3	CNTRUNNING	0x0	R	<b>Main Counter running status</b>  Indicates the current status of PCNT main counter running. The counter status will continue to indicate as Running even when it is halted during debug assertion.									
2	PCNTLOCKSTATUS	0x0	R	<b>Lock Status</b>  Indicates the current status of PCNT Lock  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>UNLOCKED</td> <td>PCNT registers are unlocked</td> </tr> <tr> <td>1</td> <td>LOCKED</td> <td>PCNT registers are locked</td> </tr> </tbody> </table>	Value	Mode	Description	0	UNLOCKED	PCNT registers are unlocked	1	LOCKED	PCNT registers are locked
Value	Mode	Description											
0	UNLOCKED	PCNT registers are unlocked											
1	LOCKED	PCNT registers are locked											
1	TOPBV	0x0	R	<b>TOP Buffer Valid</b>  This indicates that PCNTn_TOPB contains valid data that has not been written to PCNTn_TOP. This bit is also cleared when PCNTn_TOP is written.									
0	DIR	0x0	R	<b>Current Counter Direction</b>  Current direction status of the counter. This bit is valid in EXTCLKQUAD mode only.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>UP</td> <td>Up counter mode (clockwise in EXTCLKQUAD mode with the EDGE bit in PCNTn_CTRL set to 0).</td> </tr> <tr> <td>1</td> <td>DOWN</td> <td>Down counter mode.</td> </tr> </tbody> </table>	Value	Mode	Description	0	UP	Up counter mode (clockwise in EXTCLKQUAD mode with the EDGE bit in PCNTn_CTRL set to 0).	1	DOWN	Down counter mode.
Value	Mode	Description											
0	UP	Up counter mode (clockwise in EXTCLKQUAD mode with the EDGE bit in PCNTn_CTRL set to 0).											
1	DOWN	Down counter mode.											

## 28.5.11 PCNT\_AUXCNT - Auxiliary Counter Value Register

Offset	Bit Position																															
0x028	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	R															
<b>Name</b>																	AUXCNT															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	AUXCNT	0x0	R	<b>Auxiliary Counter Value</b> Gives read access to the auxiliary counter.

## 28.5.12 PCNT\_TOP - Top Value Register

Offset	Bit Position																															
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0xFF															
<b>Access</b>																	RW															
<b>Name</b>																	TOP															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	TOP	0xFF	RW	<b>Counter Top Value</b> When counting down, this value is reloaded into PCNTn_CNT when counting past 0. When counting up, 0 is written to the PCNTn_CNT register when counting past this value.

## 28.5.13 PCNT\_TOPB - Counter Top Value Buffer Register

Offset	Bit Position																															
0x030	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0xFF															
<b>Access</b>																	RW															
<b>Name</b>																	TOPB															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	TOPB	0xFF	RW	<b>Counter Top Buffer Register</b>  These bits hold the TOP buffer value. Hardware updates the TOP value from TOPB whenever there is Underflow or Overflow event on main counter. The update to TOP wont happen for Overflow event if PCNTn_CTRL.CNTEV = BOTH

## 28.5.14 PCNT\_OVSCTRL - Oversampling Control Register

Offset	Bit Position																																
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>												0x0											0x0										
<b>Access</b>												RW											RW										
<b>Name</b>												FLUTERRM											FILLEN										

Bit	Name	Reset	Access	Description
31:13	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
12	FLUTERRM	0x0	RW	<b>Flutter Remove</b>  When set, removes flutter from Quaddecoder inputs S0IN and S1IN. Available only in OVSQUAD1X-4X modes
11:8	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
7:0	FILLEN	0x0	RW	<b>Configure Filter Length for Inputs S0IN</b>  Used only in OVSINGLE,OVSQUAD1X-4X modes. To use this first enable FILTEN in PCNTn_CFG register. Filter length = (FILLEN + 5) EM23GRPACLK cycles

## 28.5.15 PCNT\_SYNCBUSY - Synchronization Busy Register

Offset	Bit Position																															
0x038	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																												0x0	0x0	0x0	0x0	0x0
<b>Access</b>																												R	R	R	R	R
<b>Name</b>																												OVCTRL	TOPB	TOP	CMD	CTRL

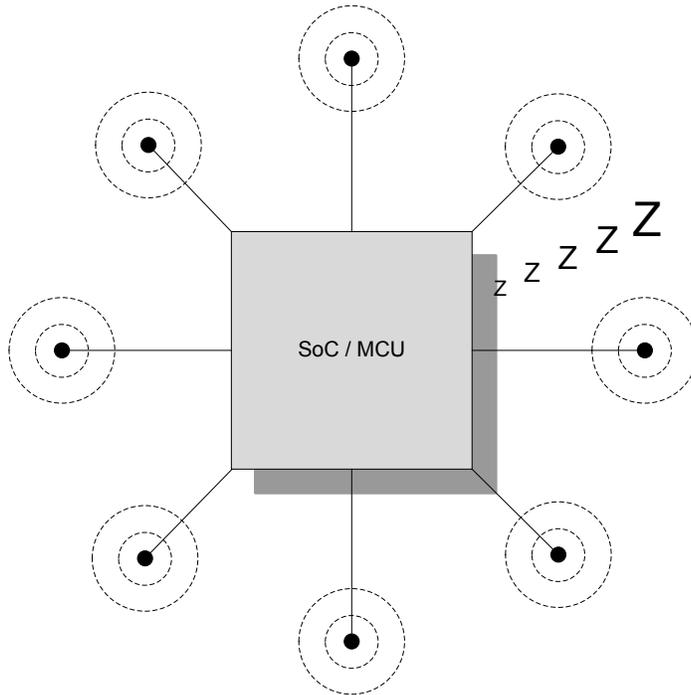

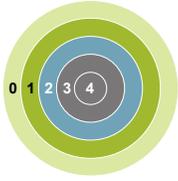

Bit	Name	Reset	Access	Description
31:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4	OVCTRL	0x0	R	<b>OVCTRL Register Busy</b> Set when the value written to OVCTRL register is being synchronized
3	TOPB	0x0	R	<b>TOPB Register Busy</b> Set when the value written to TOPB register is being synchronized
2	TOP	0x0	R	<b>TOP Register Busy</b> Set when the value written to TOP register is being synchronized
1	CMD	0x0	R	<b>CMD Register Busy</b> Set when the value written to CMD register being synchronized
0	CTRL	0x0	R	<b>CTRL Register Busy</b> Set when the value written to CTRL register being synchronized

### 28.5.16 PCNT\_LOCK - Configuration Lock Register

Offset	Bit Position																															
0x03C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	W															
<b>Name</b>																	PCNTLOCKKEY															

Bit	Name	Reset	Access	Description						
31:16	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>								
15:0	PCNTLOCKKEY	0x0	W	<p><b>Configuration Lock Key</b></p> <p>Write any other value than the unlock code to lock PCNT_CFG, PCNT_EN, PCNT_SWRST, PCNT_CMD, PCNT_CTRL, PCNT_OVCTRL, PCNT_CNT, PCNT_TOP and PCNT_TOPB registers from editing. Write the unlock code to unlock.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>42976</td> <td>UNLOCK</td> <td>Write to unock PCNT lockable registers</td> </tr> </tbody> </table>	Value	Mode	Description	42976	UNLOCK	Write to unock PCNT lockable registers
Value	Mode	Description								
42976	UNLOCK	Write to unock PCNT lockable registers								

## 29. LESENSE - Low Energy Sensor Interface

### Quick Facts

#### What?

LESENSE is a low energy sensor interface capable of autonomously collecting and processing data from multiple sensors even when in EM2. Flexible configuration makes LESENSE a versatile sensor interface compatible with a wide range of sensors and measurement schemes.

#### Why?

Capability to autonomously monitor sensors allows the EFR32xG23 to reside in a low energy mode for long periods of time while keeping track of sensor status and sensor events.

#### How?

LESENSE is highly configurable and is capable of collecting data from a wide range of sensor types. Once the data is collected, the programmable state machine, LESENSE decoder, is capable of processing sensor data without CPU intervention. A large result buffer allows the chip to remain in EM2 for long periods of time while autonomously collecting data.

### 29.1 Introduction

LESENSE is a low energy sensor interface which utilizes on-chip peripherals to perform measurement of a configurable set of sensors. The results from sensor measurements can be processed by the LESENSE decoder, which is a configurable state machine with up to 32 states. The results can also be stored in a FIFO to be collected by CPU or DMA for further processing.

LESENSE operates from EM0 down to EM2, and can wake up the CPU on configurable events.

### 29.2 Features

- Up to 16 sensors
- Autonomous sensor monitoring in EM0, EM1, and EM2
- Highly configurable decoding of sensor results
- Interrupt on sensor events
- 16-deep FIFO for result storage
- Multiple evaluation modes minimize the need for software interaction
- Supports IADC and ACMP sampling and evaluation
- Support for multiple sensor types
  - LC sensors
  - General analog sensors

### 29.3 Functional Description

The LESENSE module is capable of controlling on-chip peripherals in order to perform monitoring of different sensors with little or no CPU intervention. LESENSE uses the analog comparators (ACMP) or IADC0 for measurement of sensor signals. LESENSE can also control VDACC0 channel 0 to generate accurate reference voltages. Figure 29.1 LESENSE Block Diagram on page 1136 shows an overview of the LESENSE module.

The LESENSE module consists of a sequencer, an evaluation block, a decoder, and a FIFO buffer.

- The sequencer handles interaction with other peripherals and controls timing of sensor measurements. It also includes a counter that can be used to count pulses on the ACMP output.
- The evaluation block is used to process the data collected by the sequencer.
- To autonomously analyze sensor results, the LESENSE decoder provides the ability to define a finite state machine with up to 32 states (64 arcs), with programmable actions upon state transitions. This allows the decoder to implement a wide range of decoding schemes, such as quadrature decoding.
- Measurement results are stored in a FIFO which enables the chip to remain in a low energy mode for longer periods of time while collecting sensor data.

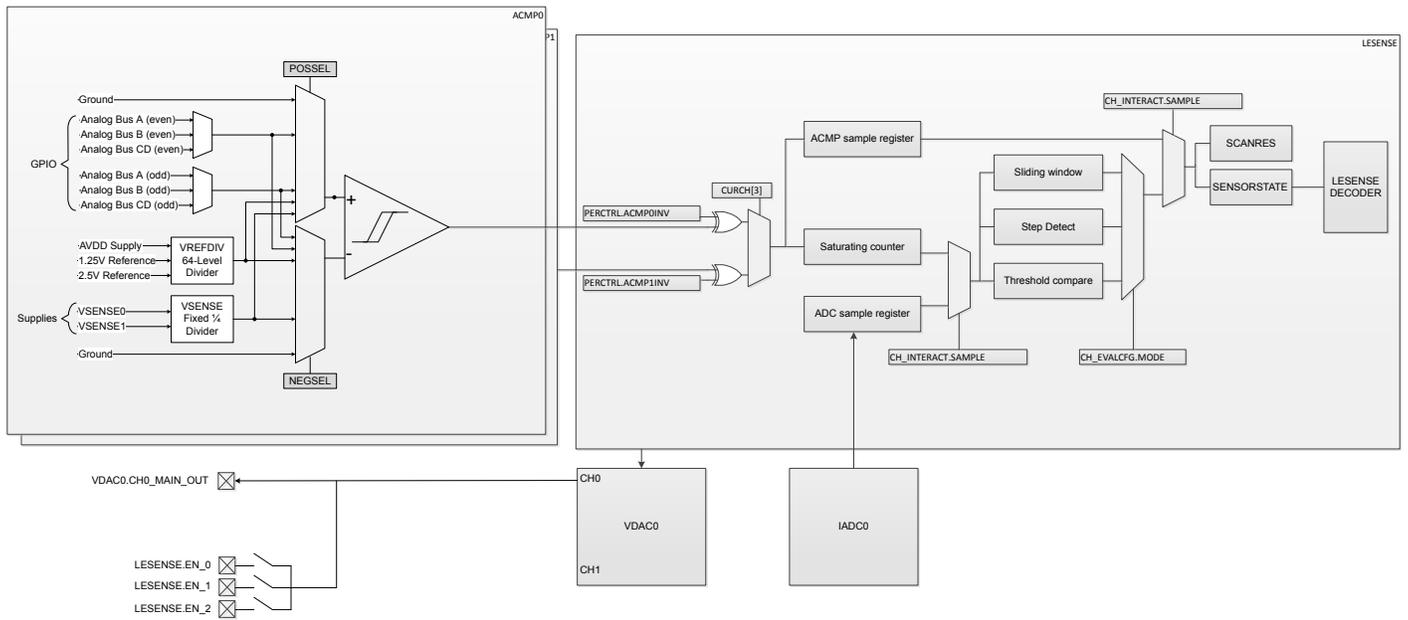

Figure 29.1. LESENSE Block Diagram

#### 29.3.1 Interface Descriptions

##### ACMP interface

ACMPs are used to measure the sensors, and must be configured according to the application in order for LESENSE to work properly. Channels 0-7 trigger ACMP0, Channels 8-15 trigger ACMP1. Depending on the configuration in the ACMP0MODE and ACMP1MODE bitfields in LESENSE\_PERCTRL, LESENSE can take control of the positive input mux and the voltage divider (VREFDIV) for the targeted ACMP. The remaining configuration of the analog comparators is done in the ACMP register interface.

When ACMPxMODE is set to MUX, the LESENSE module will take control of the positive input mux of the ACMP using the ACMP's external override interface. When used this way ACMP\_INPUTCTRL\_POSEL should be configured to the base address of the GPIO port to be used. For example, if the desired channel is on Port A, POSEL should be configured for EXTPA. The offset given by CHx\_INTERACT.OFFSET determines which of the port I/O pins on PA to access. To connect to PB03 therefore, ACMP\_INPUTCTRL\_POSEL would be set to EXTPB, and LESENSE\_CHx\_INTERACT.OFFSET to 0x03.

If ACMPxMODE in PERCTRL is set to MUXTHRES, LESENSE will also take control of the voltage divider (VREFDIV) in the ACMP. The threshold used are individual to each channel and is configured using the 6 LSBs of CHx\_INTERACT\_THRES.

In addition to all this, ACMPxINV in PERCTRL can be used to invert the result from the ACMP to the LESENSE.

## IADC interface

LESENSE can be set up to trigger IADC0 conversions and use data from IADC0 to evaluate sensor status. In order to do this, the scan mode of the IADC0 has to be configured within the IADC0 module and the IADC SCAN trigger has to be setup as LESENSE. When the sample delay configured in CHx\_TIMING\_SAMPLEDLY has expired, LESENSE will initiate an ADC sample. The OFFSET programmed in CHx\_INTERACT determines which channel specified in the IADC scanner is converted by the IADC.

## VDAC interface

LESENSE is able to drive the DAC for generation of accurate reference voltages. The refresh rate of the DAC channels can be configured in DACCONVTRIG in PERCTRL. If DACCONVTRIG is set to CHANNELSTART, the LESENSE sends a conversion trigger to the DAC channels prior to each sensor measurement. If DACCONVTRIG is set to SCANSTART, the LESENSE sends a conversion trigger to the DAC prior to each scan. The conversion data used by the DAC is either taken from its own data registers in the DAC interface or from the THRES bit-field in the CHx\_INTERACT register for the active LESENSE channel. DAC data used is configured in DACCH0DATA in PERCTRL.

None of the other DAC settings can be overridden from the LESENSE. For the DAC to be able to be used by the LESENSE, the DAC trigger source should be configured as LESENSE.

All LESENSE channels can send triggers to the DAC. However, only LESENSE channels 0,1,2 have the capability to switch the DAC output onto specific GPIOs. These channels have been mapped to LESENSE.EN\_0, EN\_1, and EN\_2 and have the possibility to control the switches that connect the VDAC channel 0 main output to these pins. This makes LESENSE able to excite sensors with output from VDAC channel 0. For LESENSE channel 0,1,2 to enable the DAC output switches in idle phase their IDLECONF should be DACOUT. For these channels to enable the switches in Excite phase the EXMODE should be DACOUT and ALTEX should be 0. Consequently, LESENSE channel 8,9,10 can enable the DAC output switches in excite phase if their EXMODE is DACOUT and ALTEX is 1.

### Note:

1. The LESENSE can interact only with VDAC0.
2. The ability to connect the output of VDAC0 to one of LESENSE channels 0, 1 or 2 — including their respective pins LESENSE.EN\_0, LESENSE.EN\_1 and LESENSE.EN\_2 — during the idle phase can be used to (a) immediately stop the oscillations from an inductive excitation phase performed on a LESENSE channel and (b) reduce the possibility for crosstalk among the three LESENSE channels when using multiple inductive LC sensor circuits.

### 29.3.2 Channel Configuration

LESENSE has 16 individually configurable channels. Each channel has its own set of configuration registers. Channel configuration is split into Four registers; CH<sub>x</sub>\_TIMING, CH<sub>x</sub>\_INTERACT, CH<sub>x</sub>\_EVALCFG and CH<sub>x</sub>\_EVALTHRES. Individual timing for each sensor is configured in CH<sub>x</sub>\_TIMING, sensor interaction is configured in CH<sub>x</sub>\_INTERACT, (static) configurations regarding evaluation of the measurements are done in CH<sub>x</sub>\_EVALCFG and the (dynamic) thresholds used in the various evaluation modes are stored in the CH<sub>x</sub>\_EVALTHRES. For improved readability, CH<sub>x</sub>\_CONF will be used to refer to all the channel configuration registers as a group (CH<sub>x</sub>\_TIMING, CH<sub>x</sub>\_INTERACT, CH<sub>x</sub>\_EVALCFG and CH<sub>x</sub>\_EVALTHRES) in places throughout this chapter.

By default, the channel configuration registers are directly mapped to the channel number. Configuring CFG.SCANCONF makes it possible to alter this mapping.

Configuring SCANCONF to INVMAP will make channels 0-7 use the channel configuration registers for channels 8-15, and vice versa. This feature allows an application to quickly and easily switch the configuration set for the channels.

Setting SCANCONF to TOGGLE will make channel *x* alternate between using CH<sub>*x*</sub>\_CONF and CH<sub>*x+8*</sub>\_CONF. The configuration used is decided by the state of the corresponding bit in SCANRES. For instance, if channel 3 is performing a scan and bit 3 in SCANRES is set, CH<sub>11</sub>\_CONF will be used. Channels 8 through 15 will toggle between CH<sub>*x*</sub>\_CONF and CH<sub>*x-8*</sub>\_CONF. This mode provides an easy way for implementation of hysteresis on channel events as threshold values can be changed depending on sensor status.

Setting SCANCONF to DECDEF will make the state of the decoder define which scan configuration to be used. If the decoder state is at index 16 or higher, channel *x* will use CH<sub>*x+8*</sub>\_CONF, otherwise it will use CH<sub>*x*</sub> configuration. Similarly, channels 8 through 15 will use CH<sub>*x*</sub> configuration when decoder state index is less than 8 and CH<sub>*x-8*</sub>\_CONF when decoder state index is higher than 7. Allowing the decoder state to define which configuration to use enables easy implementation of hysteresis, for example, as different threshold values can be used for the same channel dependent on the state of the application. [Table 29.1 LESENSE Scan Configuration Selection on page 1138](#) summarizes how channel configuration is selected for different setting of SCANCONF.

**Table 29.1. LESENSE Scan Configuration Selection**

LESENSE channel <i>x</i>	SCANCONF					
	DIRMAP	INVMAP	TOGGLE		DECDEF	
			SCANRES[ <i>n</i> ] = 0	SCANRES[ <i>n</i> ] = 1	DECSTATE < 16	DECSTATE >= 16
0 ≤ <i>x</i> < 8	CH <sub><i>x</i></sub> _CONF	CH <sub><i>x+8</i></sub> _CONF	CH <sub><i>x</i></sub> _CONF	CH <sub><i>x+8</i></sub> _CONF	CH <sub><i>x</i></sub> _CONF	CH <sub><i>x+8</i></sub> _CONF
8 ≤ <i>x</i> < 16	CH <sub><i>x</i></sub> _CONF	CH <sub><i>x-8</i></sub> _CONF	CH <sub><i>x</i></sub> _CONF	CH <sub><i>x-8</i></sub> _CONF	CH <sub><i>x</i></sub> _CONF	CH <sub><i>x-8</i></sub> _CONF

Channels are enabled in the CHEN register, where bit *x* enables channel *x*. During a scan, all enabled channels are measured, starting with the lowest indexed channel.

### 29.3.3 Scan Sequence

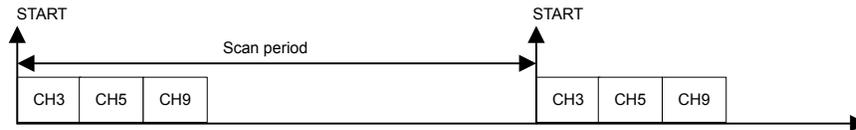

The LESENSE peripheral clock (LESENSECLK) is a low-speed clock derived from the EM23GRPACLK from the CMU. LESENSECLK is the default used to clock most of the peripheral timing during operation. The high-frequency LESENSE peripheral clock (LESENSEHFCLK) selected in the CMU may also be dynamically used for faster timing of individual sensor measurements. The LESENSE register interface runs on the LSPCLK coming from the CMU to enable faster register access.

All enabled channels are scanned each scan period. A new scan is started according to the conditions set by CFG.SCANMODE. If set to PERIODIC, the scan frequency is generated using a counter which is clocked by LESENSECLK. This counter has its own prescaler. This prescaling factor is configured in the PCPRESC field of TIMCTRL. A new scan sequence is started each time the counter reaches the top value, TIMCTRL.PCTOP. The scan frequency is calculated using [Figure 29.2 Scan frequency on page 1139](#). If SCANMODE is set to ONESHOT, a single scan will be made when START in CMD is set. To start a new scan on a PRS event, set SCANMODE to PRS and configure the LESENSE consumer register in the PRS module.

$$F_{\text{scan}} = \text{LESENSECLK} / ((1 + \text{PCTOP}) * 2^{\text{PCPRESC}})$$

**Figure 29.2. Scan frequency**

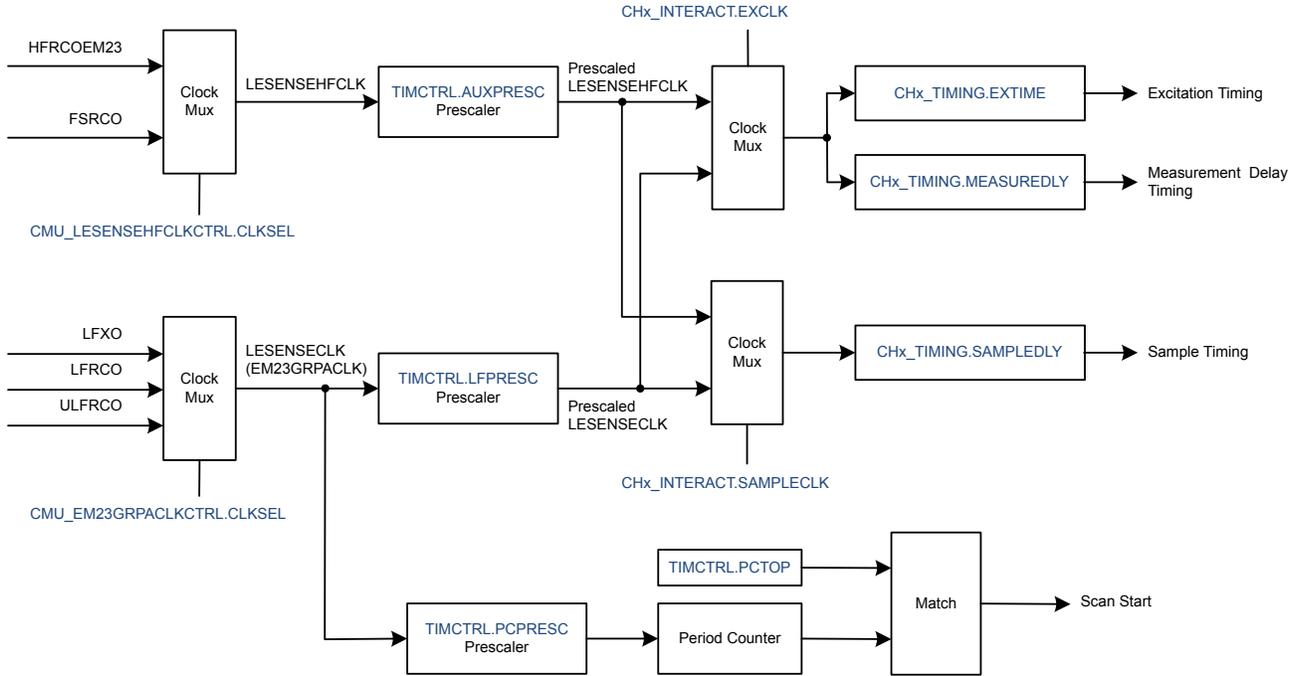

It is possible to interleave additional sensor measurements in between the periodic scans. Issuing a start command when LESENSE is idle will immediately start a new scan, without disrupting the frequency of the periodic scans. If the period counter overflows during the interleaved scan, the periodically scheduled scan will start immediately after the interleaved scan completes.

**Figure 29.3. Scan Sequence**

### 29.3.4 Sensor Timing

LESENSE includes a timer prescaler for each of the clock sources: A low frequency timer running on LESENSECLK, and a high frequency timer running on LESENSEHFCLK. The low frequency clock is prescaled by configuring LFPRESC in TIMCTRL, and the high frequency clock prescaling factor is configured in AUXPRESC in TIMCTRL. The prescaled versions of these clocks are used for channel sensor timing. A block diagram of the key controls for LESENSE clocking and timing is shown in [Figure 29.4 LESENSE Clocking and Timing Control on page 1140](#).

