

Welcome to the final Tech Talk of the series!

Tuesday, June 14

Wi-Fi: Coexistence with RS9116

View the entire series on-demand at  
[silabs.com/training](https://silabs.com/training)

We will begin in:

0:00

# Welcome

**Wi-Fi: Coexistence with RS9116**

Rich Lysaght

# Agenda

- **WiFi Portfolio Overview**
- **RS9116 Overview**
- **Coexistence**
  - Unmanaged
    - Separating channel frequencies
    - Separating radio locations
  - Managed
    - Packet Traffic Arbitration - PTA
  - RS9116 PTA Setup
    - Configuration Bits
    - Pin Usage
- **Demonstration: PTA Usage between RS9116 and EFR32**

# The Leader in IoT Wireless Connectivity

 Ultra Low Power Wi-Fi

The background of the slide features a collection of various smart and IoT devices arranged on a light gray surface. Visible items include a white quadcopter drone, a robotic arm, a cordless drill, a smart scale with a blue display, a smart light bulb, a digital clock showing '10:28', a smart camera, a smart speaker, a smart thermostat, a smart plug, a smart light switch, and a smart door lock. A white tablet is also visible at the bottom right.

## Why Wi-Fi?

### **Wi-Fi is the ubiquitous wireless standard**

- Connects wireless ‘things’ to the Internet
- Most effective cost basis

### **Massive annual deployments**

- 3-4 Billion units per year  
(includes Smartphones etc.)
- 800M are “things” (IoT type products)
- 200M are battery powered

### **Designed to be scalable**

- High bandwidth – streaming video
- Low bandwidth – command/control  
& sensors

### **Compatible with all major ecosystems**

- (Google, Amazon and others)

### **Supports all upcoming initiatives**

- Matter over Wi-Fi

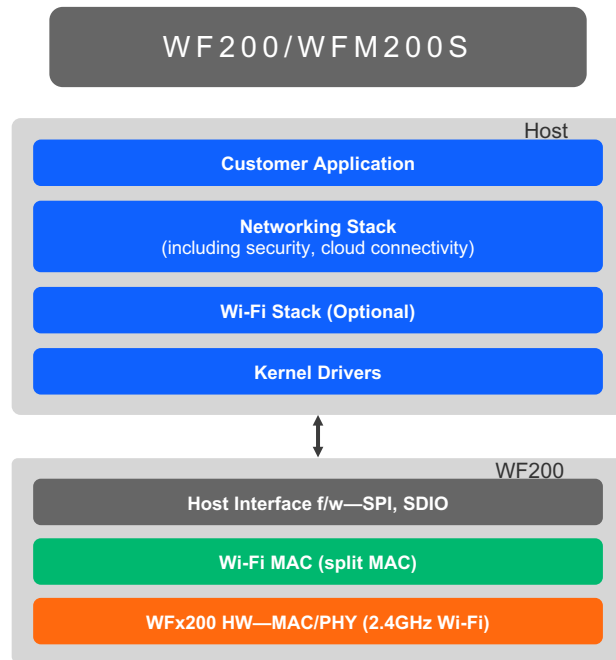

# Wi-Fi IoT Device Requirements

- **Traditional Wi-Fi is not well suited for IoT**
  - Meant for infrastructure, high bandwidth or mains powered devices
  - Used with highly resourced hardware (CPU, memory) running Linux/Android/Windows
- **Wi-Fi for IoT is different**
  - Limited device resources (MCU, memory etc.)
  - Low power consumption
  - Cost and size constrained devices
  - Challenges from crowded RF spectrum
  - Wireless, networking stack integration
  - Cloud connectivity to multiple cloud providers
  - Security from online and physical attacks
  - Coexistence and Interoperability
  - Limited User Interface options