**Figure 29.4. LESENSE Clocking and Timing Control**

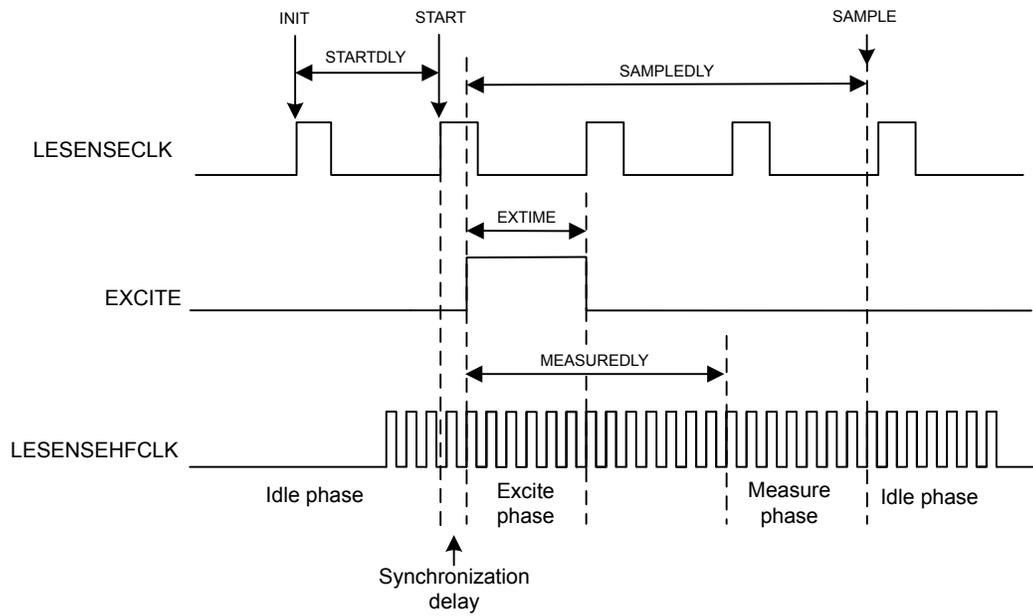

For each channel in the scan sequence, the LESENSE interface has three phases: the idle phase, the excite phase, and the measure phase. The durations of each phase are configured in the CHx\_TIMING registers.

Timing of the excite and measure phases can be either a number of  $LESENSEHFCLK_{prescaled}$  cycles or a number of  $LESENSECLK_{prescaled}$  cycles, depending on which one is selected by the EXCLK field in CHx\_INTERACT. Similarly, the sample phase is timed from the clock selected by the SAMPLECLK field in Chx\_INTERACT.

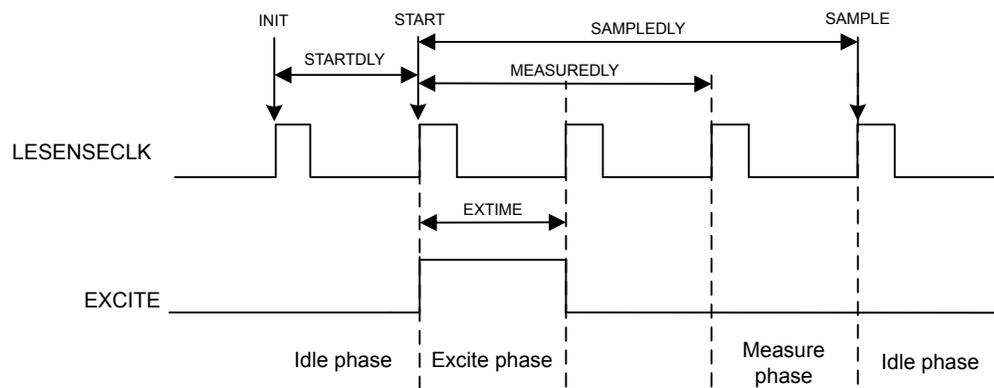

The duration of the excite phase is programmed via EXTIME in the CHx\_TIMING register. This sets how long the sensor excitation pulse will last.

The duration of the measurement phase is programmed via MEASUREDLY and SAMPLEDLY. The output of the ACMP will be ignored for MEASUREDLY EXCLK cycles after start of the sensor measurement. Sampling of the sensor will happen after SAMPLEDLY SAMPLECLK cycles. The configurable measure and sample delays enable LESENSE to easily define exact time windows for sensor measurements. A start delay can also be inserted before sensor measurement begins by configuring STARTDLY in TIMCTRL. This delay can be used to ensure that a VDAC conversion is complete and voltages have stabilized before sensor measurement begins. To reduce power consumption, the startup of HFRCOEM23/FSRCO (driving LESENSEHFCLK) can be delayed until the system enters the excite phase. This is done by configuring AUXSTARTUP in TIMCTRL to ONDEMAND. This will reduce the time the HFRCOEM23/FSRCO is enabled with the tradeoff that the starting point for high frequency timing will also be delayed the required oscillator start-up time.

[Figure 29.5 Timing Diagram, LESENSEHFCLK Based Timing on page 1141](#) depicts a sensor sequence using  $LESENSEHFCLK_{prescaled}$  based timing (EXTIME=6, MEASUREDLY=13, SAMPLEDLY=20), while [Figure 29.6 Timing Diagram, LESENSECLK Based Timing on page 1141](#) depicts a sequence with  $LESENSECLK_{prescaled}$  based timing (EXTIME=1, MEASUREDLY=2, SAMPLEDLY=3).

**Figure 29.5. Timing Diagram, LESENSEHFCLK Based Timing**

**Figure 29.6. Timing Diagram, LESENSECLK Based Timing**

### 29.3.5 Sensor Interaction

Many sensor types require some type of excitation in order to work. LESENSE can generate a variety of sensor stimuli, both on the same pin as the measurement is to be made on, and on alternative pins.

By default, excitation is performed on the LESENSE.CHxOUT signal associated with the channel number. These signals are routed to GPIO using DBUS (see [24.3.12.1 Digital Bus \(DBUS\)](#)). The mode of the pin during the excitation phase is configured using EXMODE in CHx\_INTERACT. The available modes during the excite phase are:

- DISABLED: The pin is disabled.
- HIGH: The pin is driven high.
- LOW: The pin is driven low.
- DACOUT: The pin is connected to the output of VDACC0 channel 0.

**Note:**

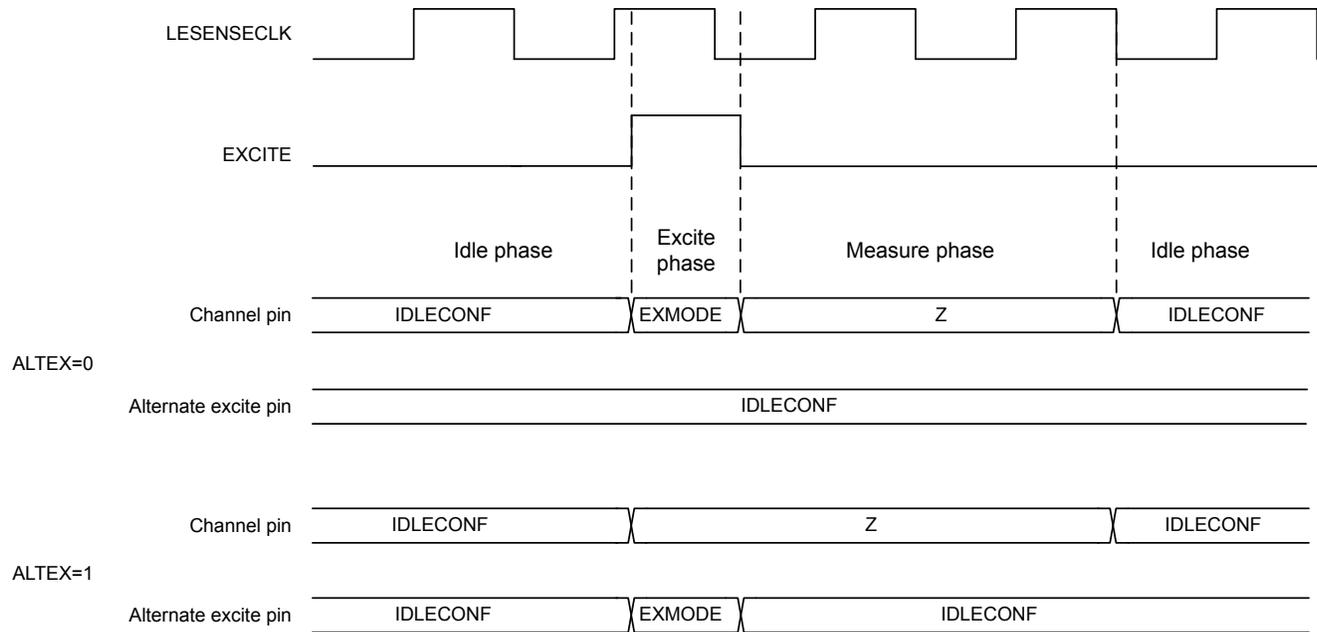

1. Excitation with VDACC0 is available only for LESENSE channels 0, 1 and 2 such that VDACC0.CH0\_MAIN\_OUT is shorted to the dedicated LESENSE.EN\_0, LESENSE.EN\_1, and LESENSE.EN\_2 pins, respectively. These pins may differ from the GPIOs selected for those specific channels.
2. The fact that LESENSE channels 0, 1 and 2 are the only channels that can be connected to the output of the VDACC makes them especially useful with LC sensor circuits. Because each of these channels can be configured to be connected to VDACC0.CH0\_MAIN\_OUT during the idle phase, the low output impedance of the VDACC stops oscillations in the LC tank circuit, thereby preventing possible crosstalk between measurement channels in case of multiple LC sensors being sequentially excited.

LESENSE is able to perform sensor excitation on one channel while measuring with another. When ALTEX in CHx\_INTERACT is set, the excitation will occur on the alternative excite pin associated with the given channel. The alternative pin associated with LESENSE CH<sub>x</sub> is LESENSE CH<sub>x+8 mod 16</sub>. [Table 29.2 LESENSE Excitation Pin Mapping on page 1142](#) shows the mapping of excitation and alternate excitation for every channel.

**Table 29.2. LESENSE Excitation Pin Mapping**

LESENSE channel	ALTEX = 0	ALTEX = 1
0	LESENSE.CH0OUT	LESENSE.CH8OUT
1	LESENSE.CH1OUT	LESENSE.CH9OUT
2	LESENSE.CH2OUT	LESENSE.CH10OUT
3	LESENSE.CH3OUT	LESENSE.CH11OUT
4	LESENSE.CH4OUT	LESENSE.CH12OUT
5	LESENSE.CH5OUT	LESENSE.CH13OUT
6	LESENSE.CH6OUT	LESENSE.CH14OUT
7	LESENSE.CH7OUT	LESENSE.CH15OUT
8	LESENSE.CH8OUT	LESENSE.CH0OUT
9	LESENSE.CH9OUT	LESENSE.CH1OUT
10	LESENSE.CH10OUT	LESENSE.CH2OUT
11	LESENSE.CH11OUT	LESENSE.CH3OUT
12	LESENSE.CH12OUT	LESENSE.CH4OUT
13	LESENSE.CH13OUT	LESENSE.CH5OUT
14	LESENSE.CH14OUT	LESENSE.CH6OUT
15	LESENSE.CH15OUT	LESENSE.CH7OUT

[Figure 29.7 Pin Sequencing on page 1143](#) illustrates the sequencing of the pin associated with the active channel and its alternative excite pin.

**Figure 29.7. Pin Sequencing**

**Note:** When exciting on the pin associated with the active channel, the pin will go through a tri-stated phase before returning to the idle configuration. This will not happen on pins used as alternative excitation pins.

The pin configuration for the idle phase can be configured individually for each LESENSE channel pin in the IDLECONF register. The modes available are the same as the modes available in the excitation phase. During the measure phase, the pin mode on the active channel is always disabled (analog input).

To enable LESENSE to control GPIO, the PORT:PIN have to programmed in the GPIO Route registers for each LESENSE channel being used. In addition, the given pin must be configured as push-pull.

### 29.3.6 Sensor Sampling

During the measurement phase, LESENSE can sample data from sensors using either the IADC0 or one of the ACMP modules (ACMP0 for LESENSE channels 0-7 and ACMP1 for LESENSE channels 8-15). This is configured in CHx\_INTERACT.SAMPLE. Together with the configuration of these peripherals, the CHx\_INTERACT.OFFSET field may be used to specify different pins to be sampled for each LESENSE channel (see [29.3.1 Interface Descriptions](#)).

If ACMP is used, LESENSE can evaluate the ACMP output at a single point in time (CHx\_INTERACT.SAMPLE = ACMP), or count pulses on the ACMP output (CHx\_INTERACT.SAMPLE = ACMPCOUNT) for a programmable period of time.

LESENSE includes the possibility to sample both analog comparators simultaneously, effectively cutting the time spent on sensor interaction in some applications in half. Setting DUALSAMPLE in LESENSE.CFG enables this mode. In dual sample mode, channels X and X+8 are paired, meaning they will be sampled at the same time. Dualsample mode only works when CHx\_INTERACT\_SAMPLE is set to ACMP.

If the IADC is used, LESENSE will initiate IADC conversions and fetch the IADC data for further evaluation. If the IADC is configured for two's complement bi-polar output, CHx\_INTERACT.SAMPLE must be set to ADCDIFF. In this mode, the output from the IADC and the threshold used for comparison will be interpreted as two's complement notation.

The sampled data from IADC or ACMP will be referred to as sensor data in the remainder of this manual.

### 29.3.7 Sensor Evaluation

When a measurement phase is completed, the sensor data is evaluated by the evaluation block. If the sensor data is taken from ACMP sample in a single point in time ( $CHx\_INTERACT\_SAMPLE = ACMP$ ), the evaluation is limited to determining if the sensor data is 0 or 1. For the other sample modes, there are three ways to do sensor evaluation; threshold comparison, sliding window, or step detection. Evaluation mode is configured in  $CHx\_EVALCFG.MODE$ .

If the evaluation of sensor data evaluates to true, the corresponding bit in the result register,  $SCANRES$ , is set. By configuring  $SETIF$  in  $CHx\_INTERACT$ , interrupt flags can also be set on  $SCANRES$  events.

Figure 29.8 Scan Result and Interrupt Generation on page 1144 illustrates how the sensor data or ACMP sample is used for evaluation and interrupt generation.

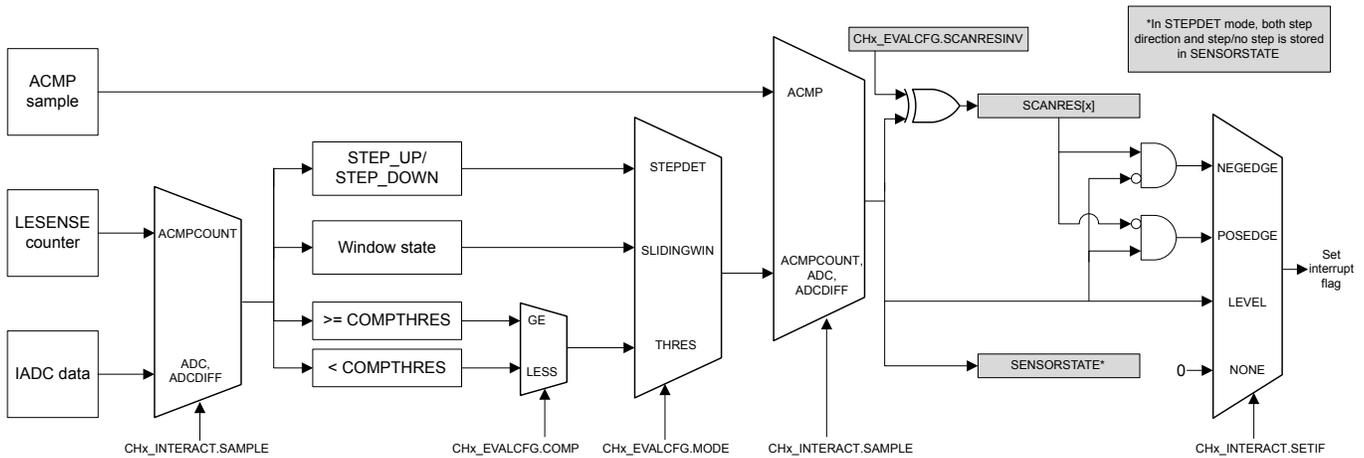

Figure 29.8. Scan Result and Interrupt Generation

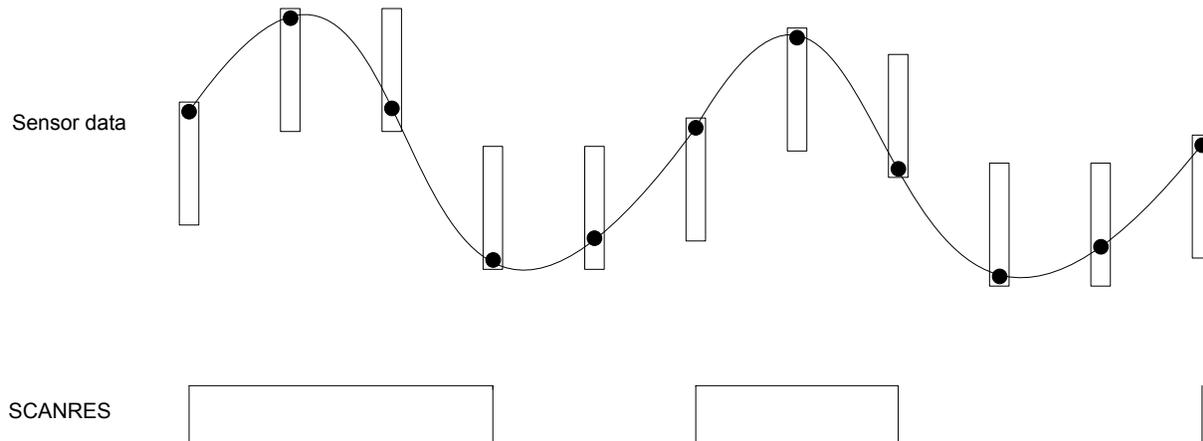

The results from sensor data evaluation can be fed into the decoder through the  $SENSORSTATE$  register, by setting  $CHx\_EVALCFG.DECODE$ . In  $DUALSAMPLE$  mode, results from both the sampled ACMPs will be stored in both  $SCANRES$  and  $SENSORSTATE$  (if enabled).

### 29.3.8 Threshold Comparison

In threshold comparison mode, the sensor data is compared to the threshold configured in  $CHx\_EVALTHRES$ . There are two modes of threshold comparison; 'less than', and 'greater than or equal'. Threshold comparison mode is configured in  $CHx\_EVALCFG.COMP$ .

### 29.3.9 Sliding Window

In sliding window mode, the sensor data is compared against the upper and lower limits of a window range. The window is defined by a base, given by `CHx_EVALTHRES`, and a size configured in `EVALCTRL_WINSIZE`. The window size is constant and the same for all LESENSE channels, while the base is specific to each channel and will be updated by LESENSE when the sensor data is outside the current window range. If the sensor data is within the window range, the sensor evaluation will remain the same as it was for the previous measurement. If the sensor data is below the window range, the measurement will evaluate as false. If the sensor data is above the window range, the measurement will evaluate as true. In both cases, the window base in `CHx_EVALTHRES` will be updated to reflect the new window range. [Figure 29.9 Sliding Window on page 1145](#) shows how the sliding window evaluation mode can be used to implement a system with two self-calibrating thresholds.

**Figure 29.9. Sliding Window**

### 29.3.10 Step Detection

Step detection is used to detect steps in the sensor data compared to sensor data from the previous measurement. The size of the step is configured in `EVALCTRL_WINSIZE`. In this mode, step up and step down are evaluated as described in [Figure 29.10 Step detection on page 1145](#):

$$\text{STEP\_UP} = \text{SENSORDATA}_i \geq \text{SENSORDATA}_{i-1} + \text{EVALCTRL\_WINSIZE}$$

$$\text{STEP\_DOWN} = \text{SENSORDATA}_i < \text{SENSORDATA}_{i-1} - \text{EVALCTRL\_WINSIZE}$$

**Figure 29.10. Step detection**

If either a step up or a step down is detected, the `SCANRES` bit for the active channel will be set. In addition, the `STEPPDIR` bit for the channel will be updated to indicate if a step up or a step down was detected. `STEPPDIR = 1` indicates a step up. In this mode, previous sensor data is stored in `CHx_EVALTHRES`.

### 29.3.11 Decoder

Many applications require some sort of processing of the sensor readings, for instance in the case of quadrature decoding. In quadrature decoding, the sensors repeatedly pass through a set of states which correspond to the position of the sensors. This sequence, and many other decoding schemes, can be described as a finite state machine. To support this type of decoding without CPU intervention, LESENSE includes a highly configurable decoder, capable of decoding input from up to four sensors. The decoder is implemented as a programmable state machine with up to 64 arcs which can represent transitions between up to 32 states. When doing a sensor scan, the results from the sensors are placed in the decoder input register, SENSORSTATE, if DECODE in CHx\_INTERACT is set, as depicted in Figure 29.11 Sensor Scan and Decode Sequence on page 1146.

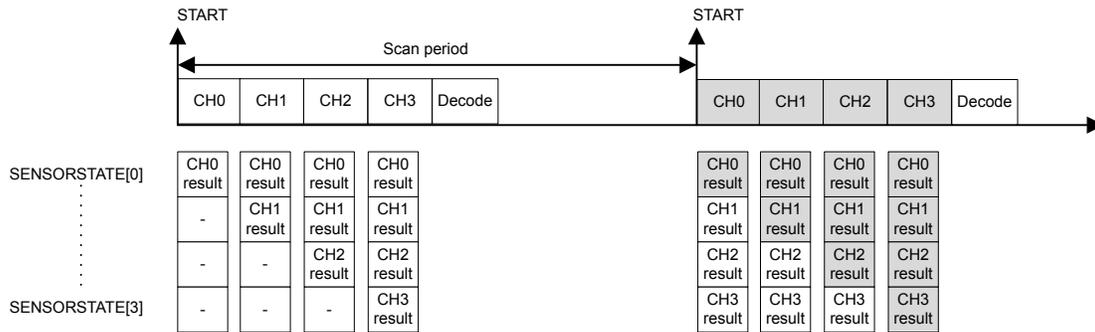

Figure 29.11. Sensor Scan and Decode Sequence

The current state is indicated by the DECSTATE register. At the end of a scan sequence, the decoder evaluates the results placed in SENSORSTATE against the defined STx\_ARC registers and the current state. The decoder evaluates all the ARCs together in parallel and uses one LESENSECLK cycle to determine the next state.

The transition criteria is established by CURRSTATE, SMASK, and SCOMP in the STx\_ARC registers. SMASK defines which bits of SENSORSTATE to mask (ignore). A '0' in SMASK means that the corresponding bit in SENSORSTATE is evaluated, while a '1' in SMASK means that bit will be masked. If STx\_ARC.CURRSTATE == DECSTATE, and the non-masked bits in SENSORSTATE are equal to those defined in SCOMP, then the transition criteria evaluates to True, and the state machine transitions to the value specified by STx\_ARC.NEXTSTATE.

It is possible that multiple ARCs will match the transition criteria. In this case, the lowest numbered ARC that meets the transition criteria determines the next state.

**Note:** When using the decoder, it is important that at least one ARC be configured for the initial state (CURRSTATE == 0), and that the ARCs be configured to not produce any dead states (a state which is the NEXTSTATE of an ARC but is not the CURRSTATE of any other ARC). Doing otherwise will result in the possibility of the decoder getting stuck where no further state transitions are possible. If this happens, a software reset of the LESENSE block would need to be performed.

Upon a state transition, LESENSE can generate a pulse on one or more of the decoder PRS producers. Which producers to generate a pulse on is configured in the PRSACT bit field. If PRSCNT in DECCTRL is set, count signals will be generated on decoder PRS producers 0 and 1 according to the PRSACT configuration. In this mode, producer 0 will pulse each time a count event occurs while producer 1 indicates the count direction (1 for up and 0 for down). The count direction will be kept at its previous state in between count events. The pulse counter on the chip may be used to keep track of events by listening to these PRS outputs. For this the PRS needs to be programmed to configure the producer of the channel(s) from the LESENSE decoder and those same channel(s) are consumed by the PCNT module.

Table 29.3. LESENSE Decoder PRS Outputs (DECCTRL.PRSCNT = 0)

PRSACT Value	Description
0	No PRS output generated
1	Pulse generated on LESENSE PRS output 0
2	Pulse generated on LESENSE PRS output 1
3	Pulse generated on LESENSE PRS output 0 and 1

PRSACT Value	Description
4	Pulse generated on LESENSE PRS output 2
5	Pulse generated on LESENSE PRS output 0 and 2
6	Pulse generated on LESENSE PRS output 1 and 2
7	Pulse generated on LESENSE PRS output 0 , 1 and 2

**Table 29.4. LESENSE Decoder PRS Outputs (DECCTRL.PRSCNT = 1)**

PRSACT Value	Description
0	No Count Outputs
1	Count Up
2	Count Down
4	Pulse generated on LESENSE PRS output 2
5	Count Up and Pulse generated on LESENSE PRS output 2
6	Count Down and Pulse generated on LESENSE PRS output 2

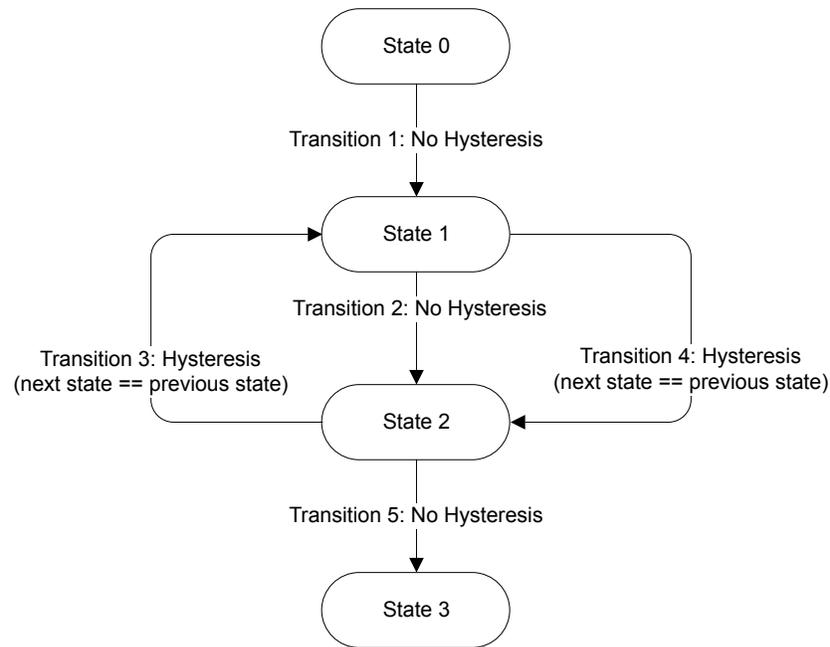

The DECODER has a PRS producer named DECCMP. This output can be used to indicate which state, or subset for states, the decoder is currently in. This PRS output is enabled by setting DECCMPEN in PRSCTRL, and configured through DECCMPMASK and DECCMPVAL in PRSCTRL. The value of this PRS output is given by [Figure 29.12 DECCMP PRS output on page 1147](#),

$$\text{PRS\_DECCMP} = (\text{DECSTATE} \& \sim\text{DECCMPMASK}) = (\text{DECCMPVAL} \& \sim\text{DECCMPMASK})$$

**Figure 29.12. DECCMP PRS output**

If SETIF is set, the DECODER interrupt flag will be set when the transition occurs. If INTMAP in DECCTRL and SETIF is set, a transition from state x and x+16 will set the CHx interrupt flag in addition to the DECODER flag.

To prevent unnecessary interrupt requests or PRS outputs when the decoder toggles back and forth between two states, a hysteresis option is available. The hysteresis function is triggered if a transition from STATE A to STATE B is preceded by a transition from STATE B to STATE A, and vice-versa. [Figure 29.13 Decoder Hysteresis on page 1148](#) illustrates how the hysteresis triggers upon state transitions.

**Figure 29.13. Decoder Hysteresis**

- When HYSTPRx is set, PRS signal x is suppressed when the hysteresis triggers.
- When HYSTIRQ is set, interrupt requests are suppressed when the hysteresis triggers.

### 29.3.12 Measurement Results

LESENSE has a FIFO for storage of up to 16 results from sensor measurements. Each time LESENSE writes data to the result buffer, the result count, RESCOUNT, is incremented. Each time a new result is read through the RESFIFO register, the result count, RESCOUNT, is decremented. The result count will not be decremented if there is no valid, unread data in the result buffer.

**Note:** The 20-bit wide RESFIFO.BUFDATASRC bitfield contains both the LESENSE result (least-significant 16 bits) as well as the LESENSE channel index (most-significant 4 bits)

LESENSE has a FIFO for storage of up to 16 results from sensor measurements. Each time LESENSE writes data to the result buffer, the result count, RESCOUNT, is incremented. Each time a new result is read through the RESFIFO register, the result count, RESCOUNT, is decremented. The result count will not be decremented if there is no valid, unread data in the result buffer.

LESENSE will not write additional data to a full result buffer and will flag a FIFO overflow in the STATUS register which can also generate an interrupt. Reading the FIFO involves synchronization of the pointers from the read (APB) to the write domain (LF) which will result in STATUS.READBUSY being high. The user should wait for the READBUSY to go low before disabling the LESENSE clock in the CMU. The FIFO read will be non-blocking. By writing the CLEARBUF field, the user can flush the FIFO. When the FIFO is flushing the FLUSHING bit in the STATUS register will be high. It is recommended that the user not flush the FIFO when the scan is running because a FIFO write during FLUSHING may be flushed as well. The APB bus is not stalled during a FLUSH. FLUSHING will also involve pointer synchronization so READBUSY can be high during and after FLUSHING. The FIFO will generate interrupt flags (RESWFIF) when the RESCOUNT reaches the CFG.RESFIDL.

During a scan, the state of each sensor is stored in SCANRES. If a sensor triggers, a 1 is stored in SCANRES, otherwise a 0 is stored in SCANRES. Whether or not a sensor is said to be triggered depends of the configuration for the given channel, and the sensor evaluation mode.

If SAMPLE is set to ACMP, the sensor is said to be triggered if the output from the analog comparator is 1 when sensor sampling is performed. If SAMPLE is set to ACMPCOUNT, a sensor is said to be triggered if the LESENSE counter value is greater than or equal, or less than CHx\_EVALTHRES, depending on the configuration of COMP. If STRSAMPLE in CHx\_EVALCFG is set, the sensor measurement (ACMP sample, IADC sample, or counter value) for the channel will be stored in the result FIFO. If STRSCANRES in CFG is set, the result vector, SCANRES, will also be stored in the result buffer. This will be stored after each scan and will be interleaved with any stored sensor measurements.

### 29.3.13 DMA Requests

LESENSE issues a DMA request when the RESCOUNT reaches CFG.RESFIDL, this request is cleared when the buffer level drops below the threshold. A single DMA request is also set whenever there is unread data in the buffer. CFG.DMAWU controls if the LESENSE can send a request for a wakeup from EM2 to transfer data once the RESCOUNT reaches CFG.RESFIDL.

The DMA controller shall read the RESFIFO register.

### 29.3.14 PRS

LESENSE is an asynchronous PRS producer and consumer. For LESENSE as a PRS consumer, other PRS producers can start a LESENSE scan. From a producer standpoint, LESENSE generates PRS signals from the programmable FSM which can be used by the PRS consumers.

## 29.4 Programmer's Model

The following steps show how to configure LESENSE to scan through 4 buttons 100 times per second, issuing an interrupt if one of them is pressed.

1. Assuming  $PERCLK_{LESENSE}$  is 32kHz, set PCPRESC to 3 and PCTOP to 39 in PERCTRL. This will make the scan frequency to 100 Hz.
2. Enable channels 0 through 3 in CHEN and IDLECONF for these channels to DISABLED. The GPIO for these channels will need to be configured in the GPIO peripheral.
3. Configure and enable the ACMP.
4. Configure the following bit fields in CHx\_CONF for channel 0 through 3
  - a. Set EXTIME to 0. No excitation is needed in this mode.
  - b. Set SAMPLE to ACMPCOUNT and COMP to LESS. This makes LESENSE interpret a sensor as active if the frequency of the channel drops below the threshold, i.e. the button is pressed.
  - c. set SAMPLEDLY to an appropriate value, each sensor will be measured for  $SAMPLEDLY / PERCLK_{LESENSE}$  seconds. MEASUREDLY should be set to 0.
5. Enable Interrupts on Channels 0 through 3.
6. Configure EVALTHRES for Channels 0 to 3. An interrupt will be issued if the counter value for a sensor is below EVALTHRES for the channel after the measurement phase.
7. Enable LESENSE by writing EN to 1.
8. Start scan sequence by writing 1 to START in CMD.
9. To store the results of the enabled channels into the LESENSE FIFO configure STRSAMPLE for these channels as 1. STRSAMPLE is in a CONFIG register so it should be configured before enabling LESENSE.
10. To configure channels to be used by the decoder set DECODE in CHx\_EVALCFG. Assume that we have set DECODE for channels 0 to 3.
11. The decoder will be called to act upon the SENSORSTATE at the end of the scan. In this case it will be after channel 3 is measured and evaluated.
12. To setup the decoder FSM configure the STn\_ARC registers before enabling the LESENSE. The reset value for the DECSTATE is 0 so there should be atleast one STn\_ARC with the current state as 0 otherwise no matter what the SENSORSTATE is there won't be a state transition. For the same reason there should not be any dead states (a state which is a NEXTSTATE of an ARC but is not the CURRENTSTATE of any ARC) while configuring the FSM else the decoder will be stuck there and the USER will need to perform a SWRST.

## 29.5 LESENSE Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	LESENSE_IPVERSION	R	IPVERSION
0x004	LESENSE_EN	RW ENABLE	Enable
0x008	LESENSE_SWRST	RW SWRST	Software Reset Register
0x00C	LESENSE_CFG	RW CONFIG	Configuration
0x010	LESENSE_TIMCTRL	RW CONFIG	Timing Control
0x014	LESENSE_PERCTRL	RW CONFIG	Peripheral Control
0x018	LESENSE_DECCTRL	RW	Decoder Control
0x01C	LESENSE_EVALCTRL	RW CONFIG	LESENSE Evaluation
0x020	LESENSE_PRSCTRL	RW	PRS Control
0x024	LESENSE_CMD	W LFSYNC	Command
0x028	LESENSE_CHEN	RW	Channel Enable
0x02C	LESENSE_SCANRES	RH	Scan Result
0x030	LESENSE_STATUS	RH	Status
0x034	LESENSE_RESCOUNT	RH	Result FIFO Count
0x038	LESENSE_RESFIFO	RH	Result Fifo
0x03C	LESENSE_CURCH	RH	Current Channel Index

## 29.6 LESENSE Register Description

### 29.6.1 LESENSE\_IPVERSION - IPVERSION

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x1																															
<b>Access</b>	R																															
<b>Name</b>	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x1	R	<b>IPVERSION</b>
	IPVERSION			

### 29.6.2 LESENSE\_EN - Enable

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																														0x0	0x0	
<b>Access</b>																														R	RW	
<b>Name</b>																														DISABLING	EN	

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISABLING Module is in disabling	0x0	R	<b>Disabling</b>
0	EN Global Enable of LESENSE functions	0x0	RW	<b>Enable</b>
	Value	Mode		Description
	0	DISABLE		Disable
	1	ENABLE		Enable

### 29.6.3 LESENSE\_SWRST - Software Reset Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																														0x0	0x0	
<b>Access</b>																														R	W	
<b>Name</b>																														RESETTING	SWRST	

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	RESETTING Module is undergoing SWRST	0x0	R	<b>Software reset busy status</b>
0	SWRST Trigger SWRST	0x0	W	<b>Software reset command</b>

### 29.6.4 LESENSE\_CFG - Configuration

Offset	Bit Position																																
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																	0x0							0x0	0x0	0x0	0x0		0x0	0x0			
<b>Access</b>																	RW							RW	RW	RW	RW		RW	RW			
<b>Name</b>																	DEBUGRUN							RESFIDL			DMAWU	STRSCANRES	DUALSAMPLE			SCANCONF	SCANMODE

Bit	Name	Reset	Access	Description									
31:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											
17	DEBUGRUN	0x0	RW	<b>Debug Mode Run Enable</b> Set to keep LESENSE running in debug mode.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>X0</td> <td>LESENSE can not start new scans in debug mode</td> </tr> <tr> <td>1</td> <td>X1</td> <td>LESENSE can start new scans in debug mode</td> </tr> </tbody> </table>	Value	Mode	Description	0	X0	LESENSE can not start new scans in debug mode	1	X1	LESENSE can start new scans in debug mode
Value	Mode	Description											
0	X0	LESENSE can not start new scans in debug mode											
1	X1	LESENSE can start new scans in debug mode											
16:12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											
11:8	RESFIDL	0x0	RW	<b>Result FIFO level</b> Result FIFO interrupt and DMA trigger level									
7	DMAWU	0x0	RW	<b>DMA wake-up from EM2</b> When set, DMA can wake and collect information based on FIFO levels  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>DISABLE</td> <td>No DMA wake-up from EM2</td> </tr> <tr> <td>1</td> <td>ENABLE</td> <td>DMA wake-up from EM2 when FIFO count is greater or equal to RESFIDL</td> </tr> </tbody> </table>	Value	Mode	Description	0	DISABLE	No DMA wake-up from EM2	1	ENABLE	DMA wake-up from EM2 when FIFO count is greater or equal to RESFIDL
Value	Mode	Description											
0	DISABLE	No DMA wake-up from EM2											
1	ENABLE	DMA wake-up from EM2 when FIFO count is greater or equal to RESFIDL											
6	STRSCANRES	0x0	RW	<b>Enable storing of SCANRES</b> When set, SCANRES will be stored in the result buffer after each scan									
5	DUALSAMPLE	0x0	RW	<b>Enable dual sample mode</b> When set, both ACMPs will be sampled simultaneously.									
4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>											
3:2	SCANCONF	0x0	RW	<b>Select scan configuration</b> These bits control which CHx_CONF registers to be used.  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> </tbody> </table>	Value	Mode	Description						
Value	Mode	Description											

Bit	Name	Reset	Access	Description
	0	DIRMAP		The channel configuration register registers used are directly mapped to the channel number.
	1	INVMAP		The channel configuration registers used are CH[X+8]_CONF for channels 0-7 and CH[X-8]_CONF for channels 8-15.
	2	TOGGLE		The channel configuration registers used toggle between CH[X]_CONF and CH[X+8]_CONF when channel x triggers
	3	DECDEF		The decoder state defines the CONF registers to be used.
1:0	SCANMODE	0x0	RW	<b>Configure scan mode</b> These bits control how the scan frequency is decided
	Value	Mode		Description
	0	PERIODIC		A new scan is started each time the period counter overflows
	1	ONESHOT		A single scan is performed when START in CMD is set
	2	PRS		Pulse on PRS channel

## 29.6.5 LESENSE\_TIMCTRL - Timing Control

Offset	Bit Position																																
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>				0x0					0x0							0x0							0x0				0x0						0x0
<b>Access</b>				RW					RW							RW							RW				RW						RW
<b>Name</b>				AUXSTARTUP					STARTDLY							PCTOP							PCPRESC				LFPRESC						AUXPRESC

Bit	Name	Reset	Access	Description
31:29	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
28	AUXSTARTUP	0x0	RW	<b>AUX startup config</b>
	Value	Mode		Description
	0	PREDEMAND		Request oscillator .5 LESENSECLK cycle before sensing starts
	1	ONDEMAND		Request oscillator at sensing time
27:24	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
23:22	STARTDLY	0x0	RW	<b>Start delay configuration</b>
	Delay sensor interaction STARTDELAY LESENSECLK cycles for each channel			
21:20	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
19:12	PCTOP	0x0	RW	<b>Period counter top value</b>
	Top value for the period counter			
11	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
10:8	PCPRESC	0x0	RW	<b>Period counter prescaling</b>
	Prescaling factor for period counter used for scan interval			
	Value	Mode		Description
	0	DIV1		The period counter clock frequency is LESENSECLK/1
	1	DIV2		The period counter clock frequency is LESENSECLK/2
	2	DIV4		The period counter clock frequency is LESENSECLK/4
	3	DIV8		The period counter clock frequency is LESENSECLK/8
	4	DIV16		The period counter clock frequency is LESENSECLK/16
	5	DIV32		The period counter clock frequency is LESENSECLK/32
	6	DIV64		The period counter clock frequency is LESENSECLK/64
	7	DIV128		The period counter clock frequency is LESENSECLK/128

Bit	Name	Reset	Access	Description
7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6:4	LFPRESC	0x0	RW	<b>Prescaling factor for low frequency time</b> Prescaling factor for low frequency timer used for Sensor timing
	Value	Mode		Description
	0	DIV1		Low frequency timer is clocked with LESENSECLK/1
	1	DIV2		Low frequency timer is clocked with LESENSECLK/2
	2	DIV4		Low frequency timer is clocked with LESENSECLK/4
	3	DIV8		Low frequency timer is clocked with LESENSECLK/8
	4	DIV16		Low frequency timer is clocked with LESENSECLK/16
	5	DIV32		Low frequency timer is clocked with LESENSECLK/32
	6	DIV64		Low frequency timer is clocked with LESENSECLK/64
	7	DIV128		Low frequency timer is clocked with LESENSECLK/128
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1:0	AUXPRESC	0x0	RW	<b>Prescaling factor for high frequency tim</b> Prescaling factor for high frequency timer used for Senosr timing
	Value	Mode		Description
	0	DIV1		High frequency timer is clocked at LESENSEHFCLK/1
	1	DIV2		High frequency timer is clocked at LESENSEHFCLK/2
	2	DIV4		High frequency timer is clocked at LESENSEHFCLK/4
	3	DIV8		High frequency timer is clocked at LESENSEHFCLK/8

## 29.6.6 LESENSE\_PERCTRL - Peripheral Control

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset							0x0	0x0		0x0		0x0												0x0		0x0					0x0	
Access							RW	RW		RW		RW												RW		RW					RW	
Name							ACMP1INV	ACMP0INV		ACMP1MODE		ACMP0MODE												DACCONVTRIG		DACSTARTUP					DACCH0DATA	

Bit	Name	Reset	Access	Description
31:26	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
25	ACMP1INV	0x0	RW	<b>Invert analog comparator 1 output</b> Bit to invert the ACMP1 output before using it within LESENSE
24	ACMP0INV	0x0	RW	<b>Invert analog comparator 0 output</b> Bit to invert the the ACMP0 output before using it within LESENSE
23	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
22	ACMP1MODE	0x0	RW	<b>ACMP1 mode</b> Configure how LESENSE controls ACMP1
	Value	Mode		Description
	0	MUX		LESENSE controls the POSSEL of ACMP1
	1	MUXTHRES		LESENSE POSSEL and reference divider of ACMP1
21	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
20	ACMP0MODE	0x0	RW	<b>ACMP0 mode</b> Configure how LESENSE controls ACMP0
	Value	Mode		Description
	0	MUX		LESENSE controls POSSEL of ACMP0
	1	MUXTHRES		LESENSE controls POSSEL and reference divider of ACMP0
19:9	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
8	DACCONVTRIG	0x0	RW	<b>DAC conversion trigger configuration</b> Decides if the DAC is triggered before every channel measurement or once per scan
	Value	Mode		Description
	0	CHANNELSTART		DAC is enabled before every LESENSE channel measurement.
	1	SCANSTART		DAC is only enabled once per scan.

Bit	Name	Reset	Access	Description
7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6	DACSTARTUP	0x0	RW	<b>DAC startup configuration</b> Decides if the DAC is triggered 0.5 or 1 LESENSECLK cycle before START
	Value	Mode	Description	
	0	FULLCYCLE	DAC is started a full LESENSECLK before sensor interaction starts.	
	1	HALFCYCLE	DAC is started half a LESENSECLK cycle before sensor interaction starts.	
5:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	DACCH0DATA	0x0	RW	<b>DAC CH0 data selection.</b> Setting this bit will override the data the DAC uses for conversion
	Value	Mode	Description	
	0	DACDATA	DAC data is defined by CH0DATA in the DAC interface.	
	1	THRES	DAC data is defined by THRES in CHx_INTERACT.	
1:0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

## 29.6.7 LESENSE\_DECCTRL - Decoder Control

Offset	Bit Position																																																					
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																						
<b>Reset</b>																								0x0	0x0	0x0	0x0	0x0	0x0																									0x0
<b>Access</b>																								RW	RW	RW	RW	RW	RW																									RW
<b>Name</b>																								PRSCNT	HYSTIRQ	HYSTPRS2	HYSTPRS1	HYSTPRS0	INTMAP																									DECDIS

Bit	Name	Reset	Access	Description
31:8	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
7	PRSCNT	0x0	RW	<b>Enable count mode on decoder PRS channel</b> When set, decoder PRS0 and PRS1 will be used to produce output which can be used by a PCNT to count up or down.
6	HYSTIRQ	0x0	RW	<b>Enable decoder hysteresis on interrupt r</b> When set, hysteresis is enabled in the decoder, suppressing interrupt requests.
5	HYSTPRS2	0x0	RW	<b>Enable decoder hysteresis on PRS2 output</b> When set, hysteresis is enabled in the decoder, suppressing changes on PRS channel 2
4	HYSTPRS1	0x0	RW	<b>Enable decoder hysteresis on PRS1 output</b> When set, hysteresis is enabled in the decoder, suppressing changes on PRS channel 1
3	HYSTPRS0	0x0	RW	<b>Enable decoder hysteresis on PRS0 output</b> When set, hysteresis is enabled in the decoder, suppressing changes on PRS channel 0
2	INTMAP	0x0	RW	<b>Enable decoder to channel interrupt map</b> When set, a transition from state x in the decoder will set interrupt flag CH[x mod 16]
1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	DECDIS	0x0	RW	<b>Disable the decoder</b> When set, the decoder is disabled. When disabled the decoder will keep its current state

## 29.6.8 LESENSE\_EVALCTRL - LESENSE Evaluation

Offset	Bit Position																															
0x01C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	RW															
<b>Name</b>																	WINSIZE															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	WINSIZE	0x0	RW	<b>Sliding window and step detection size</b>  In sliding window mode, this bit-field configures the window size. In step detection mode, this bit-field is used to configure the threshold for step detection

## 29.6.9 LESENSE\_PRSCTRL - PRS Control

Offset	Bit Position																															
0x020	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0							0x0							0x0	
<b>Access</b>																	RW							RW							RW	
<b>Name</b>																	DECCMPEN							DECCMPMASK							DECCMPVAL	

Bit	Name	Reset	Access	Description
31:17	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
16	DECCMPEN	0x0	RW	<b>Enable PRS output DECCMP</b>  Enables decoder state compare match PRS output
15:13	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
12:8	DECCMPMASK	0x0	RW	<b>Decoder state compare value mask</b>  Masks COMPVAL and DECSTATE for comparison
7:5	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
4:0	DECCMPVAL	0x0	RW	<b>Decoder state compare value</b>  Triggers prs output when equal to DECSTATE

29.6.12 LESENSE\_SCANRES - Scan Result

Offset	Bit Position																															
0x02C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0																0x0															
<b>Access</b>	R																R															
<b>Name</b>	STEPDIR																SCANRES															

Bit	Name	Reset	Access	Description
31:16	STEPDIR	0x0	R	<b>Direction of previous step detection</b> In step detection mode, bit X will be set if a step up was detected on channel X; write to initialize when LESENSE is disabled.
15:0	SCANRES	0x0	R	<b>Scan results</b> Bit X will be set depending on channel X evaluation;

### 29.6.13 LESENSE\_STATUS - Status

Offset	Bit Position																																
0x030	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
<b>Reset</b>																											0x0	0x0	0x0	0x0		0x0	0x0
<b>Access</b>																											R	R	R	R		R	R
<b>Name</b>																											FLUSHING	READBUSY	RUNNING	SCANACTIVE		RESFIFOFULL	RESFIPOV

Bit	Name	Reset	Access	Description
31:7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6	FLUSHING	0x0	R	<b>FIFO Flushing</b>
5	READBUSY	0x0	R	<b>FIFO Read Busy</b>
4	RUNNING	0x0	R	<b>LESENSE periodic counter running</b> LESENSE is running in periodic mode.
3	SCANACTIVE	0x0	R	<b>LESENSE scan active</b> LESENSE is currently interfacing sensors.
2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	RESFIFOFULL	0x0	R	<b>Result fifo full</b> Set when the result fifo is full
0	RESFIPOV	0x0	R	<b>Result fifo valid</b> Set when data is available in the result fifo. Cleared when the buffer is empty.