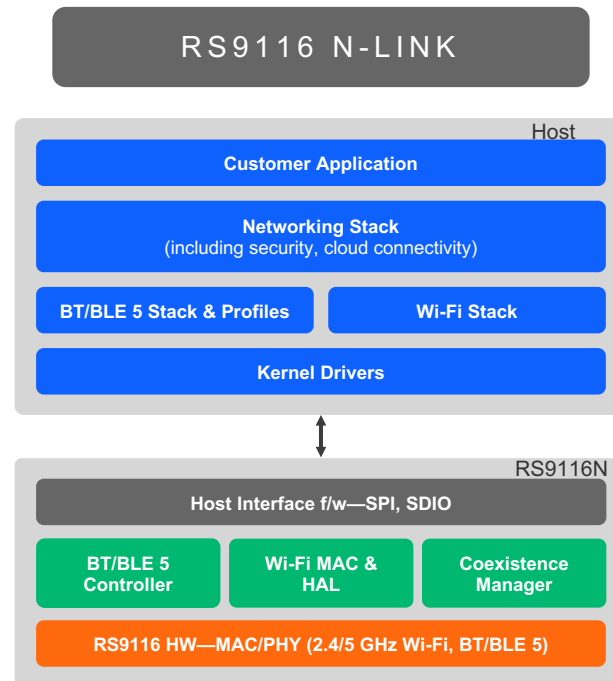

# Wi-Fi Product Family

## TRANSCEIVER SOCs & MODULES

### 2.4 GHz Wi-Fi

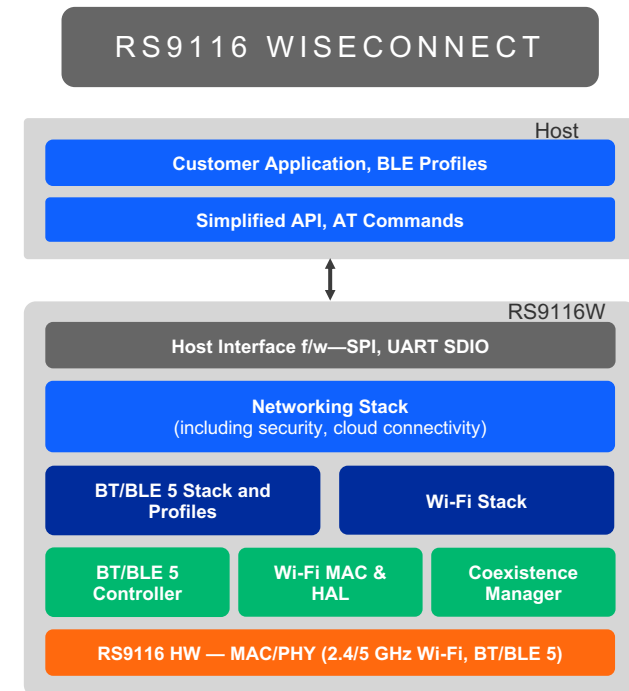

Wi-Fi and higher-level network & security stacks run on the host processor (MCU or MPU)

### 2.4/5 GHz Wi-Fi + BT + BLE 5

Wireless, network and security stacks run on the host processor (MCU or MPU)

## NETWORK CO-PROCESSOR (NCP) SOCS & MODULES

### 2.4/5 GHz Wi-Fi + BT + BLE 5

Wireless, network and security stacks run on the RS9116, while application runs on the host processor (MCU)

## IoT End Nodes

### Ultra-Low Power Wi-Fi + BT/BLE 5 for Always-on IoT Devices

#### Multi-protocol Support

Wi-Fi 4 (2.4/5 GHz)  
Bluetooth 2.1 + EDR  
BLE 4.0/4.1/4.2/5.0

#### Ultra-Low Power

55  $\mu$ A Standby Associated at 1s listen Interval  
1Mbps Listen current: 14 mA  
Deep Sleep Current: <1  $\mu$ A  
<8mA TX in BT5 mode at 2Mbps

#### Wi-Fi Radio

+20 dBm TX  
-98 dBm RX  
20 MHz Bandwidth  
1Mbps to MCS7 data rates

#### BT/BLE Radio

+20 dBm TX  
-95 dBm RX (LE)  
-106 dBm RX (LR)  
Dual mode Bluetooth 5  
125 kbps to 2Mbps BLE rates