### 29.6.14 LESENSE\_RESCOUNT - Result FIFO Count

Offset	Bit Position																															
0x034	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0			
<b>Access</b>																													R			
<b>Name</b>																													COUNT			

Bit	Name	Reset	Access	Description
31:5	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
4:0	COUNT	0x0	R	<b>Result Fifo Count</b> Number of valid data in the Result FIFO

### 29.6.15 LESENSE\_RESFIFO - Result Fifo

Offset	Bit Position																															
0x038	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0			
<b>Access</b>																													R			
<b>Name</b>																													BUFDATASRC			

Bit	Name	Reset	Access	Description
31:20	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
19:0	BUFDATASRC	0x0	R	<b>Result data and source</b> This bitfield contains the sensor result (least-significant 16 bits) and the channel index (most-significant 4 bits)

## 29.6.16 LESENSE\_CURCH - Current Channel Index

Offset	Bit Position																															
0x03C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0			
<b>Access</b>																													R			
<b>Name</b>																													CURCH			

Bit	Name	Reset	Access	Description
31:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
3:0	CURCH	0x0	R	<b>Shows the index of the current channel</b>

## 29.6.17 LESENSE\_DECSTATE - Current Decoder State

Offset	Bit Position																															
0x040	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0			
<b>Access</b>																													R			
<b>Name</b>																													DECSTATE			

Bit	Name	Reset	Access	Description
31:5	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
4:0	DECSTATE	0x0	R	<b>Shows the current decoder state</b>

29.6.18 LESENSE\_SENSORSTATE - Sensor State

Offset	Bit Position																															
0x044	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0			
<b>Access</b>																													R			
<b>Name</b>																													SENSORSTATE			

Bit	Name	Reset	Access	Description
31:4	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
3:0	SENSORSTATE	0x0	R	<b>Sensor State</b> Sensor State used as input to the DECODER state machine

### 29.6.19 LESENSE\_IDLECONF - IDLE Configuration

Offset	Bit Position																															
0x048	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Name	Reset	Access	Description
31:30	CHIDLE15	0x0	RW	<b>Channel IDLE configuration</b> Channel 15 idle phase configuration
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
	3	DAC		Channel output is connected to DAC output in idle phase (CH 0,1,2 only)
29:28	CHIDLE14	0x0	RW	<b>Channel IDLE configuration</b> Channel 14 idle phase configuration
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
	3	DAC		Channel output is connected to DAC output in idle phase (CH 0,1,2 only)
27:26	CHIDLE13	0x0	RW	<b>Channel IDLE configuration</b> Channel 13 idle phase configuration
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
	3	DAC		Channel output is connected to DAC output in idle phase (CH 0,1,2 only)
25:24	CHIDLE12	0x0	RW	<b>Channel IDLE configuration</b> Channel 12 idle phase configuration
	Value	Mode		Description

Bit	Name	Reset	Access	Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
	3	DAC		Channel output is connected to DAC output in idle phase (CH 0,1,2 only)
23:22	CHIDLE11	0x0	RW	<b>Channel IDLE configuration</b> Channel 11 idle phase configuration
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
	3	DAC		Channel output is connected to DAC output in idle phase (CH 0,1,2 only)
21:20	CHIDLE10	0x0	RW	<b>Channel IDLE configuration</b> Channel 10 idle phase configuration
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
	3	DAC		Channel output is connected to DAC output in idle phase (CH 0,1,2 only)
19:18	CHIDLE9	0x0	RW	<b>Channel IDLE configuration</b> Channel 9 idle phase configuration
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
	3	DAC		Channel output is connected to DAC output in idle phase (CH 0,1,2 only)
17:16	CHIDLE8	0x0	RW	<b>Channel IDLE configuration</b> Channel 8 idle phase configuration
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
	3	DAC		Channel output is connected to DAC output in idle phase (CH 0,1,2 only)

Bit	Name	Reset	Access	Description
15:14	CHIDLE7	0x0	RW	<b>Channel IDLE configuration</b>
	Channel 7 idle phase configuration			
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
13:12	CHIDLE6	0x0	RW	<b>Channel IDLE configuration</b>
	Channel 6 idle phase configuration			
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
11:10	CHIDLE5	0x0	RW	<b>Channel IDLE configuration</b>
	Channel 5 idle phase configuration			
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
9:8	CHIDLE4	0x0	RW	<b>Channel IDLE configuration</b>
	Channel 4 idle phase configuration			
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
7:6	CHIDLE3	0x0	RW	<b>Channel IDLE configuration</b>
	Channel 3 idle phase configuration			
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase

Bit	Name	Reset	Access	Description
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
	3	DAC		Channel output is connected to DAC output in idle phase (CH 0,1,2 only)
5:4	CHIDLE2	0x0	RW	<b>Channel IDLE configuration</b> Channel 2 idle phase configuration
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
	3	DAC		Channel output is connected to DAC output in idle phase (CH 0,1,2 only)
3:2	CHIDLE1	0x0	RW	<b>Channel IDLE configuration</b> Channel 1 idle phase configuration
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
	3	DAC		Channel output is connected to DAC output in idle phase (CH 0,1,2 only)
1:0	CHIDLE0	0x0	RW	<b>Channel IDLE configuration</b> Channel 0 idle phase configuration
	Value	Mode		Description
	0	DISABLE		Channel output is disabled in idle phase
	1	HIGH		Channel output is high in idle phase
	2	LOW		Channel output is low in idle phase
	3	DAC		Channel output is connected to DAC output in idle phase (CH 0,1,2 only)

<b>Name</b>			SAMPLE			OFFSET				SETIF		EXCLK	SAMPLECLK	ALTEX	EXMODE													THRES					

Bit	Name	Reset	Access	Description
31:30	Reserved			To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>
29:28	SAMPLE	0x0	RW	<b>Sample mode Selection</b>
	Value	Mode		Description
	0	ACMPCOUNT		
	1	ACMP		
	2	ADC		
	3	ADCDIFF		
27:24	OFFSET	0x0	RW	<b>OFFSET for IADC/ACMP interaction</b>
23:21	SETIF	0x0	RW	<b>Enable interrupt generation</b>
	Select interrupt generation mode for CHx interrupt flag.			
	Value	Mode		Description
	0	NONE		No interrupt is generated
	1	LEVEL		Set interrupt flag if the sensor triggers.
	2	POSEDGE		Set interrupt flag on positive edge of the sensor state
	3	NEGEDGE		Set interrupt flag on negative edge of the sensor state
	4	BOTHEDGES		Set interrupt flag on both edges of the sensor state
20	EXCLK	0x0	RW	<b>Select clock used for excitation timing</b>
	Value	Mode		Description
	0	LFACTK		Prescaled low-frequency LESENSECLK will be used for timing
	1	AUXHFRCO		Prescaled high-frequency LESENSEHFCLK will be used for timing
19	SAMPLECLK	0x0	RW	<b>Select clock used for timing of sample d</b>

Bit	Name	Reset	Access	Description
	Value	Mode		Description
	0	LFACLK		Prescaled low-frequency LESENSECLK will be used for timing
	1	AUXHFRCO		Prescaled high-frequency LESENSEHFCLK will be used for timing
18	ALTEX	0x0	RW	<b>Use alternative excite pin</b> If set, alternative excite pin will be used for excitation
17:16	EXMODE	0x0	RW	<b>Set GPIO mode</b> GPIO mode for the excitation phase of the scan sequence. Note that DACOUT is only available on channels 0, 1, 2
	Value	Mode		Description
	0	DISABLE		Disabled
	1	HIGH		Push Pull, GPIO is driven high
	2	LOW		Push Pull, GPIO is driven low
	3	DACOUT		DAC output
15:12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
11:0	THRES	0x0	RW	<b>ACMP threshold or DAC data</b> Set threshold used for ACMP, or data used in DAC conversion

### 29.6.25 LESENSE\_CHx\_EVALCFG - Scan Configuration

Offset	Bit Position																																				
0x108	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
<b>Reset</b>																							0x0		0x0	0x0	0x0	0x0	0x0								
<b>Access</b>																							RW		RW	RW	RW	RW	RW								
<b>Name</b>																							MODE		SCANRESINV	STRSAMPLE	COMP	DECODE									

Bit	Name	Reset	Access	Description
31:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9:8	MODE	0x0	RW	<b>Configure evaluation mode</b> Select which evaluation mode to be used on the measurement result
	Value	Mode		Description
	0	THRES		Threshold comparison is used to evaluate sensor result
	1	SLIDINGWIN		Sliding window is used to evaluate sensor result
	2	STEPDET		Step detection is used to evaluate sensor result
7	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
6	SCANRESINV	0x0	RW	<b>Enable inversion of result</b> If set, the result is inverted and stored in SCANRES .
5:4	STRSAMPLE	0x0	RW	<b>Enable storing of sensor sample in result</b> If set, the sensor sample value will be stored and available in the result buffer
	Value	Mode		Description
	0	DISABLE		Nothing will be stored in the result buffer.
	1	DATA		The sensor sample data will be stored in the result buffer.
	2	DATASRC		The data source, i.e. the channel, will be stored alongside the sensor sample data.
3	COMP	0x0	RW	<b>Select mode for threshold comparison</b> Set compare mode
	Value	Mode		Description
	0	LESS		Comparison evaluates to 1 if sensor data is less than CTRTHRESHOLD, or if the ACMP output is 0
	1	GE		Comparison evaluates to 1 if sensor data is greater than, or equal to CTRTHRESHOLD, or if the ACMP output is 1
2	DECODE	0x0	RW	<b>Send result to decoder</b>

Bit	Name	Reset	Access	Description
				If set, the result from this channel will be shifted into the decoder register.
1:0	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		

### 29.6.26 LESENSE\_CHx\_EVALTHRES - Scan Configuration

Offset	Bit Position																															
0x10C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																	0x0															
<b>Access</b>																	RW															
<b>Name</b>																	EVALTHRES															

Bit	Name	Reset	Access	Description
31:16	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>		
15:0	EVALTHRES	0x0	RW	<b>Threshold</b> This is the THRESHOLD used for evaluating the sensor results in the different evaluation modes.

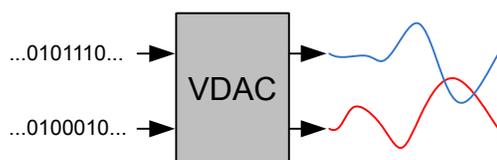

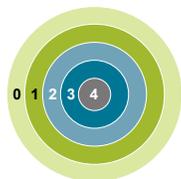

### 29.6.27 LESENSE\_STx\_ARC - State Transition Arc

Offset	Bit Position																															
0x200	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

<b>Access</b>												RW	RW				RW			RW			RW			RW						
<b>Name</b>												SETIF	NEXTSTATE				PRSACT			CURSTATE			SMASK			SCOMP						

Bit	Name	Reset	Access	Description
31:22	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
21	SETIF	0x0	RW	<b>Set interrupt flag</b> Set interrupt flag when sensor state equals COMP
20:16	NEXTSTATE	0x0	RW	<b>Next state index</b> Index of next state to be entered if the sensor state equals COMP
15:13	PRSACT	0x0	RW	<b>Configure transition action in normal mode</b> Configure which action to perform when sensor state equals COMP. Note different actions when DECCTRL.PRSCNT = 0 or 1.
	Value	Mode	Description	
	0	NONE	No PRS output generated (if PRSCOUNT == 0), or do not count (if PRSCOUNT == 1).	
	1	PRS0	Pulse generated on LESENSE PRS output 0 (if PRSCOUNT == 0).	
	1	UP	Count Up (if PRSCOUNT == 1).	
	2	PRS1	Pulse generated on LESENSE PRS output 1 (if PRSCOUNT == 0).	
	2	DOWN	Count Down (if PRSCOUNT == 1).	
	3	PRS01	Pulse generated on LESENSE PRS output 0 and 1 (if PRSCOUNT == 0).	
	4	PRS2	Pulse generated on LESENSE PRS output 2. (PRSCOUNT == 0 OR 1).	
	5	PRS02	Pulse generated on LESENSE PRS output 0 and 2 (if PRSCOUNT == 0).	
	5	UPANDPRS2	Count Up and Pulse generated on LESENSE PRS output 2 (if PRSCOUNT == 1).	
	6	PRS12	Pulse generated on LESENSE PRS output 1 and 2 (if PRSCOUNT == 0).	
	6	DOWNANDPRS2	Count Down and Pulse generated on LESENSE PRS output 2 (if PRSCOUNT == 1).	
	7	PRS012	Pulse generated on LESENSE PRS output 0, 1 and 2 (if PRSCOUNT == 0).	

Bit	Name	Reset	Access	Description
12:8	CURSTATE	0x0	RW	<b>Current State</b> Current State Index
7:4	SMASK	0x0	RW	<b>Sensor mask</b> Set bit X to exclude sensor X from evaluation.
3:0	SCOMP	0x0	RW	<b>Sensor compare value</b> State transition is triggered when sensor state equals COMP

## 30. VDAC - Digital to Analog Converter

### Quick Facts

#### What?

The VDAC is designed for low energy consumption, but can also provide very good performance. It can convert digital values to analog signals at up to 500 ksamples/second with 12-bit accuracy.

#### Why?

The VDAC can be used to generate accurate analog signals for sound, sensors and other applications, using only a limited amount of energy.

#### How?

The VDAC can generate high-resolution analog signals while the MCU is operating at low frequencies and with low total power consumption. Using the LDMA, the VDAC can be used to generate waveforms without any CPU intervention. The VDAC is available down to Energy Mode 3.

### 30.1 Introduction

The Voltage Digital to Analog Converter (VDAC) converts a digital value to an analog output voltage. It is useful in a number of different applications such as sensor excitation or low/medium frequency sound output. The VDAC has two rail-to-rail output channels that may act as independent DACs or be combined into a differential pair. The output buffers support high or low power operation as well as a high capacitance mode for driving loads up to 50 pF. Both channels have a 4-word FIFO for efficient throughput and minimum CPU intervention. Flexible conversion trigger sources allow for accurate AC and DC waveform timing, and a special sample-off mode can be used in conjunction with periodic output refresh to reduce energy consumption or act as a temporary excitation source.

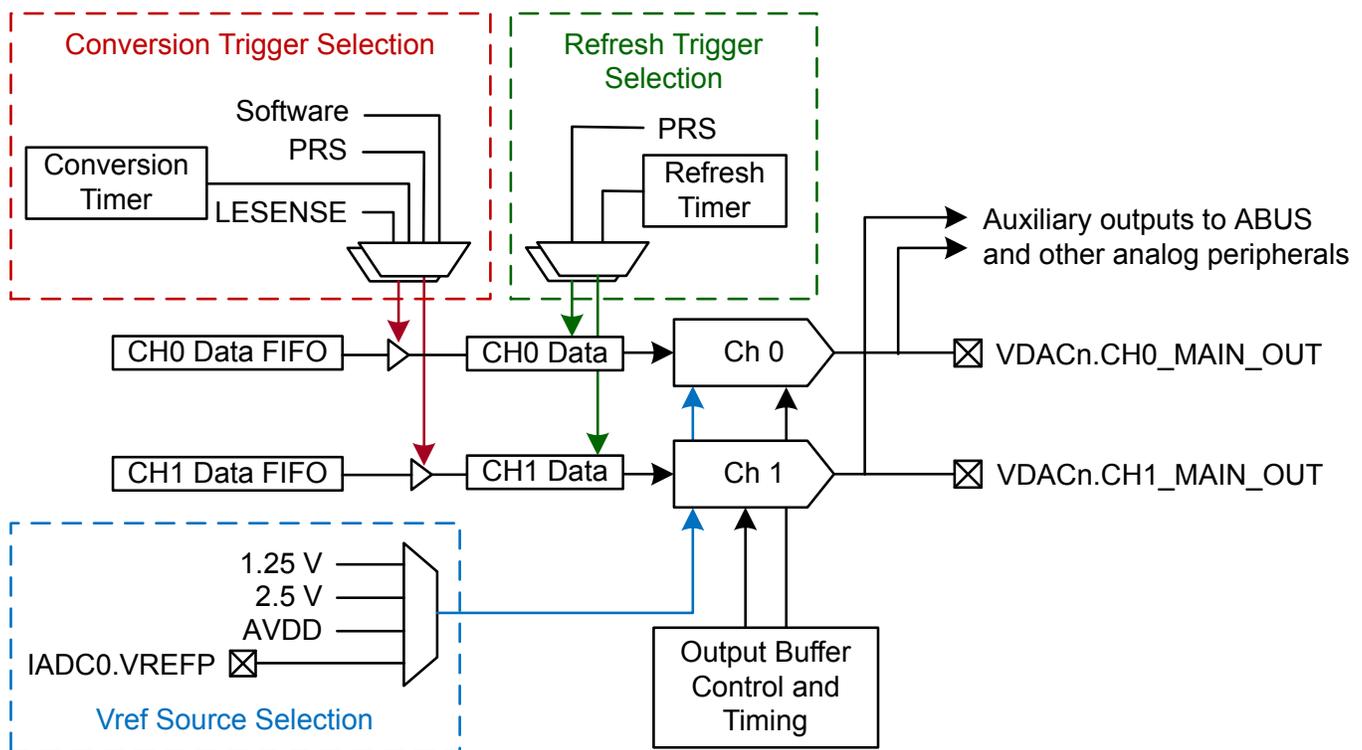

## 30.2 Features

Each VDAC instance in a device supports the following features:

- Up to 500 ksps operation
- Two output channels
  - Can be combined into one differential output
- Integrated 7-bit clock prescaler with division factors ranging from 1 to 128
- Selectable voltage reference
  - Internal 2.5 V (effective full-scale)
  - Internal 1.25 V (effective full-scale)
  - AVDD supply
  - External VREFP pin
- Outputs available for internal and external use
  - Main low-impedance outputs to dedicated GPIO
  - Auxiliary outputs routable through ABUS to any ABUS-capable GPIO (higher impedance)
  - Internal routing of auxiliary outputs to other analog blocks
- Data conversion modes selectable per channel
  - Continuous Mode for high speed conversion or constant DC output
  - Sample-off Mode for per-sample conversion followed by channel disable
- Independent FIFO per channel
  - 4 word (12bit) depth for each channel
  - Programmable data valid level
  - Supports software flush
- Conversion trigger sources
  - Data write (software)
  - PRS input (synchronous and asynchronous)
  - Internal timer with power-of-2 selection from 2-64 prescaled clock cycles
  - LESENSE
- Refresh trigger sources
  - Refresh timer with power-of-2 selection from 2-256 low-frequency clock cycles
  - PRS input (synchronous or asynchronous)
- PRS Communication
  - Separate line for each channel
  - Sync and async PRS output pulse on finished conversion
  - PRS Level Output till channel is warmed
  - Async PRS Output Pulse on Refresh Timer Overflow and Internal Timer Overflow
- LDMA request on FIFO data valid level
  - Independent requests for each DAC channel
- Sine generation mode with differential support

### 30.3 Functional Description

An overview of the VDAC module is shown [Figure 30.1 VDAC Block Overview Diagram on page 1186](#)

**Figure 30.1. VDAC Block Overview Diagram**

#### 30.3.1 Power Supply

The VDAC module power ( $V_{VDAC}$ ) is derived from the AVDD supply pin.

#### 30.3.2 I/O Pin Considerations

The maximum usable analog signal that can be seen on external VDAC outputs depends on both the AVDD and IOVDD supplies. Specifically, the VDAC output will be limited to the lower of the two supply voltages on AVDD and IOVDD.

### 30.3.3 Enabling and Disabling a Channel

The VDAC module is enabled by writing 1 to EN in VDAC\_EN.

A VDAC channel is enabled by writing 1 to the CHxEN and disabled by writing 1 to CHxDIS using in the CMD register. The channel status (enabled or disabled) can be read using the CHxENS bits in the STATUS register. The CHxENS bit will go high after a synchronization delay following a write to CHxEN. When disabling a channel the CHxENS bit will stay high until the VDAC channel is completely disabled.

Software should configure the VDAC before enabling a channel. The following registers are used to configure all the available features of the VDAC:

- VDAC\_CFG
- VDAC\_CH0CFG
- VDAC\_CH1CFG
- VDAC\_OUTTIMERCFG

A VDAC channel will not begin driving its output before it is enabled *and* has received a conversion trigger or refresh trigger. After a channel is enabled, it will listen for either conversion trigger sources specified in TRIGMODE in VDAC\_CHxCFG or refresh trigger sources specified in REFRESHSOURCE in VDAC\_CHxCFG. If TRIGMODE is set to SW and the CHxF FIFO is not empty, a conversion will start immediately when the channel is enabled. When disabling a channel, any pending triggers are flushed.

When disabling the VDAC module, user code must poll the status bit VDAC\_EN.DISABLING to ensure that the module is cleanly reset and back to its initial condition.

### 30.3.4 Clock Selection

The VDAC logic accepts three clock sources from the CMU: LSPCLK, VDACCn\_CLK, and VDACCn\_REFRESH\_CLK. The APB register interface and FIFO write logic are clocked from the LSPCLK. The rest of the VDAC state machine is clocked mainly by a prescaled version of VDACCn\_CLK. VDACCn\_DAC from the CMU can be up to 80 MHz. The PRESC bit field in the CFG register should be set to scale VDACCn\_CLK to no more than 1 MHz. The VDACCn\_REFRESH\_CLK is a low-frequency clock source which only clocks the dedicated refresh timer.

The clock request for VDACCn\_CLK to the CMU from VDAC is on-demand by default. This means the VDAC core clock is gated off most of the time except:

- New Conversion or Refresh Trigger
- Sine Generation Active Window
- VDACCn\_CFG.TRIGMODE = SYNCPRS
- VDACCn\_CFG.REFRESHSOURCE = SYNCPRS
- VDACCn\_CFG.TRIGMODE = SW and the VDAC CHx FIFO is not empty
- VDACCn\_CFG.TRIGMODE = INTTIMER

In some cases it is necessary or preferred to have the VDAC clock active all the time. To turn off on-demand clocking, the VDACCn\_CFG.ONDEMANDCLK bit can be set to '1', which always requests VDACCn\_CLK from the CMU. On-demand clocking should be disabled if EM23GRPACLK is selected for VDACCn\_CLK.

If the VDAC will only perform conversions in EM0 and EM1, any clock source for the VDAC may be used.

If the VDAC is to be operated in EM2 or EM3, VDACCn\_CLK must be configured to use either HFRCOEM23, EM23GRPACLK or FSRCO instead of the EM01GRPACLK clock. FSRCO is the fast start oscillator which starts quickly but is not as accurate as the other oscillators. HFRCOEM23 is generally recommended for EM2/EM3 operation. When using FSRCO or HFRCOEM23, the clock source can be selected to be "on demand" so as not to waste current when the DAC is not doing a conversion. On demand clocking is configured by setting VDACCn\_CFG.ONDEMANDCLK to 0.

EM23GRPACLK is recommended only when VDAC is expected to do very slow sample conversions/refresh. VDACCn\_CFG.ONDEMANDCLK should be set to 1 if EM23GRPACLK is selected as the VDAC clock source.

**Note:** When HFRCOEM23 is selected as a clock source to VDAC and clocking is on-demand (VDACCn\_CFG.ONDEMANDCLK = 0), HFRCOEM23 on-demand clocking must be enabled. This allows the power domain which powers HFRCOEM23 to be ON during EM2 and the clock request to HFRCOEM23 can be honored.

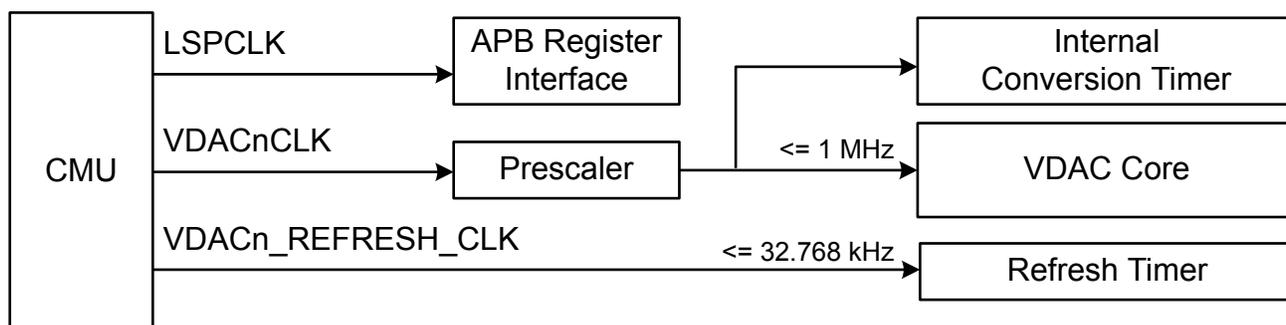

Figure 30.2. VDAC Block Clocks Diagram

### 30.3.4.1 Internal Clock Prescaler

The VDAC has an internal clock prescaler, which can divide the `VDACn_CLK` input clock by any factor between 1 and 128, by setting the `PRESC` field in the `CFG` register. The resulting prescaled clock is 50% duty cycle and is used by the converter core. The frequency is given by [Figure 30.3 VDAC Clock Prescaling on page 1189](#) :

$$f_{\text{CLK\_DAC\_PRESC}} = f_{\text{VDACn\_CLK}} / (\text{PRESC} + 1)$$

**Figure 30.3. VDAC Clock Prescaling**

where  $f_{\text{VDACn\_CLK}}$  is the input clock frequency coming from the CMU. The  $f_{\text{CLK\_DAC\_PRESC}}$  must be programmed to be at most 1 MHz.

The prescaler runs continuously when the VDAC is enabled or when `VDAC_SWRST.SWRST` is set. When running with a prescaler setting higher than 0, there can be an unpredictable delay from the time a conversion was triggered to the time the actual conversion takes place. This is because the conversions are controlled by the prescaled time base, and the conversion can arrive at any time during a prescaled clock (`CLK_DAC_PRESC`) period. A second reason for unpredictable delay between a trigger and the associated conversion is that the activity on one channel can impact whether the VDAC reference is warm or not - when two channels are used independently with warmup, it can impact whether a warmup is required on a trigger.

The uncertainty related to the clock prescaler can be addressed by using `CH0PRESCRST`. If the `CH0PRESCRST` bit in `VDAC_CFG` is set, the prescaler will be reset every time a conversion is triggered on channel 0. This leads to a predictable latency between channel 0 triggers and conversions (assuming the warmup sequence is deterministic as well). If channel *x* is used in continuous mode, the warm-up sequence will only apply once when the channel is enabled and software can use the `VDAC_STATUS.CHxWARM` bit to determine if the VDAC has warmed up.

### 30.3.4.2 VDACn\_REFRESH\_CLK

VDAC also has another clock coming in from the CMU, `VDACn_REFRESH_CLK`. This clock is asynchronous to the `VDACn_CLK` and is used to clock the internal refresh timer. `VDACn_REFRESH_CLK` is connected directly to the `EM23GRPACLK` source in the CMU and hence it is a low-frequency clock source with a maximum frequency of ~32 kHz. The refresh timer inside VDAC is a slow running, low power timer. When this refresh timer is used as a refresh trigger source and the timer overflows, it will trigger a `VDACn_CLK` on-demand request from the CMU.

## 30.3.5 Conversions

The VDAC consists of two channels (channel 0 and 1) with separate 4 deep FIFOs with 12-bits data elements (`VDAC_CHxF.DATA`). These can be used to produce two independent single ended outputs or the channel 0 register can be used to drive both outputs in a differential mode. The VDAC supports two conversion modes: **continuous** and **sample-off**.

### Continuous Mode

In continuous mode the VDAC buffers will remain on, and channels will drive their outputs continuously till the channel is disabled with the data in the `VDAC_CHxF.DATA` register. A channel is configured in continuous mode by programming the `CONVMODE` bitfield in `VDAC_CHxCFG` to `CONTINUOUS`. This mode will maintain the output voltage from a conversion indefinitely, until a new output is triggered or until the channel is disabled.

In continuous mode the `CHxOUTHOLDTIME` field in `VDAC_OUTTIMERCFG` should be programmed to zero to achieve the maximum update rate. Both these settings need to be configured before VDAC module is enabled.

### Sample-off Mode

In sample-off mode the VDAC will only drive the output for a limited time per conversion. A channel is configured in sample-off mode by programming the `CONVMODE` bitfield in `VDAC_CHxCFG` to `SAMPLEOFF`. The `CHxOUTHOLDTIME` field in the `VDAC_OUTTIMERCFG` register determines how long the output will be driven after a conversion or refresh trigger occurs. The VDAC will drive the output for `CHxOUTHOLDTIME` number of `CLK_DAC_PRESC` cycles before tri-stating the output again (and therefore if `CHxOUTHOLDTIME` is set to zero, the output will never be driven when using sample-off mode). Both these settings need to be configured before VDAC module is enabled.

### 30.3.6 Conversion Trigger

Conversions can only be performed while a channel is enabled and the CHx FIF0 is not empty, see [30.3.3 Enabling and Disabling a Channel](#).

- If CHxCFG.TRIGMODE is programmed to SW, a conversion can be started automatically when the CHx.FIF0 is not empty. Writing to the FIF0 will trigger a conversion on the specified channel.
- If CHxCFG.TRIGMODE is programmed to SYNCPRS or ASYNCPRS, a conversion can be started by an incoming pulse on the selected PRS channel. VDAC expects a PRS pulse coming from both synchronous and asynchronous PRS producers. Depending on the TRIGMODE and channel enable, the VDAC will process the PRS pulse from the respective producer.
- If CHxCFG.TRIGMODE is programmed to INTERNALTIMER, the internal timer is used to start conversions, and a new conversion will start on any overflow of the internal timer. See [30.3.13 Internal Timers](#).
- For Channel 0, if CH0CFG.TRIGMODE is programmed to LESENSE a conversion will start when the LESENSE block sends a request. This setting needs to be selected whenever the channel 0 is under LESENSE control. Note that LESENSE can only trigger a conversion to Channel 0 and not Channel 1.

### 30.3.7 Refresh Trigger

The refresh mechanism can be used to periodically refresh the output with the most recent conversion result. A refresh trigger can only happen while a channel is enabled, see [30.3.3 Enabling and Disabling a Channel](#).

- If CHxCFG.REFRESHSOURCE is programmed to SYNCPRS or ASYNCPRS, a refresh can be started by an incoming pulse on the selected PRS channel. The VDAC refresh mechanism requires a PRS pulse for either configuration of CHxCFG.REFRESHSOURCE. Depending on the REFRESHSOURCE and channel enable, VDAC processes the PRS pulse from the respective producer.
- If CHxCFG.REFRESHSOURCE is programmed to REFRESHTIMER, a conversion will start on an overflow of the refresh timer. See [30.3.13 Internal Timers](#).

Note: The refresh mechanism never pops a new conversion from the FIF0. It just re-triggers the conversion based on the last data converted by the conversion trigger to generate the same voltage output at the load. A periodic refresh of the output voltage into a suitable RC filter (to reduce ripple) may be a way to establish a low-energy DC bias in some applications.

#### Conversion Trigger and Refresh Trigger co-existence

- Conversion triggers are given preference over refresh triggers. During a conversion trigger sample conversion, if a refresh trigger occurs it is ignored.
- Refresh triggers are served only when the conversion trigger sample conversion is completely finished.
- During a refresh trigger sample conversion, if a conversion trigger occurs, it is held by the VDAC and served once the refresh trigger conversion is finished. The VDAC never ignores conversion triggers.

### 30.3.8 PRS Communication

PRS triggers can be used to set a constant sample frequency, for instance by using a TIMER, or to synchronize conversion events with other hardware. In order to get a jitter-free sample rate from a PRS source, set CHxCFG.TRIGMODE to SYNCPRS and set the CFG.CH0PRESCRST bit to ensure the prescaler is reset on trigger. Note that because the prescaler is shared between channels, this is only possible for channel 0.

For CHxCFG.TRIGMODE / CHxCFG.REFRESHSOURCE of ASYNCPRS, the sample frequency cannot be guaranteed to be jitter-free with respect to the PRS pulses. The CH0PRESCRST bit in VDAC\_CFG can still be set to reset the clock prescaler on every PRS trigger for better predictability. Note, this can be set only on channel 0.

The Input PRS frequency should never be higher than 0.5 MHz (the fastest possible sample rate). In addition, the input PRS frequency should not be higher than  $f_{VDACn\_CLK} / 4$  (in synchronous mode). If the PRS frequency is set too high, some PRS pulses may be dropped and the output can jitter.

VDAC also sends out the following list of output signals as a PRS producer:

- CHxDONEASYNC - CHx Conversion Done Asynchronous PRS Pulse Output
- CHxWARM - CHx Output Valid Async PRS Level Output
- CHxDONESYNC - CHx Conversion Done Sync PRS Pulse Output
- REFRESHTIMEROF - Refresh Timer Overflow Async PRS Pulse Output
- INTERNALTIMEROF - Internal Timer Overflow Async PRS Pulse Output

### 30.3.9 Reference Selection

The VDAC supports four voltage reference options:

- Internal 1.25 V Reference (effective full scale)
- Internal 2.5 V Reference (effective full scale)
- AVDD
- External IADC0.VREFP Pin

The voltage reference is selected by programming the REFRSEL field in VDAC\_CFG, and is shared for both VDAC channels. The selected voltage reference sets the full scale output voltage of the VDAC. In the case of the internal 1.25 V and 2.5 V reference options, the VDAC uses a lower internal voltage as the reference, and scaling techniques to produce an effective full scale voltage of 1.25 V or 2.5 V respectively. The 2.5 V internal reference can still be used over the entire supply voltage range of the device without any dropout. However, the output will be limited by the supply rail(s) and VDAC will not be able to drive above the supply.

### 30.3.10 Power Modes

The VDAC supports independently-selectable high power and low power modes per channel. Each has a maximum load capacitance of 50 pF. The power mode for each channel is configured by setting VDAC\_CHxCFG.POWERMODE. By default, the VDAC starts in HIGHPOWER mode.

VDAC also supports an additional high capacitance load mode in conjunction with the HIGHPOWER power mode. High capacitance mode is enabled by setting VDAC\_CHxCFG.HIGHCAPLOADEN to 1. The minimum load capacitance on the pin is 25 nF for this mode.

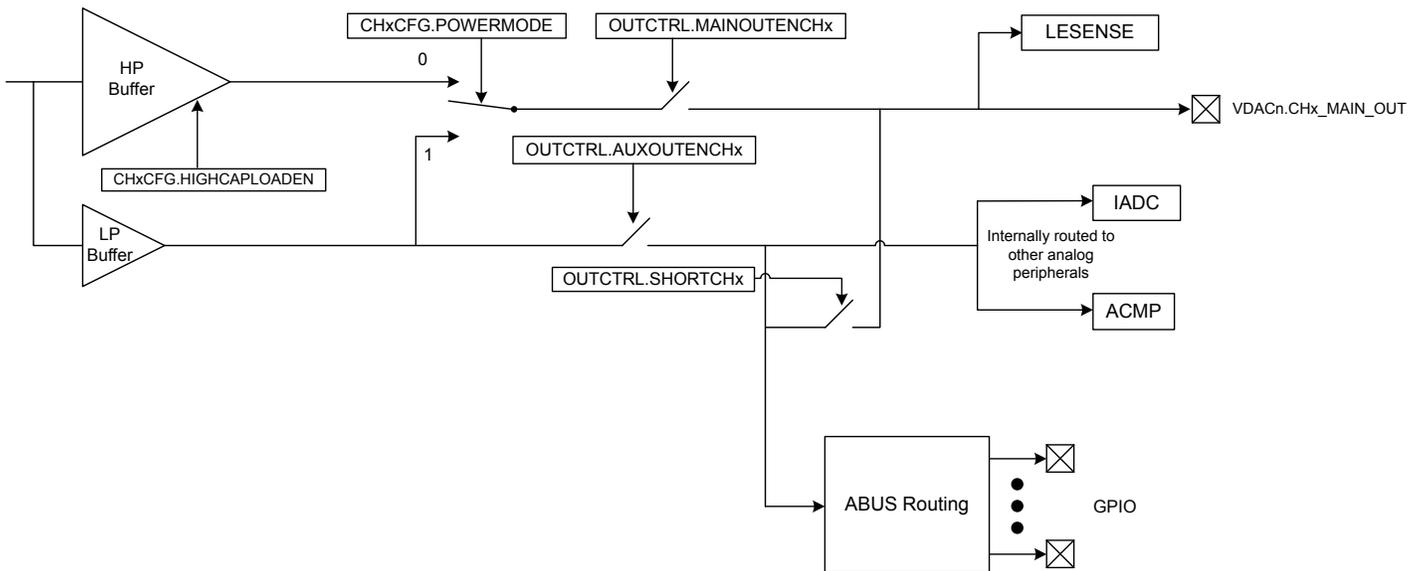

Figure 30.4. VDAC Block Power Modes Diagram

### 30.3.11 Warmup Time and Initial Conversion

When a channel is enabled, it needs to warm up. This is performed automatically when the channel is enabled if the CONVMODE in VDAC\_CHxCFG is set to Continuous mode.

If the CONVMODE in VDAC\_CHxCFG is set to Sample-off mode, then every sample conversion is preceded by warmup of the VDAC. Hence, the sample conversion time in case of sample-off mode includes the WARMUPTIME of the VDAC too.

The time allocated for warmup depends on the WARMUPTIME field in VDAC\_CFG. WARMUPTIME is specified in prescaled VDACn\_CLK cycles and should be set to a minimum of 3 us (3 clocks if CLK\_DAC\_PRESC = 1 MHz). Software is responsible for programming the correct value to WARMUPTIME before enabling a channel. If the time is programmed too short, an undefined voltage may be output until the analog portion of VDAC settles.

The CHxWARM bits in VDAC\_STATUS are set when the warmup period has completed. A consequence of the warmup period is that in continuous mode, the recommended programming model is to either wait for CHxWARM status before starting conversions in order to make sure all samples have the same timing, or perform a dummy conversion to make the VDAC settle to a known voltage first.

### 30.3.12 Output Mode

The two VDAC channels can act as two separate single-ended channels or be combined into one differential channel. This is selected through the DIFF bit in VDAC\_CFG.

#### ■ Single Ended Output

When operating in single ended mode, the channel 0 output is on VDAC\_OUT0 and the channel 1 output is on VDAC\_OUT1. The output voltage can be calculated using [Figure 30.5 VDAC Single Ended Output Voltage on page 1192](#)

$$V_{OUT} = V_{VDACn\_OUTx} - V_{SS} = V_{ref} \times CHxDATA/4096$$

**Figure 30.5. VDAC Single Ended Output Voltage**

where CHxDATA is a 12-bit unsigned integer.

#### ■ Differential Output

When operating in differential mode, both VDAC outputs are used to produce a differential output. The conversion uses the VDAC\_CH0DATA buffer as the data source. The data written to VDAC\_CH0DATA is interpreted as a two's complement number, with the MSB of the 12-bit value being the sign bit. Conceptually, a 'positive' and 'negative' output, with a common-mode voltage of  $V_{ref}/2$  are generated from this information.

The positive output appears on VDAC\_CH1 and the negative output appears on VDAC\_CH0. The output voltage can be calculated using [Figure 30.6 VDAC Differential Output Voltage on page 1192](#):

$$V_{OUT} = V_{VDACn\_CH1} - V_{VDACn\_CH0} = V_{ref} \times CH0DATA/2048$$

**Figure 30.6. VDAC Differential Output Voltage**

where CH0DATA is a 12-bit signed integer. The common mode voltage is  $V_{ref}/2$ .

When using differential mode, the user needs to program only CH0 settings to reflect to both channels. Any programmed settings in CH1 will be ignored in differential mode.

### 30.3.13 Internal Timers

VDAC has two internal timers that run independently of each other:

#### Conversion Timer

VDAC includes an internal conversion timer. This conversion timer is automatically started if a channel selects INTERNALTIMER as TRIGMODE in VDAC\_CHxCFG register and the channel is enabled. The conversion timer will count the number of prescaled VDACn\_CLK cycles programmed in VDAC\_CFG.TIMER\_OVERFLOW\_PERIOD before wrapping and generating a conversion trigger. The timer overflow period is from 2-64 prescaled VDACn\_CLK cycles. The conversion timer overflow automatically initiates the sample conversion if the CHxF FIFO is not empty.

INTERNALTIMER\_OF is also available as an asynchronous PRS signal, generating a pulse that lasts for 1 prescaled VDACn\_CLK cycle. Note that since this timer runs off prescaled VDACn\_CLK, the VDACn\_CLK is always requested from the CMU when the internal conversion timer is used.

#### Refresh Timer

VDAC includes an internal low power refresh timer. This refresh timer is automatically started if a channel selects REFRESHTIMER as REFRESH\_SOURCE in VDAC\_CHxCFG register and the channel is enabled. The refresh timer will count the number of VDACn\_REFRESH\_CLK cycles programmed in VDC\_CFG.REFRESH\_PERIOD before wrapping and generating a refresh trigger. The refresh period is from 2-256 VDACn\_REFRESH\_CLK cycles. The refresh timer overflow automatically initiates the refresh.

REFRESHTIMER\_OF is also available as an asynchronous PRS signal, generating a pulse that lasts for 1 VDACn\_REFRESH\_CLK cycle. Note that since this timer runs off VDACn\_REFRESH\_CLK, which is asynchronous to VDACn\_CLK, VDACn\_CLK is only requested from the CMU when the refresh timer overflows. Also, as discussed in [30.3.4 Clock Selection](#), this timer always runs off a slow clock, hence this refresh conversion is low power.

### 30.3.14 FIFO

VDAC has two FIFOs, one for each channel. Each FIFO is 4 samples deep. Data is pushed into the FIFO by either the CPU or LDMA, and happens on the bus clock. Samples are popped from the FIFO on the VDACn\_CLK domain by the VDAC core whenever there is a new conversion trigger. Both FIFOs support a data flush from the CPU.

#### CHx FIFO Programming Model

Before enabling VDAC, set the low threshold Data Valid Level for each channel by programming VDAC\_CHxCFG.FIFODVL Bit. If in DIFF Mode, the channel 1 DVL settings are ignored. Fill the VDAC\_CHxF.DATA with the number of entries greater than programmed DVL to avoid triggering of DVL Interrupt. Details of the DVL Interrupt are explained in [30.3.18 Interrupts and Wakeup](#). The number of valid entries per channel can be read from VDAC\_STATUS.CHxFIFOCNT (only if VDAC\_CFG.ONDEMANDCLK is set to 1). The status of whether the FIFO is full or empty can be read from VDAC\_STATUS.CHxFIFOFULL and VDAC\_STATUS.CHxFIFOEMPTY respectively.

#### CHx FIFO Flush Programming Model

In case there is incorrect data programmed in the FIFO or in the event of a FIFO overflow, the CPU can issue a flush by programming VDAC\_CMD.CHxFIFOFLUSH. This flush bit resets both the write pointer (in the bus clock domain) and the read pointer (in the CLK\_DAC domain) together. During a flush, new conversions should not be triggered on the channel whose FIFO contents are flushed. The flush status is reported with the VDAC\_STATUS.CHxFIFOFLBUSY bit, which will remain high during the flush operation and return low when it is complete. Since the CPU issues flush to the CHx FIFO, there are several steps that should be followed in order to avoid any spurious voltage at VDAC Output:

- Disable the channel using VDAC\_CMD.CHxDIS = 1
- Disable the VDAC channel in the LDMA to avoid any new CHxFIFO writes during flushing
- Issue the flush command and poll the VDAC\_STATUS.CHxFIFOFLBUSY status bit
- After flushing is complete, re-enable the VDAC channel and optionally re-program the LDMA

### 30.3.15 Keepwarm Sub-modes

VDAC has two keepwarm modes that can be used with Sample-off Conversion Mode to define the behaviour of the analog portion of the VDAC between sample conversions. The keepwarm mode needs to be set along with Sample-off Conversion Mode before enabling the VDAC module. The two options are:

#### Bias Keepwarm

Bias Keepwarm Mode is primarily used to reduce kickback to the reference bias, in case it is shared with IADC. This mode can be activated by setting the VDAC\_CFG.BIASKEEPWARM Bit to 1. During this mode, the VDAC Analog Bias remains ON in between sample conversions instead of shutting down after the hold time expires.

This mode is only relevant when using the internal 1.25 V or 2.5 V reference selections. This mode does not reduce the required warm-up time of the VDAC. Enabling this mode will typically cost about 4 uA of additional current when the VDAC is idle. The VDAC analog bias remains on irrespective of the channel enable/disable, until the VDAC module is disabled.

#### Channel Keepwarm

Channel Keepwarm Mode is primarily used to reduce kickback between the two channels, or to reduce the start-up time of the VDAC in-between sample conversions. This mode is activated per channel by setting the VDAC\_CHxCFG.KEEPWARM bit to 1. During this mode, the VDAC remains warmed up in-between sample conversions and can convert new samples without incurring a warm up delay. This mode can only be used with Sample-off conversion mode. Setting this mode typically costs about 10-20 uA of additional current when the VDAC is idle.

### 30.3.16 LDMA Interface

The VDAC has two FIFOs (one per channel) which can be filled using the LDMA whenever there is space available in the FIFO. To facilitate this, the VDAC generates a DMA request per channel to the LDMA when the FIFO count reaches the lower threshold Data Valid Level (DVL). DVL is set by programming VDAC\_CHxCFG.FIFODVL to set the watermark.

#### DMA REQ and SREQ

Both Channel 0 and 1 generate DMA requests in the bus clock domain only when the VDAC\_CMD.CHxEN bit is set. In the case of DIFF mode, Channel 1 will not generate LDMA requests. The FIFOs are initially empty, hence as soon as the channels are enabled, each channel will send out a DMA REQ. The request is cleared when FIFO is filled beyond DVL+1.

If there is at least 1 valid space in the FIFO and the DMA channel is not active, each VDAC channel will also send a SREQ to LDMA. This SREQ is also gated with the channel enable.

## EM2 Operation

When the system is in EM2, the VDAC can generate new DMA requests as well. This feature can be enabled by setting the VDAC\_CFG.DMAWU bit to 1 before enabling VDAC. When enabled and the FIFO count in the read domain falls below the programmed DVL setting, the VDAC will generate a request to the EMU to enter an EM1 state. Once the EMU enters this state and the bus clock is available, VDAC generates the DMA REQ/SREQ per channel to request new data for conversion.

The VDAC keeps the request for data high until the FIFO count is above the programmed DVL setting. Once the condition is met, VDAC automatically pulls the request low and the system can return fully to EM2.

### 30.3.17 Sine Generation Mode

The VDAC contains an automatic sine-generation mode, which is enabled by setting the SINEMODE bit in VDAC\_CFG. In this mode, the VDAC data from the FIFO is overridden with data from an internal hard-coded sine lookup table.

Sine mode is supported only for the fastest configuration of the VDAC in continuous mode. Therefore the CONVMODE bit in VDAC\_CH0CFG needs to be set to CONTINUOUS and the CH0OUTHOLDTIME bit in VDAC\_OUTTIMERCFG needs to be programmed to zero for channel 0 to use sine generation mode. The TRIGMODE and REFRESHSOURCE bitfields in VDAC\_CHxCFG need to be programmed to NONE for channel 0 in order to avoid interference in sine output generation from other triggers. Other trigger modes are not supported. The SINE wave will always be output on channel 0 and therefore requires that this channel is enabled by writing 1 to CH0EN in the VDAC\_CMD register. If DIFF is set in VDAC\_CFG, the sine wave will additionally be output on channel 1, but inverted. Note that the first sample will only be available after the CHxWARMED bit is 1 in VDAC\_STATUS register after setting CH0EN =1 in VDAC\_CMD.

Each period, starting at 0 degrees, is made up of 16 samples and the frequency is given by [Figure 30.7 VDAC Sine Generation Frequency on page 1194](#).

$$f_{\text{sine}} = f_{\text{CLK\_DAC\_PRESC}} / 32$$

**Figure 30.7. VDAC Sine Generation Frequency**

When DIFF is 0 and SINEMODE is 1 in VDAC\_CFG, a sine wave will be generated on channel 0 but channel 1 can still be used independently as a single-ended DAC output. Channel 1 settings are ignored if DIFF is 1.

To configure the VDAC for sine wave output:

- Set VDAC\_CFG.SINEMODE to 1 to put the VDAC in sine wave mode
- Set VDAC\_CH0CFG.CONVMODE to CONTINUOUS
- Set VDAC\_CH0CFG.TRIGMODE to NONE
- Set VDAC\_CH0CFG.REFRESHSOURCE to NONE
- Set VDAC\_OUTTIMERCFG.CH0OUTHOLDTIME to 0
- Configure VDAC\_CFG.DIFF for single-ended or differential output
  - 0 = Single ended output (only channel 0 is used)
  - 1 = Enable differential output (both channel 0 and channel 1 will be used)
- Configure VDAC\_CFG.SINERESET for desired behavior when halted
  - 0 = Sine wave output is not reset when halted, and will continue at the next sample when re-started
  - 1 = Sine wave output is reset to 0 degrees when halted, and output will return to Vref / 2
- Set VDAC\_CFG.CH0EN to 1 to enable the VDAC module

### 30.3.17.1 Sine Generation - Software Control

The sine signal generation may be controlled by software using the SINEMODESTART and SINEMODESTOP commands in VDAC\_CMD. When SINEMODESTART is set to 1, sine wave generation will be started. Setting SINEMODESTOP to 1 will halt the sine wave generation. If SINERESET in VDAC\_CFG is set to 1, the sine output will be reset to 0 degrees when the SINEMODESTOP bit is set to 1, resulting in a voltage of  $V_{ref} / 2$  on the output channel(s). If SINERESET equals 0, a SINEMODESTOP command will stop progress of the sine wave at the sample currently being output. The sine will continue at the next sample when SINEMODESTART is issued again.

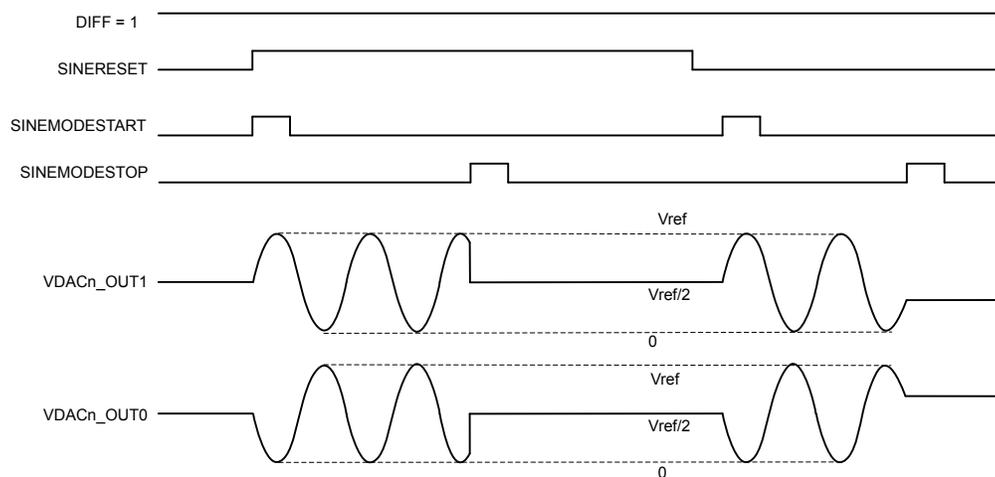

Figure 30.8. VDAC Sine Mode - Software Control

### 30.3.18 Interrupts and Wakeup

The VDAC has several interrupt flags in the VDAC\_IF register, indicating various state and error conditions related to output, FIFO status, and conversions. Each channel has a separate set of interrupt flags.

- **Conversion Done**

The Conversion Done (CHxCD) interrupt flags are set when a conversion is complete. The flags are set after a channel has driven the output with the programmed code.

- **Data Valid Level (DVL)**

The Data Valid Level (CHxDVL) interrupt flags are set when the FIFO Count reaches below or equal to Data Valid Level (DVL). The DVL number is programmed in CHxCFG.DVL Register Bits. These flags are initially set, and gets cleared when CHxF FIFO is filled with new set of data, thereby making count  $\geq$  DVL. The FIFO Count can be read through VDAC\_STATUS.CHxFIFOCNT Flag. Note that this fifo count is generated in the read domain, hence expect read synchronization delay for the count value.

- **Overflow/Underflow**

If a write is attempted in CHxF FIFO whilst it is full, the channel overflow flag (CHxOF) will be set. If a new conversion is triggered (e.g. via PRS) before whilst CHxF FIFO is empty, the channel underflow flag (CHxUF) will be set. The FIFO full and empty status can be read through VDAC\_STATUS.CHxFIFOFULL and VDAC\_STATUS.CHxFIFOEMPTY Flags.

- **ABUS Conflict/Allocation Error**

In case both channel 0 and channel 1 request the same Port and Pin for conversion output through ABUS, an ABUS Conflict Error IF (ABUSINPUTCONFLICT) will be set. In case the ABUS Allocation is not coherent with Programmed Port and Pin Setting for either channel, ABUS Allocation Error interrupt flag (ABUSALLOCERR) will be set.

Not all interrupt flags will wake up EMU to EM0 when the VDAC is operating in EM2. Only those interrupts that need interaction with the host will wakeup the CPU. For this, DVL, ABUSALLOCERR and/or ABUSINPUTCONFLICT are used as wakeup interrupt source too.

### 30.3.19 LESENSE Operation

VDAC Channel 0 can be controlled by LESENSE by programming the TRIGMODE field in VDAC\_CH0CFG to LESENSE. In LESENSE mode the conversion data can come from either the VDAC\_CHx0 FIFO or LESENSE registers, depending on the LESENSE configuration. The trigger events are also controlled by the LESENSE state machine.

When used for LESENSE, the MAIN output must be enabled and it will be driven to the main output pin. LESENSE may switch this output to connect to one of its defined DAC output pins as needed.

All the programmed VDAC settings (including the Keepwarm Modes) will be over-written by LESENSE configuration. See the LESENSE chapter for more information.

### 30.3.20 VDAC Output Configuration

The VDAC analog outputs can be routed either to specific fixed pins, to configurable GPIO through ABUS, or used internally by other blocks. These settings can be programmed in the VDAC\_OUTCTRL register after VDAC is enabled but ideally before channels are enabled. The possible settings are as follows:

- VDAC\_OUTCTRL.MAINOUTENCHx - Set this bit to route VDAC channel analog main output to the dedicated pin (CHx\_MAIN\_OUT). This is the preferred option for any DAC output. This option is also required when using VDAC CH0 in conjunction with the LESENSE switched outputs.
- VDAC\_OUTCTRL.AUXOUTENCHx - Set this bit to route VDAC channel analog auxiliary output to internal blocks such as IADC and ACMP, or to the ABUS interconnect matrix, where it can be routed to any port I/O supporting ABUS. Note that the ABUS multiplexer adds significant impedance, and this option may not be suitable for certain loads or dynamic conditions.
- VDAC\_OUTCTRL.SHORTCHx - Set this bit when using the high-power buffer option with the auxiliary outputs. This will short the MAIN and AUX outputs together. The MAIN output is still driven in this configuration.
- VDAC\_OUTCTRL.ABUSPORTSELCHx - Select a particular ABUS port for the channel. Choose values from PORTA, PORTB, PORTC, PORTD
- VDAC\_OUTCTRL.ABUSPINSELCHx - Select a particular ABUS pin for the channel. Program the pin in conjunction with the port to route the analog output to a particular GPIO.