#### World Class Software

Transceiver and Full NCP modes  
Open-Source Linux driver for transceiver mode  
Integrated Wi-Fi, BT/BLE stack  
Integrated Networking stacks  
Cloud connectivity  
Support for Simplicity Studio

#### Compact Size

7x7 mm 2.4GHz QFN ( QMS IC)  
4.63 x 7.9 mm 2.4GHz SiP  
9.1 x 9.8 mm 2.4/5GHz SiP

#### Security

WPA/WPA2-Personal,  
WPA/WPA2 Enterprise for Client  
(WPA3 in roadmap)

#### Accelerators

AES128/256 in Embedded Mode

#### Certifications

FCC/IC/CE certified modules  
(TELEC, SSRC in roadmap)  
BTSIG certification  
Wi-Fi alliance certification  
(roadmap)

# Coexistence

## 2.4GHz ISM Band Coexistence Challenge

- Several wireless protocols share the same 2.4GHz ISM Band: Wi-Fi, Bluetooth Classic, BLE, Zigbee and Thread
- These wireless protocols have different modulation schemes, channel frequencies and bandwidth
- When different ISM bands are co-located, the modulation schemes may overlap
- Signals intended for one modulation scheme will look like noise to another protocol
- If the desired receive signal is weaker than the “noise” received from co-located radio, messages could be interfered with and end up not being received as intended.

# Coexistence Impact: Co-Channel Example

- In this example Zigbee channel 12 is co-channel with Wi-Fi channel 1.
- The Zigbee channel would be blocked if the co-channel Wi-Fi signal is stronger at the Zigbee receiver than the signal being received from a remote Zigbee device
- Zigbee uses CCA (Clear Channel Assessment) to test the channel prior to transmitting. The transmit would be blocked if energy is detected  $> -75\text{dBm}$  (per 802.15.4 spec).

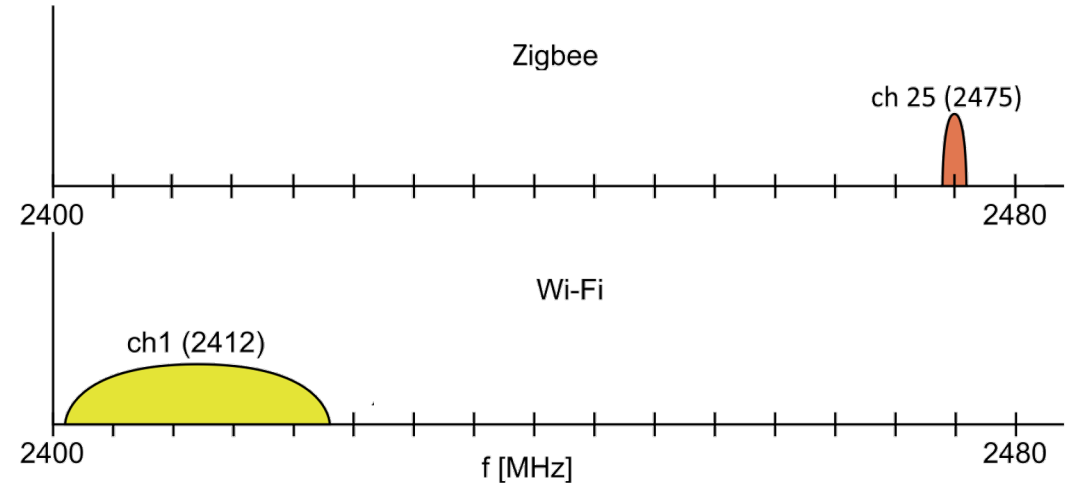

# Improving Coexistence: Unmanaged

- Frequency Separations

- Zigbee – select channels as far away from 2.4GHz Wi-Fi channel as possible
- Bluetooth Low Energy – Advertisements/Beacons occur on three channels (seen here is purple). The low, mid and high advertising frequencies tend to squeeze in between the most frequently used Wi-Fi channels (Wi-Fi Channels 1, 6 & 11)