Note: Once the channel is enabled, the output control settings in VDAC and the ABUS configuration in both VDAC and GPIO should not be changed until the channel is disabled. Changing these settings while enabled may cause spurious voltage generation on random GPIO.

#### ABUS Allocation Rules to VDAC in GPIO

- AEVEN0/BEVEN0/CDEVEN0 can only be allocated to CH0
- AEVEN1/BEVEN1/CDEVEN1 can only be allocated to CH1
- AODD0/BODD0/CDODD0 can only be allocated to CH0
- AODD1/BODD1/CDODD1 can only be allocated to CH1
- The port and pin requested by ABUSPORTSELCHx/ABUSPINSELCHx must match a bus allocated to VDAC CHx.

For example, if AEVEN0 is the only bus allocated to CH0, the selected port must be port A, and the selected pin must be even.

More details on ABUS allocation can be found in GPIO chapter

### 30.4 VDAC Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	VDAC_IPVERSION	R	IPVERSION
0x004	VDAC_EN	RW ENABLE	Module Enable

## 30.5 VDAC Register Description

### 30.5.1 VDAC\_IPVERSION - IPVERSION

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																0x1																
<b>Access</b>																R																
<b>Name</b>																IPVERSION																

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x1	R	<b>IPVERSION</b>

The read only IPVERSION field gives the version for this module. There may be minor software changes required for modules with different values of IPVERSION.

### 30.5.2 VDAC\_EN - Module Enable

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	0x0
<b>Access</b>																															R	RW
<b>Name</b>																															DISABLING	EN

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISABLING	0x0	R	<b>Disablement busy status</b>  When EN is cleared, DISABLING is set immediately, and cleared when disablement finishes. Disablement resets peripheral cores and not APB registers except hardware updated registers such as INTFLAGs and FIFOs.
0	EN	0x0	RW	<b>VDAC Module Enable</b>  Enable the VDAC module. When EN is cleared(disablement), it halts module operation immediately, and initialize the core domain such that when the is re-enabled, it starts cleanly.
	Value	Mode		Description
	0	DISABLE		Disable
	1	ENABLE		Enable

### 30.5.3 VDAC\_SWRST - Software Reset Register

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	0x0
<b>Access</b>																															R	W
<b>Name</b>																															RESETTING	SWRST

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	RESETTING	0x0	R	<b>Software reset busy status</b>  When SWRST command is issued, resetting logic sets RESETTING status immediately, and later it is cleared when reset process finishes.
0	SWRST	0x0	W	<b>Software reset command</b>  A software reset command field resets the module back to the initial condition, similar to a power on reset condition

### 30.5.4 VDACC\_CFG - Config Register

Offset	Bit Position																																
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Reset			0x2		0x0	0x0	0x0	0x0			0x0				0x0							0x0						0x0	0x0	0x0	0x0	0x0	0x0
Access			RW		RW	RW	RW	RW			RW				RW								RW						RW	RW	RW	RW	RW
Name			WARMUPTIME		DBGHALT	ONDEMANDCLK	DMAWU	BIASKEEPWARM			REFRESHPERIOD				TIMEROVRFLOWPERIOD								PRESC					REFRSEL	CHOPRESCRST	SINERESET	SINEMODE	DIFF	

Bit	Name	Reset	Access	Description									
31	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>											
30:28	WARMUPTIME	0x2	RW	<b>DAC Warmup Time</b> Number of prescaled CLK_DAC +1 cycles for the VDAC to Warmup. Default is (2+1) prescaled CLK_DAC cycles.									
27	DBGHALT	0x0	RW	<b>Debug Halt</b> VDAC behavior when halted by debugger  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>NORMAL</td> <td>Continue operation as normal during debug mode</td> </tr> <tr> <td>1</td> <td>HALT</td> <td>Complete the current conversion and then halt during debug mode</td> </tr> </tbody> </table>	Value	Mode	Description	0	NORMAL	Continue operation as normal during debug mode	1	HALT	Complete the current conversion and then halt during debug mode
Value	Mode	Description											
0	NORMAL	Continue operation as normal during debug mode											
1	HALT	Complete the current conversion and then halt during debug mode											
26	ONDEMANDCLK	0x0	RW	<b>Always allow clk_dac</b> Setting this bit to 1 always allows CLK_DAC from CMU									
25	DMAWU	0x0	RW	<b>VDAC DMA Wakeup</b> Set to enable wakeup from EM2 to EM1 for DMA to fill CHx FIFO Data									
24	BIASKEEPWARM	0x0	RW	<b>Bias Keepwarm Mode Enable</b> Set this bit to keep the Bias on for Analog portion of DAC in between conversions. Primary purpose, is to reduce kick-back to the reference shared with IADC. Relevant only for Sample-off Mode									
23	Reserved	To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a>											
22:20	REFRESHPERIOD	0x0	RW	<b>Refresh Timer Overflow Period</b> Select refresh counter period. A channel x will be refreshed with the period set in REFRESHPERIOD if the channel in VDACCn_CHxCFG has its REFRESHSOURCE set to REFRESHTIMER  <table border="1"> <thead> <tr> <th>Value</th> <th>Mode</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>CYCLES2</td> <td>All channels with enabled refresh are refreshed every 2 CLK_REFRESH cycles</td> </tr> </tbody> </table>	Value	Mode	Description	0	CYCLES2	All channels with enabled refresh are refreshed every 2 CLK_REFRESH cycles			
Value	Mode	Description											
0	CYCLES2	All channels with enabled refresh are refreshed every 2 CLK_REFRESH cycles											

Bit	Name	Reset	Access	Description
1		CYCLES4		All channels with enabled refresh are refreshed every 4 CLK_REFRESH cycles
2		CYCLES8		All channels with enabled refresh are refreshed every 8 CLK_REFRESH cycles
3		CYCLES16		All channels with enabled refresh are refreshed every 16 CLK_REFRESH cycles
4		CYCLES32		All channels with enabled refresh are refreshed every 32 CLK_REFRESH cycles
5		CYCLES64		All channels with enabled refresh are refreshed every 64 CLK_REFRESH cycles
6		CYCLES128		All channels with enabled refresh are refreshed every 128 CLK_REFRESH cycles
7		CYCLES256		All channels with enabled refresh are refreshed every 256 CLK_REFRESH cycles
19	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
18:16	TIMEROVRFLOWPERIOD	0x0	RW	<b>Internal Timer Overflow Period</b>  Select internal timer overflow period. A channel x will be provided with a conversion trigger after the period set in TIME-ROVRFLOWPERIOD if the channel in VDACn_CHxCFG has its TRIGMODE set to INTERNALTIMER
	Value	Mode	Description	
	0	CYCLES2	The Timer overflows every 2 Prescaled CLK_DAC cycles	
	1	CYCLES4	The Timer overflows every 4 Prescaled CLK_DAC cycles	
	2	CYCLES8	The Timer overflows every 8 Prescaled CLK_DAC cycles	
	3	CYCLES16	The Timer overflows every 16 Prescaled CLK_DAC cycles	
	4	CYCLES32	The Timer overflows every 32 Prescaled CLK_DAC cycles	
	5	CYCLES64	The Timer overflows every 64 Prescaled CLK_DAC cycles	
15:14	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
13:7	PRESC	0x0	RW	<b>Prescaler Setting for DAC clock</b>  Selected DAC clock source is prescaled by PRESC+1 to generate prescaled CLK_DAC with 50% duty cycle
6	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
5:4	REFRSEL	0x0	RW	<b>Reference Selection</b>  Select reference for analog portion of DAC
	Value	Mode	Description	
	0	V125	Internal 1.25 V bandgap reference	
	1	V25	Internal 2.5 V bandgap reference	
	2	VDD	AVDD reference	
	3	EXT	External pin reference	

Bit	Name	Reset	Access	Description
3	CH0PRESCRST	0x0	RW	<b>Channel 0 Start Reset Prescaler</b> Select if prescaler (determining prescaled CLK_DAC rate) is reset on channel 0 start.
	Value	Mode		Description
	0	NORESETPRESC		Prescaler not reset on channel 0 start
	1	RESETPRESC		Prescaler reset on channel 0 start
2	SINERESSET	0x0	RW	<b>Sine Wave Reset When inactive</b> In case SINERESSET is 0, SINEMODESTOP will stop progress of the sine wave at the sample currently being output in sinemode. When Set to 1, the sine output will reset to 0 degrees when SINEMODESTOP
1	SINEMODE	0x0	RW	<b>Sine Mode</b> Enable/disable sine mode.
	Value	Mode		Description
	0	DISSINEMODE		Sine mode disabled. Sine reset to 0 degrees
	1	ENSINEMODE		Sine mode enabled
0	DIFF	0x0	RW	<b>Differential Mode</b> Select single ended or differential mode.
	Value	Mode		Description
	0	SINGLEENDED		Single ended output
	1	DIFFERENTIAL		Differential output

## 30.5.5 VDAC\_STATUS - Status Register

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset	0x0	0x0	0x0	0x0	0x0	0x0			0x0	0x0		0x0	0x0			0x0			0x0				0x0	0x0			0x0	0x0			0x0	0x0
Access	R	R	R	R	R	R			R	R		R	R			R			R				R	R			R	R			R	R
Name	SYNCBUSY	ABUSALLOCERR	SINEACTIVE	ABUSINPUTCONFLICT	CH1FIFOFLBUSY	CH0FIFOFLBUSY			CH1FIFOEMPTY	CH0FIFOEMPTY		CH1CURRENTSTATE	CH0CURRENTSTATE			CH1FIFOCNT			CH0FIFOCNT				CH1FIFOFULL	CH0FIFOFULL			CH1WARM	CH0WARM			CH1ENS	CH0ENS

Bit	Name	Reset	Access	Description
31	SYNCBUSY	0x0	R	<b>Sync Busy Combined</b> Indicates synchronization ongoing
30	ABUSALLOCERR	0x0	R	<b>ABUS Allocation Error Status</b> 1 if ABUS requested is not allocated
29	SINEACTIVE	0x0	R	<b>Sine Wave Output Status on Channel</b> 1 indicates that sine wave output is generated on CH0 and/or CH1(in diff mode)
28	ABUSINPUTCONFLICT	0x0	R	<b>ABUS Input Conflict Status</b> 1 if both CH0 and CH1 request the same ABUS
27	CH1FIFOFLBUSY	0x0	R	<b>CH1 FIFO Flush Sync Busy</b> Indicates CH1 FIFO Flush Sync Busy
26	CH0FIFOFLBUSY	0x0	R	<b>CH0 FIFO Flush Sync Busy</b> Indicates CH0 FIFO Flush Sync Busy
25:24	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
23	CH1FIFOEMPTY	0x0	R	<b>Channel 1 FIFO Empty Status</b> 1 if FIFO for Channel 1 is empty
22	CH0FIFOEMPTY	0x0	R	<b>Channel 0 FIFO Empty Status</b> 1 if FIFO for Channel 0 is empty
21	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
20	CH1CURRENTSTATE	0x0	R	<b>Channel 1 Current Status</b> 0 when CH1 is in IDLE State. Set when CH1 is converting data
19	CH0CURRENTSTATE	0x0	R	<b>Channel 0 Current Status</b> 0 when CH0 is in IDLE State. Set when CH0 is converting data
18	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
17:15	CH1FIFOCNT	0x0	R	<b>Channel 1 FIFO Valid Count</b>

Bit	Name	Reset	Access	Description
				Number of Valid Entries in Channel 1. This FIFO entries Count is generated in Read Domain hence expect Synchronization Delay. Need to be used only when VDAC_CFG.ONDEMANDCLK is set to 1.
14:12	CH0FIFOCNT	0x0	R	<b>Channel 0 FIFO Valid Count</b> Number of Valid Entries in Channel 0. This FIFO entries Count is generated in Read Domain hence expect Synchronization Delay. Need to be used only when VDAC_CFG.ONDEMANDCLK is set to 1.
11:10	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
9	CH1FIFOFULL	0x0	R	<b>Channel 1 FIFO Full Status</b> 1 if FIFO for Channel 1 is full
8	CH0FIFOFULL	0x0	R	<b>Channel 0 FIFO Full Status</b> 1 if FIFO for Channel 0 is full
7:6	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
5	CH1WARM	0x0	R	<b>Channel 1 Warmed Status</b> This bit is set when channel 1 has warmed up
4	CH0WARM	0x0	R	<b>Channel 0 Warmed Status</b> This bit is set when channel 0 has warmed up
3:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	CH1ENS	0x0	R	<b>Channel 1 Enabled Status</b> This bit is set when channel 1 is enabled.
0	CH0ENS	0x0	R	<b>Channel 0 Enabled Status</b> This bit is set when channel 0 is enabled.

Bit	Name	Reset	Access	Description
	Value	Mode		Description
	0	NONE		No Conversion Trigger Source Selected for Channel 0
	1	SW		Channel 0 is triggered by Channel 0 FIFO (CH0F) write
	2	SYNCPRS		Channel 0 is triggered by Sync PRS input. PRS Trigger should have the same clock group as VDAC.
	3	LESENSE		Channel 0 is triggered by LESENSE
	4	INTERNALTIMER		Channel 0 is triggered by Internal Timer Overflow
	5	ASYNCPRS		Channel 0 is triggered by Async PRS input
3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	POWERMODE	0x0	RW	<b>Channel 0 Power Mode</b>
	Enable Power Mode for Channel 0			
	Value	Mode		Description
	0	HIGHPOWER		Default is High Power Mode
	1	LOWPOWER		Set this bit for Low Power Mode
1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	CONVMODE	0x0	RW	<b>Channel 0 Conversion Mode</b>
	Configure conversion mode			
	Value	Mode		Description
	0	CONTINUOUS		DAC channel 0 is set in continuous mode
	1	SAMPLEOFF		DAC channel 0 is set in sample/shut off mode

Bit	Name	Reset	Access	Description
	Value	Mode		Description
	0	NONE		No Conversion Trigger Source Selected for Channel 1
	1	SW		Channel 1 is triggered by Channel 1 FIFO (CH1F) write
	2	SYNCPRS		Channel 1 is triggered by Sync PRS input. PRS Trigger should have the same clock group as VDAC.
	4	INTERNALTIMER		Channel 1 is triggered by Internal Timer Overflow
	5	ASYNCPRS		Channel 1 is triggered by Async PRS input
3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2	POWERMODE	0x0	RW	<b>Channel 1 Power Mode</b> Enable Low Power Mode for Channel 1
	Value	Mode		Description
	0	HIGHPOWER		Default is High Power Mode
	1	LOWPOWER		Set this bit for Low Power Mode
1	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
0	CONVMODE	0x0	RW	<b>Channel 1 Conversion Mode</b> Configure conversion mode for Channel 1
	Value	Mode		Description
	0	CONTINUOUS		DAC channel 1 is set in continuous mode
	1	SAMPLEOFF		DAC channel 1 is set in sample/shut off mode

## 31. ACMP - Analog Comparator

### Quick Facts

#### What?

The ACMP (Analog Comparator) compares two analog signals and returns a digital value telling which is greater.

#### Why?

Applications often do not need to know the exact value of an analog signal, only if it has passed a certain threshold. Often the voltage must be monitored continuously, which requires extremely low power consumption.

#### How?

Available down to Energy Mode 3, the ACMP can wake up the system when input signals pass the threshold. The analog comparator can compare two analog signals or one analog signal and a highly configurable internal reference.

### 31.1 Introduction

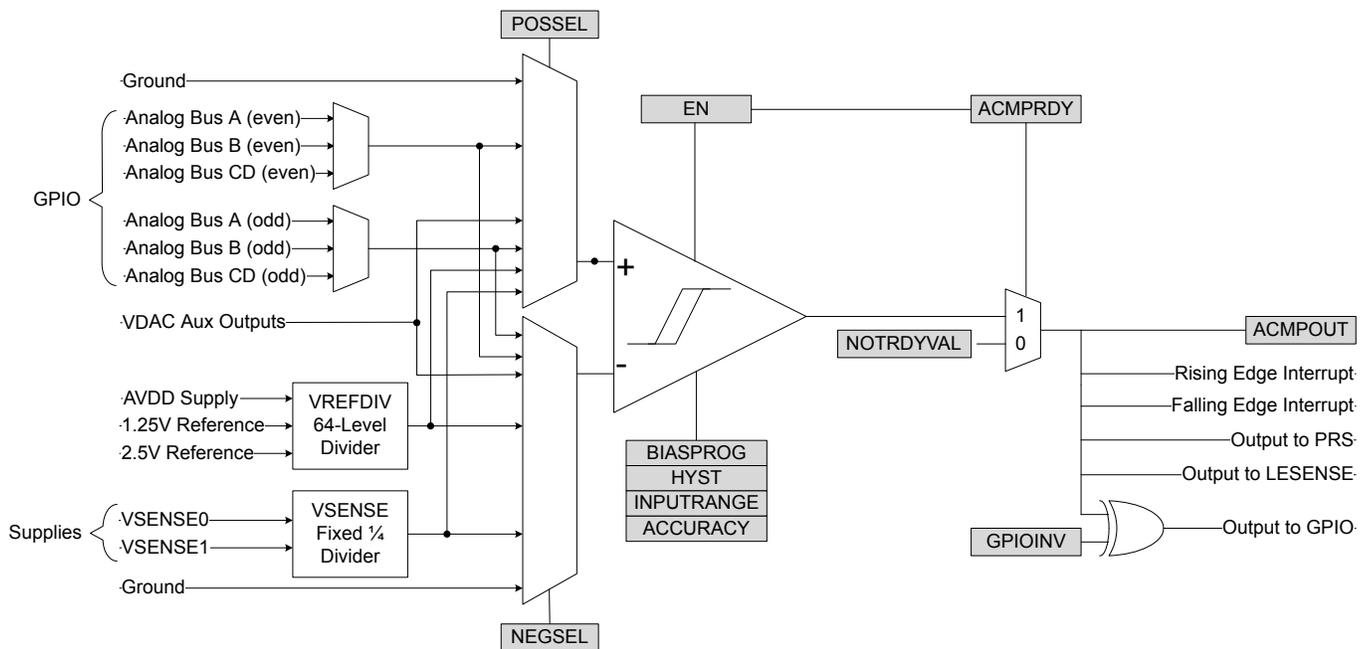

The Analog Comparator compares the voltage of two analog inputs and outputs a digital signal indicating which input voltage is higher. Inputs can either be from internal references or from external pins. Response time, and thereby the current consumption, can be configured by altering the current supply to the comparator.

### 31.2 Features

- Internal and external input selections:
  - External port I/O routed via ABUS
  - Internal 1.25 V bandgap reference voltage with programmable divider
  - Internal 2.5 V bandgap reference voltage with programmable divider
  - AVDD supply voltage with programmable divider
  - VDAC auxiliary outputs
- Voltage supply monitoring
- Configurable hysteresis
- Selectable response time
- Operational in EM0 to EM3
- Asynchronous interrupt generation on selectable edges
- Configurable output state when inactive
- Output routing options:
  - Route to GPIO via DBUS
  - Route to most peripherals via PRS
  - Available to LESENSE logic

### 31.3 Functional Description

An overview of the ACMP is shown in [Figure 31.1 ACMP Overview](#) on page 1217.

**Figure 31.1. ACMP Overview**

The comparator has two analog inputs: one positive and one negative. When the comparator is active, the output indicates which of the two input voltages is higher. When the voltage on the positive input is higher than the voltage on the negative input, the digital output is high and vice versa.

In addition to the comparator core, the ACMP front-end includes reference sources, voltage divider circuits, and input muxes to route signals to the positive and negative inputs. The output from the ACMP is available on both PRS and GPIO, in addition to being observable in the ACMP\_STATUS register.

### 31.3.1 Configuration and Control

The ACMP is configured and controlled through three registers: ACMP\_CFG, ACMP\_CTRL, and ACMP\_INPUTCTRL. Configuration through ACMP\_CFG needs to happen before the ACMP is enabled. The control registers ACMP\_CTRL and ACMP\_INPUTCTRL can only be updated after the ACMP is enabled. The ACMP is enabled by setting the EN bit in ACMP\_EN. If ACMP\_CFG is updated when EN = 1, or ACMP\_CTRL / ACMP\_INPUTCTRL is updated while EN = 0, a bus fault is issued.

The input muxes are configured in the POSSEL / NEGSEL bitfields in ACMP\_INPUTCTRL. All references and inputs are available in the modes defined for these two registers. The INPUTCTRL bit in ACMP\_SYNCBUSY should be checked before writing to ACMP\_INPUTCTRL. If the ACMP\_SYNCBUSY\_INPUTCTRL bit is 1, it means a previous write to the ACMP\_INPUTCTRL register is pending, and software should wait until ACMP\_SYNCBUSY\_INPUTCTRL bit reads 0.

The POSSEL and NEGSEL muxes share several resources on the device, such as the VREFDIV and VSENSE divider circuits. Thus, there are some constraints on the POSSEL / NEGSEL configurations:

- POSSEL and NEGSEL cannot select an even numbered GPIO pin at the same time.
- POSSEL and NEGSEL cannot select an odd numbered GPIO pin at the same time.
- POSSEL and NEGSEL cannot both select a supply voltage via one of the VSENSE inputs.
- POSSEL and NEGSEL cannot both select an input using VREFDIV.
- If POSSEL = EXTPx, a low power reference (postfixed with LP) cannot be selected for NEGSEL.

If one of these constraints are violated, the INPUTCONFLICT status flag and INPUTCONFLICTIF interrupt flag will be set.

The ACMP also uses shared chip-level analog bus resources to connect to external GPIO pins. Which bus the ACMP is using depends on the configuration of POSSEL and NEGSEL. To allow the ACMP to control an analog bus, the bus must be allocated to ACMP in the GPIO module, using the GPIO\_xBUSALLOC registers. For example, pin PB5 is an odd-numbered pin on port PB, and could connect via either analog bus BODD0 or BODD1. This is configured using the BODD0 or BODD1 field in GPIO\_BBUSALLOC.

If the ACMP peripheral is trying to access a bus that has not been allocated to that instance of ACMP, the PORTALLOCERR status flag and PORTALLOCERRIF interrupt flag will be set.

### 31.3.2 Warmup Time

When the comparator is enabled or the input muxes are reconfigured, it requires some time to stabilize. On first enable (ACMP\_EN\_EN = 1), the comparator core requires 2.5 us to stabilize. In addition to this, any references selected may require some time to warm up. See [Table 31.1 Warmup Time on page 1218](#) for warmup times for the different references. When reconfiguring the ACMP (without disabling it), only the warmup times given in the table will be observed. When the comparator is ready for use, the ACMPRDY status flag and the ACMPRDY interrupt flag will be set. During the warmup time and when the comparator is inactive, the comparator output will be set to the state defined by the NOTRDYVAL bit in ACMP\_CTRL.

**Table 31.1. Warmup Time**

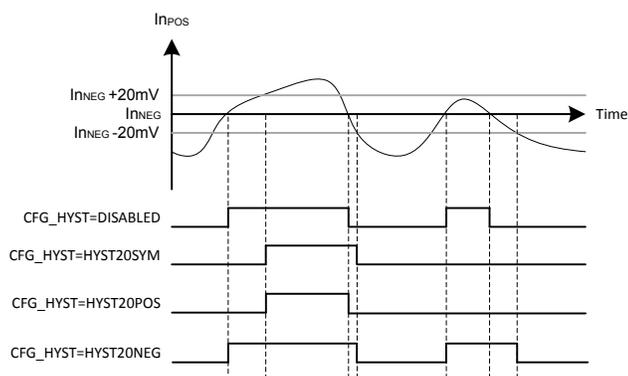

Reference	Warmup time
Low power reference: POSSEL / NEGSEL = *LP	10 us
VSENSE: POSSEL / NEGSEL = VSENSE*	5 us
VREF: POSSEL / NEGSEL = VREF*	2 us
None of the above	0.5 us

### 31.3.3 Response Time

There is a delay from when the input voltage changes polarity to when the output toggles. This delay is called the response time and can be altered by increasing or decreasing the bias current to the comparator through the BIASPROG bitfield in the ACMP\_CFG register. The current and speed of the circuit increase as the value of BIASPROG is increased. See the part datasheet for specific current and response times related to setting of BIASPROG.

### 31.3.4 Hysteresis

When the hysteresis level is set to a non-zero value, the digital output will not toggle until the positive input voltage is at a voltage equal to the hysteresis level above or below the negative input voltage (see [Figure 31.2 Hysteresis on page 1219](#)). This feature can be used to avoid continual comparator output changes due to input noise when the positive and negative inputs are similar. Hysteresis requires the input difference to exceed the hysteresis threshold before the output can change and can reject limited amounts of noise. The hysteresis in ACMP can be configured to three different levels (10 mV, 20 mV, 30 mV), and can be enabled on positive (rising), negative (falling), or both edges. Hysteresis is configured in the HYST bitfield in ACMP\_CFG.

**Figure 31.2. Hysteresis**

### 31.3.5 LESENSE Interface

The ACMP can be controlled by LESENSE using its external override interface. In this mode, the LESENSE module will take control of the positive input mux control signal, and possibly the voltage divider, VREFDIV.

To enable this mode, INPUTCTRL\_POSSEL needs to be set to EXTPA, EXTPB, EXTPC or EXTPD, according to which GPIO port will be used. In the LESENSE channel configuration, the LESENSE\_CHx\_INTERACT.OFFSET field will determine which pin on the selected port will be connected for that channel. For example, to connect the positive comparator input to PB03, INPUTCTRL\_POSSEL would be set to EXTPB, and LESENSE\_CHx\_INTERACT.OFFSET to 0x03.

The negative input of the comparator in this mode is still connected according to INPUTCTRL\_NEGSEL. LESENSE will take control of the voltage divider VREFDIV setting, if LESENSE\_PERCTRL\_ACMPxMODE is set to MUXTHRES. For the selected channel, VREFDIV will come from the 6 LSBs of LESENSE\_CHx\_INTERACT\_THRES.

### 31.3.6 Supply Voltage Monitoring (VSENSE)

The ACMP can be used to monitor supply voltages. This is done by selecting VSENSE01DIV4(LP) or VSENSE11DIV4(LP) for either POSSEL or NEGSEL. Note that the input to the comparator core will be divided by 4, as illustrated in [Figure 31.1 ACMP Overview on page 1217](#). To reduce energy consumption, a sample/hold circuit can be used to periodically sample the power supplies. To enable this, select VSENSE01DIV4LP or VSENSE11DIV4LP in POSSEL / NEGSEL. Because the sample/hold feature uses the comparator in a non-continuous fashion, enabling this will increase response times and reduce the accuracy of the comparator. The connections between VSENSE0 and VSENSE1 to power supplies are summarized in the table below.

**Table 31.2. VSENSE connections**

ACMP instance	VSENSE0	VSENSE1
ACMP0	AVDD	VDDIO0
ACMP1	DVDD	Not connected

### 31.3.7 VREFDIV Sources

The ACMP has two internal bandgap references: 2.5 V and 1.25 V. In addition, AVDD can be used as a reference. To select one of these references, configure POSSEL / NEGSEL to VREFDIVAVDD, VREFDIV1V25, or VREFDIV2V5. The ACMP also includes sample/hold functionality to reduce energy consumption. To enable the sample/hold feature, select VREFDIVAVDDL, VREFDIV1V25LP, or VREFDIV2V5LP. These references can be divided by configuring VREFDIV in ACMP\_INPUTCTRL. This division factor will be VREFDIV / 63, such that  $VREFOUT = VREFIN * (VREFDIV / 63)$ .

### 31.3.8 Input Range and Accuracy Settings

By default, the ACMP can accept external rail-to-rail inputs, from 0 to AVDD. If external voltages will never be higher than AVDD - 0.7 V, the INPUTRANGE bit in ACMP\_CFG can be set to 1 to reduce the power consumption of the block.

The ACMP also has an adjustable accuracy setting (ACCURACY in ACMP\_CFG). ACCURACY is set to LOW by default, which conserves power, but may have degraded performance for rapidly changing analog Port selections in either the ACMP or the GPIO. ACCURACY can be set to HIGH to insure ACMP accuracy (at the expense of extra power consumption), when configuration changes are expected at a high rate (more than once per ms, for example), such as when scanning through channels.

### 31.3.9 Interrupts and PRS Output

The analog comparator includes independent output flags for rising edge (RISEIF) and falling edge (FALLIF) events. These will be set when a rising or falling edge is detected, respectively.

Three other interrupt sources are also available. PORTALLOCERRIF and INPUTCONFLICTIF are input configuration error flags, detailed in [31.3.1 Configuration and Control](#). The ACMPRDYIF flag indicates comparator stability after the warmup period.

The comparator output is available as an asynchronous PRS producer, and can be routed to other peripherals in the system via PRS.

### 31.3.10 Output to GPIO

The output from the comparator is available as alternate functions to the GPIO pins. Each pin connection can be enabled/disabled separately using the GPIO module control registers. See the device data sheet for the available locations for each signal.

The GPIO pin must also be set as output. The output to the GPIO can be inverted by setting the GPIOINV bit in ACMP\_CTRL.

### 31.4 ACMP Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description

### 31.5 ACMP Register Description

#### 31.5.1 ACMP\_IPVERSION - IP Version ID

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x1																															
<b>Access</b>	R																															
<b>Name</b>	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x1	R	<b>IP version ID</b>

### 31.5.2 ACMP\_EN - ACMP Enable

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	0x0
<b>Access</b>																															R	RW
<b>Name</b>																															DISABLING	EN

Bit	Name	Reset	Access	Description
31:2	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISABLING	0x0	R	<b>Disablement busy status</b>  When En is cleared, DISABLING is set immediately, and cleared when disablement finishes. Disablement resets peripheral cores and not APB registers except hardware updated registers such as INTFLAGS and FIFOs.
0	EN	0x0	RW	<b>Module enable</b>  The ENABLE bit enables the module. Software should write to CONFIG type registers before setting the ENABLE bit. Software should write to SYNC type registers only after setting the ENABLE bit.

### 31.5.3 ACMP\_SWRST - Software Reset

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																															0x0	0x0
<b>Access</b>																															R	W
<b>Name</b>																															RESETTING	SWRST

Bit	Name	Reset	Access	Description
31:2	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	RESETTING	0x0	R	<b>Software reset busy status</b>
0	SWRST	0x0	W	<b>Software reset</b>

## 31.5.4 ACMP\_CFG - Configuration Register

Offset	Bit Position																																					
0x00C	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						
Reset															0x0	0x0									0x0													
Access															RW	RW									RW					RW								
Name															ACCURACY	INPUTRANGE									HYST									BIAS				

Bit	Name	Reset	Access	Description
31:18	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
17	ACCURACY	0x0	RW	<b>ACMP accuracy mode</b>  Setting ACCURACY to HIGH reduces the noise in the signal input path of the ACMP. Note, high frequency changes can cause the ACMP performance to degrade. For such uses, such as quickly scanning through multiple channels, this should be set to HIGH.
	Value	Mode	Description	
	0	LOW	ACMP operates in low-accuracy mode but consumes less current.	
	1	HIGH	ACMP operates in high-accuracy mode but consumes more current.	
16	INPUTRANGE	0x0	RW	<b>Input Range</b>  Adjust performance of the comparator for a given input voltage range.
	Value	Mode	Description	
	0	FULL	Use this setting when the input to the comparator core can be from 0 to AVDD.	
	1	REDUCED	It is recommended to use this setting when the input to the comparator core will always be less than AVDD-0.7V.	
15:12	Reserved	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
11:8	HYST	0x0	RW	<b>Hysteresis mode</b>  Set hysteresis mode and level.
	Value	Mode	Description	
	0	DISABLED	Hysteresis disabled	
	1	SYM10MV	10mV symmetrical hysteresis	
	2	SYM20MV	20mV symmetrical hysteresis	
	3	SYM30MV	30mV symmetrical hysteresis	
	4	POS10MV	10mV hysteresis on positive edge transitions	
	5	POS20MV	20mV hysteresis on positive edge transitions	

Bit	Name	Reset	Access	Description
6		POS30MV		30mV hysteresis on positive edge transitions
8		NEG10MV		10mV hysteresis on negative edge transitions
9		NEG20MV		20mV hysteresis on negative edge transitions
10		NEG30MV		30mV hysteresis on negative edge transitions
7:3	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
2:0	BIAS	0x4	RW	<b>Bias Configuration</b> These bits control the bias current level. See the datasheet for details.

### 31.5.5 ACMP\_CTRL - Control Register

## 32. KEYSKAN - Keyboard Scan

### Quick Facts

#### What?

The keypad scanner autonomously scans through a matrix of keypad switches to detect key presses.

#### Why?

Operating independently from the main processor, the keypad scanner can save energy by interrupting the system only as needed. The KEYSKAN peripheral also saves energy by operating in a wake-on-press mode in EM2 and EM3.

#### How?

A traditional row/column matrix of switches is scanned using a finite state machine capable of de-bouncing and settling any key press prior to processor intervention.

### 32.1 Introduction

The KEYSKAN module connects through row and column GPIOs to an external mechanical keypad. The KEYSKAN supports up to 6 rows and up to 8 columns.

### 32.2 Features

- Performs scans in EM0 / EM1 to detect the row and column address of any key
- Wake up from sleep on key press in EM2 / EM3
- Supports up to a 6 x 8 matrix of keys in one or more keypads
- Interrupt sources for detected key press and non-press
- Multi-touch mode available for detecting multiple simultaneous keys

### 32.3 Functional Description

An overview of the KEYSCAN module is shown in [Figure 32.1 KEYSCAN Overview on page 1235](#). The KEYSCAN consists of rows and columns GPIOs connected to the KEYSCAN hardware. In EM0 and EM1, KEYSCAN can actively scan all switches in the matrix for active key presses. Any closed switches between rows and columns are detected, debounced, settled, and reported to the processor via the register interface. In EM2 and EM3, KEYSCAN simultaneously checks for any key press across the entire switch matrix. Any press will wake to an active state, allowing KEYSCAN to perform a scan and determine specific key location(s).

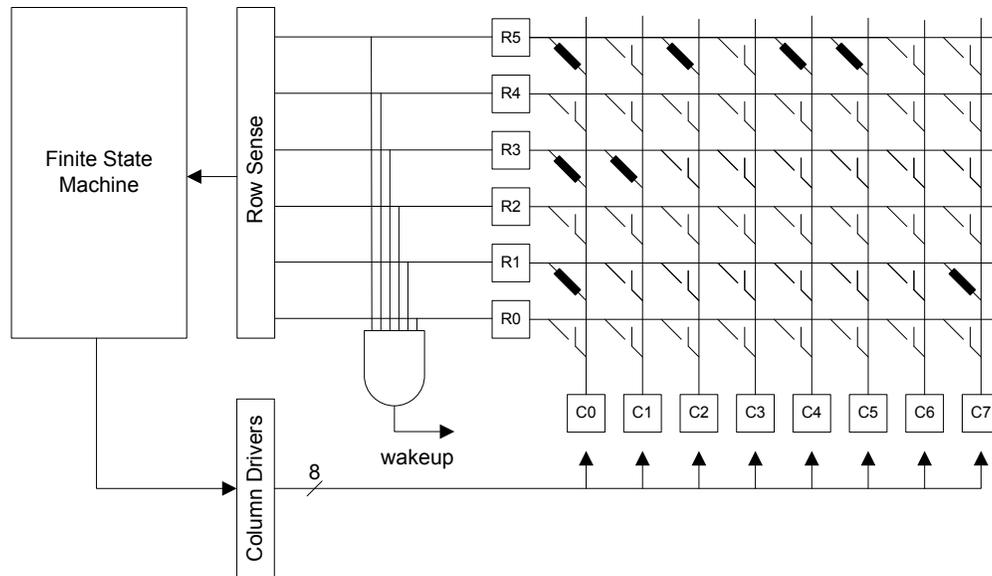

Figure 32.1. KEYSCAN Overview

#### 32.3.1 Row and Column Configuration

Row and column signals are routed to physical pins using DBUS and set up in the GPIO configuration registers.

Columns are the output drivers and can be routed to any available port pin using the `GPIO_KEYSCAN_COLOUTxROUTE` register, where 'x' is the column number. Column outputs must also be individually enabled using the bits in `GPIO_KEYSCAN_ROUTEN`.

Rows are the input sense circuitry. They are routed via the `GPIO_KEYSCAN_ROWSENSExROUTE` registers, where 'x' is the row number. Row signals are only available on ports A and B.

Rows and columns should be routed starting at the lowest number. For example, a keypad requiring 3 rows and 2 columns should route ROW0, ROW1, ROW2, COL0, and COL1.

When the GPIO registers have been configured, the `KEYSCAN_CFG.NUMROWS` and `KEYSCAN_CFG.NUMCOLS` can then be configured to indicate the number of rows and columns to include in each scan.

#### 32.3.2 Clocking and Timing

The timebase for the KEYSCAN peripheral is derived from EM01GRPACLK. The `CFG.CLKDIV` field should be used to divide EM01GRPACLK to produce a 500 Hz clock (2 ms ticks), which drives the timing of delays in the KEYSCAN state machine.

There are three timed delays used in the state machine, which are described in more detail in the following sections. Timing for these delays is configured by the `SCANDLY`, `DEBDLY`, and `STABDLY` fields in the `DELAY` register. Each of these fields specifies the number of 2 ms clock ticks for a different delay, with a range from 2 ms to 32 ms.

### 32.3.3 Scanning

Figure 32.2 [KEYSCAN State Machine on page 1236](#) shows the state machine sequence for key press scanning. When a scanning sequence begins, the scan logic grounds one column at a time, starting with column 0. The column pin is grounded for up to `DELAY.SCANDLY` clocks. If no rows are detected as low (indicating a key press) the scan logic will proceed to ground the next column in sequence.

If a row is read as logic low while a column is grounded, the scan logic will implement a debounce delay of `DELAY.DEBDLY` clocks. If any rows are still grounded at the end of the debounce delay, a stabilization delay of `DELAY.STABDLY` clocks will then be implemented.

If the row readings between the start and end of the stabilization delay match, the scan logic determines that a key has been pressed, the scanner halts, and the `IF.KEY` interrupt flag is set. The details of which column is tested are reported in `STATUS.COL`, and the reading from all rows is stored in `STATUS.ROW`. The state machine will continue once `IF.KEY` is cleared.

For single-press scanning (`CFG.SINGLEPRESS` set to `SINGLEPRESS`), the next step in the scan sequence is to wait until all keys are unpressed. The state machine grounds all columns and waits until all rows read back '1'. When all keys are detected as unpressed, the scan logic will then continue scanning with the next column in sequence.

For multi-press scanning (`CFG.SINGLEPRESS` set to `MULTIPRESS`), scanning will proceed with the next column immediately when the `IF.KEY` interrupt is cleared. In multi-press mode, the `IF.NOKEY` interrupt flag will set once after a full scan cycle is completed without detecting a new key press, to indicate that all keys have been released and allow for subsequent press detections. Scans without a key press will not set this flag again until one or more new key presses have been detected.

Finally, the `IF.SCANNED` interrupt flag is set every time the scan logic completes an entire column-by-column scan without detecting any key presses.

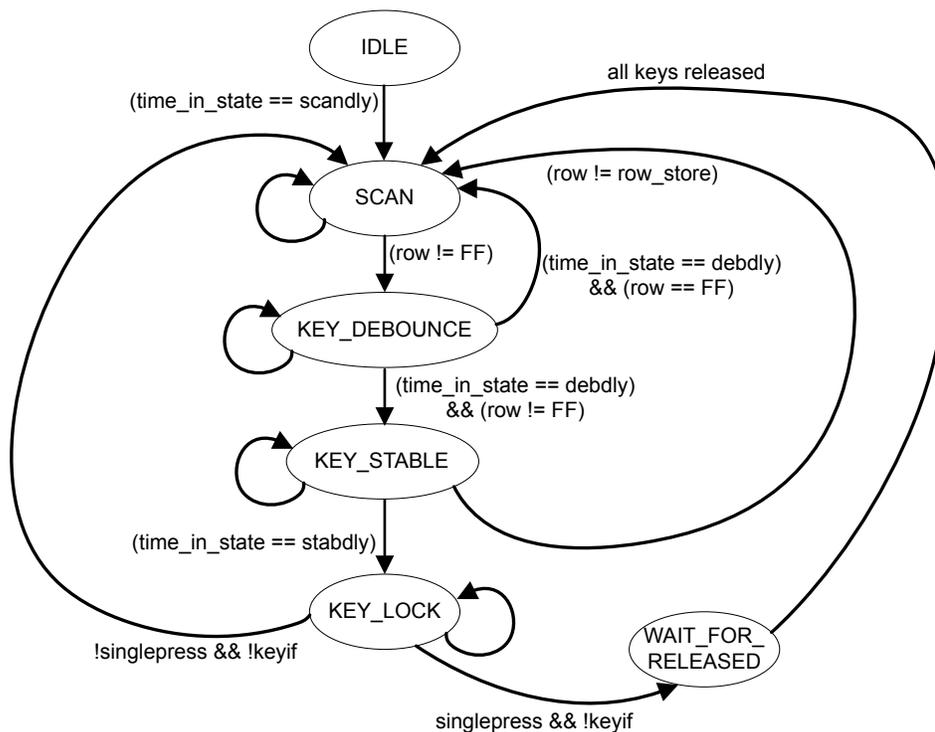

Figure 32.2. KEYSCAN State Machine

Figure 32.3 [Single Press Mode on page 1237](#) shows how the scanner operates in single-press mode. One interrupt is generated upon key press. The usage model is for a single key press at a time. If multiple keys are pressed at the same time, it stops scanning at the first column that has a key press and shows all the pressed rows for that column. Scanning does not resume until all pressed keys are released.

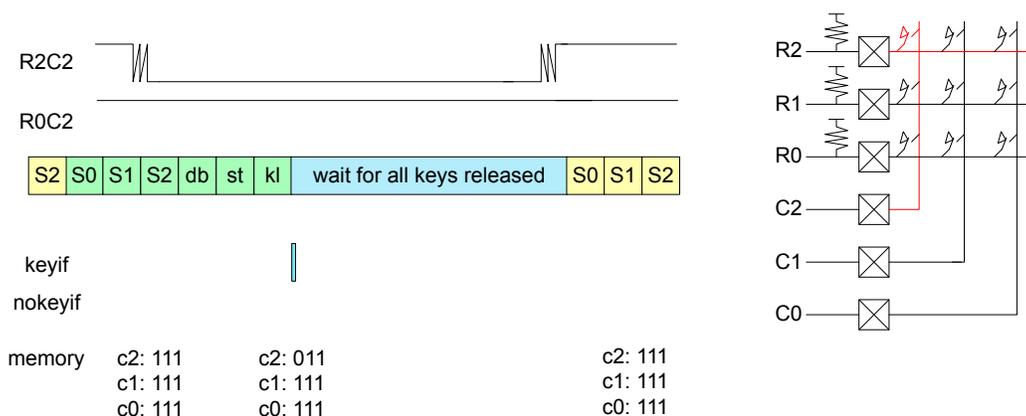

Figure 32.3. Single Press Mode

Figure 32.4 Multi-touch Mode with Multiple Key Presses on page 1237 shows two key presses that occur on the same column (R2C2 and R0C2). The first key press R2C2 was detected first and set the IF.KEY interrupt flag. The interrupt service routine read the status, updated an array in memory, and cleared the IF.KEY. Then the scanning continued until the IF.KEY was set again. Since both pressed keys are active on the same column, STATUS.ROW shows 010 for the low true key presses on R2C2 and R0C2. When both keys have been released and the scan cycles through without detecting any key presses, the IF.NOKEY flag is set.

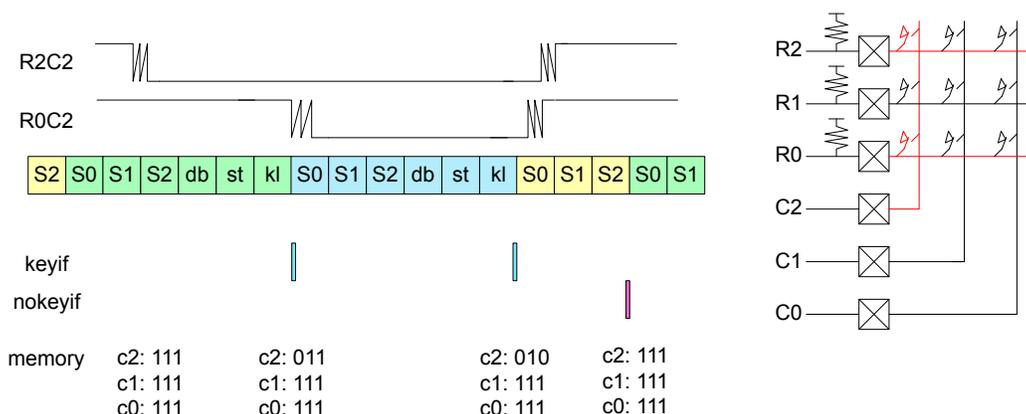

Figure 32.4. Multi-touch Mode with Multiple Key Presses

### 32.3.4 Wake on Key

The KEYSCAN module does not actively scan channels during EM2 or EM3, but it will operate in a wake-on-key mode when the IEN.WAKEUP interrupt is enabled. In this mode, all columns are driven low, and the logic waits for any of the row inputs to be pulled low. This event can wake the device from EM2 or EM3.

After waking up, the IF.WAKEUP flag will be set. Software may service this wakeup interrupt and start a new scan using the CMD.START command. Alternatively, if CMD.AUTOSTART has been used prior to sleeping, the keyscan will automatically be started each time the chip wakes up to EM0. Before going to sleep, software may use CMD.KEYSCANSTOP to turn off scanning if desired. If KEYSCANSTOP is not used, the keyscan module will still power down and stop scanning once the chip enters sleep. While most of the keyscan is powered down during EM2 and EM3, there is a small piece of logic that remains powered during EM2 and EM3 to allow a key press to wake the device.

A key press during sleep is unqualified, because no debouncing and settling are performed before waking the device. It is possible that noise in the mechanical keypad caused the wakeup without a real key press. In this case, after wakeup and scanning all columns, the IF.SCANNED interrupt comes in handy. IF.SCANNED would be set without IF.KEY or IF.NOKEY interrupts ever having been set. The IF.WAKEUP can be used to record to memory that the keypad has not yet completed any scans. Once IF.SCANNED fires without having seen any IF.KEY interrupts, this may indicate that the wakeup was due to noise instead of a key press, and the system can return to sleep.

## 32.4 KEYSCAN Register Map

The offset register address is relative to the registers base address.

Offset	Name	Type	Description
0x000	KEYSCAN_IPVERSION	R	IPVERSION
0x004	KEYSCAN_EN	RW ENABLE	Enable
0x008	KEYSCAN_SWRST	RW SWRST	Software Reset
0x00C	KEYSCAN_CFG	RW CONFIG	Config
0x010	KEYSCAN_CMD	W SYNC	Command
0x014	KEYSCAN_DELAY	RW CONFIG	Delay
0x018	KEYSCAN_STATUS	RH	Status
0x01C	KEYSCAN_IF	RWH INTFLAG	Interrupt Flags
0x020	KEYSCAN_IEN	RW	Interrupt Enables
0x1000	KEYSCAN_IPVERSION_SET	R	IPVERSION
0x1004	KEYSCAN_EN_SET	RW ENABLE	Enable
0x1008	KEYSCAN_SWRST_SET	RW SWRST	Software Reset
0x100C	KEYSCAN_CFG_SET	RW CONFIG	Config
0x1010	KEYSCAN_CMD_SET	W SYNC	Command
0x1014	KEYSCAN_DELAY_SET	RW CONFIG	Delay
0x1018	KEYSCAN_STATUS_SET	RH	Status
0x101C	KEYSCAN_IF_SET	RWH INTFLAG	Interrupt Flags
0x1020	KEYSCAN_IEN_SET	RW	Interrupt Enables
0x2000	KEYSCAN_IPVERSION_CLR	R	IPVERSION
0x2004	KEYSCAN_EN_CLR	RW ENABLE	Enable
0x2008	KEYSCAN_SWRST_CLR	RW SWRST	Software Reset
0x200C	KEYSCAN_CFG_CLR	RW CONFIG	Config
0x2010	KEYSCAN_CMD_CLR	W SYNC	Command
0x2014	KEYSCAN_DELAY_CLR	RW CONFIG	Delay
0x2018	KEYSCAN_STATUS_CLR	RH	Status
0x201C	KEYSCAN_IF_CLR	RWH INTFLAG	Interrupt Flags
0x2020	KEYSCAN_IEN_CLR	RW	Interrupt Enables
0x3000	KEYSCAN_IPVERSION_TGL	R	IPVERSION
0x3004	KEYSCAN_EN_TGL	RW ENABLE	Enable
0x3008	KEYSCAN_SWRST_TGL	RW SWRST	Software Reset
0x300C	KEYSCAN_CFG_TGL	RW CONFIG	Config
0x3010	KEYSCAN_CMD_TGL	W SYNC	Command
0x3014	KEYSCAN_DELAY_TGL	RW CONFIG	Delay
0x3018	KEYSCAN_STATUS_TGL	RH	Status
0x301C	KEYSCAN_IF_TGL	RWH INTFLAG	Interrupt Flags

Offset	Name	Type	Description
0x3020	KEYSCAN_IEN_TGL	RW	Interrupt Enables

## 32.5 KEYSKAN Register Description

### 32.5.1 KEYSKAN\_IPVERSION - IPVERSION

Offset	Bit Position																															
0x000	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset	0x1																															
Access	R																															
Name	IPVERSION																															

Bit	Name	Reset	Access	Description
31:0	IPVERSION	0x1	R	<b>IPVERSION</b>

### 32.5.2 KEYSKAN\_EN - Enable

Offset	Bit Position																															
0x004	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reset																															0x0	0x0
Access																															R	RW
Name																															DISABLING	EN

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	DISABLING	0x0	R	<b>Disablement busy status</b>  When EN is cleared, DISABLING status is set immediately, and cleared when disablement finishes. Disablement resets peripheral cores and bit fields or registers dependent on hardware state, such as INTFLAGS and FIFOs.
0	EN	0x0	RW	<b>Enable</b>
	Enable			
	Value	Mode		Description
	0	DISABLE		Stops clocking and resets peripheral core logic.
	1	ENABLE		Enables clocking, and begins scanning if CFG.AUTOSTART is 0x1.

### 32.5.3 KEYSCAN\_SWRST - Software Reset

Offset	Bit Position																															
0x008	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																													0x0	0x0		
<b>Access</b>																													R	W		
<b>Name</b>																													RESETTING	SWRST		

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	RESETTING Software reset busy status	0x0	R	<b>Software reset busy status</b>
0	SWRST Software reset command	0x0	W	<b>Software reset command</b>

Bit	Name	Reset	Access	Description
	Value	Mode		Description
	0	MULTIPRESS		After KEYIF is set and then cleared, scanning will continue. This can give multiple interrupts for the same key press, but allow multiple key presses to be detected. To use this mode for multi-key detection, the ISR should update a section of memory of COLNUM bytes on each interrupt, until key release is detected. After key release, the section of memory where key presses are recorded can be processed.
	1	SINGLEPRESS		After KEYIF has been set and cleared, it will not set again until no key press is detected. This allows faster response since the ISR can start processing data as soon as the KEYIF is set.
19:18	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
17:0	CLKDIV	0x1387F	RW	<b>Clock Divider</b>  Divides the peripheral clock by (CLKDIV+1) to produce a timebase for the keyscan timers. The nominal target timebase is 2 ms.