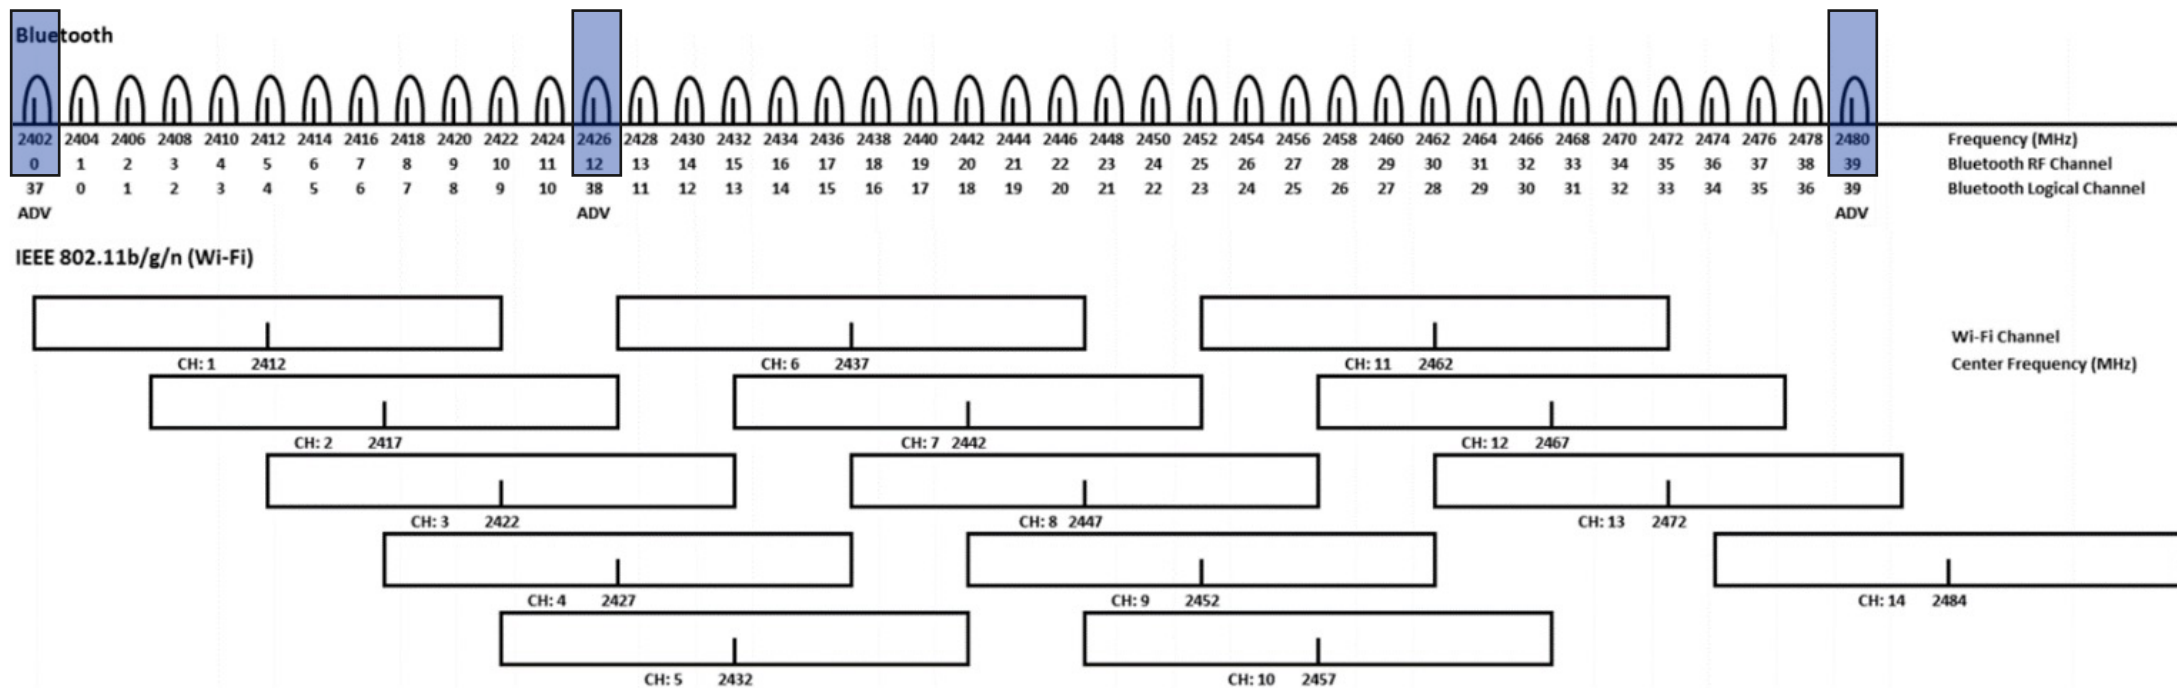

- Antenna Isolation

- Provide as much isolation between IoT and 2.4GHz Wi-Fi antennas as possible
- Use 20MHz Wi-Fi bandwidth (avoid 40MHz)
- Rely on protocol retry mechanisms

# Improving Coexistence: Unmanaged (continued)

- Wi-Fi (IEEE 802.11b/g/n) supports 14 overlapping 20/22MHz bandwidth channels with transmit powers up to +30dBm
- BLE supports 40 non-overlapping channels at 2MHz spacing with transmit powers up to +20dBm.
- BLE Beacons occur on 3 advertising channels (channels 37, 38 & 39). The channels are located at 2402MHz, 2426 MHz & 2480MHz

---

# FCC Co-Location Testing Policy

# EMC Co-Location Testing Policy

- Policy for EMC evaluation of co-located independent transmitters in a single enclosure (e.g. laptop, handheld). This does not apply to multi-radio systems with coordinated transmitters (e.g. beam forming systems, multi-sector radio systems).
- Simultaneous transmission data (radiated and antenna conducted) is required to be submitted only when the devices can transmit simultaneously and share a common antenna.
- The grantee is still responsible for compliance, even though we no longer require simultaneous transmission data to be submitted, (except for above exception).
- When a co-located, independent and non-coordinated transmitter is added, the evaluation of RF exposure conditions may still be required along with a filing of a Class II Permissive change request. However, no additional EMC test data need to be submitted.

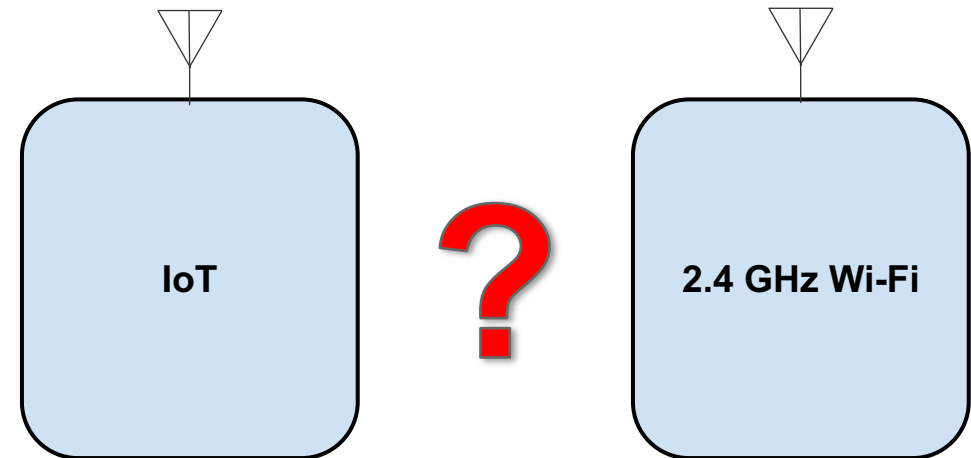

---

# Coexistence with PTA

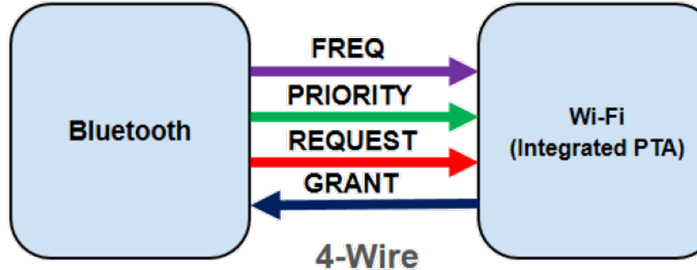

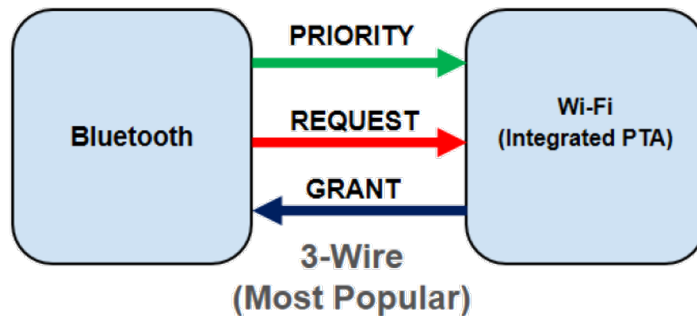

# Improving Coexistence: Managed

- Goals of Managed Coexistence
  - Separate the two radio's activities in time
  - This requires coordination between the radios
- Is there an easy way for the different radios sharing the 2.4GHz band within a single product to communicate and coordinate their communications?

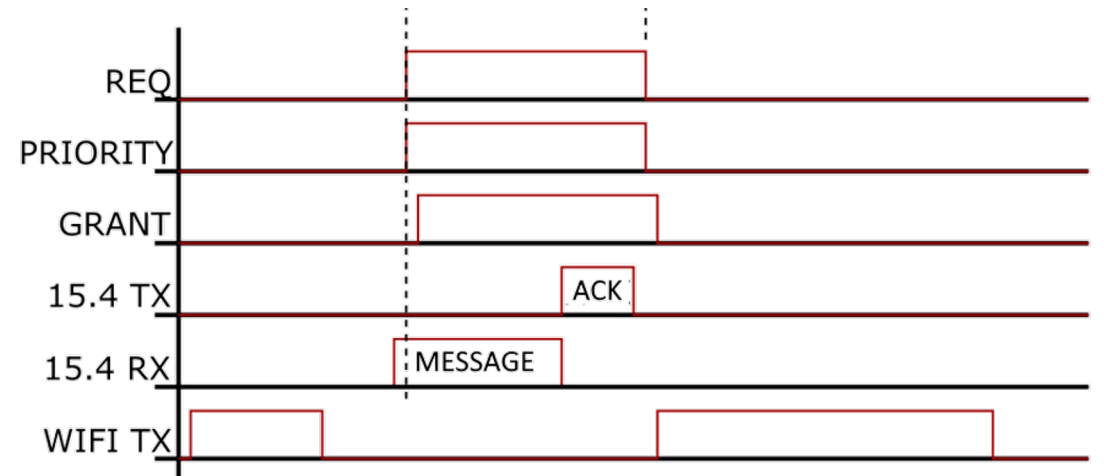

# Managed Coexistence: Packet Traffic Arbitration

- Packet Traffic Arbitration aka “PTA” is a means for allowing collocated radios a means to arbitrate and choose which radio can transmit at any given time.
- This was originally created managed coexistence between Bluetooth Classic and Wi-Fi devices
- There are four different wiring schemes used by PTA (see below).
- The 3-wire PTA tends to be the most popular.

# Packet Traffic Arbitration Basics

- IoT device asserts REQUEST and optionally asserts the PRIORITY signal
- If the Wi-Fi device can grant airtime, it asserts the GRANT signal back to the IoT device
- The Wi-Fi device is expected to stop transmitting prior to asserting GRANT signal and is expected not to begin a new transmission while GRANT is asserted.
- When the IoT transaction is completed, the IoT device de-asserts REQUEST and the Wi-Fi device follows by de-asserting GRANT.