### 32.5.5 KEYSKAN\_CMD - Command

Offset	Bit Position																															
0x010	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>																														0x0	0x0	
<b>Access</b>																														W(nB)	W(nB)	
<b>Name</b>																														KEYSCANSTOP	KEYSCANSTART	

Bit	Name	Reset	Access	Description
31:2	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
1	KEYSCANSTOP Stop Keyscan	0x0	W(nB)	<b>Keyscan Stop</b>
0	KEYSCANSTART Start Keyscan	0x0	W(nB)	<b>Keyscan Start</b>

## 32.5.6 KEYSCAN\_DELAY - Delay

Offset	Bit Position																															
0x014	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>					0x0								0x0								0x0											
<b>Access</b>					RW								RW								RW											
<b>Name</b>					STABDLY								DEBDLY								SCANDLY											

Bit	Name	Reset	Access	Description
31:28	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
27:24	STABDLY	0x0	RW	<b>Row stable Delay</b>
	Row stable delay			
	Value	Mode	Description	
	0	STABDLY2	2ms Row Stable Delay	
	1	STABDLY4	4ms Row Stable Delay	
	2	STABDLY6	6ms Row Stable Delay	
	3	STABDLY8	8ms Row Stable Delay	
	4	STABDLY10	10ms Row Stable Delay	
	5	STABDLY12	12ms Row Stable Delay	
	6	STABDLY14	14ms Row Stable Delay	
	7	STABDLY16	16ms Row Stable Delay	
	8	STABDLY18	18ms Row Stable Delay	
	9	STABDLY20	20ms Row Stable Delay	
	10	STABDLY22	22ms Row Stable Delay	
	11	STABDLY24	24ms Row Stable Delay	
	12	STABDLY26	26ms Row Stable Delay	
	13	STABDLY28	28ms Row Stable Delay	
	14	STABDLY30	30ms Row Stable Delay	
	15	STABDLY32	32ms Row Stable Delay	
23:20	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
19:16	DEBDLY	0x0	RW	<b>Debounce Delay</b>
	Debounce Delay			
	Value	Mode	Description	
	0	DEBDLY2	2ms Debounce Delay	
	1	DEBDLY4	4ms Debounce Delay	

Bit	Name	Reset	Access	Description
	2	DEBDLY6		6ms Debounce Delay
	3	DEBDLY8		8ms Debounce Delay
	4	DEBDLY10		10ms Debounce Delay
	5	DEBDLY12		12ms Debounce Delay
	6	DEBDLY14		14ms Debounce Delay
	7	DEBDLY16		16ms Debounce Delay
	8	DEBDLY18		18ms Debounce Delay
	9	DEBDLY20		20ms Debounce Delay
	10	DEBDLY22		22ms Debounce Delay
	11	DEBDLY24		24ms Debounce Delay
	12	DEBDLY26		26ms Debounce Delay
	13	DEBDLY28		28ms Debounce Delay
	14	DEBDLY30		30ms Debounce Delay
	15	DEBDLY32		32ms Debounce Delay
15:12	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		
11:8	SCANDLY Scan Delay	0x0	RW	<b>Scan Delay</b>
	Value	Mode	Description	
	0	SCANDLY2	2ms Scan Delay	
	1	SCANDLY4	4ms Scan Delay	
	2	SCANDLY6	6ms Scan Delay	
	3	SCANDLY8	8ms Scan Delay	
	4	SCANDLY10	10ms Scan Delay	
	5	SCANDLY12	12ms Scan Delay	
	6	SCANDLY14	14ms Scan Delay	
	7	SCANDLY16	16ms Scan Delay	
	8	SCANDLY18	18ms Scan Delay	
	9	SCANDLY20	20ms Scan Delay	
	10	SCANDLY22	22ms Scan Delay	
	11	SCANDLY24	24ms Scan Delay	
	12	SCANDLY26	26ms Scan Delay	
	13	SCANDLY28	28ms Scan Delay	
	14	SCANDLY30	30ms Scan Delay	
	15	SCANDLY32	32ms Scan Delay	
7:0	<i>Reserved</i>	<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>		

## 32.5.7 KEYSCAN\_STATUS - Status

Offset	Bit Position																															
0x018	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<b>Reset</b>	0x0	0x1				0x0									0x0															0x0		
<b>Access</b>	R	R				R									R															R		
<b>Name</b>	SYNCBUSY	NOKEY				COL									RUNNING															ROW		

Bit	Name	Reset	Access	Description
31	SYNCBUSY	0x0	R	<b>Sync Busy</b> Sync Busy
30	NOKEY	0x1	R	<b>No Key pressed status</b> No Key pressed status. Requires EN=1 when reading.
29:27	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
26:24	COL	0x0	R	<b>Column Latched</b> column that corresponds to key press
23:17	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
16	RUNNING	0x0	R	<b>Running</b> Running status. Requires EN=1 when reading.
15:6	<i>Reserved</i>			<i>To ensure compatibility with future devices, always write Reserved bits to their reset value, unless otherwise stated. More information in <a href="#">1.2 Conventions</a></i>
5:0	ROW	0x0	R	<b>Row detection</b> Rows (1: pull up for no key press, 0: key press)

## 33. Revision History

### Revision 1.1

January, 2024

- [4.2 Functional Description](#): Added content regarding additional flash regions.
- [4.2.2 Flash](#): Removed flash erase cycle and data retention endurance. Flash characteristics are provided in device datasheet and data retention information is published in Quarterly Quality and Reliability Report.
- [4.2.4.1 Peripheral Map](#): Removed AMUXCP0.
- [6.3.4 User Data \(UD\) Page Description](#): Changed User Data Page erase mechanism.
- [6.3.5 Bootloader](#): Updated user guide reference from UG266 to UG489.
- [6.3.12 Erase and Write Operations](#): Removed flash write and erase operations clock source and configuration information. These settings should not be modified from default.
- [6.3.12.2 Flash Lock](#): Updated User Data lock mechanism.
- [6.4.2.2 DEVINFO\\_PART - Part Info](#): Added SG family to FAMILY field.
- [6.6.6 SYSCFG Register Description](#): Added SYSCFG\_CHIPREV.CHIP values and register bit descriptions.
- [6.8 MSC Register Description](#):
  - Updated RDATACTRL.AFDIS bit description.
  - Clarified WRITECMD.ERASEMAIN0 and WRITECMD.WRITEEND bit descriptions.
  - Clarified STATUS.WREADY and STATUS.PWRON bit descriptions; fixed STATUS.TIMEOUT, STATUS.PENDING, and STATUS.ERASEABORTED bit descriptions.
  - Updated USERDATASIZE.USERDATASIZE bit description.
  - Replaced MSC\_CTRL with MSC\_RDATACTRL in LOCK.LOCKKEY bit description regarding lock access effected registers.
  - Clarified PWRCTRL bitfield descriptions.
- [Figure 8.1 Bus Clocks on page 148](#):
  - Changed KEYPAD APB to KEYSKAN APB in PCLK branch.
  - Removed SYXO0 APB, HFRCO1 APB clock and added HFXO0 APB, HFRCOEM23 APB in LSPCLK branch.
- [Figure 8.2 High Frequency Peripheral Clocks on page 149](#): Added KEYSKAN peripheral in EM01GRPACLK branch.
- [8.3.1.1 SYSCLK - Bus Clock](#): Updated SYSCLK source boot sequence.
- [8.3.5 Clock Output](#): Merged Clock Output on PRS with Clock Output on a Pin.
- [9.2.3.5 On-Demand Clocking](#): Updated language and register usage for software requested HFXO enablement.
- [9.2.3.7 Protection](#): Removed MANUALOVERRIDE step when gaining access to HFXO locked registers while in steady state.
- [9.3.3.2 On-Demand Clocking](#): Updated language and register usage for software requested HFRCO enablement.
- [9.3.3.2.1 EM2/EM3 On-Demand Operation \(HFRCOEM23\)](#): Added on-demand description for HFRCO23 use in low energy modes.
- [9.4.3.2 Lock Modes](#): Updated language regarding DPLL phase lock mode.
- [9.6.3.2 On-Demand Clocking](#): Updated language and register usage for software requested LFRCO enablement.
- [9.6.4 LFRCO Register Map](#), [9.6.5 LFRCO Register Description](#): Removed LFRCO\_CTRL register and its corresponding SET, CLR, and TGL register.
- [12.3.1 Energy Modes](#):
  - Updated description of peripherals with the ability to temporarily enable additional logic in low energy modes.
  - Added text referring low energy modules to power domain details.
- [Table 12.2 Energy Modes on page 289](#): Removed SYSRTC Memory Retained entry, added BURAM entry, and added note regarding Low Power Domain B.
- [12.3.1.6 EM4](#) : Removed wake-up reference to RFSENSE.
- [Table 12.4 Peripheral Power Subdomains on page 296](#): Added table describing peripherals and their associated power domain.
- [12.3.5.2 Voltage Scaling in EM2 and EM3](#): Updated language for improved clarity.
- [Table 12.6 DRVSPEED, IPKVAL, and IPKMAXCTRL Recommended Settings for buck DC-DC on page 304](#): Corrected Buck Mode Recommended Settings for EM23CTRL0.DRVSPED and CTRL.IPKTMAXCTRL.
- [12.3.8.3 Buck DC-DC Recommended Configuration Settings](#): Removed note regarding DCDC\_CTRL\_DCMONLYEN to select between DCM and CCM modes.
- [12. EMU - Energy Management Unit](#): Removed Register Resets section.

- [12.4 EMU Register Map](#), [12.5 EMU Register Description](#):
  - Added EMU.TAMPERRSTCAUSE register and corresponding SET, CLR, and TGL registers.
  - Added EMU.CMD.TAMPERRCCLR bit and description.
  - Updated EMU.CMD.EM2DBGGEN bit description.
  - Added EMU.RSTCAUSE.SETAMPER bit and description.
- Updated register enum descriptions for DRVSPEED in [12.7.3 DCDC\\_EM01CTRL0 - EM01 Control](#) and [12.7.4 DCDC\\_EM23CTRL0 - EM23 Control](#) to clarify that only the default setting is recommended for use (no benefit to using other settings).
- [12.7.5 DCDC\\_PFMXCTRL - PFMX Control Register](#): Added IPKVAL enumerations and descriptions for 90 mA through 120 mA Ipeak.
- [12.7.8 DCDC\\_STATUS - Status Register](#): Updated STATUS.VREGIN description to add consistency with device pinout.
- [18.10 Using the LETIMER in EM3](#): Refined language for LETIMER usage in EM3.
- [21.2 Features](#): Added stop bits configuration details for HF clock and LF clock, and added details regarding IrDA support.
- [21.3.2 Asynchronous Operation](#) : Added overview section regarding EUSART asynchronous operation.
- [Table 21.4 Stop Bits on page 634](#), [Table 21.6 Oversampling \(EUSARTn\\_CFG0\\_OVS\) on page 636](#): Updated tables to reflect HF clock only operation.
- [21.3.2.4 Auto Baud Detection \(HF clock only\)](#): Cleaned up notes section and added comment regarding no availability with LF clock.
- [21.3.2.5.1 Transmit FIFO Operation](#): Updated note language regarding TXFL interrupt flag and wakeup flag behavior.
- [21.3.2.6.3 Data Sampling and Filtering](#): Added note regarding oversampling configurations in HF and LF modes.
- [21.3.2.16 EM2 operation \(EUSART0 Only\)](#): Updated language to clarify EM2 operation with EUSART0.
- [21.3.3.3 Main SPI Interface Mode \(Clock Driver\)](#): Clarified energy mode operation and clock source requirements.
- [21.5.15 EUSART\\_CMD - Command Register](#): Updated CMD.CLEAR\_TX bit description to clarify usage.
- [23. IADC - Incremental Analog to Digital Converter](#): Updated clock names throughout chapter to add consistency and clarity.
- [23.2 Features](#): Removed IADC FIFO depth.
- [23.3.2 Clocking](#): Added a minimum recommended ADC\_CLK frequency.
- [24. GPIO - General Purpose Input/Output](#): Updated references to GPIO interrupt flag clear and set registers.
- [24.3.12.1 Digital Bus \(DBUS\)](#): Updated digital resource interconnect examples.
- [24.3.12.2 Analog Bus \(ABUS\)](#): Added note regarding ABUSes voltage limit.
- [Table 24.3 GPIO Alternate Function Table on page 805](#): Added column entry for QFN48 with HFCLKOUT Package.
- [25.6 LDMA Register Map](#), [25.7.1 LDMA\\_IPVERSION - IP Version](#): Corrected IPVERSION register title.
- [25.3 Functional Description](#), [25.7.4 LDMA\\_STATUS - DMA Status Register](#): Corrected number of LDMA channels to 8.
- [25.3.7.2 SYNC Descriptor Structure](#): Added missing fields in SRC and DST words.
- [25.3.7.3 WRI Descriptor Structure](#): Added missing field in SRC word.
- [25.7.11 LDMA\\_CHDIS - DMA Channel Disable Register](#): Updated CHDIS field description.
- [25.7.28 LDMA\\_CHx\\_LINK - Channel Descriptor Link Address](#): Corrected LINK field description.
- [25.7.14 LDMA\\_CHDONE - DMA Channel Linking Done Register](#): Updated field descriptions.
- [26.2 Features](#) , [26.3 Functional Description](#) , [26.3.3 Energy Mode Handling](#) : Added EM1 Sleep as a selection option for running/freezing of watchdog.
- [27. LCD - Liquid Crystal Display Driver](#): Corrected maximum number of LCD segments within the Quick Facts section.
- [27.2 Features](#): Added multiplexing configurations and COM/SEG combinations.
- [27.3 Functional Description](#): Added note regarding LCDCLK references throughout chapter.
- [27.3.1 LCD Frame Rates](#): Updated language regarding phase periods per frame.
- [Table 27.2 LCD Mux Settings on page 1053](#): Fixed MUX, Mode and Multiplexing columns in table.
- [27.3.12 LCD DMA Transfer](#): Added note regarding LCD synchronization requirement after LDMA transfer.
- [27.5.4 LCD\\_CTRL - Control Register](#): Added additional information regarding UDCTRL operating in REGULAR mode.
- [28.3.5 Clock Sources](#): Removed LE interface clock requirement.
- [29.3.1 Interface Descriptions](#): Updated note clarifying the limitations of the VDAC interface and its use during idle phases.
- [29.3.5 Sensor Interaction](#): VDAC excitation note updated to specify use only with VDAC0.CH0\_MAIN\_OUT and also how its low impedance can be used to damp LC oscillation during idle phases.
- [29.3.5 Sensor Interaction](#): Added clarifying language regarding excitation signal routing.
- [29.3.6 Sensor Sampling](#): Added CHx\_INTERACT.OFFSET field usage.
- [29.3.12 Measurement Results](#): Added LESENSE FIFO buffer description.
- [30.3.17 Sine Generation Mode](#): Updated functional description and added VDAC sine wave output configuration.
- [30.3.17.1 Sine Generation - Software Control](#): Added functional description of software controlled sine signal generation.

- [31. ACMP - Analog Comparator](#), [29. LESENSE - Low Energy Sensor Interface](#): Deprecated capacitive sensing. Removed capacitive sense mode chapter, removed register description mentions of capacitive sensing, and removed other references of capacitive sensing throughout document. This feature is not recommended for new designs.
- [31.3.1 Configuration and Control](#): Added configuration note that low power reference is not supported when externally controlled.
- [32. KEYSKAN - Keyboard Scan](#): Updated row configuration description to add clarification regarding available ports.

## Revision 1.0

March, 2022

- [Table 1.1 Register Access Types on page 30](#): Corrected nomenclature descriptions, and updated register definitions with same nomenclature.
- [3.3.1 Interrupt Operation](#): Added note that writing directly to main interrupt flag register has no effect.
- [Table 6.1 MSC Flash Memory Mapping on page 58](#): Added debug as write/erase source for User Data (UD).
- [6.3.7 Flash Startup](#): Removed discussion of startup steps that user code does not implement.
- "Secure Element" changed to "Secure Engine" throughout document.
- [7. DBG - Debug Interface](#): Removed register tables.
- [8. CMU - Clock Management Unit](#)
  - Clock output to pin and PRS updated, clock tree diagram and register definitions updated to normalize on EXPORTCLK name.
  - Removed TIMERNRETIME branch to avoid confusion.
  - Corrected maximum clock speed limits to match datasheets.
- [9.3.5.2 HFRCO\\_CTRL - Ctrl Register](#): Added EM23ONDEMAND bit.
- [9.8 ULFRCO - Ultra Low Frequency RC Oscillator](#): Updated text to clarify that ULFRCO is available in EM4.
- [Table 13.3 List of Logic Functions on page 346](#): Corrected swapped definitions for FNSEL values 0xB and 0xD.
- [21.5.4 EUSART\\_CFG1 - Configuration 1 Register](#): Added RXDMAWU and TXDMAWU bits.
- Added [21.5.9 EUSART\\_IRLFCFG - LF IrDA Pulse Config Register](#) description.
- [21.5.20 EUSART\\_IF - Interrupt Flag Register](#): Added CSWU bit (also in EUSART\_IEN).
- [23.5.6 IADC\\_STATUS - Status](#): Removed debug bits SINGLEDATADV and SCANDATADV.
- [23.5.24 IADC\\_SINGLE - Single Queue Port Selection](#): Removed unavailable PADANA0 and PADANA1 options from port selection.
- [23.5.25 IADC\\_SCANx - SCAN Entry](#): Removed unavailable PADANA0 and PADANA1 options from port selection.
- [24.3.10 Interrupt Generation](#): Replaced references to EXTILEVEL with EM4WUPOL.
- [25.5 LDMA Source Selection Details](#): Fixed index numbers in SOURCESEL column.

## Revision 0.5

August, 2021

- Removed confidential watermark
- Updated text in accordance with Inclusive Lexicon Project in following sections:
  - [4. Memory and Bus System](#): Master / Slave replaced with Manager / Subordinate
  - [10. SMU - Security Management Unit](#): Master / Slave replaced with Manager / Subordinate
  - [20. USART - Universal Synchronous Asynchronous Receiver/Transmitter](#): Master / Slave replaced with Main / Secondary
  - [21. EUSART - Universal Synchronous Asynchronous Receiver/Transmitter](#): Master / Slave replaced with Main / Secondary
  - [22. I2C - Inter-Integrated Circuit Interface](#): Master / Slave replaced with Leader / Follower
  - **Note:** Register, bit, and enumeration names which would impact software builds have not been updated as of this release.
- Added [Figure 29.4 LESENSE Clocking and Timing Control on page 1140](#).
- Removed CRYPTOACC chapter.

## Revision 0.2

June, 2021

- Corrected typographical errors, fixed broken cross-references, and applied title-case throughout document.
- Updated Reserved bit description in all registers with reserved bits to indicate reserved bits should be written to their reset values instead of 0.
- [4.2.4.1 Peripheral Map](#): Updated Power Domain column and corrected LFRCO domain information.
- [6.3.3 Device Information \(DI\) Page](#) : Updated to latest DEVINFO revision (DEVINFOREV = 0xC), SWCAPA1.XOUT field added.
- Added register details: [6.6.6.6 SYSCFG\\_CFGSYSTIC - SysTick Clock Source](#).
- [7.3.2 Embedded Trace Macrocell \(ETM\)](#): Corrected pin descriptions to include Trace Data 1, 2, and 3.
- Added section: [9.2.3.9 High Frequency Clock Output \(HFCLKOUT\)](#).
- Added register details for LFRCO\_CTRL.
- [13.3.3.1 Producer Details](#): Removed unused internal signals.
- [Figure 18.8 LETIMER - Free Running Mode Waveform on page 478](#): Fixed major explosion in timing diagram.
- [19. TIMER - Timer/Counter](#): Updated references to external signals in diagrams.
- [21. EUSART - Universal Synchronous Asynchronous Receiver/Transmitter](#)
  - [21.3.2.16 EM2 operation \(EUSART0 Only\)](#): Added information about TXDMA wake request handling on empty buffer.
  - Removed internal programming notes sections.
- [22.3.5 Clock Generation](#): Updated clock synchronization details with additional precision.
- [23. IADC - Incremental Analog to Digital Converter](#)
  - Removed erroneous references to 0.25x Analog Gain option.
  - Added note about effective front-end sampling rate during conversions.
  - Added information on LESENSE interface to IADC.
  - Added [Table 23.2 Input Sampling Capacitance vs. Analog Gain on page 748](#) and information on calculating effective input impedance.
  - Removed unused feature bits from register details.
- [24. GPIO - General Purpose Input/Output](#): Corrected descriptions of interrupt source options - all GPIO interrupts are edge-based (naming removed level / edge).
- [30. VDAC - Digital to Analog Converter](#)
  - Updated clocking discussion for clarity, removed internal clock names and used CMU clock names throughout chapter.
  - Updated diagrams for clarity and to remove internal details.
  - Updated text and figures to use main output pin naming where appropriate.
  - Corrected sine mode figure to remove PRS and show effects of enable and disable.
- [31. ACMP - Analog Comparator](#)
  - Modified text and diagrams to show VDAC and LESENSE connections.
  - Added LESENSE interface details.

## Revision 0.1

October, 2020

Initial Release.

**Appendix 1. Abbreviations**

This section lists abbreviations used in this document.

**Table 1.1. Abbreviations**

Abbreviation	Description
ADC	Analog to Digital Converter
AES	Advanced Encryption Standard
AFC	Automatic Frequency Control
AGC	Automatic Gain Control
AHB	AMBA Advanced High-performance Bus. AMBA is short for "Advanced Microcontroller Bus Architecture".
APB	AMBA Advanced Peripheral Bus. AMBA is short for "Advanced Microcontroller Bus Architecture".
APC	Automatic Power Control
ASK	Amplitude Shift Keying
BLE	Bluetooth Low Energy
BLE-LR	Bluetooth Low Energy Long Range
BR	Baud Rate
BT	Bandwidth Time product
BUFC	Buffer Controller
BW	Bandwidth
CBC	Cipher Block Chaining (AES mode of operation)
CBC-MAC	Cipher Block Chaining - Message Authentication Code (AES mode of operation)
CC	Compare / Capture
CCA	Clear Channel Assessment
CFB	Cipher Feedback (AES mode of operation)
CHF	Channel Filter
CLK	Clock
CM3	ARM Cortex-M3
CM4	ARM Cortex-M4
CMD	Command
CMU	Clock Management Unit
CRC	Cyclic Redundancy Check
CTR	Counter mode (AES mode of operation)
CTRL	Control
DBG	Debug
DC	Direct Current
DEC	Decimator
DEMOD	Demodulator

Abbreviation	Description
DSA	Detection of Signal Arrival
DSSS	Direct Sequence Spread Spectrum
ECB	Electronic Code Book (AES mode of operation)
EFM32	Energy Friendly Microcontroller
EFR32	Wireless Gecko
EM	Energy Mode
EMU	Energy Management Unit
FEC	Forward Error Correction
FIR	Finite Impulse Response
FRC	Frame Controller
FSK	Frequency Shift Keying
FSM	Finite State Machine
GFSK	Gaussian Frequency Shift Keying
GMSK	Gaussian Minimum Shift Keying
GPIO	General Purpose Input / Output
HFRCO	High Frequency RC Oscillator
HFXO	High Frequency Crystal Oscillator
HW	Hardware
Hz	Hertz
IF	Intermediate Frequency
IFADC	Intermediate Frequency Analog to Digital Converter
ISR	Interrupt Service Routine
LFRCO	Low Frequency RC Oscillator
LFXO	Low Frequency Crystal Oscillator
LNA	Low Noise Amplifier
LO	Local Oscillator
MOD	Modulator
MODEM	Modulator and Demodulator
MSK	Minimum Shift Keying
NRZ	Non Return to Zero
NVIC	Nested Vector Interrupt Controller
OFB	Output Feedback Mode (AES mode of operation)
OOK	On Off Keying
OQPSK	Offset Quadrature Phase Shift Keying
OSR	Over-Sampling Ratio
PA	Power Amplifier
PD	Power Down

Abbreviation	Description
PHY	Physical Layer
PROTIMER	Protocol Timer
PRS	Peripheral Reflex System
PWM	Pulse Width Modulation
RAC	Radio Controller
RAM	Random Access Memory
RF	Radio Frequency
RMU	Reset Management Unit
RSM	Radio State Machine
RSSI	Received Signal Strength Indicator
RTC	Real Time Counter
RX	Receive
SEQ	Radio Sequencer
SPI	Serial Peripheral Interface
SRC	Sample Rate Converter
STIMER	Sequencer Timer
SW	Software
SYNTH	Synthesizer
TX	Transmit
XTAL	Crystal

# Simplicity Studio

One-click access to MCU and wireless tools, documentation, software, source code libraries & more. Available for Windows, Mac and Linux!

## Disclaimer

Silicon Labs intends to provide customers with the latest, accurate, and in-depth documentation of all peripherals and modules available for system and software implementers using or intending to use the Silicon Labs products. Characterization data, available modules and peripherals, memory sizes and memory addresses refer to each specific device, and "Typical" parameters provided can and do vary in different applications. Application examples described herein are for illustrative purposes only. Silicon Labs reserves the right to make changes without further notice to the product information, specifications, and descriptions herein, and does not give warranties as to the accuracy or completeness of the included information. Without prior notification, Silicon Labs may update product firmware during the manufacturing process for security or reliability reasons. Such changes will not alter the specifications or the performance of the product. Silicon Labs shall have no liability for the consequences of use of the information supplied in this document. This document does not imply or expressly grant any license to design or fabricate any integrated circuits. The products are not designed or authorized to be used within any FDA Class III devices, applications for which FDA premarket approval is required or Life Support Systems without the specific written consent of Silicon Labs. A "Life Support System" is any product or system intended to support or sustain life and/or health, which, if it fails, can be reasonably expected to result in significant personal injury or death. Silicon Labs products are not designed or authorized for military applications. Silicon Labs products shall under no circumstances be used in weapons of mass destruction including (but not limited to) nuclear, biological or chemical weapons, or missiles capable of delivering such weapons. Silicon Labs disclaims all express and implied warranties and shall not be responsible or liable for any injuries or damages related to use of a Silicon Labs product in such unauthorized applications.

**Note: This content may contain offensive terminology that is now obsolete. Silicon Labs is replacing these terms with inclusive language wherever possible. For more information, visit [www.silabs.com/about-us/inclusive-lexicon-project](http://www.silabs.com/about-us/inclusive-lexicon-project)**