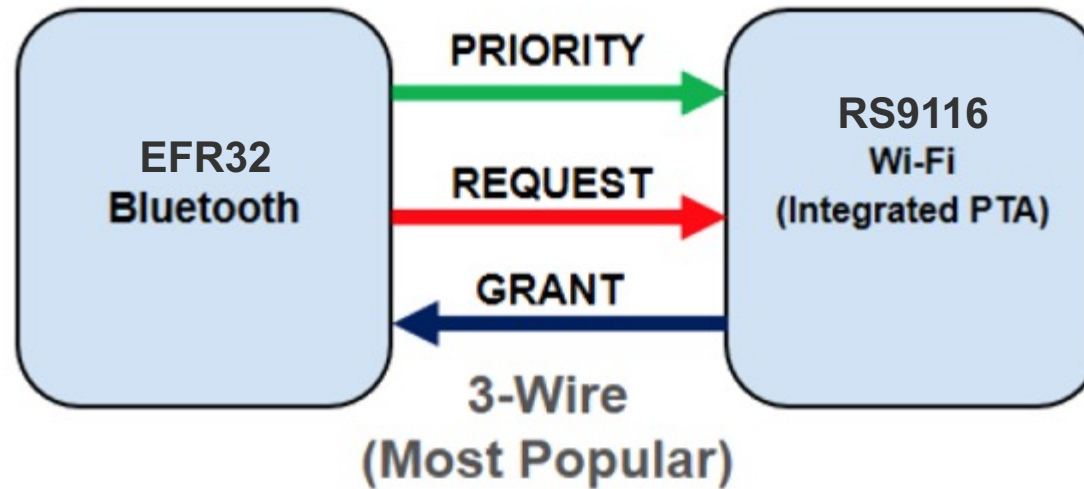

---

# RS9116 PTA Setup

## Managed Coexistence: RS9116 Uses 3-Wire PTA

- RS9116 Uses a 3-Wire PTA Scheme
- In this case, EFR32 BLE device will REQUEST permission to transmit and assert a PRIORITY
- The RS9116 will GRANT permission for EFR32 to transmit.
- Configuration bits in the RS9116 govern how aggressively permission is GRANTED.

# Managed Coexistence: RS9116 PTA Configurations

- To use PTA with the RS9116, Bit 21 in the **config\_feature\_bit\_map** enables 3-Wire PTA.
- Bits 22 & 23 determine the configuration of the 3-Wire PTA
- Bit 31 in **ext\_txp\_ip\_feature\_bit\_map** must be set to enable **config\_feature\_bit\_map** settings.
- <https://docs.silabs.com/rs9116-wiseconnect/latest/wifibt-wc-sapi-reference/opermode#rsi-config-feature-bitmap>

BIT 23	BIT 22	Config
0	0	Reserved
0	1	Config 1
1	0	Config 2
1	1	Config 3

## Managed Coexistence: RS9116 PTA Configurations (continued)

PTA Config	Description
Config 1	PTA Master will aggressively assert GRANT if the REQUEST is asserted irrespective of PRIORITY being asserted or not. This will mean anything ongoing transmission on Wi-Fi will be aborted and GRANT will be provided to the PTA slave.
Config 2	PTA Master will aggressively assert GRANT if the REQUEST is asserted irrespective of PRIORITY being asserted or not, with only one exception of an ongoing ACK/Block ACK Transmission in response to a Wi-Fi reception. In case there is an ongoing ACK/Block ACK transmission in response to a Wi-Fi Reception, PTA MASTER will GRANT access if PRIORITY is asserted along with REQUEST.
Config 3	If there is an ongoing Wi-Fi Transmission (Including ACK/BLOCK ACK) then PTA MASTER will not assert GRANT to an asserted REQUEST. However, if PRIORITY and REQUEST both are asserted then PTA MASTER will assert GRANT.

# Managed Coexistence: RS9116 PTA GPIO

Pin Description	RS9116 GPIO Pin	EVK Peripheral Card	EFR32 Pin
REQUEST	ULP_GPIO_1	J2 – PIN 8	Programmable
PRIORITY	ULP_GPIO_6	J2 – PIN 20	Programmable
GRANT	ULP_GPIO_0	J2 – PIN 6	Programmable
